comprising nine federal states, including Vienna and Vienna's neighbouring states Lower Austria and Burgenland. These three states have their own spatial plans; for example, in Vienna the Urban Development Plan Vienna (STEP 2025) is currently in force. At the regional level, the Spatial Development of the City Region of Vienna, Lower Austria and Burgenland (PGO 2011) serves as a guideline for the states involved. Plan implementation at the urban regional level unfolds mainly through projects fulfilling priority areas of spatial development, such as housing, public transportation, public spaces, green infrastructures and all projects aimed at improving the quality of life (interview at Vienna City Council). Two main projects were identified by the respondents at Vienna City Council and at Vienna University of Technology. One is the repurposing of old railway facilities in Vienna city centre, where development of a multi-functional facility (i.e., housing, offices and retail) is planned. This project involves a partnership between Vienna City Council and the Austrian Railway network owner (ÖBB-Infrastruktur AG). The second identified project is the urban-regional development project of Aspern Seestadt (<http://www.aspern-seestadt.at/en>). This project is Vienna's largest urban development project and, as such, will be constructed in several phases over a period of at least two decades (interview at VUT). This project involves collaborations between public authorities and private investors. Several small-scale projects in Vienna urban districts have been implemented, mainly with the aim of reinforcing the housing offer, creating public spaces and boosting the public transportation network. Two regional managers act in Vienna urban region as project-making and implementation facilitators. Their role is to negotiate projects with municipalities and align the local with the regional interests (interview at VCC). Scarce land resources for new housing developments in the core city of Vienna and the need to effectively managed financial, human and natural resources are the reasons for the implementation of plans through development projects. Furthermore, the weak regional plan for Vienna urban region propels project-making as a fast-track modus operandi to enact spatial transformation.

Case study*	Examples of projects	Main urban function of the projects	RQ 1: The reasons for the implementation plans through projects	RQ 2: Territorial governance behind project-making
Barcelona	Several urban regeneration projects	Urban regeneration Residential City-making	Limited financial resources, mainly at the municipal level.	Collaboration between municipalities and the AMB.
Cardiff	South Wales Metro. http://gov.wales/topics/transport/public/metro/	Residential Retail Transportation	Limited financial resources.	Collaboration between the UK and the Welsh governments and city councils.
Copenhagen	Nordhavn http://www.nordhavn.dk/ & others.	Residential Retail Transportation Cruise tourism	Scarce land resources. The need to repurpose outdated harbour facilities.	Collaboration between municipalities and the Danish government.
Dublin	North Lotts & Grand Canal Dock Strategic Development Zone Planning & others.	Residential Retail Business Public spaces Transportation	Limited financial resources. The need to repurpose outdated harbour and industrial facilities.	Collaboration between public authorities such as Dublin City Council and private interest groups
Edinburgh	Several projects (names not specified during interviews).	Innovation hubs Infrastructures Residential Cultural tourism	Limited financial resources.	Collaboration between the six local authorities and the UK and Scottish Governments.
Hamburg	Several projects (names not specified during interviews).	Retail Tourism Culture Transportation Residential Green infrastructure	Scarce land resources. Limited financial resources at the municipal level. Limited technical resources. The need to repurpose outdated harbour facilities.	Collaboration between Hamburg Metropolitan Region and municipalities located in Hamburg Region.
Hannover	Several projects (names not specified during interviews).	Residential Transportation Retail	Scarce land resources. Limited financial and technical resources at the	Collaboration between Region Hannover and

	interviews).	Green infrastructure	municipal level. The need to repurpose outdated industrial facilities.	municipalities in the region.
Helsinki-Uusimaa	Several projects (names not specified during interviews).	Residential Transportation Green infrastructure	Scarce land resources. Limited financial resources at the municipal level.	Collaboration between Helsinki-Uusimaa Regional Council and municipalities.
Lyon	Redeveloping of Lyon Part-Dieu district & others on housing and transportation.	Residential Food Energy Retail Industrial	Limited financial resources. Scarce land resources. Environmental preoccupations	Collaboration between Greater Lyon and private interest groups.
Milan	Welfare project Urban; Regeneration project; Habitability project.	Residential Urban regeneration	Limited financial resources. Scarce land resources.	Projects promoted by a variety of interest groups.
Oslo-Akershus	Several projects (names not specified during interviews).	Residential Retail Transportation Green infrastructure Public spaces	Scarce land resources. Environmental preoccupations. The need to repurpose outdated harbour and breweries facilities.	Partnership between Akershus County Council and Oslo City Council.
Stockholm	Stockholm Royal Seaport http://www.stockholmroyalseaport.com & others	Residential Transportation Retail Green infrastructure Public spaces	Scarce land resources. Scarce built up areas. Environmental preoccupations.	Partnership between Stockholm City Council and Stockholm County Council.
Stuttgart	Neckar Landscape Park http://www.landchaftspark-region-stuttgart.de	Green infrastructure Public spaces Residential Industrial Transportation	Limited financial resources at the municipal level. Scarce land resources. Environmental preoccupations.	Collaboration between VRS and municipalities. Collaboration between VRS and private groups.
Vienna	Project for reconversion of rail facilities into residential and commercial areas; Aspern Seestadt project.	Residential Transportation Industrial Green infrastructure Water front regeneration	Limited financial resources. Scarce land resources. Scarce built up areas. The need to repurpose outdated railway facilities.	Partnership between Vienna City Council and Austrian Railway network owner (ÖBB-Infrastruktur AG). Other public-private collaborations.
Main concluding remarks of the analysis of the case studies.	Main urban function of the projects (see in Figure 1):		RQ 1 - Main justification for plan implementation through projects:	RQ 2 - Main type of territorial governance arrangements:
	1) Residential; 2) Transportation; 3) Green infrastructures; 4) Retail; 5) Public spaces; 6) Industrial.		1) Limited financial resources; 2) Scarce land resources; 3) Repurposing of outdated facilities; 4) Environmental preoccupations.	1) Collaborations among public entities; 2) Collaborations between public entities and private interest groups.

5 CONCLUDING REMARKS

This paper provides a contribution to the main conference them – “Spaces of Dialog for Places of Dignity: Fostering the European Dimension of Planning” by revealing that the selected 14 European urban regions have been implementing strategic plans through urban-regional development projects in times of resource scarcity. Figure 1 summarize the key findings, in line with Table 2. The paper also highlights that such area-specific and functionally-oriented urban-regional development projects can act as catalysts for effective structural, socio-spatial and spatial-economic transformation, thereby contributing to fairer and more equitable spatial development. The implementation of strategic plans through projects is mainly attributable to limited financial resources, including at the municipal level (RQ 1, Fig. 1). In most of the

selected cases, local levels of government have no financial mechanisms for implementing local development plans in an organic manner (i.e., through a concerted implementation effort without projects - path A, Fig. 1). In this regard, municipalities are, to some extent, obliged to engage with national or regional governments to seek funding so they can implement plans through projects (path B, Fig. 1). For the municipalities to receive funding, they have to establish projects that fulfil specific needs (e.g., more social housing; better intraregional transportation networks) in concrete territorial areas. Projects are then seen as the most effective and least time consuming path for spatial transformation to actually happen at the ground level. In the majority of the cases, the projects are co-developed through collaborations or multiple partnerships involving a wide range of territorial governance structures (e.g., regional entities, municipalities, and private interest groups such as retail investors or real estate agents, RQ 2). The majority of the urban-regional development projects are supported by funding schemes from entities at supranational (e.g., European Union, EU), supraregional (e.g., national governments) or supralocal (e.g., regional agencies or regional governments) levels.

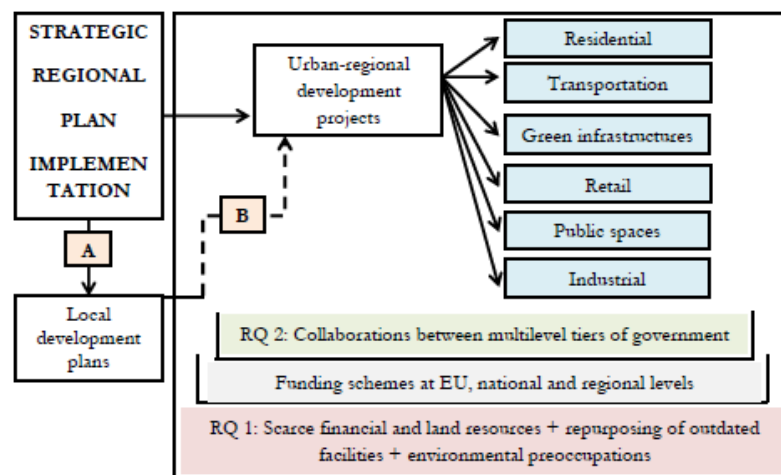

Figure 1 - Schematic representation of strategic regional plan implementation in the selected cases.

ID 1345 | THE URBAN-RURAN RELATIONSHIP AND ITS DEVELOPMENT TENDENCY BASED ON THE PHENOMENON OF PSEUDO COUNTER- URBANIZATION - TAKING WUHAN AS AN EXAMPLE

Hong Geng¹; Jing Qiao¹; Ningxing Lv¹
¹Hua Zhong University of Science and Technology

1 BACKGROUND OF THE STUDY ON THE URBAN-RURAL RELATIONS BASED ON "PSEUDO COUNTER URBANIZATION"

1.1 THE JUDGMENT OF URBAN-RURAL RELATIONS IS AN IMPORTANT PREREQUISITE FOR THE COGNITION OF THE CHARACTERISTICS AND CONNOTATION OF URBANIZATION

Urbanization is, with the development of social productive forces, the process of promoting the rural population's migration in urban areas, causing changes in the social and economic space, and making closer sharing relations of public services. In this process, the urban area and the rural area are the two poles of the flowing of elements such as population, economy, and service, and is an important geographical space carrier in urbanization. Therefore, the judgment of the urban-rural relations has an important role of explanation and prediction for the cognition of the characteristics and connotation of urbanization development. And different development stages of urbanization are accompanied by different economic and social development levels, industrial divisions and institutional changes, and then show the corresponding urban-rural relations characteristics, forms, and functions. Therefore, so the prejudgment for the development trend of urban-rural relations is also an important basis for formulating the future urbanization development strategies.

1.2 URBANIZATION'S NEW CHALLENGES AND DEVELOPMENT TREND BROUGHT BY THE CHANGE OF URBAN-RURAL RELATIONS

The evolution of urban-rural relations in China is divided into three stages. The first stage (before the reform and opening up): The dual urban-rural system was comprehensively established, the areas with urban-rural antagonism continued to be expanded and its degree was continuously strengthened, and the rural areas are the main base for urbanization and industrialization; the second stage (1978 - 2002): Part of the dual urban-rural system began to break away, and in some fields such as the urban-rural land system and market were further strengthened with urban areas bring along rural areas; the third stage (2002 to present): Overall urban-rural development was clearly put forward. With the comprehensive deepening of the economic system reform, the dual urban-rural system began to really be broken systematically from the whole perspective, and rural areas began to be brought along by urban areas. At present, China has entered the stage of rapid evolution of urban-rural relations. Much of rural population, land, and industries have all begun to transfer to urban areas. The quality of urbanization needs to be improved. A large number of labor released by the "agricultural to non-agricultural transfer" are in urgent need for allocation, accompanied by a significant "semi-urbanization" population movement [1]. Therefore, the characteristics and connotation of urbanization in China will face more challenges as the economic and social changes are more diverse and complicated.

1.3 "PSEUDO COUNTER URBANIZATION" SITUATIONS LIKE "NON-AGRICULTURAL TO AGRICULTURAL TRANSFER" AND "MIGRATING INTO URBAN AREAS WITHOUT TRANSFERRING AGRICULTURAL HOUSEHOLDS" APPEARED IN SOME CITIES

"Counter urbanization" refers to the process that a large number of urban population and resources flow to rural areas and small towns when western countries' development of urbanization comes to a certain stage and the development of big cities begins to slow down [1]. According to the curve of urbanization and the experience of developed countries, "counter urbanization" generally appears in the stable development stage of the urbanization rate, and is an inevitable stage in urbanization. With great development of China's urbanization, the "non-agricultural to agricultural transfer" in household registration has quietly appeared in some places. Contrary to the usual "agricultural to non-agricultural transfer" trend in urbanization, some people hope that their urban household registration could be transferred into rural household registration. For example, in Hangzhou City and Tongxiang City of Zhejiang Province there have been collective requirements of college students for inter-provincial "agricultural to non-agricultural transfer". And a national survey also shows that more than 75% of migrant farmers are not willing to give up their agricultural household registrations. This situation appears to belong to "counter urbanization", but its logic and connotation are some different from the "counter urbanization" experienced by developed countries.

2 THE CONNOTATION OF "COUNTER URBANIZATION" AND ITS CHARACTERISTICS OF URBAN-RURAL RELATIONS

2.1 INTERNAL DRIVING FORCE AND EXTERNAL CONDITIONS OF "COUNTER URBANIZATION"

Residents' pursuit of low-cost, high-quality life and enterprises' goal of prioritizing profits are the internal driving force of "counter-urbanization" [2]. In the 1970s, developed countries accumulated the results of rapid development of urbanization, while their traffic congestion, environmental pollution and other "urban diseases" became increasingly serious. Urban space was unable to meet the residents' high quality needs for production, living, recreation and transportation and other basic functions. Enterprises would increasingly tend to use small towns or rural areas with lower element cost. Therefore, when a city develops to a certain scale, residents and businesses begin to relocate, to seek lower living costs and better living environment. On the other hand, with the continuous improvement of information technology and transportation network, the space and time distance between urban and rural areas was shortening, providing necessary technical conditions for "counter urbanization". At the same time, to deal with "urban

diseases" and the dual urban-rural economic contradiction, the western governments generally implemented the rural-urban relations policy of supporting agriculture in return and rural areas, strengthening rural infrastructure construction, improving the rural public service level, and narrowing the urban-rural gap [2], providing policy guarantee for attracting elements like population and capital and to transfer from large cities to small towns and rural areas.

2.2 CHARACTERISTICS OF URBAN-RURAL RELATIONS UNDER "COUNTER URBANIZATION"

In the "counter urbanization" of Western developed countries, their urban-rural relations also showed certain characteristics, specifically in population flow, spatial change and public services:

(1) THE CLASS OF POPULATION FLOW WAS THE RICH CLASS, AND IT WAS THE FREE FLOW BETWEEN URBAN AND RURAL AREAS.

Western developed countries have experienced four stages: urbanization, suburban urbanization, counter urbanization, and re-urbanization. From the suburban urbanization, the outward flow of population began to emerge, first appearing in the rich, and later extending to the middle class. Its initial power, as mentioned above, was the city residents beginning to pursuing a better living environment. Therefore, the essence of its population flow is "free flow" of pursuing higher life quality, and only the social class above the middle class has the capital for "free flow".

(2) THE SPACE OF CENTRAL CITIES SPACE GOT NEARLY SATURATED, WITH HIGH LEVEL OF URBANIZATION, THEIR FUNCTIONS SPILLING OVER.

The urban population of London in the UK decreased by 100,000 from 1950 to 1970, and after 1970, the speed and scale of "counter urbanization" accelerated. In the 1950s, the British urban population decreased by 20,000 per year, in the 1960s 40,000, and in the 1970s 90,000. In France, Germany, the United States, Japan, and other countries, the urban population also decreased at different degrees each year [3]. From (Figure 1), it can be found that the backgrounds of the urbanizations in developed countries were all stages with high-level urbanization. The city scale had been over a long-term accumulation of elements, and its space development was in a saturated state. These were the significant spatial features of counter urbanization.

Figure 1 - In Britain, the United States, France, Germany, the urbanization rate since 1950

(3) THE CHARACTERISTICS OF THE INTEGRATION OF URBAN-RURAL PUBLIC SERVICES ARE OBVIOUS, WITH SMALL URBAN-RURAL GAP.

The Western "counter urbanization" was achieved under the premise of the urban-rural equalization of infrastructure and public services. For example, Japan's counter urbanization, was in the context of urban-

rural social integration. Its development of urban and rural industries and living facilities gradually converged, its urban-rural gap narrowed, and rural areas had a more favorable living environment than cities, resulting in a large number of urban population's free outflow. Therefore, urban-rural integration, especially the integration of public services, is a prerequisite for urbanization.

3. THE CHARACTERISTICS AND CAUSES OF THE URBAN-RURAL RELATIONS UNDER "PSEUDO COUNTER URBANIZATION" IN WUHAN

Wuhan City is a megacity in the central region, and 61.94% of its jurisdictional area is the agricultural ecological zone. In 2014, the agricultural population was 2.6803 million, with about 2030 incorporated villages and about 18,000 unincorporated villages. The overall population distribution, in accordance with its natural and geographical environment, features dense-north and sparse-south (as in Figure 2). At the end of 2013, Wuhan City's per capita net income of farmers already reached 12731 yuan, more than the national average of 8896 yuan. The income ratio of urban and rural residents was 2.34: 1, which was significantly lower than the national level of 3.03: 1 in the same period, and has gradually decreased in recent years. However, both from the income level or the urban-rural gap, Wuhan City lags behind Shanghai in a certain degree (as in Figure 3). Therefore, it still has a big development space in the driving force of "urban" on "rural" areas.

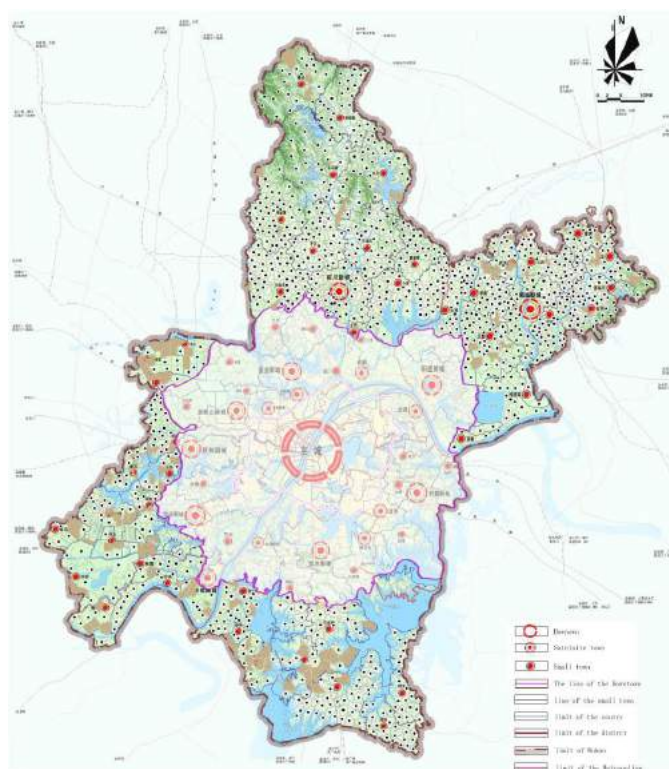

Figure 2 – The rural space distribution features in Wuhan

Figure 3 – The change of the urban and rural gap in Wuhan

3.1 THE AGRICULTURAL POPULATION HAS RISEN SLIGHTLY IN RECENT YEARS. "COUNTER URBANIZATION" OR "PSEUDO COUNTER URBANIZATION"?

In recent years, the agricultural population in Wuhan City, has shown a downward trend in volatility. Compared with the change trends of agricultural population and change rates in Shanghai and Chengdu, the driving effect of Wuhan's main urban area to the rural areas around it is still less than that of Shanghai. Through research, it is found that the majority of the rural residents in Wuhan are willing to move to the new urban area and the main urban area, but the current change trend of the agricultural population shows that the rate of urbanization of the agricultural population is on the fluctuant decrease, and in 2011-2014, "counter urbanization" appeared with its agricultural population growth. From (Figure 4), it can be found that the change rate of the agricultural population in Shanghai is relatively stable, showing that the rate of urbanization in Shanghai is relatively stable, while for Wuhan and Chengdu, the two metropolis at the similar development stage, "counter urbanization" appears with a fluctuant change in agricultural population. However, through in-depth analysis, it is found that the urban-rural relations of this "counter urbanization" are not consistent with the characteristics of "counter urbanization" in developed countries.

Figure 4 – The change of agricultural population and the population rate in 2008-2014 in Wuhan, Chengdu and Shanghai

3.2 DEMONSTRATION OF THE CONNOTATION OF "PSEUDO COUNTER URBANIZATION" IN WUHAN BASED ON THE CHARACTERISTICS OF URBAN-RURAL RELATIONS

The urbanization rate of resident population in Wuhan in 2013 was 79.3%, and the urbanization rate of registered population was 67.6%. The household registration system is not only a sign of identity difference, but also a difference in the level of rights and benefits. The equality of rights attached to the household registration for employment, enrollment, social security and others, determines the real level of urbanization. Therefore, considerable "semi-urbanized" people in Wuhan haven't been "citizenized" and enjoy the same treatment of urban residents, which is the focus of the current new urbanization. Wuhan's "pseudo counter urbanization" can be seen from the difference between its urbanization rate of household registration and that of its resident population. From the perspective of population flow, spatial changes and public services between urban and rural areas, the "pseudo counter urbanization" of Wuhan has the following characteristics.

(1) THE FLOWING POPULATION IS IN A "FORCED FLOW" BETWEEN URBAN AND RURAL AREAS OF FARMER-BASED MIDDLE-OR-LOW CLASS IN SOCIETY.

The main part of the flowing population in Wuhan is not the middle class flowing to the suburbs, but is mainly composed of migrant workers. Due to the high cost in the city and because they cannot settle in the city with household registration, most farmers still retain their agricultural household registration and their rural land as a way to increase income, but also as the reserved guaranty when they return their hometowns. So the flow of the population features repetitiveness and "forced flow" due to low income. Calculated with the natural growth rate of 7.5 ‰ in Wuhan, the agricultural population in 2013 and 2014 is basically the same as that of natural growth. Therefore, it can be found that there is not much change of household registration in agricultural population in recent years, and the growth is mainly natural growth.

(2) WUHAN'S URBANIZATION LEVEL AND ITS MAIN CITY AREA STILL HAVE A LARGE DEVELOPMENT SPACE.

Wuhan is a megacity in the central region, with an extremely high primacy ratio. The large-scale agglomeration of economy, education, industry and other elements enables it to have strong population absorbing ability, with its foreign population in 2014 reaching more than two million. And its population growth still has a strong momentum, so the development of its urbanization level still has a large space. From the perspective of space utilization rate in urban development, its spatial expansion is fast, but its extensive development way results in its poor land performance. Therefore, in its next development stage, the main city and urban development area still have a large population holding potential. Its urban space hasn't reached the saturation degree of "counter urbanization".

(3) THE DEGREE OF URBAN-RURAL PUBLIC SERVICE INTEGRATION IS NOT HIGH.

There are still big gaps between rural and urban areas of Wuhan in education, health care, and social security. The huge rural-urban difference in infrastructure and public services make it not have the conditions for "counter urbanization", and it still takes "urbanization" as the main driving force. Through the sample survey on Yanghu Village and Yingxiong Village of Jiangxia District, it was found that except basic public service needs, rural residents basically use public service facilities in urban areas. Although basic public service is accessible in rural areas, the facilities' configuration standards are too low, and their use rate is not high.

3.3 THE CAUSES OF "PSEUDO COUNTER URBANIZATION" IN WUHAN CITY

3.3.1 GRADUAL INCREASE IN THE BENEFITS OF RURAL HOUSEHOLD REGISTRATION MAKES SOME RURAL RESIDENTS RETAIN THEIR HOUSEHOLD REGISTRATION.

In 2014, the State Council promulgated the Opinions on Further Promoting the Reform of Household Registration System. It decided to establish a unified household registration system for urban and rural areas, cancel the non-agricultural household registration and ensure the legitimate rights and interests of the agricultural transfer population. Wuhan City has also established a pilot project for household registration reform. This is undoubtedly a great policy for the vast number of migrant farmers who desire to truly integrate into cities. However, according to a research report by the Academy of Social Sciences, nearly 80% of farmers do not want to become citizens, because the benefits of agricultural household registration are gradually increasing .

3.3.2 ECONOMY ESSENTIALLY DETERMINES THE DIRECTION AND DURATION OF THE RURAL POPULATION'S FLOW.

Through the survey of some rural villages in Jiangxia District and Xinzhou District of Wuhan City, it was found that farmers' income in agriculture is far less than that as migrant workers. Therefore, the young and middle-aged labor in rural areas chooses to work as migrant workers in cities to earn the annual income of 50-100 thousand yuan. The survey also found that agricultural income accounted for about 20% - 45% of the total income of farmers, and only a few agricultural villages could reach 60%.

The economy determines the outflow of the rural population in nature, but the instability of being a migrant worker in cities and the gap between migrant workers and urban workers in social security have led to the fact that the duration of migrant workers' work in cities is uncertain, and the high cost of urban life makes farmers not afford to completely settle in cities. Therefore, the outflow of rural labor is cyclical and repetitive. In Professor He Xuefeng's view, farmers' migrating into cities itself is a repeated, long-term process, and cannot be achieved overnight. British urbanization, from the clustering, suburbanization, counter urbanization, to urban-rural integration, took 250 years, France 120 years, and the United States, Canada, and Japan about 100 years [4]. In rough calculation, according to the annual income of 12731 yuan of farmers, and the main city's housing price of 8,000 yuan/m² and the new city area of 3,000 yuan/m², if a farmer would purchase an apartment of 70 m², he would spend, respectively, 43 years and 16 years

(not taking into account price increases and living expenses). In other words, it still needs to take Wuhan farmers at least 20 years to completely migrate into the city, and the citizenization of migrant workers is still a long process.

3.3.3 THE CONTRADICTION OF THE UNIQUENESS AND BINDING OF LAND LEAD TO THE INSTABILITY OF FARMERS' FLOW.

Under the current land system and collective construction land system, land is still the only means of production for farmers. Therefore, it is difficult for farmers to give up their only living guarantee and enter the city to engage in an unstable, not decent job. During the process of land transfer, farmers and village collectives don't participating the sharing of the value-added benefits for the non-agricultural use of agricultural land. On the other hand, for migrant farmers, the land without high output efficiency becomes encumbrance and binding. This contradiction caused by the uniqueness and binding makes the land use ineffective, and also leads to different willingness of land transfer for farmers with different land amounts, resulting in the instability of the rural-to-urban flow.

Therefore, in summary, the current "counter urbanization" in Wuhan City is actually a "pseudo counter urbanization". It is not the same process as the developed countries "counter urbanization", but a special phenomenon formed in the urbanization under China's special dual urban-rural system. In this special urbanization phenomenon, the urban-rural relations are still in a relatively fragmented and antagonistic state. However, with the macro regulation in policy and the economic development, Wuhan's urban-rural relations will face a new development trend in population, space, public services, and other aspects in the new round of urbanization development.

4 ON THE DEVELOPMENT TREND OF URBAN-RURAL RELATIONS IN THE NEW ROUND OF URBANIZATION IN WUHAN

At present, Wuhan City is facing a new round of the revision work for its overall planning. Therefore, it is of great significance to correctly understand the development of urbanization and to predict the development trend of urban-rural relations accurately for formulating urbanization development strategies and achieving urban-rural integration in the new round of overall planning. In the following, I still analyze the development trends of urban-rural population flow, urban-rural spatial relations, and urban-rural public service.

4.1 DEVELOPMENT TREND OF URBAN-RURAL POPULATION FLOW IN WUHAN

4.1.1 WUHAN'S RURAL POPULATION TRANSFER WILL SLOW DOWN, BUT THERE IS STILL MUCH TRANSFER DEMAND WITH MUCH TRANSFER PRESSURE.

In accordance with the relevant theory and international experience, when the urbanization rate is greater than 60% and agricultural workers accounted for less than 20% of the proportion of all employees, the dual urban-rural economic development stage, in the labor transfer level, has ended the dual structure, which means that the stock surplus labor has been finished being transferred [5]. In 2013, the proportion of the first industry practitioners in Wuhan was 9.7%, in theory, having crossed the "second Lewis turning point", but the future transfer of rural surplus labor will continue to exist. Because the rural areas of Wuhan are mainly concentrated in six new urban areas, the urbanization rate of the six new urban areas in 2014 was only 51.36%, which is lower than the national average of 54.77%. In the same period, the proportion of non-agricultural labor force in the new urban area was 64.8 %. In accordance with the 13th "Five-Year Plan" of Wuhan City, during this period there are still 50,000 of rural surplus labor needing to be transferred. However, because the population has been over the demographic dividend range, the rate of population transfer will slow down in some sense.

In addition, the pressure of Wuhan's transfer of incremental labor is also large. Wuhan City, as a megacity, the central city has strong attracting power to workers from the surrounding towns, as well as those from other areas. And there is a certain contradiction between the demand structure of Wuhan labor force and

the nature of surplus labor force. With Wuhan's the rapid industrial transformation and gradual growth of the high-tech industry, it needs more and more professional and technical personnel. And Wuhan is rich in human resources from university graduates, so the remaining labor generally has low education. Therefore, there is certain difficulty in employment transfer in Wuhan. At the same time, Wuhan City is in transition from the traditional agriculture to modern agriculture, so the scale land scale operation is bound to release a large number of surplus labor force, so in the new round of development, the pressure on the transfer of rural population is still great.

4.1.2 WUHAN'S RURAL AREAS WILL CONTINUE TO ASSUME SOCIAL SECURITY FUNCTIONS FOR A LONG TIME IN THE FUTURE.

The rural area is the carrier to maintain rural life and social stability. Rural areas first ensure the economic interests of farmers, and are the migrant workers' final home when returning their hometowns. They are the reservoir and stabilizer for China's modernization and urbanization. If there is economic turmoil in this country, migrant workers can still return to the rural areas, providing a buffer for modernization. As the process of migrant workers migrating into the city is a very long and repetitive process, in the next period of time, Wuhan's rural areas will still undertake their social security functions in addition to their functions of agricultural production, ecological conservation, and rural cultural heritage in the process of urbanization.

4.2 DEVELOPMENT TREND OF URBAN-RURAL SPATIAL CHANGES IN WUHAN

4.2.1 WUHAN'S MAIN URBAN SPACE DEVELOPMENT SHOULD COMBINE "STOCK POTENTIAL-EXPLOITING" AND "CONTROL OVER INCREMENTAL ACCOUNT".

Wuhan City, as a large-capacity carrier for urban and rural population, not only has a large population base, but also has the prominent demands for further population growth. External population has become the absolute mainstream of the growth of the resident population, especially the urban population. The population source structure tends to be diversified, the liquidity is increasing day by day, and the demand for production and life tends to be complicated. Therefore, the associated rapid expansion will be reflected in the space. The spatial growth of the main urban area is still the development trend of the next phase in Wuhan City. The future strategic direction of the main city's space development should be combining "stock potential-exploiting" and "control over incremental population". In addition, the new city areas and small towns will be the main urban space of the next stage of urbanization .

4.2.2 WUHAN'S RURAL AREAS SHOULD ENSURE "THE MINIMUM GUARANTEE" AND "OPTIMIZATION".

Compared with urbanization, the scale reduction of rural areas is an inevitable trend, but the future rural areas still bear important functions of production, life, industry and ecology, so the rural space development strategy should mainly be "the minimum guarantee" and "optimization". On the one hand, the production and living service functions of the rural areas should be supplemented, providing perfected facilities and conditions for the remaining rural people and getting ready for the reflow of population from residents of the main city areas. On the other hand, with the improvement of the urbanization, the overall size of rural areas will be reduced, and the layout of the residential areas will face new changes. Much functional configuration and social layout of the planning should not only meet the development needs of the current stage, but also take into account of the impact of the future size reduction. Coupled with the current instability of the transfer brought by incomplete urbanization of population, the rural space development strategy should be "ensuring minimum guarantee" to ensure the basic functions of rural areas in the urbanization. And at the same time, the idea of "optimization" development should be taken to get ready for the real "counter urbanization".

4.3 DEVELOPMENT TREND OF URBAN-RURAL RELATIONS IN PUBLIC SERVICE SHARING IN WUHAN

4.3.1 THE HIERARCHICAL CONFIGURATION SYSTEM LIMITED BY THE ADMINISTRATIVE DIVISION HAS BEEN BROKEN, AND THE NETWORK URBAN-RURAL PUBLIC SERVICE SHARING RELATIONS GRADUALLY APPEAR.

The emergence of new industries and technological revolution has brought about profound changes in residents' way of life or production, and the network systems such as rail transit have become more and more mature. The traditional hierarchical relationship between urban and rural systems limited by administrative divisions has been broken in some fields of functional relationships. The network characteristics of factor flow and energy transfer are more obvious. The urban-rural relations show an obvious network trend. The living circle of the most important public facilities in the rural areas has undergone a change without the limitation of the stratification of the administrative division. But the architecture of the rural area is still necessary to exist, and its significance lies in improving the efficiency of the facilities. Therefore, the future urban-rural public service sharing relationship should take the residents' facility use as the basis of the construction of the rural space system and "living circle" should be taken as a link between urban and rural areas, to form a network time-space relationship and society sharing relationship.

4.3.2 THE TREND OF RURAL HOLLOWNESS AND AGING POPULATION IS INEVITABLE, AND IT SHOULD BE GIVEN APPROPRIATE SUPPORT.

The rural hollowness and aging population is an inevitable trend in the urbanization in China. If the idea of "solving the problem" is taken to restrain this trend, it is bound to be difficult to solve it. Therefore, we should adapt to the change of social structure, improve the rural-related aging facilities, and carry out more activities for the elderly. We should give "auxiliary support" based on the existing status. This not only continuously improves the rural life quality, but also gets ready for the integration of the urban-rural public service for the visionary population reflow.

5 CONCLUSION

Wuhan City, as a megacity in the central region, its socio-economic development, and urbanization process characteristics will make its urban-rural relations have corresponding particularity, but also to a certain extent, considerable universality, because China's urban-rural relations in the same system framework are generally in a similar development base and stage. This paper analyzes the present situation and development trend of the urban-rural relations in Wuhan from the perspective of the special urbanization of Wuhan City's "pseudo counter urbanization", hoping to analyze and judge the urban-rural relations by analyzing its logic, so that the urbanization and urban and rural overall development in Wuhan have a more rational research foundation in a new round of development, to help lay a foundation for the construction of Wuhan City as a national central city. In 2014, the level of urbanization in China ushered in this historic threshold of 50% (54.77%). To promote a fundamental change from "rural China" to "urban China" in a country with the population accounting for nearly 1/5 of the world, the connotation and characteristics of urbanization will face some unique phenomena in China, and urban-rural relations will also face new changes. There is no doubt that this research will definitely be able to make due contributions to the strategic objective of achieving the new urbanization.

ID 1418 | FOR AN ANTI- AND POST-CRISIS TERRITORIAL REGENERATION AGENDA. THE FRIULI VENEZIA GIULIA REGION AS A STUDY AREA

Sandro Fabbro¹

¹Dipartimento Politecnico di Ingegneria e Architettura, Università degli Studi di Udine
sandro.fabbro@uniud.it

ABSTRACT: The territorial impact of the longest and most severe post-war economic crisis is interacting, in Italy, with endemic territorial neglect that exposes people and local communities to devastating risks and a permanent state of insecurity and uncertainty. The "low carbon future" has also assumed, in the institutional and scientific literature and beyond its direct environmental implications, wider technological and socio-economic implications. A decades-long cycle of "reterritorialization", based on the regeneration of "territorial capital", can therefore become a major "Country project", at both local and national levels. It should be aimed at assuring security to the people exposed to risks, redevelopment of the settlements, certainty for investments, basic efficiency in the residential, production and service systems. It should also be oriented, on a broader horizon, towards the low carbon future. The huge financial commitment and the European fiscal compact are often considered the real constraints to the feasibility of such projects. However, the simulation (qualitative and quantitative) that is conducted in this paper, with reference to the Friuli Venezia-Giulia Region (not particularly large although functionally rather complex and governed with a Special Statute of Autonomy), demonstrates that the main problem is not so much financial nor the constraints on public budgets because most of the resources, in the regeneration of territorial capital, would be private (household savings), while public resources (essentially regional) should above all play a leveraging role. The problem appears rather to be cultural and political.

KEYWORDS: territorial capital regeneration, post-crisis plans, low carbon future

1 FOREWORD

The most serious post-war crisis is leaving obvious signs on local and regional economies and territories. This is compounded by the structural inadequacy of much of the national housing stock whose disastrous effects have again recently been demonstrated by the earthquake in central Italy. As a whole, the state of the Italian "territorial capital" (OECD, 2001) is due, in particular, to endemic neglect by central government.

Even the maintenance and upgrading of buildings by private individuals is lacking, apart from the new and promising investment prospects in big cities. Consequently, the territorial capital is visibly degrading: it loses security, cultural features, inhabitants, attractiveness, good performance, in a word, value. In such a

widely problematic situation, it should be attempted to produce appropriate analysis and diagnosis of the territory, along with timely interventions.

What is presented below is neither a policy work in progress nor a plan under study. It is just a simulation of something that, to be believed in, has to be considered useful and necessary by people and their governing elites. If the crisis, by virtue of some strange self-deception, makes it difficult for the governing elites to see the usefulness and necessity of an "anti-crisis" plan centered on the regeneration of territorial capital, this is not a problem of futility or impossibility of the plan itself, but a difficulty of analysis and vision by these governing elites.

The area we intend to focus on is Friuli Venezia Giulia (FVG), the Italian region firmly anchored, until a few years ago, in northeast Italy and its economic performance and also decidedly projected towards an advanced European context and a stable Central Europe (at least in the fields of logistics and transport; see Fabbro and Maresca, 2014). Today, the FVG Region seems to be going back to being a distressed (Mattioni, 2015), if not marginal region, while its border position is no longer perceived and managed as a resource but rather as a threat.

How to act, therefore, in the face of such a contradictory situation?

First of all, perhaps, by trying to put it in a perspective of critical analysis of the territory. In this case, it is inevitable to seek inspiration, guidance and teaching from the long cycles of territorial evolution. In the case of the FVG Region, we are now probably at the end of a cycle of structuration, or better of "territorialization"¹, which lasted from the 1960s and that saw, in the "Friuli model"² of post-earthquake reconstruction of 1976, its "climax" and its political and cultural emblem.

The current phase of "deterritorialization" (Raffestin, 1986) certainly incorporates the crisis from 2008 onwards, but started before then and perhaps in the early 2000s. Deterritorialization implies a loss of functionality, of attractiveness of the urban structures, of value of the buildings and also the loss of control and power over the material, social and symbolic reproduction of the territory itself (Becattini, 2015). It is therefore clear that the return to a redevelopment process of the territory implies a credible and shared socio-economic perspective and also some degree of self-determination. These are faces of the same coin, and remain the pillars of every process that aims to rebuild conditions of self-reproduction in territories. It is what we could call the start of a "reterritorialization" cycle (Raffestin, 1984, 1986), and that here we try to pivot around a decades-long plan for the regeneration of territorial capital. The case study area is, therefore, the Friuli Venezia Giulia (FVG) Region. The simulation aims to verify the main parameters and technical feasibility of this regeneration plan, as well as the possibility of replicating the approach in other regions. The vision is that of a low carbon future but firmly anchored to the current and diffuse territorial needs. The social organization model that supports the plan is strongly based on the subsidiarity principle and not only in the vertical direction (from bottom to top) but also in the horizontal one, which means a strong initiative of individual local units, in cooperation with public bodies, but with distinct missions, tasks and operations (Moroni, 2015).

A plan for the redevelopment and improvement of the national housing stock, given its enormous technical and financial dimension, must be allocated in a decades-long and maybe even multigenerational perspective. As such, it must necessarily also deal with the more general global problems such as climate change, lack of jobs, aging population, migratory flows, which are often cited as the most critical issues of the coming decades (Mason, 2015). Moreover, the context of a stagnant economy amplifies the problems, reduces the chances of overcoming the crisis and also makes the cited criticalities interact with each other. A general plan for the reterritorialization of the country cannot therefore be conceived without putting it in relation to these critical issues and in the face of the European and international policies already in place to cope with them (UNFCCC, 2015). The "low carbon" strategies, i.e. based on the minimization of anthropogenic emissions of CO₂ in the atmosphere, assume, in the institutional (CEC, 2008; ECF, 2010) and scientific (Wilson and Piper, 2010) literature, socio-economic and technological implications in

¹ This refers to the cycle of "territorialization, deterritorialization and reterritorialization" theorized by the Swiss geographer Claude Raffestin during the 1980s.

² The concept of the "Friuli Model" is an ex-post rationalization of what has been thought, decided and realized to completely reconstruct, in more or less ten years, the wide area of Friuli (Northeastern Italy) stricken by the 1976 earthquake and is due, in particular to Luciano Di Sopra (1998, 2016).

addition, of course, to the environmental ones. If the purposes of the strategies are to reduce air pollution and mitigate climate change and its adverse effects (which are often also the origin of large migration flows), the "tactical" action has to meet the shift in energy systems, the acceleration in the production and use of renewable energy, the changes in local communities and regional economies and, not least, in human settlements (Crawford and French, 2008). The "low carbon" strategy must therefore, in the long term, inform and guide the regional and national plans as well as the regeneration of the territorial capital.

2 FROM BUILDING RENOVATION TO THE TERRITORIAL CAPITAL REGENERATION

The old motto *quand le batiment va tout va* has, for decades, described the flywheel function of the building cycle. Is it a still valid motto? The idea that new buildings and infrastructure are just occasions to open building sites and boost the economy is still a quite widespread belief, but that now has to be radically redefined. If we look at some of the data relating to the construction industry, we realize that a historical cycle seems instead to have been completed and that territorialization processes must be radically rethought:

1. The first "macro" data are related to the environmental component of territorial capital. Artificial land use has reached (in territories of different level), in absolute as well as in relative value, a critical threshold: among the major European countries, Italy is the one with most artificial covering (about 10%; Eurostat, 2012); FVG is in eighth place among the twenty Italian regions, with 8% of artificial surface (ISPRA, 2015). This does not mean, of course, that no further square meter of open area should be built on, but that the state of strong urbanization of land, combined with the effects of climate change, is such as to advise against further expansion and to rethink current urban structures (Musco, 2012).
2. The second type of "macro" data are related to the settlement component of territorial capital. In the last decade, in fact, building activity has been halved. The data of the national "Territorial Agency" report that 100 residential sales in 2007 have become, in 2014, 54.8 in Italy and 51.4 in the north-east (non-residential is less than 50.0); other data (the residential area authorized by building permits) pass from a value of 1 square meter per family in 2003 to 0.3 in 2012 (ISTAT, 2015). Moreover, the data of ANCE¹ FVG (the association of builders) on the evolution of companies and employees in the building sector, show that the sector has almost halved in recent years: 100 companies in 2008, have dropped, in 2015, to 57.7 and the workers to 63.2.
3. Other very important "macro" data (ISTAT, 2011) are related to the maintenance of existing buildings. Data regarding the buildings previous to 1971 (therefore 50 years of age and over) show that more than half of the buildings (53.67% in Italy, 53.51% in FVG) are now outdated and consequently more vulnerable to the impact of natural disasters. It is therefore not true that there is less need to work in construction. It is instead true that there is a great need for maintenance, refurbishment and redevelopment of buildings in order to pursue new private and public goods, other than those of the past.
4. The last type of decisive data are related to human and social capital that, in FVG, are becoming impoverished more quickly than in the rest of Italy and Europe: the index of structural dependency (inactive population against working age population) passes in FVG, in the period 2001-2014, from 48% to 61% while it is smaller and slower in the rest of Europe where, in the same period, it goes from 49% to 52% (Eurostat, 2015).

If all this is true, then it is also true that:

1. The crisis in the building sector and, more generally, in the real estate market (the housing bubble of the first decade of 2000), cannot be explained, at least in western countries, only by sectorial and financial factors but also by more general and structural factors primarily connected with environmental, demographic, social and cultural factors.
2. The existing buildings satisfy the demand for space for housing and production. But, at the same time, because the crisis has impacted heavily on household investments, they lack maintenance,

¹ ANCE is the acronym of the Italian association of builders.

- renovation and structural adjustments. Consequently they are visibly deteriorating, losing functionality and economic value.
3. Deprived of even the basic interventions of seismic upgrading, the building stock will become even more vulnerable to natural and anthropic risks and will, as a whole, lose performance capabilities that will also lead to a loss of functionality of the settlements as well as the quality and attractiveness of entire areas.
 4. There is therefore a great need to return to producing in the construction industry because buildings, infrastructure and settlements inevitably degrade and, like any other artifact, need continuous maintenance.
 5. The building sector is also labor-intensive and capable of activating a huge and intricate economic and employment supply chain¹.

A productive relaunch plan of the building industry, suitable to overcome the current crisis and meet the new structural changes on the demand side, must inevitably focus on the activation of a more complex and inter-sectorial supply chain than in the past (Veronesi and Zanoni, 2012). This supply chain is that of territorial capital regeneration which includes, in addition to settlements and infrastructural capital, natural and environmental capital, and social and human capital (Camagni, 2008).

3 THE CET SUPPLY CHAIN TOWARDS RETERRITORIALIZATION PROCESSES

If, together with information on the building sector, we read that related to hydrogeological risk and the degradation and depopulation of settlements, we cannot fail to note that, at least in FVG, a long "territorialization" cycle definitely ended with the early 2000s and that, since then, we have been in a lengthy and strong phase of deterritorialization:

- settlements and infrastructure are in excess in relation to their actual use; in some cases they are also under-utilized and/or obsolete (as, for example, some seaside and mountain tourism centers); entire territories are affected by severe abandonment processes;
- even human capital is shrinking and depleting faster than elsewhere (FVG is one of the regions with the highest rate of aging of Europe);
- the identity of places is strongly affected by external intervention (the shopping centers of the last decades or more recent infrastructure) but also by endogenous, high impact, interventions against which the old land use planning seems no longer effective (since the 1990s, the FVG Region has been trying to replace the old Piano Urbanistico Regionale of 1978, but without any significant result);
- the combination of several factors has therefore generated a loss of economic value as well as of the cultural and symbolic values of the territory. But also, which is possibly even worse, a loss of autonomy and self-government of the local communities.

The question is now which approach to adopt in order to frame and deliver a long-term strategy of "territorialization" based on a wide and deep regeneration of the territorial capital. A top-down macro-structural framework (mainly infrastructural and environmental) as the EU spatial policies have proposed for more than a decade (Fabbro, 2007) starting from the ESPD (1999)? Or a bottom-up micro-structural framework more closely related to the places of people's daily lives and the real local economies (Becattini, 2015)? There is no doubt that a valid approach should represent an alternative against the real difficulties that those macro-frames have demonstrated (Fabbro et al., 2015) particularly in terms of multilevel governance. But a plan for basic interventions aimed at the maintenance and upgrading of the existing building stock could obtain a broader consensus and transcend the limits of a traditional and sectorial policy, only if it helps, cumulatively, to move a larger and integrated supply chain of urban regeneration, land use protection from hydrogeological risks, landscape restoration (which, for simplicity, can be called the "construction, environment and territory" supply chain or CET). The development of a CET supply chain:

¹ According to ANCE to invest a billion euro in the building sector generates a fallout, on the overall economy (direct, indirect and induced), of over 3.3 billion and creates 17,000 jobs, of which about 11,000 in construction and 6,000 in the related sectors.

1. could deliver a multiple sustainability perspective (economic, environmental and social);
2. is also strongly subsidiary and inclusive because it would be based on the effective activation and participation of citizens even as small owners, investors, operators;
3. unfolds on different territorial and social scales: from building to urban block, from city to territorial and regional system; but it is also split into different dimensions of the social reproduction system: from housing, to production, to education.

The question that must therefore be answered is how to deliver a plan for the development of the CET chain onto a wide and diffuse process of reterritorialization. The hypothesis that is supported here is to issue a plan of public and private investment, on the CET supply chain, starting from the rehabilitation of buildings for seismic safety and energy efficiency.

It has been estimated¹ that, in FVG, for the energy rehabilitation of about 136 thousand single or double residential buildings and 146 thousand apartments, all built before 1971 (that, presumably, have very low energy efficiency) would require approximately 8 billion euro in the whole region (including the interventions for seismic safety in the territories at greatest risk but external to the zone of the 1976 earthquake and the reconstruction that followed it). This is a very considerable sum (equal to almost half the cost of the post-earthquake reconstruction in Friuli, at present value) but is extended to the whole region and comprises, for the greater part, the investment of household savings in the durable and primary good of the home.

An intervention of regional finance, equal to about 1 billion euro in five years, would trigger a total investment (private and public) of almost 5 billion euro which, if the ANCE multiplier is correct, would in turn generate a fall-out, on the entire CET supply chain, which is 3.3 times higher and would amount to a total of 15 billion euro. The regional intervention, which would be 200 million euro per year, is relevant but not impossible as it would be equal to 4% of the current annual regional budget. The feasibility of the five-year plan, like the one proposed here, does not seem to be so much financial but more strictly political and organizational because of:

- the competition, for regional financial resources, with other economic strategies (such as those related to technological innovation in the manufacturing sectors and that go under the generic but seductive definition of "factory 4.0");
- the greater political interest in symbolic policies instead of difficult ones requiring strong and durable choices in resource allocation;
- the long duration of a ten-year plan that conflicts with the short horizons of political returns;
- the significant financial, organizational and cultural magnitude of the plan that requires the existence of a particularly able and motivated public management.

The process of regeneration of the territorial capital starts structurally from private houses and embraces the entire territorial system but, at the same time, starts financially from the Region and involves thousands of families. The municipalities and their associations, in a subsidiary position in relation to the families, have to identify the structural territorial elements (linear, punctual or areal) to be considered and restructured for the urban integrated regeneration as well as to identify places, spaces and services centers to be shared for the co-working and co-housing activities. Moreover, the Region, in order to provide sustainable mobility (based, in the first place, on the railway network) and general access to digital information, mainly has the task of identifying and intervening, through "territorial projects", on nodes, networks and connections of the various territories to be regenerated.

As regards the planning tools in the strict sense, these are not to be separated from the larger plan of territorial capital regeneration as they are, in fact, instrumental to this. The Region is responsible, with a regional spatial plan, for identifying both the value areas to be enhanced and the risk areas to be protected, and those areas to be considered as a priority in the redevelopment and regeneration process. But a socially embedded long term vision towards the low carbon future, has also to be promoted (see Fig. 1).

¹ See "Territorial capital and urban regeneration: the case of FVG region", MSc thesis in Civil Engineering by Elizabeth Paviotti, University of Udine, 2016

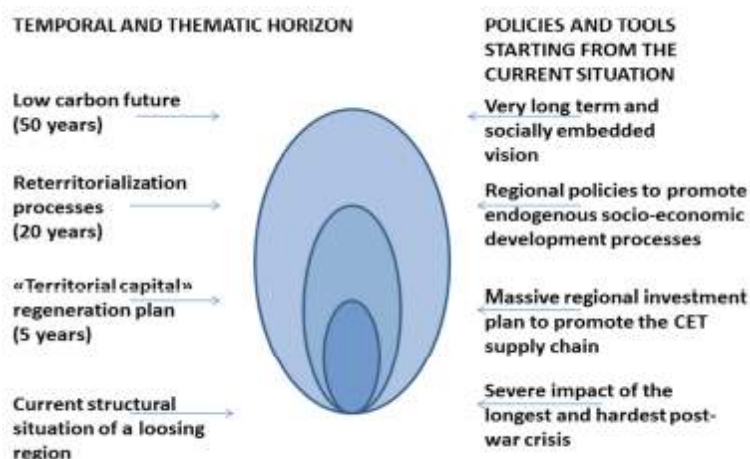

Fig. 1. For an anti- and post-crisis territorial regeneration agenda. Policies and tools aimed at pursuing a "low carbon" regional future along with the overcoming of the regional effects of the ten-year-long crisis

4 CONCLUSION

The territorial capital regeneration process, starting from the redevelopment of the existing houses and buildings, ultimately means to motivate the basic reasons and efforts for redevelopment of the building stock but bearing in mind, if possible, a broader reterritorialization process of the country. It is certainly a "vast programme" but it is no longer an option but a real emergency essential to revive the credibility and competitiveness of the country. Without basic territorial security and quality, in fact, there are not even the minimum conditions of efficiency to initiate credible and sustainable economic recovery plans. Moreover, a massive investment plan, on the CET chain, starting from single houses and small centers, has to be considered regenerative of all the capacities and qualities of the territories. As such, it is the basis and the heart of a real economic program of long-term reterritorialization. Some might argue that it would be easier and more profitable to bet on other scenarios such as the development of manufacturing sectors with higher added value, or territorial smartness (the world of "apps" that promises a happier life by manipulating the smartphone) or research & development or food and wine chains or local tourism. But none of these can, by itself, be an alternative to the CET scenario, only supplementary. The CET scenario is basic in the sense that, without an acceptable level of quality of the territory (in terms of safety, functionality, accessibility, attractiveness, aesthetics etc.) none of the other mentioned scenarios can stand alone.

The question we sought to answer is, therefore, how to pivot, towards a global low carbon strategy, a process of wide and diffuse anti-crisis territorial regeneration. The first answer is that, to be widely consensual but, at the same time, effective, the process would probably require to be reversed according to these steps: a. widespread mobilization of private household resources, through a regional financial leveraging, for energy improvement and earthquake safety of houses and buildings; b. an economic priority attributed to the regional CET production chain in order to pursue a rooted and strong anti-recession perspective; c. local, regional and national spatial plans to promote and encourage long-term investment in the overall territorial capital regeneration. In the paper, simulating the process in a small but functionally complex region like Friuli Venezia Giulia, we have tried to demonstrate that such a process is technically feasible but initially requires both the will to recognize the severity of the crisis as well as the state of the territory (which the governing elites do not normally like to recognize except for a short time after the latest disaster) and, consequently, the necessity for a nationwide long-term plan to overcome both the crisis and the degradation of the territory.

ABSTRACT: Different funding schemes of mental health care coexist in Spain due to the transfer of power made to regional governments. Comparing the efficiency of those regional systems implies assessing several aspects. Among them, one of the most important is the structure and composition of the mental health network across the each region. This work attempt to present the mental health atlases (MHA) as a

tool developed to describe the current state of the regional mental health network but also to support the planning of health policies. MHA offer a comprehensive approach to the mental health care since it encompasses services provided by the health care system but also services provided by other agents of the regional government. To do this, the DESDE-LTC classification as well as a geographical information system are employed. The DESDE-LTC classification allows making an inventory of the different service unit embodied within the mental health network, describing the function of each unit in a standardized way, regardless the denomination of the unit or its affiliation to a body of the regional government. To illustrate the MHA, this work present the MHA of Bizkaia and Guipuzkoa, whose mental health networks are composed by more than 150 and 130 standardized services, respectively. The MHA of Bizkaia shows that there is a high concentration of services in an area called "Ría de Bilbao". Meanwhile the MHA of Guipuzkoa exhibits a mental health network more geographically dispersed. Despite these differences, both examples yield a good performance in terms of quality of care, except in the case of long-term stay in hospitals. This work contributes to the planning of public services by delivering a tool, which can be applied to other countries or adapted to be used to analyze the current state of public services networks across the space.

1 INTRODUCTION

According to a WHO study, one third of the adult population suffers from a mental disorder each year. The European Study of the Epidemiology of Mental Disorders (ESEMeD) project stated that around 13% of the population reported a lifetime history of major depressive disorder in a large sample from six European countries (Alonso et al., 2004). In Spain, the ESEMeD group calculated the major depression lifetime prevalence to be 10.6%, which is a low value in comparison with other Western countries (Gabilondo et al., 2010). Across Europe, there is a growing awareness of the need for specific strategies, interventions and dedicated services for people with mental disorder but there is inconsistent implementation of evidence based practices.

Due to different political, cultural and socioeconomic contexts, the development and implementation of mental health services across countries has not been a well-coordinated, or uniform process. In order to assess mental health service provision internationally and understand different service contexts when implementing models of care, standardized service mapping tools are required. The Description and Evaluation of Services and Directories for Long Term Care (DESDE-LTC) project developed a classification tool for the coding of longer-term mental health care services. The DESDE-LTC (Salvador-Carulla, et al., 2011) describes service provision at the local level and later aggregates the information to the regional and national level, using a standard unit of analysis of health services based on functional teams.

This standardized information is introduced within the REMAST tool (Salvador-Carulla et al., 2015) which allows to collect and map detailed information, within a study area, of the structure of health and social care services, that provide care for, or are used by, people with mental disorders in terms of service distribution and utilization. To do this, different instruments and visualization techniques are employed, resulting in mental health atlases (MHA). The MHA brings together practice, policy and research to inform Mental Health policy and priority settings across Europe. To illustrate this, we carry out an ecological study aimed at describing and comparing mental health services at a meso level (small health areas) in two northern Spanish regions, Gipuzkoa and Bizkaia, which perform well although they exhibit differences in their mental health network services.

The remainder of the paper is organized as follows. The next section describe the area of study and briefly introduce the methods employed. The third section goes further into the MHA compilation, showing the main results for each type of analysis carried out. In this section, each analysis is illustrated with a sample of those results obtained from Bizkaia and Guipuzkoa provinces. Finally, concluding remarks are offered.

2 SCOPE OF STUDY AND METHODS

Guipuzkoa and Bizkaia are two of the province of Autonomous Community of The Basque Country, a region of northern Spain. Almost half of the 2,155,546 inhabitants of the Basque Autonomous Community

live in Bilbao's metropolitan area, which is sited within the province of Bizkaia. Of the ten most populous cities, six form part of this area.

In Basque Country, the level of sanitary zoning is the Health Area whose first delimitation took place in 1990. There are three Health Areas, which are the same that the so-called Historical Territories: Bizkaia, Gipuzkoa and Araba (the third province). These zones are subdivided into mental health catchment areas and, in turn, the catchment areas are structured by many basic health areas. Currently, there are a total of 20 catchment areas in Bizkaia and 12 in Gipuzkoa.

To carry out this research, data are drawn from two databases: i) the Minimum Data Set for Outpatient Mental Health Centers (CMBD-SMA), provided by the Gipuzkoa and Bizkaia Mental Health Services and Basque Government Department, safeguarding the privacy of patients to prevent geographical identification of individual cases; ii) the data sheets of mental health services obtained with DESDE-LTC instrument. All the data refer to years 2013 and 2014.

Based on this data, an ecological, comparative, descriptive and transversal study of Mental Health in Bizkaia and Gipuzkoa is carried out. It focuses on the evaluation of "services" and "basic types of care" at the meso level (catchment areas) following the model proposed in the Matrix of Thornicroft and Tansella (1999) for the evaluation of services. In addition, a GIS system is used for or mapping sociodemographic, provision and service use indicators. Results are shown by the MHA, covering different issues of the major importance for planning, such as: Health Metal Zoning, Socio-demographic analysis of mental health areas, Catalog of mental health services, Use of services, Accessibility to services and Comparison with other territories. The next section give further details of each step within the process and, at the same time, show the main results of each section.

3 RESULTS

Getting a full depict of a mental health network services that can be useful for planning purpose, implies a high level of research effort and training. This section goes further in the several steps followed within this process and illustrate them by showing a sample of results obtained from the study of Bizkaia and Guipuzkoa mental health network.

The first step is mapping those social and demographic indicators that are relevant to mental health care (Table 1). Information from population data, socioeconomics indicators and service inventory can be combined to provide a detailed description of the study area and to make comparison within each study area.

VARIABLE	STUDY AREA	
	Guipuzkoa	Bizkaia
Population density	7,856.05	21,144.08
Dependency rate	53.20	56.05
Aging index	177.37	214.13
Immigration index	92.96	94.07
People living alone	9.88	9.54
Elderly living alone	22.04	20.55
Unemployment rate	10.83	14.72

Table 1- Relevant information to Mental Health Care

Only maps for population density of Guipuzkoa and Bizkaia are depicted (Figures 1 and 2), but maps for each variable are available upon request to the authors.

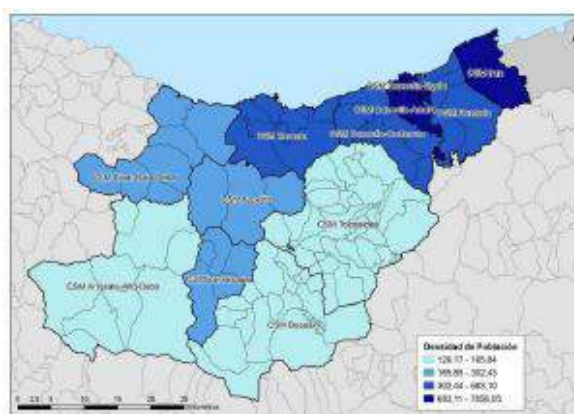

Figure 1 – Population density of Guipuzkoa province. Source: Authors' elaboration.

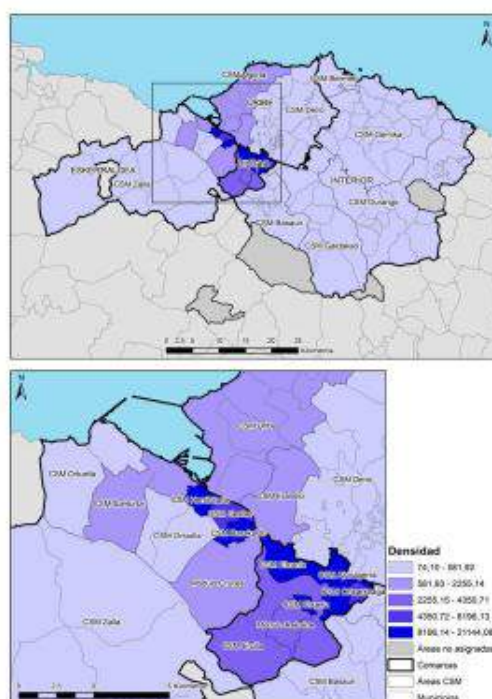

Figure 2 – Population density of Bizkaia province. Source: Authors' elaboration.

Once the study area is characterized, the second step is the classification and mapping of service provision (see Table 2). Classification is made by using the 'Description and Evaluation of Services and Directories for Long Term Care' (DESDE-LTC) instrument, which allows the standardized description of services for long-term Care based on the identification and coding of care teams within services. It follows the approach to service and care team evaluation developed by the EPCAT Group (European Psychiatric Care Assessment Team) and PSICOST Scientific Association since 1997, starting with the development of ESMS (European Care team Mapping Schedule) for the evaluation of services in mental health (Johnson et al, 2000), and related adaptations to the evaluation of services for older people in Spain (DESDAE) and services for disabilities (DESDE) and social care. This instrument is intended to compile information on input and process of care at the meso-level (e.g. health/social catchment areas) and micro-level (e.g. individual services) as defined at a modified version of the Care Matrix developed for the assessment of mental health care (Tansella & Thornicroft, 1999). In sum, DESDE-LTC allows to perform the following tasks in an standardized way: 1) Compiling a standard directory of long term care services in catchment areas, including the provision of social and health care services by the public, private and/or voluntary sectors; 2) Identifying the number of services/care teams in a catchment area for health system analysis and mapping; 3) Identifying the services availability, diversity, placement capacity and workforce capacity of the care teams operating in a catchment area; 4) Measuring and comparing the levels of provision/availability and utilization of services/care teams between different catchment areas using an international

coding system; 5) Comparing the structure and organization of services/care teams in different catchment areas; and finally, 6) Recording changes through time in services/care teams available within a catchment area.

Table 2- Classification of service in Guipuzkoa by DESDE-LTC Source: Authors' elaboration.

As a result, a wide range of service are classified in an standarised way and therefore comparisson are possible. As can be seen from Table 2 the service classified are those related with information and assessemet of health and non-health related needs, denoted with letter "I". Outpatient care facilities, which are denotd with letter "O" are also mapped. These facilities involve contact between staff and users for some purpose related to management of their condition and its associated clinical and social difficulties. Two major characteristics define these type of services: Acuity and Mobility. Acute care is provide by emergency facilities, which makes assessment and initial treatment in response to a crisis, deterioration in physical or mental state, behaviour or social functioning which is related to the condition; and (ii) can usually provide a same day response during working hours or at least within 72 hours after the care demand. Non acute care provide users with continuing care including regular contact with a health professional, which may be long term if required. Continuing care care teams may also provide acute/emergency care on a regular basis. Regarding to mobility, we distinguish between high an low mobility. In the former or home & mobile facilities contact with users occurs in a range of settings including users' homes, as judged most appropriate by professionals and users. For a care team to be classified as high mobility (home & mobile), at least 50% of contacts should take place away from the premises at which the care team is based; otherwise the service will be classified as a low mobility facility. Finally day care facilities, denoted by "D", are also considered. These facilities are normally available to several users at a time (rather than delivering care teams to individuals one at a time); (ii) provide some combination of treatment for problems related to long-term care needs: e.g. providing a structured activity, or social contact and/or support; (iii) have regular opening hours during which they are normally available: and (iv) expect care team users to stay at the facilities beyond the periods during which they have face-to-face contact with staff (i.e. the care team is not simply based on individuals coming for appointments with staff and then leaving immediately after their appointments). The care delivery is usually planned in advance. Day car facilities are also classified into acute and non-acute care. The former deals with health related needs, whereas the latter deals with non-health related needs. Although it is not included in Table 2, information about residencial care facilities, where hospital are condiered, are also collected.

Once each single facility has been classified using the DESDE-LTC code, they are geocoded and located in the territory, resulting in a map as shown in Figure 3 and 4. In this way, a picture of the complete mental health network across the territory is obtained, but showing the type of care provided by each facility.

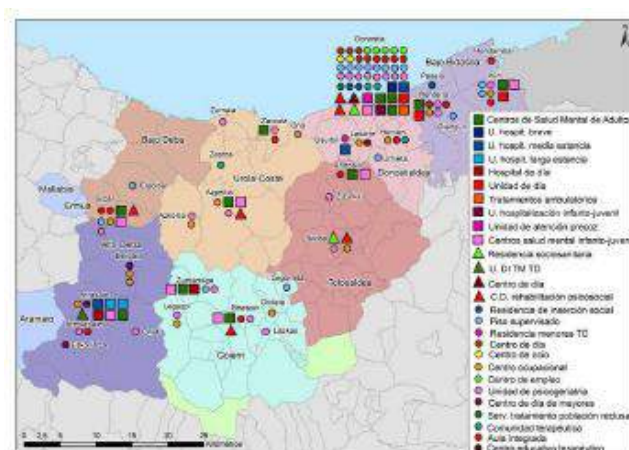

Figure 3 – Services in Guipuzkoa. Source: Authors' elaboration.

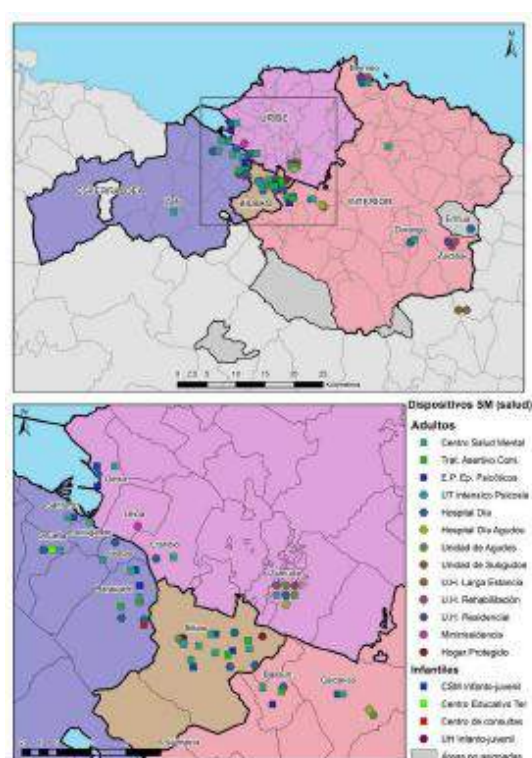

Figure 4 – Services in Bizkaia. Source: Authors' elaboration.

Then, several characteristic of the facilities are analyzed, such as availability of main types of care, placement capacity (beds and places) and workforce capacity per inhabitant. These characteristics determine the patterns of care and make possible comparison within different health system across Europe. In addition, these patterns can help to explain the differences in the financing systems of each region or country. For example, the overall capacity of a system and its balance between hospital and community care can influence the way the same incentive operates in two different countries. In this step, spider graphs are employed to depict and compare the mentioned characteristics, as can be seen in Figures 5, 6, 7 and 9.

Figure 5 – Comparison of main type of care group in Bizkaia and Guipuzkoa. Source: Authors' elaboration.

Figure 6 – Comparison of placement capacity in Bizkaia and Guipuzkoa. Source: Authors' elaboration.

In Figure 4, main type of care service per 100,000 inhabitants is shown. In this case, it can be observed that outpatient residential care are the most important type of care in the Bizkaia's mental health network outpatient; whereas day care facilities to cover work related needs are the most frequent type of service.

Figure 5 shows the number of beds/places in the corresponding main type of care. In this case, Bizkaia offers a greater number of places in other day care facilities; meanwhile Guipuzkoa offers more beds in non-acute hospitals and in works related facilities. A zoom can be also done over the previous information in order to obtain a more detailed view. For example, in Figure 7 residential care for medium and long-term stays are depicted, concretely the R11 code which refers to non-hospital facilities for adult population. It can be observed that Guipuzkoa exhibits a higher number of beds in this type of facility than then average of other eight Spanish Autonomous Communities with available data. On the other hand, Figure 8 shows that Bizkaia also promotes this type of care but in hospital facilities (codes R4 to R6), more than in other Spanish regions.

Figure 7 – Residential care for medium and long-term stays at non-hospital facilities in Guipuzkoa.
Source: Authors' elaboration.

Figure 8 – Residential care for medium and long-term stays at hospital facilities in Bizkaia.
Source: Authors' elaboration.

The previous steps allow characterizing the mental health network services in each study area in a detailed way. The following steps collect and offers information about the use and the accessibility of these services providing a useful information for decision making. Thus, a bunch of relevant information about utilization of mental health services is drawn from the health dataset available, such as admissions and discharges in residential care, contacts in outpatient care, length of stay and so on. Several indicators are then calculated (see Table 3) for each of the main type of care group.

Finally, the last step is analysed geographical accessibility. In this step, the spatial unit is the catchment area of Mental Health Centre. Overlapping these areas with the corresponding drive time isochrones maps is possible to show the level of accessibility across the territory (Figure 11). In the case of Bizkaia, the map show that those areas with a high level of accessibility are mainly located in Bilbao0's metropolitan area and, to a lower extent, in isolated places of the remaining territory of Bizkaia province. In addition, places located in the frontiers with other provinces exhibit a low accessibility to mental health centres. If we put together this piece of information and the previous one, related to frequency, we can observe that the low accessibility of the western are of the province of Bizkaia could explain the low levels of frequency shown in Figure 10.

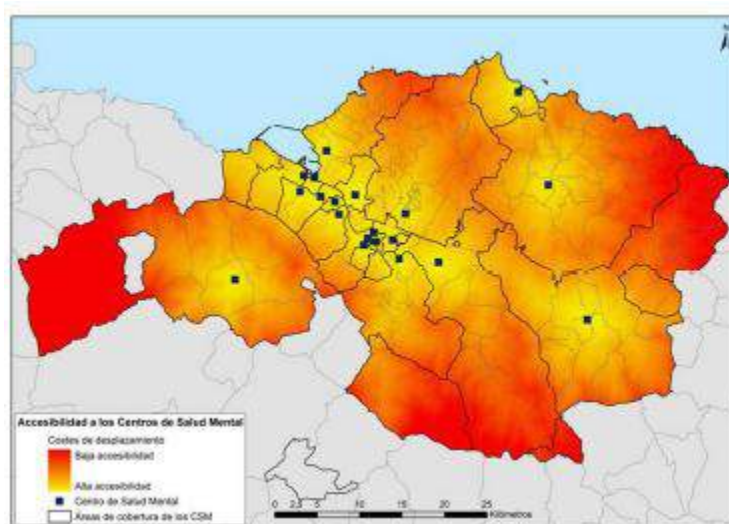

Figure 11 – Accessibility to Mental Health Centres in Bizkaia. Source: Authors' elaboration.

The whole MHAs for both provinces allows us to conclude that there is a high concentration of services in an area called “Ría de Bilbao” in the province of Bizkaia with can explain the utilization rate. Meanwhile the MHA of Guipuzkoa exhibits a mental health network more geographically dispersed. Despite these differences, both examples yield a good performance in terms of quality of care, except in the case of long-term stay in hospitals.

4 CONCLUDING REMARKS

The MHA toolkit allows for the collection of exhaustive and standardized information on the typology and functioning of services based on the territory useful for the planning of mental care based on informed-evidence. Compiling the MHA requires a huge research effort and also a high level of training, concretely to disentangle the different mental health facilities and to classify them by using DESDE-LTC coding, which allows to make comparison between different mental health networks, which includes mental care services offered by different providers and not only by the health system. At this point, it should be noted that there is a huge disparity in the availability of service and geographical information across different regions, making this task quite difficult.

The tool also provides information on the location of the services and highlights the existence of shortage areas for a better provision and equitable access to mental health care. The visual maps illustrate problem areas in the provision of services, becoming an easy-to-understand information for planners and decision makers.

Unfortunately, the results obtained from a sample of mental health networks across national territory cannot be extrapolated to the whole nation. In this senses, full regional and national service mapping should be carried out to obtain a complete depict of state of the mental health system in such territories and to effectively planning of this system. Despite this limitation, the compilation of MHA improve the information to users and society on the available resources of mental health care, allowing a more ethical, transparent and democratic participations in health issues. Furthermore, MHA provides a methodology that

can be extrapolated for analysing the current state of public services networks across the space and planning their evolution according to population needs.

ID 1502 | SPATIAL PATTERN ANALYSIS OF MIXED-USE AND VERTICALIZED URBAN MANUFACTURING INDUSTRY IN THE SEOUL METROPOLITAN AREA OF SOUTH KOREA

Jeong-Il Park¹

¹Department of Urban Planning, Keimyung University,
1095 Dalgubeol-daero, Dalseo-gu, Daegu 42601, Republic of Korea
jiip@kmu.ac.kr

1 INTRODUCTION

Despite long-term job losses, manufacturing remains a critical part of the economic base of most metropolitan areas in South Korea. Most of the existing literature on urban manufacturing is focused on the locations of manufacturing and its economic impacts. Very little empirical research has been conducted on the spatial patterns of urban manufacturing industries which are characterized by mixed-use and verticalization. Using the Establishment Census Spatial database (DB) in 2013 of the Korea National Statistical Office, this research attempts to examine mixed-use patterns of urban manufacturing industry in the Seoul metropolitan area of South Korea. It calculates the urban industrial space mixed-use index, which is a modified entropy index, for each building unit based on individual establishments. Further, it attempts to examine the verticalization patterns of the urban manufacturing industry by calculating the average number of floors of establishments with respect to manufacturing subsectors.

2 URBAN MANUFACTURING AND ITS SPATIAL PATTERNS

There is a large body of existing literature which claims that manufacturing remains a leading sector in local and regional economies, with a much larger share of employment, higher wages, and a greater proportion of tax revenues vis-à-vis other industries (Helper, 2008; Helper, Krueger, & Wial, 2012; Leigh, Hoelzel, Kraft, & Dempwolf, 2014). Furthermore, a recent increase in interest in manufacturing around world is linked to the development of manufacturing technologies and processes (Reynolds, 2017). It is important to consider the location manufacturing facilities when coping with changes in the industrial environment, such as the fourth industrial revolution, the convergence of industries, the servitization of manufacturing, and the proliferation of smart factories.

While the traditional manufacturing establishments have moved their production activities to the outskirts of metropolitan areas, seeking lower land and production costs, the new manufacturing establishments in the knowledge-based or advanced industries tend to be spatially concentrated in large urban or metropolitan areas. In an analysis of the establishment dynamics of the knowledge-based industry, Park and Seo (2016) found that the metropolitan areas, especially the Seoul metropolitan area, are the growth hubs of the knowledge-based industry of South Korea. Their study revealed that 83.3% of knowledge-based manufacturing establishments started within the five major metropolitan areas between 2010 and 2013. Further, 92.5% of the knowledge-based manufacturing establishments have relocated within these metropolitan areas (Park & Seo, 2016). These spatial patterns can be associated with positive external economies or agglomeration economies of large urban areas or metropolitan areas (Glaeser, Kallal, Scheinkman, & Shleifer, 1992; Hoover, 1937; Jacobs, 1969; Krugman, 1993; Marshall, [1860] 1961). By selecting a location near each other, urban manufacturing establishments can receive access to specialized input suppliers and customers, a shared pooled market for skilled workers, and the benefits of technological spillovers.

Manufacturing establishments located in large urban areas or metropolitan areas may have a mixed-use and verticalized pattern. While traditional manufacturing industries are spatially concentrated in a single industry or a small number of industry sectors, urban manufacturing industries with their demands for locations in large cities tend to accumulate in various industries to perform different functions. As Jacobs (1969) pointed out, the urban manufacturing industries tend to seek knowledge spillover by stimulating growth between industries, rather than within them. In addition, urban manufacturing industries may prefer verticalization to horizontalization strategy in high-density urban spaces as a way to overcome relatively high land prices and utilize the space efficiently. Recently Rappaport's (2016) study revealed that urban factories are built as vertical and hybrid buildings as they are smaller, cleaner, and quieter.

3 METHODOLOGY

3.1 DATA

To examine the mixed-use and verticalization patterns of the urban manufacturing industry in the Seoul metropolitan area, this study uses the 'Establishment Census Spatial DB' of 2013 of the Korea National Statistical Office. It combines the floor plan information of the building with the Census on Establishments of 2013 of the Seoul metropolitan area (Seoul, Incheon, and Gyeonggi-do), as well as Busan, the second largest city in South Korea. It provides various information not only on establishments, such as industrial classification, organization type, and the number of employees, but also on buildings, such as their addresses, number of floors, highest and lowest floor, and the total floor area of the establishment. Thus, it is useful for the analysis of mixed-use and verticalization patterns of urban industrial location. However, the spatial DB does not include all establishments within these areas, as it includes only those buildings with more than 15 establishments. This research focuses on establishments within the Seoul metropolitan area. The spatial DB provides information on about 358,000 establishments, which constitutes about 20.6% of 1.7 million establishments in the area.

3.2 METHODS

3.2.1 MEASURING MIXED-USE

A modified entropy index can be used to measure the mixed-use pattern of the urban manufacturing industry (Chang et al., 2016). Using the total floor areas of establishments and buildings, this research measures a pattern of combination and segregation of different industrial subsectors (2-digit level of the Korean Standard Industrial Classification, KSIC) within each individual building unit. The mixed-use index can be expressed as :

$$-\sum_{i=1}^k [(p_{ij}) \cdot (\ln p_{ij})] / \ln k_j$$

Where

- p_{ij} : Percentage of total floor area of industrial subsector i (2-digit level of the KSIC) in the total floor area of building j
- k_j : Number of represented industrial subsectors in building j

The mixed-use index indicates the concentration or dispersion of different industrial subsectors within a building unit. It takes a value between 0, which implies that it is composed of a single industrial subsector, and 1. The closer the value is to 1, the higher is the mixed-use. The mixed-use index is depicted for each building using different shades of a colour to indicate its level in Figure 1 below.

3.2.2 MEASURING VERTICALIZATION

To analyse the verticalization patterns of the urban manufacturing industry, the number of floors of establishments in the manufacturing industry was measured based on the Establishment Census Spatial DB of 2013. Further, the average number of floors for 2-digit level of manufacturing subsectors was calculated.

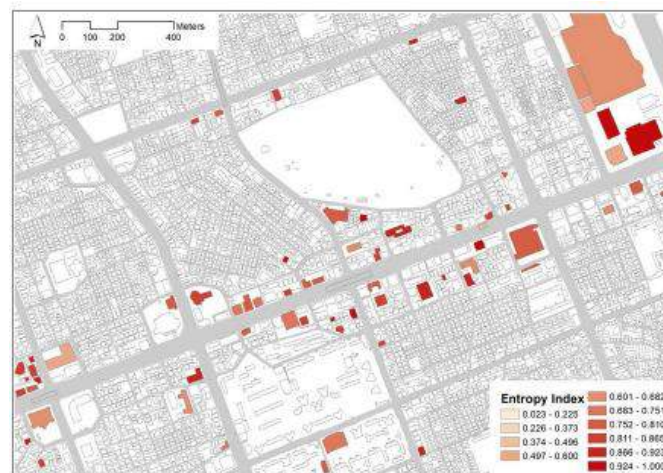

Figure 1. Mixed-use (Entropy) Index of Each Building Unit

4 ANALYSIS

4.1 MIXED-USE OF URBAN MANUFACTURING

4.1.1 MIXED-USE PATTERN BY MANUFACTURING SUBSECTOR

After calculating the mixed-use indexes of each individual building unit, they were aggregated for each industrial subsector to compare the mixed-use pattern differences among the manufacturing subsectors.

As depicted in Figure 2, the mixed-use patterns vary considerably across different manufacturing subsectors. The motor vehicles, trailers, and semitrailers indicates the highest mixed-use index (0.812), followed by the coke, hard-coal and lignite fuel briquettes, and refined petroleum products (0.809), pharmaceuticals, medicinal chemicals, and botanical products (0.807), electronic components, computer, radio, TV and communication equipment and apparatuses (0.796), and chemicals and chemical products (0.792).

It is interesting that the knowledge-based manufacturing industries (indicated by yellow bars in Figure 2) seem to have a higher mixed-use index than other manufacturing industries (indicated by grey bars in Figure 2). This implies that manufacturing establishments in knowledge-based industries are more likely to be located in a building with a diverse industrial composition. On the other hand, the traditional manufacturing subsectors, such as tobacco products, textiles (except apparel), beverages, and apparel, clothing accessories, and fur articles, have a lower mixed-use index, indicating that establishments in the traditional industries are more likely to be located in a building composed of a single or less diverse industrial subsectors.

Figure 2. Mixed-use Index by Manufacturing Subsector

4.1.2 SPATIAL PATTERN OF MIXED-USE URBAN MANUFACTURING

This research conducts a spatial pattern analysis in Geographic Information Systems (GIS) to identify and compare agglomeration patterns of mixed-use urban manufacturing industries within the Seoul metropolitan area. In particular, hot spot analysis was performed to identify spatial clusters of areas with either high or low values of mixed-use within the manufacturing subsector. As depicted in Figure 3, the hot spot analysis indicated a spatial clustering of mixed-use patterns in Gangnam and Geumcheon areas in Seoul, as well as Anyang, Uiwang, Suwon, and Goyang areas in the Gyeonggi-do province. Gangnam is one of the well-known clusters of knowledge-based industries which have emerged spontaneously in South Korea. Meanwhile, Geumcheon is one of the clusters of knowledge-based industries with a planned national industrial park which started as Guro Industrial Park and became the Seoul Digital Industrial Park in the 2000s. Anyang, Uiwang, Suwon, and Goyang areas in the Gyeonggi-do are also representative high-tech industrial clusters of IT, R&D, Mobile, and LCD. On the other hand, Jongno and Yeongdeungpo areas were cold spots with a low tendency for mixed-use. These areas are famous as a cluster of traditional manufacturing industries such as precious metals and mechanical metals.

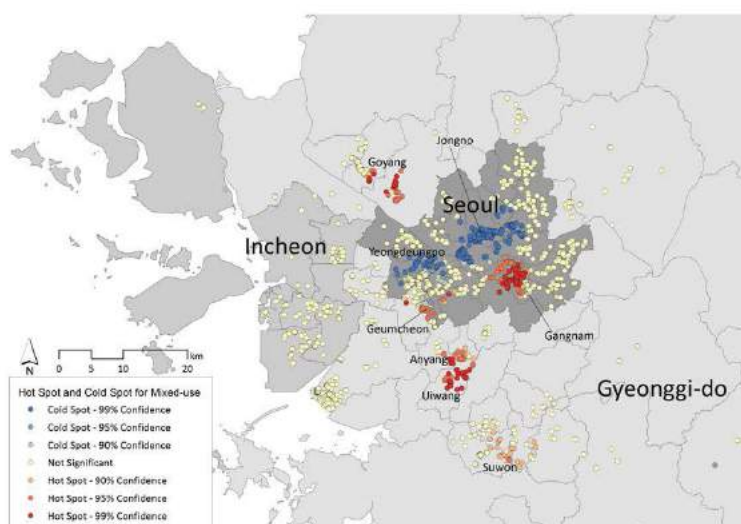

Figure 3. Hot Spot and Cold Spot for Mixed-use of Urban Manufacturing

4.2 VERTICALIZED URBAN MANUFACTURING

4.2.1 VERTICALIZATION PATTERN BY MANUFACTURING SUBSECTOR

To identify and compare the verticalization pattern of urban manufacturing, this research calculated the average number of floors of establishments with respect to manufacturing subsectors. As depicted in Figure 4, the average number of floors in the entire manufacturing industry was 4.0, with significant differences in the average number of floors of each manufacturing subsector. The manufacturing industry with the highest average number of floors was coke, hard coal and lignite fuel briquettes, and refined petroleum products industry with eight floors. It is followed by electronic components, computer, radio, TV and communication equipment, and apparatuses manufacturing (5.9 floors), medical, precision and optical instruments, and watches and clocks manufacturing (5.8 floors), other transport equipment manufacturing (5.7 floors), chemicals and chemical products manufacturing (5.7 floors), and pharmaceuticals, medicinal chemicals, and botanical products manufacturing (5.7 floors). All of these belong to the knowledge-based industry. Therefore, manufacturing establishments in the knowledge-based industry sectors (indicated by yellow bars in Figure 4) tend to be more verticalized within urban industrial spaces.

In contrast, food products, tobacco products, and fabricated metal products manufacturing industries have the lowest average number of floors with 1.2, 2.0, and 2.2 floors, respectively. Except food product manufacturing, the traditional manufacturing subsectors (indicated by grey bars in Figure 4) seems to have a tendency to be located in lower floors of a building. This seems to be related to the convenience of parts unloading, production, and storage spaces.

Figure 4. Average Number of Floors by Manufacturing Subsector

4.2.2 SPATIAL PATTERN OF VERTICALIZED URBAN MANUFACTURING

As depicted in Figure 5, hot spot analysis was performed to identify a spatial cluster of either high or low values of verticalization. Similar to the mixed-use patterns in Figure 3, Gangnam and Geumcheon, the clusters of knowledge-based industries, in Seoul are hot spots for verticalized urban manufacturing. In addition, the figure depicts a new emerging hot spot area in Seoul. Mapo is a cluster of new media and entertainment industry based on digital technology where Sangam Digital Media City (DMC) is located. Manufacturing establishments in these areas tend to have a more verticalized pattern.

However, in the outskirts of Seoul, Gyeonggi-do province indicates different patterns. Anyang and Uiwang continue to be hot spots for verticalized urban manufacturing, but their degrees of verticalization are not high. Further, Suwon, and Goyang are no longer hot spots for verticalization. Instead, some areas in Gyeonggi-do such as Suwon and Siheung have become cold spots for verticalization, indicating that manufacturing establishments in those areas tend to be located on the lower floors. In fact, Siheung has one of the old industrial parks with many low-rising flat factories.

Overall, the spatial pattern of verticalization is clearly different between Seoul and its surrounding areas. These patterns may be associated with the high land prices in the urban areas. Thus, urban manufacturing industries may prefer verticalization to horizontalization strategy.

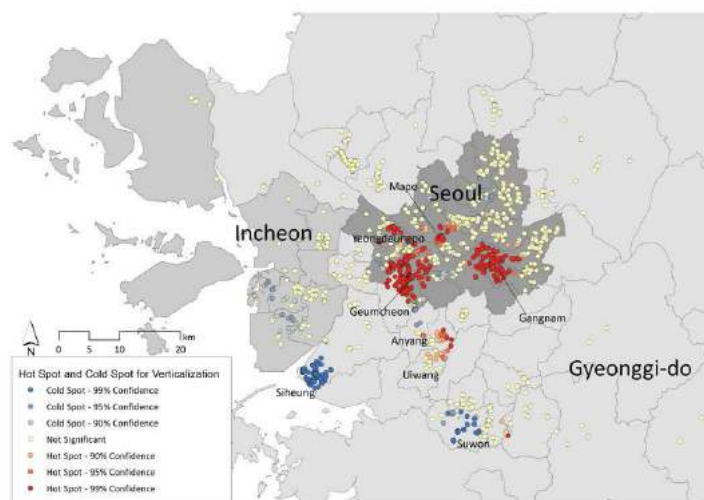

Figure 5. Hot Spots and Cold Spots of Verticalized Urban Manufacturing

5 CONCLUSION

This research analysed industrial location patterns of urban manufacturing in the Seoul metropolitan area of South Korea, which is characterized by mixed-use and verticalization, using the Establishment Census Spatial DB of 2013 of the Korea National Statistical Office. By calculating the modified entropy index for each individual building unit, this research found that the mixed-use patterns vary considerably among different manufacturing subsectors, with manufacturing establishments in the knowledge-based industries having a greater likelihood of being located in a building with a diverse industrial composition. In addition, the spatial pattern analysis indicated that several clusters of knowledge-based or high-tech industries in the Seoul metropolitan area, such as Gangnam and Geumcheon in Seoul as well as Anyang, Uiwang, Suwon, and Goyang in Gyeonggi-do, are identified as hot spots with a high tendency of mixed-use.

This research also examined the verticalization pattern of urban manufacturing by calculating the average number of floors of establishments with respect to manufacturing subsectors. The verticalization patterns vary significantly among different manufacturing subsectors, with manufacturing establishments in the knowledge-based industry being located in higher floors of buildings, indicating a highly verticalized pattern within the urban industrial spaces. The hot spot analysis of verticalization indicated a clear difference between Seoul and its surrounding areas.

The mixed-use pattern analysis was applied only to individual building units. However, the techniques in the research are methodologically replicable and extendable. Thus, the modified entropy index can be

extended for a certain district unit or grid zone. Furthermore, the mixed-use index in this research only identified the mixed-use patterns between industries, but it can also be based on functional classifications such as production, education, research, commerce, culture, finance, and transportation.

ID 1685 | PRIORITIZATION OF THE LOCAL ECONOMIC DEVELOPMENT FACTORS: TR41 AND TRC1 NUTS II REGIONS IN TURKEY

Ebru Kurt¹, Gülden Erku¹

¹Istanbul Technical University

ebru.kurt@gmail.com

1 INTRODUCTION

One of the reasons for the emergence of the local economic development approach is the interregional development disparities and the inequalities created by these disparities. On the other hand, each country has not benefited from the offer made by the global economy and economic inequality between countries has continued to increase over time. With the impact of globalization, trade has been liberalized and borders have been abolished. 'Top-down' approaches have weakened and left their place in intervention on the local economy. Through this 'bottom-up' approach, local needs are better defined and strategies are being developed parallel to local targets (ILO).

This paper searches how the prioritization of local economic development factors differ by the actors in TR41 and TRC1 NUTS II regions which has different socio-economic development levels. In this context, the local economic development factors that have been determined by Wong (1998) as a result of extensive literature review and agreed upon in different scientific studies have been used and the frame developed by Wong has been the basis for this study.

In the first part of the paper, local economic development approach has been defined. Then, local economic development factors which has been the main input for the study, have been reviewed. In the thirdpart, the role of local policies in regional approaches in Turkey has been examined through development plans and regional development tools which are the most basic instruments of development. Regarding the analysis part, the questionnaire responses of the different institutional actors who ranked the local economic development factors according to their prioritizations at the local level have been evaluated by using Mann- Whitney U tests for regional differences, Kruskal-Wallis tests for institutional differences and mean rank.

2 LOCAL ECONOMIC DEVELOPMENT

Blakely (1994) defines local economic development as the process through which local governments or community-based organizations come together to maintain or revitalize business activities and/or employment. Local economic development mainly aims at mobilizing local employment in the market.

Employment associations, which are instruments of local economic development, also reveal the main purpose of local economic development approach by increasing the local economic capacity. And so these instruments help people who live in the settlement to have better living conditions and raise the social welfare level (Bartik, 2003). Similarly, World Bank (2003) describes local economic development as a process in which public, business and civil society sector partners work collectively to create better conditions for economic growth and employment. According to World Bank, local economic development aims to build up the economic capacity of the settlement to improve quality of life and provide better economic conditions for everyone.

Trah (2004) defines local economic development as a regional concept as well as a part of local development and regional government. According to her, local economic development is related to local activities which contribute to make the markets work better. Trah states that local economic development aims to revive the local economy by creating employment in the region and ensuring effective use of local resources in that region and to achieve new localities and opportunities by considering supply and demand.

International Labour Organization refers to local economic development as a process as World Bank describes. To International Labour Organization (ILO), local economic development is a participatory development process (ILO, 2006). Beyond World Bank and International Labour Organization, German Technical Cooperation Agency (GTZ) is another major international development organization which is actively involved in local economic development (Rogerson & Rogerson, 2010). The German Technical Cooperation Agency (GTZ) also describes local economic development as a process. According to German Technical Cooperation, local economic development is "an ongoing process by which key stakeholders and institutions from all spheres of society, the public and private sector as well as civil society, work jointly to create a unique advantage for the locality and its firms, tackle market failures, remove bureaucratic obstacles for local businesses and strengthen the competitiveness of local firms." (Ruecker &

Trah, 2007). The concept of local economic development emphasizes 'locality' where every purpose, target, action and stakeholder has been stated in literature review or in the definitions of important international organizations. Tello (2010) determines the key factors underlying the concept of local economic development, which are indigenous resources and local control, new wealth formation, new capacity building and resource expansion, through local emphasis as well.

2.1 LOCAL ECONOMIC DEVELOPMENT FACTORS

Economic planning and management of limited local resources are crucial for local economic development. Despite that fact, there is still no definitive list of the factors which are critical for local economic development in literature (Steiner, 1990).

The local economic development factors have been developed by Wong (1998) as a result of extensive literature review and agreed upon in different scientific studies. In order to determine a comprehensive list

of the factors which are substantial for local economic development, she has reviewed 30 fundamental studies published in the US, UK and Europe. Topics of the studies is quite broad ranging from general local economic development surveys to statistical studies of economic conditions and to specific sectorial studies.

As result of literature review, despite the differences in terminology and classification, many common key components have been found. As Wong has studied, these common key components have enabled to reach 11 broad indicators which cover all fundamental issues in the general framework of local economic development. Based on the extensive literature-based grouping of Wong (1998) and the classifications in the basic strategies of local economic development, these 11 factors can be divided into 2 broad groups as traditional economic development factors and intangible factors (or we can name them as soft factors) are shown in Table 1.

Traditional economic development factors	Intangible factors
1. Locational factors	8. Quality of life
2. Physical factors	9. Business culture
3. Infrastructure	10. Community identity and image
4. Human resources	11. Institutional capacity
5. Finance and capital	
6. Knowledge and technology	
7. Industrial structure	

Table 1 – Local economic development (LED) factors (Wong, 1998).

According to Cities Alliance (2007), many indicators can influence regional competition. Therefore, it is very important to determine LED factors and to consider the local economic development indicators while designing local economic development strategies. Cities Alliance states the local economic development indicators measured and monitored during the strategic planning process under four categories (Table 2).

As described in Table 2, national indicators and local indicators are not independent of each other, only scale differences exist. In addition to monitoring the data at the local economic level, national indicators have broader scope. Although the scale of national indicators is large, national and local indicators are intertwined. Many cities follow the national economy to frame their local economy. Local indicators are likewise dependent on national factors however local dynamics and local resources are key determinants of local indicators.

National Indicators	Local Indicators
Economic structure	Economic structure
Overall size and growth	Size of the economy
Sectorial structure	Sectorial structure and specialization
Exports	Exports
Productivity	Firm structure and dynamism
Investment	
Local endowments	Local endowments
Transport and utilities infrastructure	Transport infrastructure
Financial infrastructure	Availability and quality of land and premises
	Cost of utilities
Human capital	Human capital
General demographics	Demographics
Employment and income	Employment and income
Education and skills	Education and skills
Institutions	Institutions
Governance (including rule of law, transparency and accountability)	Local business enabling environment

Table 2 – LED Indicators at the Local and National Levels (Cities Alliance, 2007).

Despite increasing recognition and applicability of local economic development whose practices can be traced back to the 1960's (Pike and others, 2006), measurement, tracking and analysis of local economic development (LED) approach are quite hard because of the complex components LED contains and process challenges. The 'locality' concept which underlies the notion of local economic development,

represents unique characteristics of each region. As a consequence, it becomes increasingly difficult to measure local economic development and standardize indicators.

Another study on indicators related to measuring local economic development belongs to Hodge and Midmore (2008), who determine the indicators and methods at different scales, taking into consideration of different development levels. While the study is more concerned with rural development policies, Hodge and Midmore also addresses alternative scales representing different approaches. The authors examine the basic indicators, indicative methods and implications of the local economic development process under four categories as sectorial, multi-sectorial, territorial and local.

3 THE CASE OF TURKEY

Regional approaches, evaluated at the level of local policies, include development plans that are fundamental development instruments and regional development tools. Development plans are examined in terms of approaches and policies, and instruments. On the other hand, regional development tools are examined in terms of scale. Regional development tools strategies vary with their own dynamics, supportive actors, different coordination levels, and their visions.

Development Plans	Approach & Policies	Instruments
1 st Five-Year Development Plan (1963-1967)	-Regional planning -Growth poles (ex. East Marmara, Çukurova, Antalya, Zonguldak)	-Financial incentives -Investment on less developed regions
2 nd Five-Year Development Plan (1968-1972)	-Region and provincial planning -Indirect regional planning	-Tax reduction -Financial incentive for private sector investment -Pilot projects-Keban
3 rd Five-Year Development Plan (1973-1977)	-Sectorial and provincial planning	-Financial incentives -Industrialization programmes for less developed regions -Inventory studies -Package projects -Prior provinces for development
4 th Five-Year Development Plan (1978-1983)	-Strengthen the link between sectors and regions	-Interest reduction for investments -Financial aids -Package projects -Provincial and regional investments -Çukurova Urban Development Project -GAP (DPT-JICA)
5 th Five-Year Development Plan (1985-1989)	-Direct regional planning including regional impacts of projects (proposed 16 functional region)	-Acceleration of regional development programmes in order to determine potential resources -Through those programmes, selection of investments -Development of infrastructure in prior regions for industrialization projects -Financial aids for investments in prior provinces
6 th Five-Year Development Plan (1990-1994)	-Regional and sub-regional planning	-Increasing financial aids for investments in prior provinces -Cash up for this purpose -Industrial zones -Continue to prior provinces for development strategy
7 th Five-Year Development Plan (1996-2000)	-Regional and sub-regional projects -Mobilization of regional abilities -Sustainable development	-Urgent support programme for East and South-East Anatolia -GAP -Legal regulations -Residential projects -Supporting SME in prior provinces -ZBK, DOKAP, DAP
8 th Five-Year Development Plan (2001-2005)	-Strategic regional planning -Clustering -Province development plans	-SBE supports -EU fund -First comprehensive regional plans -Human capital -Yeşilirmak River Basin Development Project
9 th Five-Year Development Plan (2007-2013)	-Holistic approach -Sectorial and thematic policies -Policy development on active labour -Initiation of regional development policies on central level	-Development of institutional governance of SME -Extending Turkey Employment Agency programmes -Public investments -e-Government practice

10 th Five-Year Development Plan (2014-2018)	<ul style="list-style-type: none"> -For human, with human development approach -Sustainable development -Participative approach -Benefit from scale economies while reconstruction of local governments 	<ul style="list-style-type: none"> -Strengthen the Local Institutional Capacity Programme -Supporting infrastructure investments of rural and medium-small municipalities (KÖYDES, BELDES and SUKAP projects) -For an effective rural development policy, Rural Development Plan is promulgated for the first time

Table 3 – Integrated evaluation of regional approaches in Development Plans,
(Adapted from Regional Development ad hoc committee report (2008))

Development plans have focused in local approach in regional policies and local targets over time. Planning approaches and policies, targets and instruments have transferred from traditional to local and differentiated as well. Another major instrument of regional policies is regional development tools. Each regional development tool has differentiated strategies in terms of its own dynamics, supportive actors, coordination levels, and visions.

According to Ad Hoc Committee Report on Regional Development (2008), local and regional development tools are; investment support office, industrial parks/organized industrial zones, enterprise capital, conference/exhibit/fair centres, alternative tourism, cultural centres, business incubators, derivative businesses and insemination/core capital centres. When those tools are evaluated within the frame of Turkey, it is obvious that, tools, actors and coordination levels has been changing and will continue to change.

In order to determine appropriate mechanisms and tools for Turkey, it is necessary to designate which mechanism and instrument, at which scale, in which region, at which level and how should be implemented. National development targets, strategies and plans have major importance for that issue. However, the approach changes according to the scale of region where development tools are managed. The strengths and weaknesses, potentials and threats, local dynamics based on local analytical studies should be well established to produce optimum benefit at the local level. Not only central government (Ministry of Industry and Commerce etc.), but also local actors who affect local development have important responsibilities on the achievement of this process. The primary actors to contribute to local development and to determine the appropriate mechanisms and instruments are; governorships, district governorships, regional development agencies that are local but dependent to central government and in addition municipalities, provincial special administrations that are local governments (Ad Hoc Committee Report on Regional Development, 2008).

4 METHODOLOGY

The study aims to evaluate how local economic development factors are prioritized and perceived by different institutionalized actors in TR41 and TRC1 NUTS II regions with different socio-economic development levels.

Regarding the research topic, a wide literature review has been conducted on the different definitions of the local economic development approach from basic references and the LED factors that constitute the basic input of the study. Literature review has continued with the objective data aimed at revealing the local economic development approach in Turkey. The conceptual framework has been completed with these approaches.

In this paper which aims to demonstrate how the prioritization of local economic development factors differ by the actors in TR41 and TRC1 NUTS II regions with different socio-economic development levels, results of online questionnaire answered by different institutional actors have been measured by different quantitative methods to reveal regional and institutional differences. This stage constitutes the subjective evaluation part of the study.

TR41 and TRC1 NUTS II regions, which are the case areas and also has different socio-economical development levels, has been described with secondary data of the LED factors that has been taken into account in the paper. Secondary data about the regions has been objectively compiled. In the objective evaluation part which is the first phase of the assessment, TR41 and TRC1 NUTS II regions have

reviewed through the socio-economic development ranking surveys of provinces and regions (SEGE) and The International Competitiveness Research Institute's (URAK) inter-city competitiveness index and sub-indices that consist of human capital and quality of life sub-index, branding skills and innovation sub-index, trade skill and production potential sub-index and accessibility sub-index (Table 4).

		Years	Bursa	Eskişehir	Bilecik	TR41	Gaziantep	Adıyaman	Kilis	TRC1

		2008-2009	8	11	28	-	12	55	68	-
		2009-2010	8	13	30	-	12	56	68	-

Table 4 – Ranking of provinces and regions, Socio-Economic Development Index (SEGE,1996-2011) and Competitiveness Index(URAK, 2007-2011)

The questionnaire was sent to the actors with a prominent role in local economic development in TR41 and TRC1 NUTS II regions. These actors consist of governorships, district governorships, provincial special administrations, metropolitan municipalities, provincial and district municipalities and affiliated administrations, regional development agencies, chambers of commerce and industry, city councils, relevant NGOs, public and private partnerships. The questionnaires were delivered to the relevant units and experts. Participants who were sent the questionnaires by mail were asked to rank the local economic development factors according to their prioritizations in contributing to local economic development. In addition, the participants were asked about other indicators, suggestions, values, potentials, strengths and weaknesses of the locality they inhabit in order to evaluate better their perception about the local economic development.

	TR41 NUTS II REGION		TRC1 NUTS II REGION	
	Number of responses/ Target sample	Response rate (%)	Number of responses/ Target sample	Response rate (%)
Governorship	2/3	66.6	1/3	33.3
District Governorship	13/38	34.2	9/20	45
Regional Development Agency	1/1	100	1/1	100
Central Government	16/42	38	11/24	45.8
Municipality	19/43	44.1	12/25	48
Provincial Special Administration	1	100	0/2	0
Local Government	20/44	45.4	12/27	44.4

Chamber of Trade and Industry	9/18	50	5/9	55.5
NGOs	5/6	83.3	2/3	66.6
Private sector/Firms	2/2	100	7/7	100
Total	52/112	46.4	37/70	52.8

Table 5 –Frequency distribution of institutions in the questionnaire and their response rates

Questionnaires answered by the actors of different organizational structures who have ranked LED factors according to their prioritizations considering their local economic development, have been evaluated. The analyses have been based on the results of Mann-Whitney U tests for regional differences, Kruskal-Wallis tests for institutional differences and mean rankings.

5 PERCEPTUAL ASSESSMENT OF THE LOCAL ECONOMIC DEVELOPMENT FACTORS

Regional differences: In order to measure regional differences, the Mann-Whitney U test, a nonparametric statistical test used to examine whether two quantitative scale observation samples come from the same distribution was conducted. H0 and HA were hypothesized for each local economic growth factor and thresholds for reliability interval were tested.

H0: there is no statistically significant difference between TRC1 and TR41 NUTS II regions in terms of their perception on location factors' impact level on local economic development.

HA: there is statistically significant difference between TRC1 and TR41 NUTS II regions in terms of their perception on location factors' impact level on local economic development.

H0 is rejected for all LED factors. In other words, the result is; there is statistically significant difference between TRC1 and TR41 NUTS II regions in terms of all factors' impact level on local economic development. After that, the priority level differences of LED factors in regions were revealed by calculating the mean rank of local economic development factors (Table 6).

	Bursa	Eskişehir	Bilecik	TR41	Gaziantep	Adıyaman	Kilis	TRC1
Locational factors	2,322581	1,7916667	3,090909	2,257576	3,23076923	2,875	2,3333333	3,12
Physical factors	3,451613	2,9583333	4	3,363636	4,20512821	4,5	2	4,12
Infrastructure	3,387097	2,875	5	3,469697	3,87179487	4,625	2,3333333	3,9
Human Resources	3,774194	2,7083333	4,272727	3,469697	3,74358974	3,25	2,3333333	3,58
Finance and capital	3,580645	4,5	4,727273	4,106061	3,69230769	3,5	2	3,56
Knowledge and technology	4,677419	3,6666667	6,454545	4,606061	4,25641026	4,14285714	3	4,163265
Industrial structure	3,612903	3,875	6,3	4,123077	4,20512821	3,875	4	4,14
Quality of life	3,870968	2,7916667	5,909091	3,818182	4,55263158	5	2,666667	4,510204
Institutional capacity	4,258065	3,9583333	6,090909	4,454545	3,64102564	4,75	4,3333333	3,86
Business culture	3,709677	4,0833333	5,272727	4,106061	3,34210526	3,625	1,5	3,3125
Community identity and image	4,387097	3,826087	6,454545	4,538462	3,76923077	4,375	2,666667	3,8

Table 6 – Mean rank of local economic development factors

Institutional differences: In this study, institutional differences are evaluated in 2 main axes; institutions that are dependant to central government and local governments. Institutions that dependant to central government are governorships, district governorships, regional development agencies and provincial and regional directorate of ministries. Local governments are municipalities, provincial special administrations. Aside from this differentiation, chambers include; chambers of commerce and industry, commodity exchanges, chamber of merchants and craftsmen, NGOs include; city council and professional chamber and private sector include; companies. Institutions that are not quantitatively appropriate are excluded from questionnaire. In order to measure institutional differentiation, the Kruskal-Wallis test was conducted to examine whether more than two quantitative scale observation samples come from the same distribution. Institutional differentiations are evaluated within their regions. The difference between institutions that to central government and local government is aimed to reveal. H_0 and H_A were hypothesized for each local economic growth factor and thresholds for reliability interval were tested.

TR41 NUTS II Region: The null hypothesis was supported in the factors of locational factors, finance and capital, industrial structure, quality of life, business culture and community identity and image. That is, prioritization level of these factors does not differ between the institutions within the TR41 NUTS II region. After this, how prioritization of the LED factors differ was revealed by calculating mean ranks of the local economic development factors institutionally (Figure 1).

Figure 1 - Local economic development factors: TR41 NUTS II Region

TRC1 NUTS II Region: The null hypothesis was supported for all LED factors which are locational factors, physical factors, infrastructure, human resources, finance and capital, knowledge and technology, industrial structure, quality of life, institutional capacity, business culture and community identity and image. That is, prioritization level of these factors does not differ between the institutions within the TRC1 NUTS II region. After this, how prioritization of the LED factors differ was revealed by calculating mean ranks of the local economic development factors institutionally (Figure 2).

Figure 2 - Local economic development factors: TRC1 NUTS II Region

6 CONCLUSION

Objective assessment: TR41 and TRC1 NUTS II regions, which are the case areas and also has different socio-economical development levels, has been described with secondary data of the LED factors that has been taken into account in the paper. Secondary data about the regions has been objectively compiled. In the objective evaluation part which is the first phase of the assessment, TR41 and TRC1 NUTS II regions have reviewed through the socio-economic development ranking surveys of provinces and regions (SEGE) and The International Competitiveness Research Institute's (URAK) inter-city competitiveness index and sub-indices that consist of human capital and quality of life sub-index, branding skills and innovation sub-index, trade skill and production potential sub-index and accessibility sub-index. As well as the socioeconomic development ranking surveys of provinces and regions (SEGE) and The International Competitiveness Research Institute's (URAK) inter-city competitiveness index and sub-indices, the social capital levels of TR41 and TRC1 NUTS II regions were considered in the context of the objective evaluation part. Social capital level of NUTS II regions was grouped considering some particular variables which are turnout rate, number of associations per ten thousand people, suicide rate, divorce rate, edition of newspapers and magazines, tax-collection accrual rate, net migration rate, electricity theft-loss rate and the ration of higher educated population in total population. While TR41 NUTS II region is among the first developed regions in terms of social capital, TRC1 NUTS II region is among the fourth most developed regions in terms of social capital. It has been demonstrated that TR41 and TRC1 NUTS II regions have different development levels in terms of socio-economic development and competitiveness.

Subjective assessment: In the subjective assessment part, which constitutes the second stage of the evaluation section, it is observed generally parallel results to objective assessment. Prioritization of the local economic development factors, which consists of locational factors, physical factors, infrastructure, human resources, finance and capital, knowledge and technology, industrial structure, quality of life, institutional capacity, business culture and community identity and image differ in these two regions. In order to measure regional differences, the Mann-Whitney U test, a non-parametric statistical test used to examine whether two quantitative scale observation samples come from the same distribution was conducted. H_0 and H_A were hypothesized for each local economic growth factor and thresholds for reliability interval were tested. H_0 is rejected for all LED factors. In other words, the result is; there is statistically significant difference between TRC1 and TR41 NUTS II regions in terms of all factors' impact level on local economic development. After that, the priority level differences of LED factors in regions were revealed by calculating the mean rank of local economic development factors. Mean rank values also support the results of statistical test. The locational factors stand out for both regions in terms of contributing to the localities' economic development. Industrial structure and human resources are among the factors that have similar priorities for both regions. As a result of these values, it has seen that the quality of life factor for the TR41 NUTS II region and the business culture factor for the TRC1 NUTS II region stand out. According to the result of the Kruskal-Wallis tests which was used to measure institutional differences, prioritization level of location, finance and capital, industrial structure, quality of life, business culture and community identity and image factors does not differ between the institutions within the TR41 NUTS II region. And prioritization level of all LED factors does not differ between the institutions within the TRC1 NUTS II region.

Traditional economic development factors/Intangible factors: The analysis have been evaluated within the framework of traditional economic development factors and intangible factors, and it has been observed that the traditional factors are still important for the TR41 NUTS II region and the locational factors are most important traditional factors for the region. Finance and capital, human resources, infrastructure and locational factors stand out for the TRC1 NUTS II region, as well as traditional economic development factors are important. This result can be attributed to the current economic structure in the region. For the intangible factors, it has observed that community identity and image, business culture and institutional capacity are prominent in TRC1 NUTS II region. This result is parallel to the current business dynamics and economic structure of the province of Gaziantep, which is relatively most developed within the region. It is an expected result that factors such as business culture and institutional capacity stand out because of the region's current industrial production and active economic structure. The findings of the research presented in this paper suggests that, local economic development and related basic factors change according to the level of socio-economic development and the local government structures. In addition to taking into consideration the central government's development axes and visions, local governments which adopted a multi-actored, multi-leveled and 'bottom-up' approach, are expected to be more successful in local economic development by making more effective policies considering local potentials.

1 A NEED FOR CHANGING THE APPROACH TO PLANNING?

Portugal inherited the European post-war planning approaches based on strong direct public action and regulation of private investment, both of which based on growth-oriented logics. Yet the socioeconomic and territorial impacts of the recent socioeconomic crisis have created different contexts and demands, aggravating the mismatch between the established planning practices and the needed action, thus raising the debate on the need to reframe the planning approach.

Portugal is a paradigmatic case of a wider mismatch, a territory where not only the impact of the crisis and the following austerity policies were especially severe, but also where planning practices still have difficulty in dealing with these new demands and need to be reframed towards more adequate local policies.

Set within this debate, and taking the Northwest of Portugal as a laboratory and a territory to reflect upon, this paper will argue that the recurrent growth paradigm of planning should be further changed into a capability approach to the territories: by understanding the existing contexts and their demands, local resources and stakeholders; by recognizing social and territorial diversity as a value; by defining local-sensitive solutions instead of one-size-fits-all models; and by treasuring specificity instead of specialization or competitiveness.

This reflection follows an applied-research project requested by the Regional Coordination and Development Commission of the North of Portugal (CCDR-N), which aimed at the definition of orientations for the cohesion of the North-western region of Portugal. This project paid special attention to territories that are usually less addressed than the denser urban cores: the peri-urban zones, the diffuse urbanization areas and the low-density territories. It analysed their demands and challenges by mapping statistical data, morphologies and dynamics throughout time, through fieldwork and workshops with municipal technicians, decision-makers and professionals from different disciplinary fields.

This project will thus be used here to discuss and support the argument that reframing the established planning practices is urgently needed – by focusing on the challenges to planning in scarce-resource contexts –, as well as to illustrate how these demands can be overcome through the valorisation of local specificities, the attraction of further resources, the involvement and reflexivity of the different actors, decentralised and network-based decision-making processes and small-scale articulated actions, in order to achieve territorial cohesion and inclusive solutions.

1.1 INTERNATIONAL DEBATE ON PLANNING WITHIN SCARCITY

In Europe, the widespread tradition of a planning system built upon rationality, strong public action and investment, has been put into question by the recent financial and economic crisis. Indeed, through both the recent aggravation of social demands and the limitations in public direct investment, the recent crisis exposed and aggravated the signs of mismatch between action and demand that the established planning system was starting to show in the previous years (Bourdin, 2014).

These signs have fuelled the rise of the debate over the orientation of public action, questioning the policies of austerity and suggesting its replacement by a more adequate distribution and use of resources (Awan et al, 2013), as well as over governance and networks of actors, reframing the roles of each participant in the planning processes, both by a stronger presence of the citizen participation (Healey, 2006; Forester, 2008) and through the transformation of the public administration (Sanderson, 2009; Cels et al, 2012).

Thus, while the framework for new planning approaches has widely been debated, the challenges lie on the implementation of planning practices that may implement these logics, to which this paper aims to contribute.

1.2 A VIEW FROM THE NORTHWEST OF PORTUGAL

Portugal is especially paradigmatic of this mismatch between the existing planning tools and the recent territorial and socioeconomic transformations, being a fertile laboratory for debating planning policies and practices.

Therefore, this discussion will address the challenges within the planning paradigms in Portugal, and their impact namely in the north-western area, from their relation with the consolidation of the welfare state – built in counter-cycle in comparison with most European counterparts, and in which the structural funds had a major role (Cordeiro Santos et al, 2015) – to the recent transformation of dynamics, demands and aspirations that call for new practices of governance and local action.

1.2.1 A LEGACY OF A GROWTH-ORIENTED PLANNING APPROACH

Following the European trends, Portugal has built its planning culture largely upon the modern principles of rationality, predictability and major public investment, but especially upon the logics of growth and its management: by defining constraints to urban occupation, by relying on public gains from private investment and by using major public investments financed by the as drivers and the backbone of territorial transformation. Therefore, within a logic of growth, most established planning tools within the Portuguese territorial framework have been frequently designed towards the ideas of intensity, density and expansion. Even though not always explicitly, these concerns seem to have dictated the underlying principles of several of the existing planning tools, in different scales and outputs. Indeed, at regional level, the regional plans seem to highlight the logics of density, the relations amongst denser urban cores and the focus on dynamics of intensification, of which the representation of the territorial model of the northwest [Fig.2] forms an example. The municipal masterplans could also be cited as paradigmatic of the planning logics of growth, namely managed through land use and the contention of urban perimeters.

These planning orientations might have been adequate within a context of growth, where densification and compactation would represent major issues. Nonetheless, recent transformations undertook a different direction, demanding new planning practices.

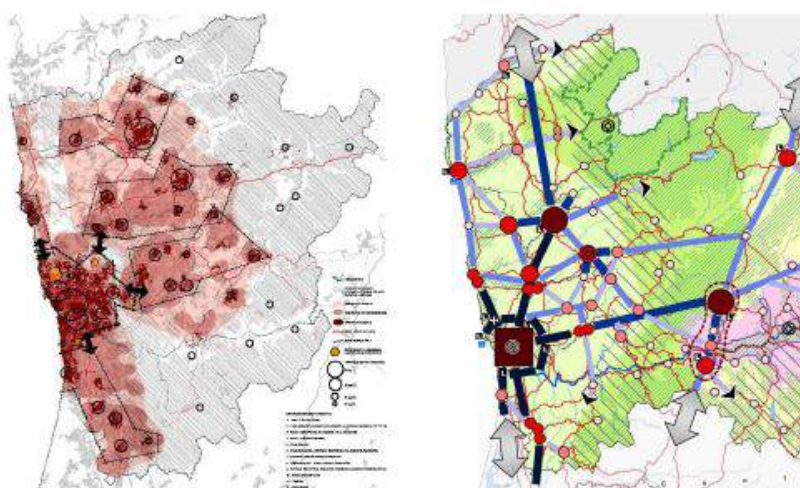

Figure 1 - Territorial models of the Northwest of Portugal, produced within the analysis and the plan of PROT-N, the Territorial Plan for the Northern Region of Portugal [source: CCDR-N, 2009].

1.2.2 RECENT SOCIOECONOMIC AND TERRITORIAL CHANGES

In recent years the growth-oriented approach has become increasingly mismatched from demands, proving to be not only unviable, but also somehow inadequate in certain contexts and in face of radical socioeconomic transformations. Firstly, due to the recent economic crisis that has put resources and capacities into risk, by drastically reducing public intervention and redirecting private investment into very specific areas such as the historical centres, which was accompanied by decreasing demographic rates and aggravated social demands. Additionally, striking evidences show that many territories do not follow growth patterns and are thus not benefited by growth-oriented planning tools or the centralization of services and facilities. Furthermore, these territories have also been the ones that suffered more radically the impacts by changes in the policy of allocation of resources: with the withdrawal of the welfare state and the cuts on public expenses demanded by the recent structural adjustment, these territories have been facing the closure of public facilities and the cuts on social support policies, thus contributing to aggravate their population loss, social vulnerability and territorial fragility.

Along with the previous trend of desertification of the interior of the country, we now witness the shrinkage of many urbanised areas, the losses of populations and the fragilization of many territories, even within the areas of more intense occupation [Fig.2].

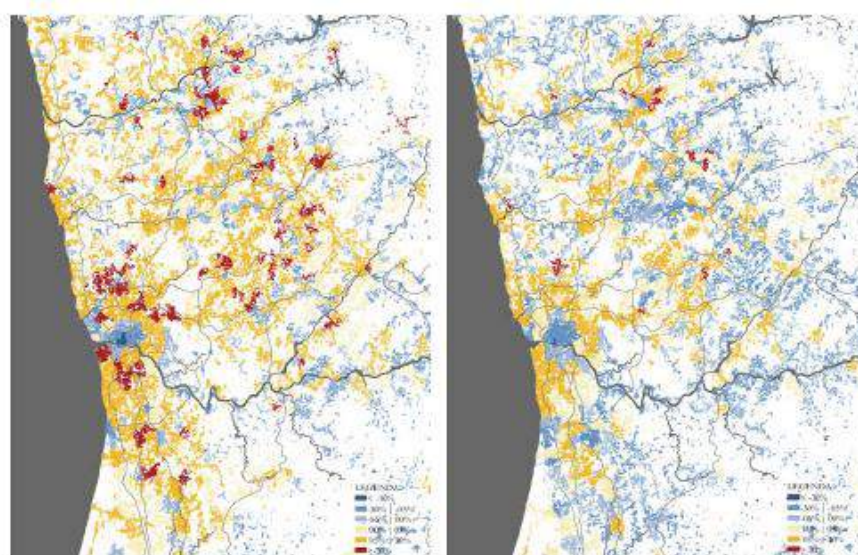

Figure 2 -Population variation in 1991-2001 and 2001-2011, in the northwest of Portugal, representing in warm colours the territories that are gaining population and in cold colours the ones with decreasing demography [source: MDT-CEAU-FAUP, based on data from INE -Instituto Nacional de Estatística].

Furthermore, the recent economic crisis aggravated the socioeconomic context, in which the increase in social vulnerabilities is one of the most visible aspects, shown namely by the intense raise of the unemployment rate is especially expressive of the aggravation of living conditions [Fig.3]. Even though this map refers to data from 2011 and the situation may have meanwhile changed, their structural impacts remain, along with the difficulties in implementing policies and practices to address them.

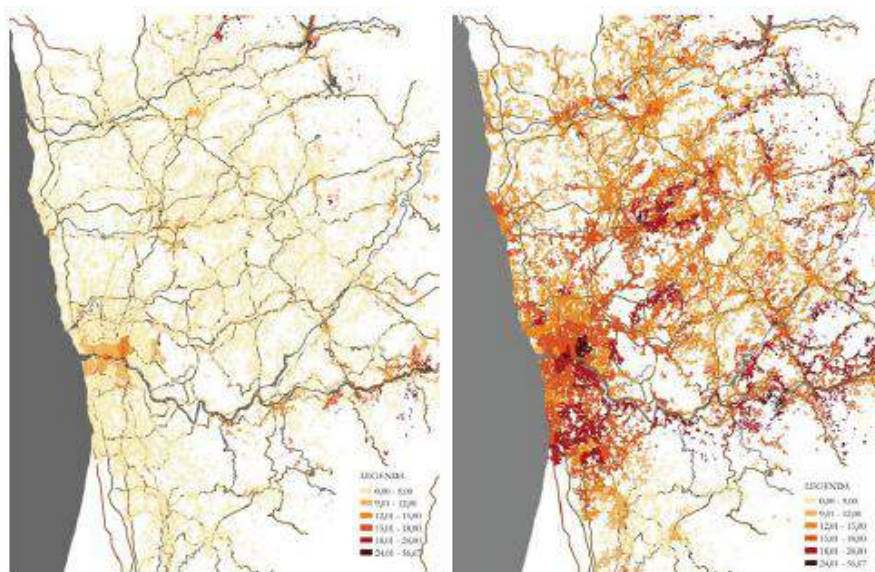

Figure 3 -Unemployment in 2001 and 2011, in the northwest of Portugal [source: MDT-CEAU-FAUP, based on data from INE -Instituto Nacional de Estatística].

These patterns represent a change in needs and the aggravation of conditions, to which are added the policies of austerity and their impact, along with the change in the capacities of the public administration to face and tackle those needs.

Indeed, the fragilization of the Welfare State – with the privatization of basic support services, the cuts in public expenses and their impact in the reduction of services and support networks – contributed to the aggravation of social demands.

Along with this impact, we also witnessed the intense decrease of private investment, an important driver of the process of urbanization with their consequences: the bankruptcy of companies and investors and their impact in unemployment, the stagnation of the real estate market, the interruption of construction sites and the abandonment of unfinished constructions (Travasso et al, 2014). This also represented a pillar of public income, which therefore translated into further impacts.

Thus, the decrease in major public works, which have formerly acted as major drivers of urbanization and territorial improvement, has suffered an almost complete halt.

In this process of the last years, the modes of production, the relations amongst actors and the social demands have radically changed and represent probably a structural transformation, one which means that former patterns will not be retaken, but have rather changed into a new paradigm.

Traditional planning tools have shown difficulty in adapting to this new context, which requires a change of the spatial planning practices, both by understanding the existing territories and demands, as well as by reframing planning practices and roles, paying particular attention to qualification, instead of mainly growth logics. And if there has been an effort to address the qualification and rehabilitation of existing fabrics, this logic has mostly been concentrating uniquely in historical centres, forgetting the other territories.

This doesn't mean that the existing planning tools are obsolete, but rather that they may need to be adjusted to the different territories and demands, as well as complemented with further practices and approaches to make the whole planning framework more responsive, as well as to provide a more intense involvement of different stakeholders, and specially the civil society, in the role of designing common future.

In this task the academia, and applied research, may have an important role, by rethinking the way questions are debated, diagnosis are formulated, potentials are identified, and solutions are jointly achieved.

2 THE 'METAPOLITAN ARCH': A PROJECT FOR DISCUSSING THE TERRITORIAL COHESION OF THE NORTHWEST OF PORTUGAL

The research group MDT – which studies Territory Dynamics and Morphologies within CEAU-FAUP – has been actively engaged in rethinking planning approaches and agents, namely through applied research projects in partnership with the regional and local administration, aiming at a wider public as well. Therefore, a project will be used as illustration to discuss this approach. It is a laboratory due to its nature of experimentation, where we have been trying to test different tools, ways of looking and reframing challenges, as well as in reaching for different publics in the task of conceiving planning as a shared task.

The 'Metapolitan Arch' ('Arco Metropolitano') project, commissioned by CCDDR-N – the Commission for the Coordination and Regional Development of the Northern region –, aims to contribute to the territorial cohesion of the north-western area of Portugal. This project is coordinated by Nuno Portas, Manuel Fernandes de Sá and Teresa Calix and, after documenting the impact of the recent socioeconomic and territorial transformations, paid special attention to territories that are usually less addressed, such as peripheral areas, diffuse urbanization and low-density territories.

The project adopted the concept of metapolis (Ascher, 1995), which expands beyond the idea of metropolis, in order to describe a continuous urban area with heterogeneous densities and behaviours, but specially to address, analyse and understand the phenomena that shape it and that take place not only inside this territory but also beyond it. This "arch" stretches around Porto, comprising 43 municipalities and gathering more than three million inhabitants (almost one third of the total national population). The project gathered different professionals and disciplinary fields, undertaking multiple tasks and formats, namely through workshops with municipal technicians, fieldwork, the production of cartography and diagrams.

The intention of this project has been to contribute to strengthen a point of view that establishes territorial diversity, local identities and tactic interventions as major drivers of spatial and living improvement. Thus this example aims to discuss how a new planning culture based on a more profound comprehension of local specificities, on small-scale extensive and articulated actions, as well as in the awareness and reflexivity of the different actors within decision-making processes, while requiring less economic resources than the previous growth-oriented approach, may prove more responsive and flexible, inclusive and sensitive to both territorial diversity, as well as to societal challenges.

2.1 THE 'METAPOLITAN' LOGICS OF THE NORTHWEST

The project started with the characterization of the Northwestern area of Portugal, focusing both on the patterns of occupation, as well as on the socioeconomic dynamics and reactions to the recent transformations. Thus, the analysis of the behaviour of this metapolis allowed to discuss the major logics of relation and spacialization of the different phenomena, the territorial asymmetries (cf. Calix, 2017), as well as the relations between the denser areas, the extensive urbanisation and the low-density areas, trying not only to characterize the specificities of different territories, but especially debating their potentials. Towards this aim, a set of territorial samples were selected in different contexts to be studied in detail, both in their urbanization patterns, as well as in their role within the green infrastructure [Fig.4].

Figure 4 – The territorial samples studied in detail within the project, representing their non-built areas (from left to right, and top to bottom): eastern Porto and Maia representing the limits of denser cores; four areas close to Santo Tirso, Famalicão, Paços de Ferreira and Paredes representing the diffuse urbanization areas, and Esposende and Douro showing examples of lower density [source: MDT-CEAU-FAUP, based on GoogleEarth imagery].

2.2 THE PROCESSES OF FORMATION AND TRANSFORMATION OF THE TERRITORIES

The selected territorial samples allowed to test several exercises of analysis, especially focusing in areas that are often undervalued, which are often described negatively through enphysizing socioeconomic vulnerabilities, population loss, spatial fragmentation or difficulty in understanding their logics.

A fundamental starting point was recognizing the importance of the ‘intelligibility’ of the territories – or the ability to understand their own logics – as an important aspect for detecting their potentials and specific values, for strengthening the sense of belonging of the residents and the meaning of each territory to its outside, as well as for designing adequate and sensitive policies and actions.

Therefore, one essential task was to understand, present and describe the processes of formation and transformation of the territories, their logics and specific attributes. Indeed, often an inability of understanding a specific phenomenon derives from a lack of perception of its own patterns or the complex overlapping of different layers and processes that generated a complex reality. Thus, analysing and highlighting these different patterns may be useful for clarifying the different layers that form the territories, recognizing the specific ‘nature’ and causes of each story that they comprise [Fig.5].

Therefore, this task could contribute to detect and illustrate the specificities of each territory and their own logics of formation, transformation and use, which forms its identity and could further inform local policies.

Figure 5 – Different occupation logics in a territory close to Santo Tirso. The diagram: in green, the rural routes and buildings; in black, the urbanization along existing roads and cores; in blue, some housing developments. The photographs correspond to examples of these three patterns [source: MDT-CEAU-FAUP].

2.3 TERRITORIAL ENDOGENOUS AND SPECIFIC VALUES

Based on the specific logics of formation and transformation of each territory, the project also undertook studies on the identification of endogenous values and potentials, namely in order to understand how each layer and process may encompass attributes that are not only important for the territory's resilience, but may also represent elements – actors, materials, spaces – with the capacity to improve the quality of the territory and of the life of its residents.

Therefore, by illustrating some of these capacities, this task aimed at giving visibility to local attributes and potentials, highlighting the importance of the identification of specific logics, testimonies and legacies that tell the stories of the lives, uses, processes and transformations that shaped the space [Fig.6].

Simultaneously, and by focusing on positive aspects and potentials, this project has helped to discuss preconceptions that have established negative identities and thus limit the development of some territories. This study has shown, for instance, that the areas of extensive or diffuse urbanization, which tend to be mostly described as an occupation with high consumption of land and energy (UN-Habitat, 2016), actually have an opposite behaviour in the Northwest of Portugal: not only because it represents a pattern of a very permeable built fabric in which the constructions are closely related with non-built areas (most of which used for family and small-scale agriculture that provides for complementary subsistence or income, improving the livelihood and resilience), but also because it shows a high incidence of pedestrian routines for pendular movements (thus illustrating a pattern of proximity and low-energy consumption for daily transport). The studies on the low-density areas and on the limits of denser urban cores have also shown the potentials for improved quality of life, namely due to the privileged relation with green areas, which could be further enhanced and represent major attractors for new residents and visitors.

Figure 6 – Location of cultivated fields and old houses related with agriculture close to Santo Tirso [sources: MDT-CEAU-FAUP].

Finally, a third aspect the project discussed was the potential of tactic intervention, thinking beyond the structural action, by dealing with the existing structure and attributes of each territory, complementing the extensive intervention with a network of chirurgical actions. This goal was tested through identifying leftover spaces that could be put into public use for improvement of the quality of life of residents and visitors: dead-ends, street enlargements, abandoned public facilities, amongst others, were just some examples of potential spaces that could be transformed into improved public places for everyday neighbourhood life, either through direct public intervention, through citizen mobilization and/or networks of agents, representing an endless potential in conceiving the territories, the decision-making processes and the actions [Fig.7].

3 FINAL NOTES: THREE POINTS TO REFLECT UPON, TOWARDS A 'CAPABILITY APPROACH' TO THE TERRITORIES

3.1 TO VALUE EACH TERRITORY'S SPECIFIC IDENTITIES

Yet this effort means, furthermore, to go way beyond the data into understanding, explaining and re-observing territories and their dynamics, according to the different perspectives and publics. Indeed, the attribution of patterns, identities, specificities, values and conflicts depends on the points of view, some of which fail to be recognized or taken into account in observation, diagnosis, prospective and planning of the territories. Some tasks and processes may be crucial for taking these aspects and meanings into consideration.

The deconstruction of the multiple layers that form complex realities and territories may also help not only in understanding their patterns and logics, but also in explaining them and putting them into discussion. Indeed, the difficulty in reading, analysing and finding a sense into the specific processes of formation and transformation of some territories has often dictated interventions without clear directions and the implementation of contradictory planning actions, contributing to increasing misconceptions, negative perceptions and decreased sense of belonging. This vicious cycle might be inverted by further efforts into reading, discussing and sharing views on complex territories.

Finally, an aspect that is always crucial to take into account is the process and the relations amongst actors. Their identification, may not only help understanding their impact into shaping the territory, but may also shed some light into possibilities of reshaping processes, both to improve existing responses and to react to new demands.

3.2 THE IMPORTANCE OF QUALIFICATION, RATHER THAN GROWTH

A second major theme to be discussed has to do with the attitude towards action, here advocating for the importance of thinking beyond growth, but rather aiming at qualification beyond the urban cores. This starts from the recognition of the diversity of settlement patterns, and thus highlighting that one size doesn't fit all, as well as that growth and intensification may not be the sole aspiration of every territory. This attitude, though often defended, ends up rarely being taken as a priority, crashing into de normalization of models, procedures and rules.

The different patterns of the territory, from higher density to lower density, from intensely urbanized areas to territories of agriculture and forest predominance, face therefore distinct challenges and their value indeed abides to their specificity and diversity, characteristics that should be further highlighted as drivers of development, qualification and improvement.

This attitude may be materialised into finding the specificity and value in each territory, detecting elements, paths and patterns that may be recognised as part of local identities, improving their visibility and caring for their identification and qualification.

Additionally, the small scale, strategic thinking and tactic action might contribute to an effective improvement of the quality of the territories, namely the intervention in devalued public space, by acting chirurgically yet with major repercussions at local level in the daily use of the space.

3.3 BUILDING COMMON GROUNDS

The third aspect we wished to highlight is the construction of common grounds for discussion of the territory, for building shared visions and projects for the future, taking the debate of the territory as a pillar of citizenship and its planning as a collective action.

The strengthening of a dialogue amongst actors is a crucial task, one where the academia may work as a facilitator, by establishing connections, building networks, making voices heard, within the local administration, within technicians of different municipalities, with different approaches within the same institution, involving students, different generations, mapping affections and memories, discussing needs, potentials and visions: building a common future.

Figure 8 – Work session undertaken with representatives of the municipalities of Santo Tirso and Vila Nova de Famalicão within the “Metapolitan Arch” project, and workshop undertaken with the Association “Geração” (aimed at the active ageing) set with the “Território: Casa Comum” project [source: MDT-CEAU-FAUP].

T09 | BRIDGING GAPS IN TRANSNATIONAL PLANNING

CO-CHAIRS: TUNA TASAN-KOK; THOMAS DILLINGER; PAULO CORREIA

While hyperactivity of global financial capital (Sassen, 1994) seems to continue in full-speed, looking for profitable locations across the borders, some recent geo-political and economic trends require new discussions in the field of transnational spatial governance and planning. 'Borderless world' has become quite a shadowy concept for one, due to increasing terror threats and attacks across the globe and increasing cross-border mobility triggered by wars, and other forms of social or political unrest. These fears have fuelled a new spate of wall-building along the borders around the globe even within the EU. Another interesting trend is fuelled by Brexit, with unclear consequences of UK's leaving the EU, which may also influence transnational regulations of spatial governance and planning. In relation to these trends, rules of supranational trade agreements may change, causing new rescaling tendencies of governance. There are obviously some gaps in theory not only in understanding how these new trends will shape new political, economic and spatial relations in Europe and elsewhere, but also in discussing their consequences for transnational spatial governance and planning.

Aiming to capture these new trends and their long and short term impacts, this track on "Bridging gaps in transnational planning" will put together planning scholars who will bring fresh blood to the traditional transnational planning field with rich case studies, empirical evidence and conceptual frameworks to close the gap. Potential themes of interest might include, but are not limited to:

- New forms of transnational and cross-border cooperation and spatial planning approaches that may promote inclusiveness, cohesion and integration in cross-border regions;
- Empirical and/or comparative studies that tackle new tendencies in governance of cross-border regions;
- Case studies that examine the challenges created by the changing transnational political economic landscape;
- Conceptualisations of transnational spatial governance and planning;
- Papers that link changing forms of rescaling governance and changing political economic landscape of Europe.

ID 1326 | COMPLEXITY AND ASYMMETRY WITHIN THE BORDER CITIES IN THE BASEL METROPOLITAN AREA. TOWARDS AN ANALYSIS OF RECENT SPATIAL AND ORGANIZATIONAL PROCESSES.

Silvia Fernández Marín¹

¹Universidad Politécnica de Madrid

fdezmsilvia@gmail.com

1 INTRODUCTION

In the European context, changes derived from the globalization process and those concerning cooperation and integration -intensified at the end of the Cold War- have led to an increasing border permeability in a number of cases.

Under this framework, border urban systems become contact areas, where new opportunities for cooperation and collective development arise, but also new challenges, pressures and risks.

The case of the Basel metropolitan area, where urban systems from France, Switzerland and Germany converge, is a valuable example for analysing these issues. It is a paradigm of cross-border cooperation. Nevertheless, significant asymmetries persist and new unbalanced dependencies and internal conflicts have arose. Some of the most representative projects involving transnational coordination and development, which have led in some cases to losses of complexity at the local scale, serve as an example.

Cooperation, coordination and/or exploitation of cross-border differentials (Wages, prices, costs, land availability...) might be essential for the development of new optimization solutions, but they should not reduce either the complexity or the individual capacity of the urban nuclei located on both sides of the border to face uncertainty. Thus within a context of complexity, not only the potential benefits of collaborative development must be analysed, but also its implications at the local scale.

1.1 BORDERS WITHIN A CONTEXT OF GLOBALIZATION

In a globalized world, discussions concerning the "disappearance of the border" have multiplied in a number of fields, especially since the 1980s. Such a viewpoint contrasts with the intensification of political, social or armed conflicts throughout the planet, as well as with the understanding of borders as administrative divisions.

In the European context, the integration processes deployed from the end of the Second World War, that were intensified particularly after the end of the Cold War and that have continued up to the present, are leading to the enhancement of border permeability. The globalization process and the specific willingness of cooperation of the entities involved have contributed decisively as well (Sohn, 2014). Consequently, borders are acquiring a new significance (Groupe frontière, 2004); (Anderson and O'Dowd, 1999) and new roles; but they have not disappeared. In this context, collaborative projects have proliferated (Rojo, 2010). Therefore, border regions are not necessarily peripheral disadvantaged arenas, but spaces with high potential for interaction, especially in the social and economic spheres (Van Geenhuizen and Ratti, 2001). Since the late 1970s, new spatial, organizational and relational forms have emerged, driven by global demands. Transformations in traditional mechanisms and channels of exchange and communication have accelerated. The scale of interaction is global and competitiveness has grown in importance. Border urban systems are becoming contact areas of strategic interest, especially those entities capable of taking profit of physical proximity to different urban nuclei, regarding mainly cooperation and cross-border differentials and resources.

instruments, boundaries and limits for decision-making and distribution of power in each case is a fact. Their ability to face uncertainty and their autonomy is highly unequal. On the other hand, projects involving cross-border coordination and being regulated by those instruments might lead to contradictions between scales, or even to loss of urban complexity if global objectives are followed to the detriment of the local. We will analyse this two issues in the following sections.

2.1 NEW INSTRUMENTS OF CROSS-BORDER COOPERATION FACED WITH COUNTRY-SPECIFIC INSTRUMENTS OF REGULATION

The area of our study has been a pioneer in the field of cross-border cooperation in Europe. Cross-border cooperation structures have expanded since the 1960s. In 1963, the Regio Basiliensis project arose, bringing together the Swiss authorities in order to pursue joint economic, political and cultural development in the Upper Rhine¹. Two years later, the French authorities of the region of Mulhouse joined into the Regio du Haut Rhin². As a result of the former, in 1971 the Conférence Tripartite Rhénane was created (Hildebrand, 1996), aimed at encouraging exchanges among the state of Baden Württemberg (Germany), the region of Alsace (France) and the Swiss cantons of Basel-Landschaft and Basel-Stadt. It was an important first approach to this field, substituted by the Commission intergouvernementale franco-germano-suisse in 1976. Nine years later, the Freiburger Regio-Gesellschaft was founded. It would pursue the same objectives as its French and Swiss homologous developed in the sixties. Thus, even though the three countries kept having distinct planning instruments and their own economic development, the foundations of tri-national development had been built. It was not until 1990s when the main efforts in search for coordinated development took off. On the one hand, thanks to the implementation of the Interreg programs. On the other hand, with the commitment made in 1995 to reinforce cross-border cooperation in the area, which would lead a few years later to the creation of the Trinational Basel Agglomeration (ATB) and to the development of a common development strategy for the member cities and municipalities. Its main objectives were to define priority projects and the creation of the association Agglomération Trinationale de Bâle (ATB partnership) (Duvina et al., 2009). It enabled to give a regulatory framework to the practices that had been taking place during the previous years. In 2007, the ATB would become the ETB³ and the cooperation perimeter expanded. The guidelines of a common development strategy were set out as well. In contrast, the systems of regulation within each country maintain strong differences, which have traditionally conferred unequal power to the communes/gemeinden⁴, concerning their duties and functions. Despite the fact that cooperation at the local level has existed in the area from a long time ago, flexibility and ability to adapt to a changing environment vary on each case as well.

Thus, while centralization and hierarchy have traditionally characterized the French planning system, the Swiss one is highly devolved. The Confederation has a limited legislative responsibility. It collaborates with the cantons and coordinates them. The latter decide the competences that they will delegate to the communes. In any case, the higher authorities must allow the lower ones⁵ room for manoeuvre. On the other hand, in the German system significant powers are granted to the Länder (Federated States), but unlike the French case, no privileges are conceded to any city over the rest. On their part, the gemeinden have a high level of autonomy as well, keeping general competence for issues at a local scale.

The above-mentioned asymmetries have affected the relations among the border cities, especially concerning the action strategies enabled by border permeability⁶: -Firstly because the ability to anticipate and to think strategically is crucial under the described framework⁷. Hence, those nuclei with greater decision-making capacity at the local level, such as Basel-Stadt, have an advantage regarding both the

³ As described in the Statutes of the Trinational Eurodistrict, the so-called ETB is a cross-border cooperation platform of the Trinational Agglomeration of Basel. It was created in 2007 as an association of local law, registered in the Register of Associations of the Court of Instance of Hünigau.

⁴ The gemeente is the smallest subnational entity in Germany, comparable to the commune in France (both terms are used in Switzerland). It is commonly translated into English as "municipality" or "township".

⁵ Art. 2 para. of the Loi fédérale sur l'aménagement du territoire du 22 juin 1978.

⁶ Even if the possibility existed that the whole area was unified from an administrative viewpoint, the border would not disappear, it would just be displaced.

⁷ Both to anticipate changes in the environment and to act in advance, as well as to propose collective projects aimed at achieving collective goals while satisfying individual needs.

development of collaborative projects and the adaptability to changing environments. -Secondly because the development of projects based on bi-national cooperation enables costs-sharing, but it entails longer development processes and less unilateral control. The distribution of power and the availability of resources on each case, turn out to be essential. Therefore, cross-border projects should not be analysed without considering its local effects, and the latter must be studied simultaneously on each of the urban systems that are directly affected. With all of the above in mind, we will analyse major projects in two key fields regarding the recent development of border urban systems in the Basel metropolitan area: communications and life sciences, from a viewpoint of urban complexity. Our research focuses on the 1985-2010 period¹.

2.2 BEYOND THE BORDER: COMMUNICATIONS AND LIFE SCIENCES

2.2.1 THE BASEL METROPOLITAN AREA AS A COMMUNICATIONS NODE

The Basel metropolitan area is located in a privileged environment in the space where the northern front of Switzerland converges with the boundaries of south Alsace and the Land of Baden Württemberg (fig. 1). It brings together the area where the Rhine begins to be navigable² and a key location along the Rhine-Alpine corridor, one of Europe's busiest freight transport routes. The convergence of these two factors, added to its function as a gateway between Europe and Switzerland, turns this area into an important communicative hub.

Figure 1 - Geographical and administrative framework of the studied area.
Municipal boundaries are shown in red; state boundaries in black. Source: Own elaboration.

The major city, Basel-Stadt, is settled in an area with an extension of only 37km². It is subjected to growing pressures, increased by the boost given to "life sciences" industry in the city during the last decades. Firstly, because a multiplicity of leading companies in this field are located in Basel, creating a "pull" effect. Secondly, because this circumstance leads to additional demands (e.g. concerning land availability). On its part, the relationship with the canton of Basel-Landschaft, independent since the s. XIX (after numerous confrontations regarding distribution of power), adds an "internal border" to the already mentioned ones, at both the administrative and the physical level, and more difficulties concerning management purposes.

¹ Covering the period from the years prior to the establishment of the Schengen Agreement -with France and Germany as initial signatories- up to a recent stage, as a preamble to the new period that will start with the IBA Basel 2020.

² The river is navigable on a stretch of 883 km that links Basel and its delta in the North Sea.

2.2.1.1 THE CASE OF CROSS-BORDER HIGHWAYS: COMMON OBJECTIVES, UNEQUAL URBAN RESPONSES

Given this background, nodal areas regarding transport and logistics demand an increasing capacity for improvement (e.g. optimization of communication infrastructures, organization, transportation and storage capacity....). This ensemble of factors has introduced cumulative pressure over an area forced to deal simultaneously with issues concerning both global and local scales in order to solve external problems while keeping internal organization. From this angle, heterogeneous solutions have been adopted, ranging from expensive technical designs to cross-border coordination and search for opportunities beyond the border. The impact of those processes at the urban scale has been different in each case.

We will first focus on the main projects aimed at enhancing cross-border road connectivity in this area during the above-mentioned period¹². Even though they share common objectives, the final developments are the result of individual planning approaches coordinated with those of the surrounding areas, and not of a single unified project. Thus, despite the fact that they succeed in solving common needs, we will analyse whether in any of the cases it was done at the sacrifice of urban complexity in what follows.

As stated, the Basel metropolitan area has an important location with regards to the North-South axis of the European communication network. In addition to the rail network that was built centuries ago (Linking the network in Basel with the German and the French ones), cross-border highways have been gradually developed, strengthening this axis. During the last decades, a number of approaches aimed at linking the main highways in this area have arose. The key project is the so-called Nordtangente, in Basel-City. It connects the French highway A35 with the A3 in Switzerland, and in turn with the A5 in Germany, within a spatial configuration that locates the junctions and the main linking section in an urban area on the northern front of Basel (figure 2), as we will discuss later.

Figure 2 – Basel Nordtangente and its surroundings. Underpass road sections are shown in blue, State boundaries in black. Source: Own elaboration.

The section of the French highway, A35, linking Saint Louis (airport) and the Swiss border was opened in the late 1980s, when the German highway, A5, had already been in service for many years. It involved the duplication of the route that linked the Swiss exit of the airport with the city of Basel, but in this case as part of the French network³. The project was not only an axis of linear north-south connectivity. It also favoured the subsequent development of strategies targeted to increase the attractiveness of surrounding pieces of land. They were based on the general improvement of accessibility, the economic dynamics and the “pull”

¹ All of the analysed cases started before the development of the ATB/ETB, although some have been concluded a few years ago.

² It must be noted that dissimilarities regarding the projects presented do not necessarily emphasize the presence of the border, since the starting points, specificities of design, conditions and periods diverge, but they are valuable examples to analyse local effects of supra-local and collaborative projects.

³ Connectivity solutions are distinct regarding network topology. The Swiss road links directly with Basel, and controls are carried out at the airport. Although it is located in France no intermediate customs points exist. The French highway, on its part, has multiple junctions. Additional customs control is required.

effect created by the leading industrial groups located in the environs. As a consequence, the degree of (inter)dependence with Basel-city was increased, as we will discuss later.

From a spatio-relational viewpoint, the ability to harmonize scales in this context was limited. The construction of the route did not create a large internal break in the local scale, since it was adapted to the structure that had been developed years ago (when the customs route linking the Euro-airport and Basel was built), but it established new rules that affected the subsequent development of surrounding space. The presence of large parking spaces related with the customs areas in the French A35 and in the German A5 respectively, serve as an example: both are located outside the Basel area, and constitute large “closed spaces” with almost no interaction with its surroundings. This latter is an important fact regarding the relation with Basel from the viewpoint of urban development. In spite of the customs giving service to both sides of the border, Saint Louis suffers the highest disruption regarding the future possibilities of improving urban continuity and activity¹. It must be added that the spatial configuration of local networks in the border has suffered almost no variations in the analysed period. The maintenance of control-oriented structures at the local scale, where only a number of major roads go across the border while the rest are disadvantaged, generates weak and vulnerable networks. Thus, the communication with the neighbouring urban nuclei are limited, and so is the potential for new relations to emerge.

On its part, the Nordtangente project was approved in 1987, more than 50 years after the first ideas for its development came up, and after the rejection of an alternative option (Baumann, 1996). It became operational in 2008. The aim of the project, besides improving connectivity, was to separate through traffic from residential areas by building tunnels² and above-ground sections, and by including two levels in the Dreirosenbrücke (Dreirosen Bridge). Even though the highway would accommodate part of the local traffic as well, from a topological viewpoint unequal linking solutions were created. They involved a theoretical reduction of travel times in major roads while regaining street space for pedestrians, bicycles and public transport, but also the enhancement of the attractiveness of many surrounding areas (with an important economic component)³. Regardless of the specificities of design, which have been controversial⁴, the solution adopted allowed to make functions compatible in a more complex way than the one presupposed for infrastructure projects of this kind. It was not only due to the separation of traffic flows, but also because it enabled to preserve the coherence of the urban fabric by keeping a high degree of connectivity at the local scale and by permitting the emergence and or maintenance of activity in the area.

However, the characteristics of the immediate environment were being transformed, and new rules regarding their development and the probability of variation were introduced. Not only the area under direct transformation was affected, but also those of the urban systems in its surroundings, which became directly connected through this specific channel.

The example illustrates the contradiction between potential and fragility in cross-border cooperation relations within a framework of asymmetrical spatial planning systems and economic, social and political conditions. In the Nordtangente project, a number of factors concerning specific economic interests and availability of resources, among others, enabled optimization at a supra-local scale without the local simplification that the introduction of channels of this kind commonly entails.

Nevertheless, projects of this kind bring on new risks for the urban system, especially within a context of poor land availability. These processes involve new developments and/or renovation of disused areas, but also the transformation of the economic conditions of the area where they are established. They may lead to potential displacement or expulsion of population and local uses and activity in the long term. It must be added that the creation of increasingly complex artificial artefacts as these ones, based to a greater or lesser extent on cooperation or bilateral or trilateral agreements implies not only growing dependence on the natural environment that they degrade, but also reciprocal dependence relations (and not necessarily balanced) among the urban nuclei involved. Since the proposed model depends on non-unilateral actions, so does its survival.

¹ Although this greater connectivity has benefited St. Louis in other ways.

² Grossbasel Tunnel (1432m) and Kleinbasel Tunnel (1092m).

³ In 2003, the Grand Council of Basel approved a development plan that included building and residential developments associated with the Nordtangente project.

⁴ Some design issues have been publicly criticized, especially concerning street widths, considered oversized in a number of cases, and the design of public space.

These phenomena have also occurred in other fields that have been essential in the recent development of the city, such as the life sciences. Projects based on co-ordination, cooperation and/or exploitation of differentials have arisen during the analysed period. In the following section we will deepen into some particular cases and their implications at the local scale.

2.2.2 BASEL AS A LIFE SCIENCES HUB

Basel-Stadt is not only a node regarding communication networks, but also life sciences, mainly due to the major role played by companies in the pharmaceutical and chemical fields since a long time. In the 1980s Basel remained an industrial city that showed signs of crisis, but that progressively began to redirect a significant part of its activity towards management and R&D. The boost given to this field from then on, derived from the confluence and the evolution of leading chemical, pharmaceutical and bio-tech companies, would turn the city and its surroundings into a hub at a supra-regional level.

The repercussions of changes concerning production, management and research activities were not only material, but also -and mainly- economic (Diener et al., 2006), social and organizational. Not only Basel, but also other nuclei in the metropolitan area such as Hünigues, Saint Louis and Weil am Rhein, experienced new trends (housing, projects aimed at taking advantage of the tri-national condition, etc.). It must be added that, mainly during the 1970s and 1980s, a number of SMEs and companies were established in the nuclei surrounding Basel, attracted by the pull effect created by this latter.

However, the effects of proximity regarding the industrial establishments and the labour market have been contradictory. On the one hand, although it has served to attract new businesses to the smaller nuclei of the metropolitan area, asymmetrical dependencies have emerged, as Basel-Stadt is clearly the leading node (companies like Roche, Syngenta or Novartis have contributed decisively to its wealth). On the other hand, a number of small and medium enterprises located in those urban nuclei have experienced difficulties in competing with the conditions offered in Basel¹.

Given this framework, we will deepen into the urban transformations carried out by large corporations like Novartis in response to the needs derived from their context. They have directly affected nuclei on both sides of the border by taking profit of cross-border coordination and differentials while locating their headquarters in Basel.

2.2.2.1 COMPLEXITY AND ASYMMETRY IN THE CASE OF THE NOVARTIS HEADQUARTERS

CAMPUS

The case of the Novartis Campus Headquarters is a valuable example to analyse whether new local conflicts and dependencies arise under these circumstances, and their effects regarding the surrounding urban areas.

In 1999 a competition was proposed to transform an old industrial complex next to the Rhine into a "campus" oriented mainly to R&D and management activities. Two years later Novartis made the official commission. The object of the redesign was to transform the area of St. Johann in Basel (figure 3). The master plan included the development of buildings designed by renowned architects, the modification of Hünigerstrasse between the Hünigues Customs and Kraftstrasse, (incorporating it into the Campus private area) and the relocation of one of the local customs points. With aspects of the adjacent industrial zones located in Hünigues, a new linking road was designed. This latter was not only aimed at improving connectivity between areas on both sides of the border, but also at serving spaces that would later be reconverted. Besides this, a new underpass would link the parking area of Novartis in Hünigues with the Campus area in Basel. As a result, the whole area turned into a continuous closed space located in two different countries.

¹ As highlighted in the 2011 PLU of Saint Louis, the areas located close to the border attracted a great number of enterprises especially during the 1970s and 1980s. Progressively, strong alternatives in the rest of Haut-Rhin and Alsace appeared, and the land prices in communes close to Basel-Stadt started to rise. Besides this, the conditions provided by Basel concerning wages (among others) induced additional difficulties. As a consequence, the amount of settlements of new enterprises in those areas has diminished considerably.

From a complexity viewpoint, the project is based on reducing the uncertainty of the environment in order to increase internal control. Although the design of Novartis Campus and the kind of activity it performs is adequate for integration at the local scale, the willingness of control prevails. The area becomes a “blind spot” that acts as a barrier to its immediate environment. As a consequence, its ability to evolve is restricted and the possibilities of interacting with the rest of the city are limited: the specific “rules” established for a definite area determine the future probability of transformation of its surroundings as well.

Figure 3 – Novartis Campus Headquarters and its surroundings in 2010. Source: Own elaboration.

Moreover, the persistence of borders on the physical and administrative levels has continued to affect design strategies. As stated, the ensemble has internal continuity on both sides of the border from a connectivity viewpoint, but the linkages between the two urban border nuclei are not significantly improved. It solves the needs of the campus area while generating an “external border”.

Despite all of the above, the final design in this case is not a consequence of a lack of resources. It results from a deliberate action aimed at reducing complexity to increase control. The example illustrates how projects and actions based on cooperation or exploitation of cross-border differentials do not necessarily lead to mitigate the “border effect”.

Variations of the conditions and or of the elements on the border urban system lead to unpredictable transformations and asymmetric relations with those on its surroundings, in spatial terms, as analyzed, but also economic or social. Recent changes experienced by urban nuclei like Saint Louis, account for this as well. They are no longer –or, at least, not only- based on small operations associated with its own scale and needs, but linked to the needs and demands in major urban systems of its environment:

A number of projects developed during the last decades have been based on cooperation and/or reciprocal exploitation of resources on the other side. Although these practices might lead to a positive-sum game, the relation is not symmetric: Saint Louis relies part of its development strategy on the possibilities opened by the enhancement of connectivity and the potential of physical proximity to a key node like Basel. This latter takes profit of the resources on the other side as well, but the distribution of power and the ability to anticipate and to develop strategies is different in each case, and the sharing of burdens and benefits can hardly be equitable. Both unilateral and collective solutions should not only be geared to adapt²⁰ to changes in the environment, but to anticipate them.

3 CONCLUSIONS AND DEBATE

The settlement of a border involves differentiation, and also, consequently, relation. Thus, within a framework of accelerated globalization and increasing European integration, border urban systems have become contact arenas where relative permeability has brought new horizons for planning in a scenario of contradiction. Nevertheless, that does not mean lack of conflict and/or risk. These areas are subjected to a

high degree of uncertainty and they must often be able to deal simultaneously with local and cross-border solutions in order to evolve within a changing environment.

In the case of the urban system of Basel, subjected to significant limitations, the possibility of taking advantage of cross-border differentials and cooperation has been essential for it to face new challenges. Nevertheless, although tri-national cooperation has been present since a long time and its importance has increased in recent decades, the relations among the border urban nuclei within its metropolitan area are not symmetrical.

Collective development should not be detrimental to local development. The analysed projects illustrate that, despite the fact of sharing objectives and cooperating, new internal conflicts have arose at the local scale. The solutions adopted have led in some cases to the simplification of the urban space. They lead us to wonder to which extent those concessions made by each of the nuclei following common objectives may jeopardize their future ability to cope with uncertainty. The answer is not easy, since we can only analyse trends. In any case, it is essential to ensure a relative local degree of autonomy. Each of the urban systems must find its own "place" in the cross-border complex.

ABSTRACT: The Danube river connects many countries, different landscapes and a number of regions with various cultural identities. A transnational EU project known as the Danube Urban Brand (DANURB) aims to create a continuous promenade alongside the Danube, one of Europe's main waterways. This aim entails a whole series of challenges for the involved stakeholders and experts. The main essential tasks from the planning point of view pertain to the development of a cross-border strategy, which requires spatial analysis of well-developed regions. The main findings are being further developed within interdisciplinary teams for interregional and international usage. To tackle these complex planning tasks, a process was developed that ensures the sustainability of the resulting strategy and its outcomes, as well as its transferability to other Danube regions. A stable timeframe and a good team of planners are vital prerequisites for successful regional planning. Clarity and attractive presentation help generate the necessary understanding and support, and create an awareness of planning issues among all the stakeholders.

KEYWORDS: complex planning problems, planning process, strategy, transferability, sustainability

1 INTRODUCTION

1.1 MOTIVATION

The population decline in rural regions is a Europe-wide phenomenon that gives rise to major challenges for sustainable usage of rural environments, especially village settlements. In many places, tourism and agriculture are the most important economic drivers that contribute to preserving the cultural landscapes and enable the population decline in rural settlements to be delayed, or ideally stopped. The course of the Danube river, rising in Germany and ending in the Black Sea, represents a collection of various landscapes and cultural identities.

The historical and political environments in the eastern and western parts resulted in the evolution of different kinds of development in the settled regions alongside the river. An EU-funded project known as the Danube Urban Brand (DANURB) aims to try to connect these regions via a holistic strategy which similarly preserves individual cultural identities within the regions. The project focuses on the design of a continuous promenade, which requires cross-border knowledge transfer, communication and cooperation concerning spatial development strategies. Tackling this ambitious goal involves the spatial analysis of well-developed regions. On the one hand, this requires the transfer of theoretical planning methods proven in practice and the definition of essential fundamental information for their practical application. On the other hand, it calls for the design of guidelines for the digital transfer of spatially pinpointed information to

enable structured storage of analysis outcomes, easy data handling for all involved stakeholders and ongoing future research within these fields.

1.2 STATE OF THE ART

To develop a common, sustainable strategy of this kind for the whole Danube region, established and proven methods from the German-speaking countries are used, serving as a structural framework to fulfil the aim of producing holistic, transferable solutions for complex planning problems. Scholl employs the method of "test planning", whose core idea is the regular discussion of possible solutions, their advantages and disadvantages as well as conclusions drawn from them. This happens within the framework of an organized process, in which several planning teams as well as experts and important stakeholders participate (cf. Scholl, 2011).

In order to deal effectively with complex planning tasks, the topmost priority, according to Schönwandt, is to define the problems – "problems first". Only then should a suitable set of methods and solutions be sought. The problem definitions should be as concrete and well-founded as possible. It is important to note that problems are not self-evident and, above all, not objective, but rather concern the perception of individual actors and are therefore socially constructed (cf. Schönwandt and Voigt; 2012).

The definition of the problems should be expressed in terms of time and place, not just in words, but also by illustrative images and representative numbers. This approach facilitates the understanding of the solutionfinding process and the solution per se through conclusive arguments (cf. Scholl, 2012 and Signer, 2012). The use of images and numbers in planning is one of the most important means of communication for the visualization of spatial information. By using digital tools such as geographic information systems (GIS), complex planning problems and possible solutions can not only be viewed in a multi-scalar way, but also can also be stored and transferred in a sustainable manner. In addition, digital tools enable the development of a common documentation standard within cooperative planning processes.

1.3 OVERVIEW

The EU project "DANUrB – Danube Urban Brand" forms the basis for the application of these planning methods. DANUrB, which was launched in January 2017 within the INTERREG Danube Transnational Programme and ends in June 2019, is a project for cooperation in a comprehensive spatio-cultural network to strengthen cultural identity and solidarity in the whole Danube region through tourism and education. Thirty-nine partners from Hungary, Slovakia, Austria, Croatia, Romania, Bulgaria and Serbia (...from seven countries bordering the Danube), representing universities, research institutions, socio-cultural NPOs, tourism enterprises and organizations such as regional and local authorities are involved. The aim is to develop innovative, sustainable cultural and tourism strategies with the intention of generating valuable economic and social impulses for the region (DANUrB, 2017).

The main assignment of TU Wien is to select suitable methods of spatial planning and research and show the practical implementation of the latter. A spatial analysis was carried out in which the methods were tested on site (in Austria's Wachau region); the subsequently defined problems? provide the framework for the development of project ideas and solutions. Particularly important is the possible transferability of this process and the potential solutions to other regions downstream on the Danube. In addition to this process, the results and findings are structured, processed and stored in digital form using a GIS database in order to ensure the transfer of knowledge and the reuse of the findings in other regions.

1.4 CASE STUDY REGION

The case study region is the Wachau, a landscape in Lower Austria (Figure 1) which forms the valley of the Danube between the towns of Melk and Krems an der Donau (Figure 2) and lies about 80 kilometres west of Vienna. Together with the abbeys of Melk and Göttweig and the historic town of Krems and Stein (Figure 3), the cultural landscape of Wachau was inscribed on the UNESCO World Cultural and Natural Heritage list in 2000.

Figure 1: Location of Wachau in Austria. Source: own illustration, modified from: oesterreich.com

Figure 2: Wachau region with largest municipalities. Source: own illustrations, modified from: data.gv.at

The region is known worldwide for its unique medieval cultural landscape, its wine-growing culture and specific building culture. Figures 3, 4 and 5 below show impressions of the topographical situation of the region, with its vineyard hills and historic ruins. The main challenges are the preservation of the valuable capital of the region, as well as its compatible and sustainable development under the aspect of the UNESCO World Heritage.

2 METHODOLOGY

In order to address the complex tasks of the DANUrB project, the following structure of a planning process, illustrated in Figure 6, was considered:

Figure 6: Structure of the planning process; source: own illustration

The process starts with the exploration of the research area. The Wachau region in Lower Austria served as the research region (see Chapter 3). This exploration is followed by the research and analysis of certain previously defined topics for the selected region. The results of these analyses are incorporated into a Strength - Weakness - Opportunity – Threads (SWOT) analysis, which forms the basis for the problem finding and definition. After defining the problem areas, tailor-made solutions are developed by several teams working in parallel. The best and most relevant solutions are combined to form a common strategy for the development of the region. The exact sequence and an explanation of the individual steps can be found in the following.

2.1 SPATIAL EXPLORATION

In order to analyze the research area and its conditions and challenges / problems, it is important to get to know the space, to explore it with all of our senses. This was done during a multi-day on-site research camp. Project partners as well as students from all partner countries participated in this research camp. The basis for the spatial exploration were lectures on the research area, the Wachau region itself, as well as the theoretical presentation of methods for spatial research and planning. The spatial exploration itself took place on two mornings; in the afternoon parallel workshop sessions were held for students and project partners, which served to record the impressions obtained.

The region was explored by train and bus along the riverbanks, with stops and tours in historically significant places and tourism hotspots. As well as getting to know the physical space, exploring the social and economic circumstances was also important. The local lifestyle, agriculture, culinary culture, contact with the local population and finding out about the typical regional traditions also played a key role. The perceptions and impressions were captured in photos and sketches.

2.2 RESEARCH AND ANALYSIS

The analyses were carried out in international and interdisciplinary teams, consisting of students of spatial planning, architecture and landscape planning, focusing on five thematic areas - natural conditions and landscape, transport and technical infrastructure, settlements and villages, population and social infrastructure, and economy. The mixed team composition allowed the input of experiences and knowledge from the individual disciplines, but also from the different nations and cultures. The thematic areas were defined in advance and covered all the fields relevant to the planning of the area.

The first phase of the analysis, the collection and processing of the findings obtained through the exploration of the space, took place during the research camp. First, strengths and weaknesses of the region with regard to the topic of analysis were filtered out. The week's results were presented at the end of the research camp. An in-depth analysis took place in the further course of the semester.

2.3 SWOT ANALYSIS

In the following step, considerations regarding strengths, weaknesses, opportunities and threats were first recorded within the group, after which they were discussed and weighed up in the plenum and rejected or supplemented as appropriate. The SWOT were documented in tabular form. This first SWOT analysis formed the basis for the problem definitions.

2.4 PROBLEM DEFINITION

The problem definition process was essentially divided into four working steps. The basis for this, as already mentioned, was the SWOT analysis, supplemented by a group-internal listing of relevant problem areas according to the individual analysis topics. The first step after this preparation was the collection of all problem areas, including a joint discussion, as well as another brainstorming session (Figure 7) to record any additions.

These problems were documented by word, picture and number, in order to ensure later traceability. From this brainstorming session, an attempt was made to compile a problem cluster in order to identify and understand the interconnections and effects of the individual problem areas (Figure 8). Subsequent to this step, the cluster diagram was reworked once more by adding a weighting to the individual effects. This took into account how strongly a problem field affects other problems and vice versa, which problems are affected by this, and to what extent (Figure 9). From this diagram of a problem cluster and the accompanying plenum discussions, some main problem areas emerged (Figure 10), which were noted for definite inclusion in the possible solutions. In addition to this method of filtering out problems, an attempt was also made to locate the problem and its chronological place by means of graphical illustrations, in this case, by map illustrations. The challenge was to illustrate the problems in a meaningful way. Since this was not possible in all problem areas, a literal description was added.

2.5 POSSIBLE APPROACHES TO SOLUTIONS

At this stage it should be mentioned that the former five analysis teams reformed into three project teams in order to perform the following tasks in the manner of a test planning procedure.

The task of the teams was to develop ideas and projects for the region based on the jointly defined problems. These ideas and projects should also be transferable and act as an inspiration to other Danube regions in terms of their basic ideas and planning approaches. According to the "problems first!" approach, relevant problem areas were selected and debated, in order to develop a vision formulating objectives for the development of the Wachau region. The projects were to focus on a specific location and give details of stakeholders involved, a cost estimate and an explanation of the anticipated effect, documented with reference examples.

The solution-finding step was embedded in an open, constructive process in which the teams alternated between working individually and in the plenum. At these plenary meetings, the ideas and the status of the work in progress were presented to all and discussed together, debating the pros and cons of the project ideas, and whether there were similar ideas taking different approaches.

2.6 COMMON STRATEGY

In order to arrive at a joint strategy for the Wachau region in the last step, the best ideas from all the project teams were brought together and interlinked.

After the Wachau, the suggested process was also applied in two other Danube regions in Serbia and Hungary.

To exchange the results, a workshop was organized in which the students presented their work reciprocally and then looked for similarities or differences between the respective regions in order to create knowledge bases and possible process adaptations for the future work in further Danube regions.

2.7 ADDITIONAL COMMON PRINCIPLES AND TASKS

In addition to this strategic planning process, there are a number of other important principles and tasks within the framework of DANURB which were essential for the transferability and further use of knowledge and implementation of the process. These are briefly explained below.

Knowledge, expertise: The most important basis for research into the spatial, social, cultural, historical and legal circumstances and characteristics of a region is proper training in spatial planning. The students are familiar with the methods and tools of planning and know how to deal with them. This know-how is essential to the success of the project.

Organization of an on-site research camp: In order to find suitable methods that can be used in research and planning in all Danube regions, the on-site research camp turned out to an ideal way of preparing project partners - researchers, stakeholders, representatives from different cities and countries, as well as students – for the complex planning tasks ahead. Particularly important was the excursion to the region, so that the participants could get a feeling for the region and its challenges. Furthermore, the workshop format was the only way to get partners from all countries around a single table. This made communication and cooperation much easier.

Data collection and data processing: In order for all the analysis and project results to be documented by word, image and number, comprehensive data collection and verification of these data were required. Furthermore, as already mentioned in chapter 1.3, a GIS database structure was developed. This database serves to store the basic data, analysis and project data as well as to transfer it to project partners in other countries.

The latter will then fill the database with results from other Danube regions throughout the entire duration of the project. An information and knowledge platform can thus be provided for all partners involved.

Determination of common scales: In order to ensure a certain comparability between the results and data from the respective project regions, the partners at the on-site research camp agreed on common standards that will be applied in the further course of the project. The focus is on a multi-scale view of the problems and results.

Creation of a glossary: The joint elaboration of a glossary containing definitions on the key issues surrounding the DANUrB project was essential in order to ensure a common understanding of the terms, to communicate one's own understanding to partners from other countries and, where necessary, to compare one another's interpretations of these key concepts.

3 RESULTS AND CONCLUSION

It proved useful to structure complex planning tasks into a defined process that is fully applicable and transferable to other regions. This was supplemented by jointly defined methods and benchmarks which allow a certain degree of comparability among the results for the specific regions. A GIS database was compiled to store all the above results and information and make them available for further use.

This strategy meant that in the very first months of the DANUrB project it was already possible to show the diversity along THE European river – the Danube – to resolve common problems, exchange ideas, and communicate and cooperate between regions and across national borders.

Work in planning practice must be underpinned by a solid foundation of planning theory and methodology. On the one hand, tried-and-tested approaches and concepts can be applied; on the other hand, however, difficult planning phases repeatedly occur in which special attention and a cautious, sometimes time-consuming approach are required. Innovative concepts and approaches are called for at all times. A strategic approach requires those involved to keep an eye on the essentials while simultaneously dealing with important, urgent matters. This calls for overviews of spatial and time resources, the organisation of the planning process and the key players in regional development, coupled with precise insights into specific regional and local circumstances.

A stable timeframe and a good team of planners are vital prerequisites for successful regional planning. The planning problems, be they routine tasks or unresolved complex problems of great societal and spatial significance, should be kept in mind at all times ("Problems first!"). Clarity and attractive presentation help generate the necessary understanding and support, and create an awareness of planning issues among all the stakeholders. The DANUrB research project has offered plentiful evidence of this, and will continue to do so.

The particular challenges of the project lie in the need for cooperation among teams from a number of regional contexts and planning cultures that differ to varying extents in terms of language, culture in the broadest sense, and mindset. Knowledge and understanding of these differences, combined with the will to build up trust and place the emphasis on shared characteristics, are important prerequisites for successful projects and developments at European level.

4 ACKNOWLEDGMENT

The DANUrB – Danube Urban Brand project is co-funded by the European Union (ERDF, ENI, IPA II) (see Logo Figure 11).

ID1450 | THE BOSNIAN SPATIAL PLANNING SYSTEM - ATTEMPT AT AN EXPLANATION

Edib Uruci¹

¹TU Wien

edib.uruci@tuwien.ac.at

ABSTRACT: To understand the Bosnian spatial planning system it is necessary to get an overview of the structure and hierarchical levels in Bosnia and Hercegovina (BiH). The process, of setting up a new state formation and order is directly linked with the war and its all impact (1992-1995), which has started after Bosnians independence from the former Yugoslavia (Socialist Federal Republic of Yugoslavia – SFRY) in March 1992. The war consequences have still an enormous influence on daily life in Bosnia and Hercegovina and on the spatial planning system as well. This paper tries to explain the complexity of the Bosnian spatial planning system, to show its gaps and to explain the cause for its transnational planning character.

KEYWORDS: Bosnia and Hercegovina, Federation of Bosnia and Hercegovina, Republic of Srpska, Canton, Spatial planning, Planning gaps, transnational planning

1 INTRODUCTION IN BOSNIANS ADMINISTRATIVE-TERRITORY STRUCTURE

After the war in Bosnia (1992-1995), which ended in November 1995 by the Dayton Freedom Agreement (DFA), Bosnia and Hercegovina become a new state structure. Since then, the country is structured in two entities, Federation of Bosnia and Hercegovina (FBiH), Republic of Srpska (RS) and one district -Brčko District. Brčko District, in northeastern part of BiH, is a self-governing administrative unit, as well as condominium¹ under the dual sovereignty of the two entities. The Figure 1 shows an overview of the administrative structure in BiH. Before the war, there was 109 administrative-territorial units respectively municipalities on Bosnians approx. 51.000 km² territory area. Through the DFA, the number of this units increases up to 142 (Ministarstvo za ljudska prava i izbjeglice, 2006). FBiH contains 79 administrative-territorial units, which are allocated in the ten cantons, 62 of 142 are situated in RS and one administrative-territorial unit is Brčko District (Ministarstvo za ljudska prava i izbjeglice, 2006).

¹ Merriam-Webster dictionary defines a condominium as a politically dependent territory under condominium (<https://www.merriam-webster.com/dictionary/condominium>)

The Federation of BiH, which covers 51% of the territory of Bosnia and Hercegovina is divided in ten cantons by the constitution. The law of federal units clearly defines cantons, defined in terms of their administrative characteristics and authorities. On the other side, there is no law, nor regulation about the minimum territory size or a number of inhabitants as a requirement needed for becoming the status of a canton. Comparing available data from the Agency for Statistics BiH (Table 1), it can be concluded, that the minimum territory size of a canton has to be bigger than 324km² (see canton No. 2 in Table 1), with at least three municipalities (see canton N No. 2 and 5 in Table 1) and more than 30.000 inhabitants (see canton No. 2 and 5 in Table 1). The capital of FBiH is the same as capital of Bosnia and Hercegovina, the city of Sarajevo. In Federation part of Bosnia and Hercegovina there are three administrative levels. The highest is the entity or federal level with the federal government, parliament, presidency and the house of people. The next or middle level is the cantonal level. As mentioned before, there are ten cantons with the cantonal government and cantonal council. The lowest level in FBiH is the local level with municipalities and/or cities councils and mayors.

The other entity, RS, which covers 49% of Bosnians territory area, has a less administrative structure than the FBiH. This part of BiH has two administrative levels - the entity and local level. It can be said, that the entity of Republic of Srpska has a central organisation in its capital Banja Luka. By the law on spatial planning until 2015 of the Republic of Srpska, there have been defined six regions without a legislation. The first stage plan for RS has foreseen four nodal-functional regions. Later, through the elaboration of the spatial planning law of the Republic of Srpska until 2015, the territory was divided, as mentioned before, into six regions. It was a trial to create a regional structure, using a centre concept (Figure 2). The territorial structure with its six regions had the greatest impact on localisation of certain institutions and organisations such as health care facilities or waste management. The new spatial planning law for RS, valid from 2015 until 2025, foresees five nodal-functional regions (Figure 3). It is evident that there is no continuity in the regionalisation of the territory of Republic of Srpska.

Figure 2 | Structure of Republic of Srpska in six regions until 2015

No.	Canton	Area in km ²	Municipalities in Canton	Inhabitants
1	Unsko-sanski kanton	4.125,00	8	287.030
2	Posavski kanton	324,60	3	38.375
3	Tuzlanski kanton	2.649,00	13	498.766
4	Zeničko-dobojski kanton	3.344,10	12	396.732
5	Bosansko-podrinjski kanton	504,60	3	32.341
6	Srednjobosanski kanton	3.189,00	12	251.714
7	Hercegovačko-neretvanski kanton	4.401,00	9	223.471
8	Zapadno-hercegovački kanton	1.362,20	4	81.309
9	Kanton Sarajevo	1.276,90	9	446.853
10	Kanton 10	4.934,10	6	77.757
TOTAL		26.110,50	79	2.334.348

Figure 3 | Structure of Republic of Srpska in five regions until 20025

The other entity, RS, which covers 49% of Bosnian territory area, has a less administrative structure than the FBiH. This part of BiH has two administrative levels – the entity and local level. It can be said, that the entity of Republic of Srpska has a central organization in its capital Banja Luka. By the law of spatial planning until 2015 of the Republic of Srpska, there have been defined six regions without a legislation. The first stage plan for RS has foreseen four nodal-functional regions. Later, through the elaboration of the Republic of Srpska until 2015, the territory was divided, as mention before, into six regions. It was a trail to create a regional structure, using a centre concept (Figure 2). The territorial structure with its six regions had the greatest impact on localization of certain institutions and organisations such as health care facilities or waste management. The new spatial planning law for RS, valid from 2015 until 2025, foresees five nodal-functional regions (Figure 3). It is evident that there is no continuity in the regionalization of the territory of Republic of Srpska.

Figure 2: Structure of Republic os Srpska in six regions until 2015

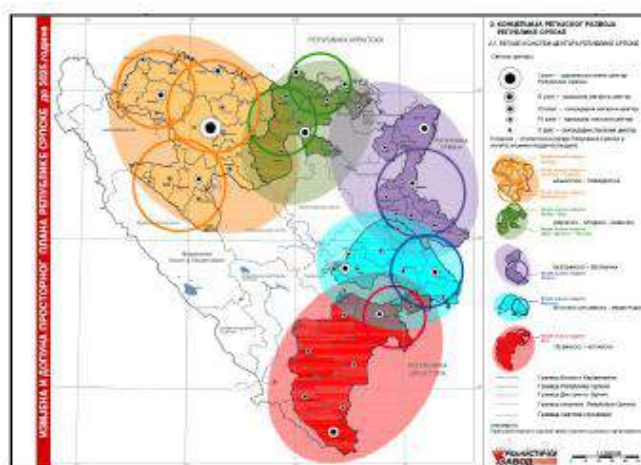

Figure 3: Structure of Republic os Srpska in five regions until 2025

The Statute of Brčko District co ome into force in May 2008, defines the special and unique case of the administrative-territorial unit of Brčko District (Statut Brčko). Brčko District with its self-governing characteristics is a territorial-admi inistrative unit on the local level. This special case of territory of the Brčko District includes the whole territoory of the municipality Brčko as it was on the 1sst of January in 1991, i.e. before the war. One of the resultts through the position and statute of Brčko Distrrict is that no one of the entities has a coherent territory bo ody.

2 SPATIAL PLANNING SYSTEM IN BOSNIA AND HERCEGOVINA AMONG PLANNING DOCUMENTS

Before 1992 the spatial planning system in Bosnia was centrally organised with a strict structure like in all other republics of former Yugoslavia (Figure 4).

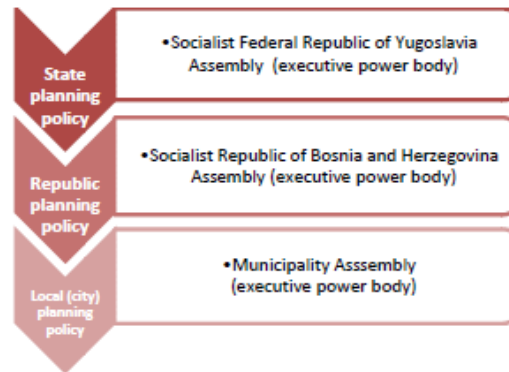

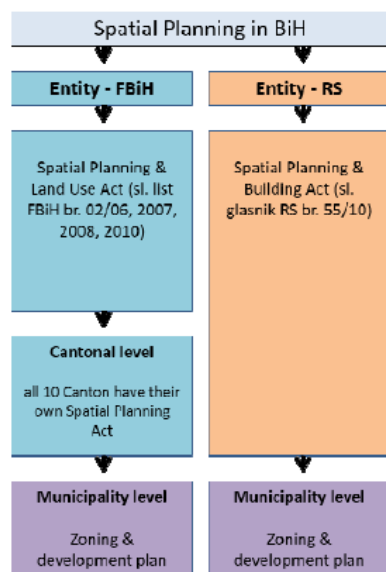

Figure 4 | Spatial planning system in SFRY (E. Uruči by N. Taborić, 2017)

Following the new state order, the Bosnian spatial planning system was changed and got its competencies in the new system. The whole complex administrative and political structure of BiH becomes obvious among the spatial planning system (Figure 5). The highest administrative level, with spatial planning competencies, is the entity level. In Federation of Bosnia and Herzegovina spatial planning is regulated by the Law for spatial planning and land use, Law on Housing Relations and Law on the national monuments are the highest legal acts of regulations and rules. The highest legal act for spatial planning in the Republic of Srpska is the Law for urban planning and construction. The lower level is the cantonal level, but only in FBiH. Every Canton is obliged to develop and draw its own cantonal spatial plan according to the regulations which are defined in the federal spatial plan (Table 2). The lowest level with spatial planning competencies is the municipality level. The Law for spatial planning and construction is regulating the spatial planning issues in Brčko District. This is, as mentioned before, situated on the municipality level.

The result of an administrative construction like this is the proliferation of complexity in every single field of activity including the spatial planning. Just counting all Bosnian spatial planning acts, we get an incredible number of twelve (!), ten cantonal and two entity, spatial planning acts, which should solve all problems and challenges of spatial planning and development of the whole Bosnian territory. Additional on this, there are spatial plans, including zoning plans and development plans for each city and municipality.

Figure 5 | Levels with spatial planning competencies in Bosnia and Herzegovina without Brčko District (E. Uruči, 2013 by GAP 2013)

No.	Canton	Law

Table 2 | Overview of cantonal laws on spatial planning (Korjenic, 2015)

3 PLANNING DOCUMENTS IN BOSNIA AND HERCEGOVINA

The spatial plan of FBiH contains development strategies and directions for planning management and land use of this entity. There are defined protected areas and development corridors which should take into account in spatial and land use plans on the lower levels (cantonal and municipal level). This federal law regulates: planning and land use, drawing and adoption of planning documents, art and contains of planning documents, its enforcement and supervision on enforcing of adopted planning documents (Figure 6). Since its first implementation in 2006, this law has been an amendment in 2007, 2008 and three times in 2010 (Sl. novine FBiH br. 72/07, 32/08, 4/10, 13/10 and 35/10). This is just one of indicators that shows the process of setting-up of a state system is still not finished. Beside of this law, the federal government has adopted few statutes which should manage all activities of spatial planning and land use on the territory of FBiH (Korjenic, 2015). According to this fact, the following documents may be mentioned as important documents:

- The Regulation on a Uniform Methodology for Drafting Physical Planning Documents,
- Regulation on special conditions to be fulfilled by companies and other legal persons so that they can register for performing professional tasks of drafting of planning documents,
- The Regulation on the Content and the Carriers of a Unique Information System, the methodology for collecting and processing data, and the forms of keeping the records,
- The Regulation on Amendments to the Regulation on Contact and the Carriers of a Unique Information System, the methodology for collecting and processing data, and the forms of keeping the records.

The intermediate, cantonal level in FBiH has the obligations to create they own spatial planning plans, in consideration on the federal spatial plan. As shown in Table 2 for every canton exists a spatial planning law, but the draw and implementation of a cantonal spatial plan are still not finished in every canton. The cantonal spatial plan contents definitions and projections for future land use and development axes taking into account the federal spatial planning law and other cantonal law, which are decided through the cantonal council. The cantonal law is created for the specific needs and opportunities for each canton referring to the federal law.

In process of drawing and preparing spatial planning and development documents, municipalities in Federation have the obligation to comply their documents and harmonise with the documents on the

higher level. This is a long-term plan made by the municipality and adopted through the municipalities council. Along the implementation of cantonal spatial planning laws, municipalities are obliged to create a municipal spatial plan or spatial plan of local self-government. Exceptions of this regulations are municipalities, which are part of a City for which no municipality spatial plan is foreseen. These local units are treated through development strategies, which rely on spatial plans of the City (Korjenčić, 2015).

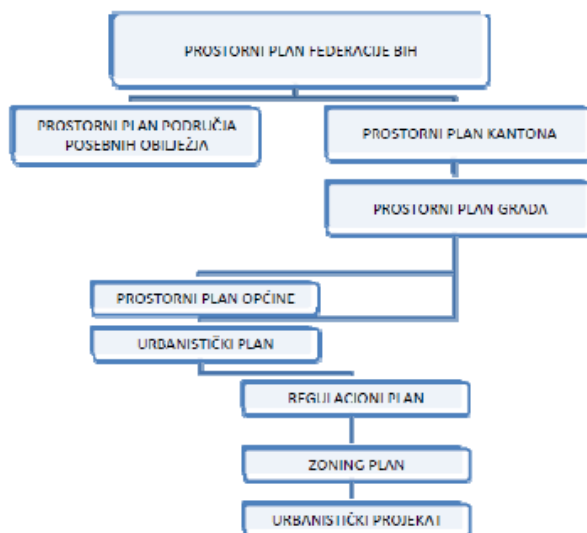

Figure 6 | Planning hierarchy, plans and documents in FBiH (Korjenčić, 2015)

In the Republic of Srpska, the Law on urban planning and construction regulates the: planning and regulation of space, type, and content of spatial planning documents, the method of preparation and the procedure for adopting spatial planning documents and the basics of organisation. The documents of spatial planning define the organisation, purpose, and manner of using and managing the space, as well as criteria and guidelines for regulations and protection of space in this Bosnian entity. In addition to the mentioned law, there are adopted two basic regulatory acts for managing the spatial planning process in RS (Korjenčić, 2015). These regulatory acts are:

- Regulatory act on Content and Control of Technical Documentation (sl. glasnik RS br. 8/2011) which regulates the parts and content of technical documentation, validation and control of technical documentation and types of projects,
- Regulatory act on Content of creating spatial planning documents (sl. glasnik RS br. 59/11) which prescribe the procedure for drafting and issuing spatial planning documents, the content of spatial planning document and the creation of the spatial planning document.

Spatial planning documents in RS can be strategic (Figure 7) or implementation (Figure 8) document.

The spatial plan of the Republic of Srpska, as the highest order plan, is adopted and passed by the National Assembly of this Bosnian entity. The Assembly is also in charge for spatial plans of special purpose areas, e.g. national parks. Spatial planning at the local level is based on every local administrative unit. The municipality makes decisions on spatial planning which reflect all territorial specificity of the municipality. The local spatial planning decisions have to be aligned with the Law of urban planning and construction of the RS, as well as with the two regulatory acts, mentioned above (Korjenčić, 2015).

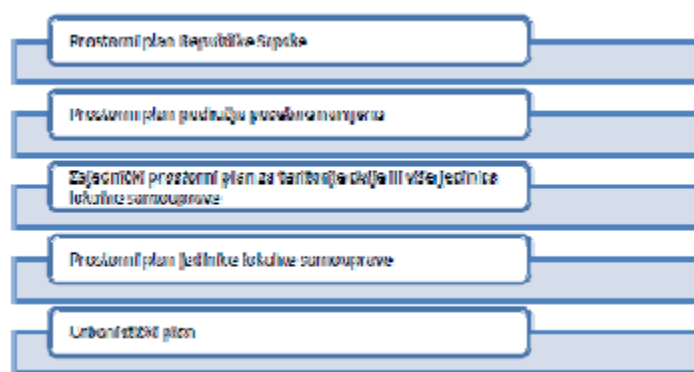

Figure 7| Strategic spatial planning documents in RS Figure 8 | Implementation spatial planning documents in RS

4 GAPS IN SPATIAL PLANNING IN BOSNIA AND HERCEGOVINA

The concrete problem in the field of spatial planning is the uncoordinated spatial planning and development between territory units on the same level, like the cases on the cantonal level in FBiH is and the uncoordinated spatial planning and development on the vertical line of administrative structure (top-down) in each entity. Any attempt to implement a balanced development between the two entities or between entity-canton-municipality was not successful due to a strong political influence. In Bosnia and Hercegovina are every two years elections. One for the municipality and City level and two years later for the state and entity level, including the cantonal level. This fact affected directly the dynamic and continuously work in every single administrative sector.

The need for a comprehensive and coordinative spatial planning and development between the both entities and their administrative levels is best presentable on the example of the City or Canton of Sarajevo. The city of Sarajevo is divided in East Sarajevo (RS) with six municipalities and Canton Sarajevo (FBiH) with nine municipalities. Before the war, the city of Sarajevo included six city municipalities and four outskirt municipalities, with more or less the same area that the two cities have today. It was a differentiation of urban and suburban areas. In fact, the whole area is one coherent city-region area with small, middle and one big focal centre (Figure 9) (Nurković, 2016).

Figure 9 | Urban and suburban structure in Sarajevo region (Nurković, 2016)

Through the new order, the spatial planning competence for the city-region area of the capital of Bosnia and Hercegovina is spread over all administrative levels with no really a chance to ensure a balance and harmonised spatial planning. Spatial planning competencies, as mentioned before, are represented on all administrative level, except the state level. This is also the reason for not adopting or creating a spatial planning development strategy on the state level. Even other development strategies like economic, social, agricultural etc. do not exist on the state level of Bosnia and Hercegovina. Any attempt of creating a common development strategy for the whole country in any sphere becomes a transnational character. That means, that any decision has to be approved by the entity parliament and the city council of Brčko District. Decision made by the Federation of BiH has to be approved by every cantonal council. One attempt to overcome of this entity-political interests and administrative borders was the implementation of economic regions of BiH (Figure 10). This implementation is the result of the European project EURED (Regional Economic Development Programme in BiH). The goal was to ensure a balanced development of each region and to reduce disparities between urban and rural areas. The work of the regions was from its beginning full of administrative obstacles and political obstruction. Two of five regions are not active anymore.

Figure 10 | Economic regions in Bosnia and Hercegovina
(<http://serda.ba/bs/2012-06-17-15-57-28/2012-06-17-15-58-54.html>)

On the other hand, there is an intersectoral fight between authorities on the cantonal level. Every Ministry e.g. spatial planning, traffic, economic etc. creates its plans and laws which are not referring and harmonised to each other. The next fact which affected the imbalanced spatial planning and development are the municipalities. The local authorities are only interested into developing their area as much as possible, into so-called, rentable projects of housing, office areas and shopping centres with no serious preparation or feasibility study for the certain project. Local authorities are often influenced by potential investors in cooperation with their political and private interests.

5 CONCLUSIONS AND RECOMMENDATIONS

The transition and reform processes which is Bosnia and Hercegovina following on its road to the EU membership should be harmonised to the reform agenda and to the contemporary trends in EU member states in all spheres, including the sphere of spatial planning (Korjenčić, 2015). In the process of becoming the status of candidate state for EU membership, it is necessary to harmonise the national administrative system, in order to become more effective. For future development of the whole country, the acquisition of EU funding and EU partnership will play an important role. In this context, it is necessary to install an administration-management body with experts board on the state level which is not bound to the current administrative structures and hierarchies. This body should be a state Institute for Planning and Development. The task of the Institute would be to track current European and global trends in the sphere of spatial planning, to connect and organise working groups with the Bosnian authorities for spatial

planning, to create with them a common vision and action plans for certain spatial planning issues and areas of Bosnia and Hercegovina, to ensure a qualitative education in spatial planning, to create the profile, duties and action areas of spatial planner, and to connect Bosnia and Hercegovina with other countries and partners on the international level in the sphere of spatial planning.

ID 1471 | UNDERSTANDING DIFFERENCES IN THE GOVERNANCE OF MACRO-REGIONAL COOPERATION

Theodoros Soukos¹

¹Institute for Management Research, Radboud University
t.soukos@fm.ru.nl

1 INTRODUCTION

Since 2009, the gradual establishment of four so-called EU macro-regions has signalled a more comprehensive macro-regional strategy at the EU level. Up until now, such macro-regions have been established in four European areas: the Baltic Sea (2009), the Danube river (2010), the Adriatic and Ionian Seas (2014) and the Alpine mountains (2015). Since they have only been in place for about 2 to 7 years, macro-regions can still be considered a very recent phenomenon. Hence a systematic empirical overview of them is still in a primary stage (e.g. EC, 2016a).

When EU macro-regions were first launched, they were defined as areas ‘covering a number of administrative regions but with sufficient issues in common to justify a single strategic approach’ (EC, 2009: 5). From this definition, two elements are apparent. Firstly, EU macro-regions are composed of a number of smaller (regions or municipalities) or larger (nation-states) territorial entities each of them addressing their respective desires. Secondly, EU macro-regions correspond to areas with common issues, which may be geographical or sectoral in nature. These issues need a strategic approach in order to be addressed. Such an approach demands ‘integrated frameworks [which help] to identify needs and allocate available resources’, the so-called EU macro-regional strategies (Samecki, 2009: 1). Based on these two elements, it is fair to conclude that EU macro-regions encompass both a territorial and a functional dimension. Therefore, I argue that macro-regions are hybrid forms of organization balancing between these two dimensions.

Furthermore, existing macro-regions face various issues; they have different histories, political backgrounds, normative viewpoints and cultural preferences. In addition, they are brought into practice by a huge variety of actors and institutions. As a result, the way in which various macro-regions accommodate both dimensions is hypothesized to vary greatly. Hence, the underlying objective of this paper is to understand the hybrid nature of EU macro-regions and how they balance between the territorial and functional interdependences.

In order to address this question, I aim, first, to give an overview of the current state of the four existing macro-regions and, second, illustrate their hybrid nature by focusing on three aspects: 1) the pre-existing forms of cooperation and geo-political backgrounds these macro-regions build upon, 2) the substantive issues these macro-regions are dealing with, and 3) the governance structures they have set up. Both steps are the outcome of a thorough investigation of relevant EU and ‘macro-regional’ documents as well as interviews with a selective number of EU, cross-regional and national officials¹.

2 THEORETICAL AND ANALYTICAL POSITIONING

2.1 MACRO-REGIONS AS TERRITORIAL AND FUNCTIONAL SPACES

In the existing literature, the understanding of EU macro-regions has been developed by a number of considerations. From an EU perspective, macro-regional strategies are considered a form of bottom-up and place-based policy (Samecki, 2009; Barca, 2009), which has to be designed and implemented predominantly by its constituents. Another consideration comes from Stocchiero (2010) who welcomed the initiation of macro-regions by arguing that they constitute an ‘interesting political experiment’ comprising actors from various territorial levels (Stocchiero, 2010: 3). Furthermore, Schymik (2011) recognized the territorial and functional aspects of macro-regions by seeing them as a ‘model experiment of macro-regional strategy’ (Schymik, 2011: 5). Similarly, Dühr (2011) suggested that ‘the argument for territorial and

¹ A list of interviewees is available on demand.

functional interrelations is at the heart of the EU macro-regional strategies' by arguing that macro-regions provide an additional governance layer for transnational cooperation (Dühr, 2011: 38). Lastly, Stead (2014) links macro-regions with the concept of soft spaces 'in terms of resource efficiency and policy coordination and integration' (Stead, 2014: 687). Although these considerations do refer to some functional and territorial aspects of macro-regions, they mainly point out their experimental substance. Interestingly, they do not address the issue of how these macro-regions balance between those aspects and how the state of macro-regions is affected by those aspects.

The following contributions, however, do connect to the distinction between territorial and functional organization within EU macro-regions. For example, Kern and Gänzle (2013) suggest that EU macro-regions may be affected by 'a shift from territorial to functional regions' (Kern and Gänzle, 2013: 10). In their terms, such a shift is described by the process of macro-regionalization and it affects the 'spatial dimension, boundaries, institutional set-up and governance' of macro-regions (ibid). As a result, macro-regions differ from territorial regions in their demarcation (based on functional interdependencies), shifting boundaries (transcending existing territorial boundaries), policy-specific institutional arrangements and new forms of functional governance.

Furthermore, Blatter (2004) elaborates the distinction between territorial and functional governance. To develop this distinction, he analyses categories such as 'the structural pattern of interaction, sectoral differentiation, functional scope, geographic scale, and institutional stability' (Blatter, 2004: 533). Based on them, he concludes that, in the ideal type of territorial governance, a central authority is charged with top-down interactions across the organizational structure (usually the nation-state); actors from the public sector dominate the participation in general-purpose institutions, which have clear boundaries across time and space. In contrast, the ideal type of functional governance encompasses networks interacting horizontally, incorporating both public and non-public actors, working in task-specific issues beyond concrete territorial, time and space boundaries.

2.2 AN ANALYTICAL FRAMEWORK TO STUDY EU MACRO-REGIONS

For the purposes of this study, I recognize the experimental character which macro-regions have thus far, however I regard their hybrid nature balancing between the territorial and functional dimension. To illustrate this hybrid nature of EU macro-regions, I suggest an assembled analytical framework. This framework is inspired by the contributions made by Kern and Gänzle (2013) and Blatter (2004), and it addresses two elements. The first element highlights the role of pre-existing institutions in mobilizing macro-regional processes, developing them and making them work. In fact, EU macro-regions build on pre-existing institutional arrangements, but the macro-regional processes themselves may, in turn, be affected by the pre-existing institutional arrangements. It is exactly because of this reason that 'macro-regional strategies need to be embedded in the already existing institutions operating at the macro-regional level' (Kern and Gänzle, 2013: 12). Yet, the second element shows the analytical pertinence of substantive scope and governance of EU macro-regions. This is because EU macro-regions result in a sort of new policies and governance structures. Drawing upon Blatter (2004) and Kern and Gänzle (2013), the substantial scope of EU macro-regions may refer to functional goals, tasks, boundaries or issues which territorial or functional regions have to deal with, while governance of EU macro-regions can be seen in the new forms of governance structures established in territorial or functional regions.

Hence, in order to understand how macro-regions are hybrid models balancing between their territorial or functional interdependencies, I focus on three aspects, namely 1) pre-existing institutions, 2) substantive content of macro-regional strategies, and 3) governance structures. To operationalize the three aspects, the first aspect analyzes the institutional and historical background which surrounds existing EU macro-regions. This includes an overview of pre-existing forms of cooperation preceded by a short overview of historical milestones determining the status of cooperation which have been in place before the launch of EU macro-regions. The second aspect concerns the substantial issues such as the scope, objectives, drivers and challenges attached to existing EU macro-regional strategies. The third aspect covers the organizational issues such as what governance mechanisms have been created and what issues they struggle with.

3 AN OVERVIEW OF THE CURRENT STATE OF EU MACRO-REGIONS¹

BALTIC SEA REGION

The EU Strategy for the Baltic Sea Region (EUSBSR) can be traced back to 2006, when a report of the European Parliament called for a strategy for the Baltic region as a means to reinforce the regional cooperation of countries in the Baltics (EP, 2006). Following that, the European Commission (EC) released the Communication and the Action Plan for the EUSBSR in June 2009 and the European Council officially endorsed the Strategy in October 2009. The EUSBSR was the first EU macro-regional strategy and although it started as a purely European strategy including 8 EU member states, it was soon widened to involve 4 non-EU countries. It addresses 3 main objectives, namely 'save the sea', 'increase prosperity' and 'connect the region' which are further specified in 13 Policy Areas and 4 Horizontal Actions. At the end of the day, all these strategy features aim to develop implementation projects (flagship projects).

In order to make the EUSBSR work, various key actors are currently involved. Firstly, the European Commission holds a strategic role in facilitating the EUSBSR. Secondly, national coordinators are responsible for coordinating the EUSBSR at the national ministries level, while the coordinators of policy areas and coordinators of horizontal actions are in charge of the coordination of specific thematic actions (under Policy Areas and Horizontal Actions of EUSBSR). Furthermore, flagship leaders make EUSBSR projects run, while managing authorities of various funding programmes aim at ensuring complementarities between EUSBSR projects and other existing programmes. These actors get involved in or support the workings of EUSBSR governance mechanisms. In brief, the three components of the EUSBSR governance are: 1) the National Coordinators Group, 2) the Policy Area Steering Committee/Coordination Group, and 3) the Horizontal Action Steering Group.

DANUBE REGION

The EU Strategy for the Danube Region (EUSDR) was initiated, primarily by the efforts of Austria and Romania, as a new project of regional cooperation (Romanian Ministry of Foreign Affairs, 2010). The EUSDR was adopted by the EC in December 2010 and endorsed by the European Council in April 2011. The Strategy involves 9 EU and 5 non-EU countries and it addresses 4 main objectives, namely 'connecting the region', 'protecting the environment', 'strengthening the region', and 'building prosperity'.

Regarding the main actors involved in EUSDR, the European Commission offers strategic coordination and administrative support. In turn, National Coordinators (NCs) and Policy Area Coordinators (PACs) are in charge of coordination at the national and inter-ministerial level. In order to facilitate the coordination and communication between project experts and policy makers, the Danube Strategy Point (DSP) was established in 2015. Building on the involvement and expertise of actors, the EUSDR governance is organized around three components, namely 1) the Meetings of National Coordinators, and 2) the Priority Area Steering Groups, while 3) the Danube Strategy Point has got a more intermediate role between the other two components as well as the EC services.

ADRIATIC-IONIAN REGION

In 2014, the EU Strategy for the Adriatic-Ionian Region (EUSAIR) was launched as a tool for building prosperity in the region alongside the integration process of the Western Balkans (EC, 2014a). The EC adopted the EUSAIR Communication and its accompanied Action Plan in June 2014, while the European Council endorsed the documents in October 2014. EUSAIR involves 4 EU and 4 non-EU countries and aims at four basic areas of cooperation, namely 'blue growth', 'connecting the region', 'environmental quality', and 'sustainable tourism'.

The EUSAIR benefits from the EC support and the involvement of other actors. The EC services help the development of EUSAIR as facilitators and policy coordinators. National Coordinators supported by other institutions ensure the coordination and policy making at the macro-regional level. Another significant body at this level is the Adriatic Ionian Council, which informs the coordination of national agendas regarding

¹ See also Table 1, Annex.

EUSAIR among the Foreign Affairs ministers. Other officials at the national, inter-ministerial and regional levels (namely the Coordinators of Thematic Steering Groups) are engaged in running and implementing EUSAIR in their respective policy areas. Lastly, managing authorities of European programmes take part in the implementation/financing of EUSAIR projects. In terms of governance, EUSAIR consists of three main components: 1) the Governing Board, which is the main body coordinating representatives across the national level, and 2) the Thematic Steering Groups in charge of EUSAIR coordination and implementation, while 3) the EUSAIR Facility Point is anticipated to be an intermediate mechanism to support the previous two components and the EC services.

ALPINE REGION

More recently, the EU Strategy for the Alpine Region (EUSALP) was released by the European Commission in November 2015 and endorsed by the European Council in June 2016. It is perceived to be an EU laboratory for effective cross-sectorial and multi-level governance (EC, 2015a). The Strategy is composed of 5 EU and 2 non-EU countries which target at three basic areas of cooperation: sustainable growth and innovation, connectivity and sustainability.

The EUSALP is quite unique in terms of the actors' involvement. The EC services are present in order to provide strategic coordination and facilitation. National representatives get involved in various governance arrangements (e.g. Executive Board), but, due to their empowered role, actors from the regional administrations are of particular importance in EUSALP. Lastly, the Alpine Convention and the Interreg Alpine Space Programme participate as observers to support the implementation of EUSALP. After all, the governance structure of EUSALP includes: 1) the General Assembly, where EC, national and regional representatives meet in order to set the political agenda, 2) the Executive Board which is in charge of the overall coordination of EUSALP, and 3) the Actions Groups in charge of the implementation of EUSALP.

4 COMPARING THE CURRENT ISSUES OF EU MACRO-REGIONS¹

4.1 PRE-EXISTING INSTITUTIONS

BALTIC SEA REGION

Although the Baltic Sea states were politically divided during the largest part of the 20th century, they targeted to cooperate according to the provisions of the Helsinki Convention on the marine environment already in 1974. However, this was not realized until the 1992 convention. Under this convention, the Helsinki Commission (HELCOM) was established in 1995 to address a good environmental status in the Baltic Sea. This body has been a key contributor with regard to sea matters, while its relevance and expertise has resulted to the 'Baltic Sea Action Plan' in 2007, a plan for the restoration of the ecological status of the Baltic marine environment until 2021. Similarly, the VASAB has been another crucial actor in the Baltic Sea cooperation in the field of spatial planning. Its activities can be traced back in 1992, while it is currently active in the framework of the Baltic macro-region by offering its expertise on various spatially related sectors. These two pre-existing institutions indicate that functional interdependences have been drivers of cooperation in the Baltic Region already for a long time. Nevertheless, political cooperation has gradually emerged since the 1990s, indicating territorial interdependencies in the Baltic Region as well. From this point of view, the Northern Dimension (ND) and the Council of the Baltic Sea States (CBSS) are important frameworks. On the one hand, the ND constitutes a tool for political dialogue and cooperation of the EU member states with neighbouring countries commenced in 1999 and extended in 2006 in order to frame the political cooperation in the Baltics. On the other hand, this political cooperation is enhanced by the CBSS, an intergovernmental body among Baltic states operating since 1992. The CBSS supports joint activities in a variety of policy areas, and it is currently involved in the EU Strategy for the Baltic Sea Region in the fields of security, climate change and neighbour relations.

Lately, the EU strategy for the Baltic Sea region (EUSBSR) was suggested to reinforce the regional cooperation of institutions in the Baltics countries (EP, 2006). This goal seems to be achieved according to a recent EC report, which states that the EU Strategy for the Baltic Sea Region has been a development

¹ See also Table 2, Annex.

which 'reinforces' and even 'deepens' the cooperation between existing regional frameworks (e.g. HELCOM and ND) as well as supports 'the establishment of new networks and joint initiatives' (EC, 2016b: 11). It has also provided 'a new stimulus to put back on the political agenda some topics of regional importance' (EC, 2016b: 13-14). Although the launch of EUSBSR may seem a development based on territorial drivers, it is equally dependent on functional needs. Based on empirical evidence, the EUSBSR is seen 'to help the systematic cooperation of existing institutions' and 'to create a hub of knowledge' deriving from existing expertise (Interview 4). This expertise certainly comes from 'a number of 'Pan-Baltic organizations' which contribute to EUSBSR (Interview 9). In addition, respondents suggest that while pre-existing institutions (especially under HELCOM) offered significant work of political organization, the EUSBSR has contributed to policy coordination among participating countries and pre-existing cooperation arrangements (Interview 4). As an example, the Annual Fora organized by EUSBSR provide arenas for interaction between 'pre-existing organizations [to] share their views' (Interview 9).

DANUBE REGION

The Danube region is characterized by a unique geographical element (the Danube river) as well as fundamental transitions in political conditions of its constituent states. Illustrating its functional drivers, regional cooperation across the Danube river has been significant in the area of navigation since 1948. For almost seventy years, the Danube Commission has been a key actor to ensure a free navigation system in the Danube. Following the same functional logic, the International Commission for the Protection of the Danube River (ICPDR) and the International Sava River Basin Commission (ISRBC) operate, since 1998 and 2005 respectively, in order to support the navigation and sustainable water management in the Danube and Sava river basins. More recently, however, regional cooperation has also been developing to support stability and integration of Danube countries, especially the Eastern European countries in transition. Serving a more territorial scope, the Central Europe Initiative (CEI), the Danube Countries Working Group (ARGE Donauländer) and the Regional Cooperation Council (RCC) have been supporting the Danube states in their trajectory to increase capacity building and facilitate regional cooperation in the matters of economy, society, energy, transportation and tourism among others.

Since 2010, the emergence of the EU strategy for the Danube region (EUSDR) has brought a new momentum of regional cooperation among institutions and countries in the Danube region. Due to the EUSDR, for example, the 'culture of cooperation' in the Danube region has been improved (EC, 2016b: 26). This improvement predominantly comes from functional drivers. As mentioned by interviewees, 'there was no systematic cooperation in some policy areas before, but they exist now (e.g. education, entrepreneurship)' (Interview 2). Similarly, 'new organizations get organized' such as networks of researchers (Interview 5). Together with improved cooperation, a growing 'political relevance' of the region is recognized (EC, 2016b: 27), however, the main challenge of EUSDR is considered to be 'how to avoid duplication (e.g. ICDRP)' without having parallel structures working on the same issues (Interview 2).

ADRIATIC-IONIAN REGION

The Adriatic-Ionian region displays its own specificities due to its very diverse and delicate geopolitical space, as overwhelmingly illustrated by the collapse of the Soviet Union, the transition to an open economy, the partition of Yugoslavia and the Kosovo conflicts. In their effort to leave behind old conflicts and cease new opportunities, the Adriatic-Ionian countries tried to establish transnational cooperation starting from the political domain. As a result, a major accomplishment in this region was the creation of the Adriatic and Ionian Initiative (AII). This is an intergovernmental body created in 1999 in order to bolster regional cooperation and promote political and economic stability in the area. Hence, the AII mainly reflects a form of territorial cooperation aiming to address functional issues. Later, the AII constituted the forerunner of the Adriatic-Ionian macro-region. Following the AII, additional cooperation spinoffs were established since 1990 in order to address a more functional imperatives (e.g. among economic chambers, universities and local municipalities). From a similar perspective, cooperation among the Adriatic and Ionian regions was also supported by the CPMR Inter-Mediterranean Commission since 1990 and the Adriatic-Ionian Euro-region since 2005.

Since 2014, the EU strategy for the Adriatic-Ionian Region (EUSAIR) was initiated and has benefitted from the experiences of the Adriatic-Ionian Initiative, its spin-off organizations and cooperation structures

operating in the Mediterranean space (EC, 2016b: 38-40). Along the same lines, interviews suggest that 'all these networks are very useful for the future development of the Strategy... because all these networks showed that something is needed' as well as 'all pre-existing structures made some kind of seeds...' (Interview 7). However, we should be aware that other interview responses pointing to the Adriatic Ionian case suggest that cooperation of pre-existing institutions under EUSAIR entails 'nothing really revolutionary' and 'no really new ways of operating' (Interview 8).

ALPINE REGION

The Alpine area can be considered as a different case in contrast to other macro-regions in geopolitical and geographical terms. It has been a relatively stable and prosperous area throughout the last few centuries, while countries shaping the Alpine region retain a long tradition in transnational cooperation with a common view over the good condition of the mountain environment and its ecosystems. From a more territorial perspective, the Alpine Convention has been a major development in the region by targeting to the preservation and protection of the Alps since 1995. Alpine Convention is an international treaty covering all major areas of interests of Alpine states. Compared to the Alpine Convention, the International Commission for the Protection of the Alps (CIPRA) has been a wide network of institutions, which have been focusing on the protection and sustainable development of the Alps from a more functional perspective. Already since 1952, CIPRA advocates the added value of regional cooperation among the Alpine regions and surrounding areas in the fields of biodiversity and landscape, climate and energy, transport and mobility as well as youth-related issues.

Only very recently, the EU strategy for the Alpine Region (EUSALP) has emerged as an additional layer of coordination among institutions in the Alpine space. Since its launch, the EUSALP is expected to 'ensure their participation, where relevant, in order to build on existing expertise and to organize possible synergies among themselves' (EC, 2016b: 50). However, the EUSALP seems to be actually situated within an already institutionally overloaded arena comprising of the Alpine Convention and numerous sub-national regions (Interview 5). Against this background, the Alpine Convention is currently involved in EUSALP by dealing with the "Preservation and valorisation of natural resources" and supporting other policy areas as well, while CIPRA's involvement in EUSALP is still a process in progress (Interview 5).

4.2 SUBSTANTIVE CONTENT OF MACRO-REGIONAL STRATEGIES¹

BALTIC SEA REGION

The substantive scope of EUSBSR has been described to reinforce existing cooperation in the Baltic Sea region. Following this, the Baltic Sea region was viewed by its constituents as an ideal case to test new approaches of regional cooperation and regional governance which can be further copied by other macro-regions. However, such a view was stimulated by two main drivers. The first and foremost driver of EUSBSR was the deteriorating condition of the Baltic Sea and its water environment. The improvement of such a water environment was recognized as a challenge shared by all countries of the Baltic macro-region, illustrating their significant interdependence with it. Hence, the so-called 'Cleaning the Sea' goal, was considered a sensitive and actual issue to be addressed by the EUSBSR, and it has been reconfirmed as 'a core field' in the Strategy as well (EC, 2016b: 16; Interview 5; Interview 9). Secondly, there are also geopolitical drivers justifying the emergence of EUSBSR (Interview 5). Although the Baltic Sea macro-region was largely initiated as a merely European project, it was soon widened by the participation of Russia and other countries of the Nordic arc. This momentum has brought high expectations regarding the usefulness of EUSBSR, however evidence remains divided. On the one hand, it is argued that the visibility and understanding of the role, purpose and added value of the EUSBSR 'is still not sufficient' (EC, 2016b: 17). On the other hand, it is supported that actors saw the added value of EUSBSR due to the fact that cooperation in the Baltics was already more coordinated than other cooperation frameworks (Interview 3), as well as institutions identified new opportunities 'to get role again' (Interview 5).

¹ Four macro-regional strategies have been launched so far: the EU Strategy for the Baltic Sea Region (EUSBSR), the EU Strategy for the Danube Region (EUSDR), the EU Strategy for the Adriatic-Ionian Region (EUSAIR) and the EU Strategy for the Alpine Region (EUSALP).

DANUBE REGION

Similar to the EUSBSR, the overall scope of EUSDR was conceived as a new project of regional cooperation. The main trigger which justified or even hastened the initiation of EUSDR was the issue of floods and their implications to navigation of ships within Danube in 2007. To illustrate this issue, interviewees note that 'there was an actual problem (that of floods) and flood management required a transnational perspective' (Interview 2). Yet, the EUSDR's objective lies on a vision of building prosperity realized by a context-specific sub-goals such as supporting connectivity, attractiveness, environmental conditions, and ecosystems. In that sense, the Danube macro-region seems to be equally motivated by new opportunities to be taken by countries across Danube. These two elements suggest that functional interdependencies are clear drivers for EUSDR. Yet, the EUSDR instead of depending purely on functionalities, it also adds the territorial element of integration of the Western Balkans. In doing so, political motives were crucial triggers. To illustrate this, empirical interviews suggest that 'the Danube macro-region helps the cooperation of operational level actors without the need of legal complications' (Interview 2), element which provides a certain degree of flexibility in joint action and project development among countries. Although political motives may be drivers in favour of EUSDR, an emerging risk is the fading political discourses illustrated by 'the EUSDR seems to be given a lower priority in the political narrative at national level' (EC, 2016b: 30). Additional substantive challenges in the development of EUSDR relate to how 'to define the actual joint action or what is really the focus' and how to achieve 'more concrete outputs' (Interview 2).

ADRIATIC-IONIAN REGION

The overarching scope of EUSAIR is to primarily address the prosperity challenge and, secondarily, the integration challenge. Regarding the first challenge, the EUSAIR's ultimate goal is to promote economic and social prosperity by supporting attractiveness, connectivity, competitiveness and the marine environment in the region. Certainly, this goal suggests a sort of vision based on the economic and social interdependencies between the Adriatic-Ionian macro-regions. It is partly inspired by the logic and objectives of the preceding EU sea-level strategy in the Adriatic-Ionian region. Hence, the main motives for cooperation under EUSAIR have been instigated by sectoral challenges. Regarding the second challenge, the accession and integration processes of Western Balkans are significant to EUSAIR. The crucial issue in such processes is the Adriatic-Ionian countries to 're-start talking', illustrating the territorial dimension of the EUSAIR content. Interestingly, in such processes the 'EC seems to have played a more active role' as well (Interview 3). This last point is partly related to a key issue in the content of EUSAIR, which is an important gap between the political commitment expressed by the high/ministerial level and the sequential support of their subjected administrations. Although EUSAIR is 'still in its initial phase' (EC, 2016b: 36), the above-mentioned issue is often attributed to the 'lack of adequate human, financial, administrative and technical resources' as well as 'the lack of leadership, commitment and ownership' among the participating administrations (EC, 2016b: 41). All these causes, nevertheless, reflect both an organizational/functional and a territorial/political nature of problems emerging in the EUSAIR.

ALPINE REGION

In the EUSALP, attention is mainly stressed to ensuring an effective horizontal (across sectors) and vertical (between territorial levels) governance of the macro-regional project. The Alpine macro-region seems to be predominantly motivated by seizing further opportunities, similarly to the Danube case. These opportunities pinpoint to functional interdependencies such as environmental, social and economic concerns in the Alpine mountains. As a result, the main objective of EUSALP depicts a vision of building prosperity by supporting attractiveness, competitiveness, connectivity and environmental conditions. However, the main difference compared to other macro-regions is the enhanced role of sub-national regions instead of national states (Interview 3). As in the EUSAIR case, the EUSALP is considered to be 'still in an initial stage' (EC, 2016b: 46), and the crucial issue to EUSALP success is the 'gap between the Strategy and funding opportunities' (EC, 2016b: 49). As such, this gap seems to be explained by '[the] structures, frameworks and timeframes [of existing programmes, which are] often not compatible with the needs of a macro-regional strategy' (ibid).

CROSS-CUTTING ISSUES

Empirical research highlights a number of issues cutting across the content of all existing macro-regional strategies. The first issue refers how macro-regional strategies themselves are perceived. For example, macro-regional strategies are perceived as 'a platform of cooperation at the transnational level in order to avoid duplications' (Interview 3). In a similar logic, they are seen as 'frameworks of cooperation [offering] opportunities for strategic cooperation' to those involved (Interview 5). The second issue relates to the involvement of actors. Actors get motivated to develop macro-regional strategies 'because they are confronted with things that they cannot deal individually' (Interview 4). The last issue refers to a lack of clarity persisting across macro-regions. Illustrative quotes demonstrate a lack of clarity regarding 'what is really the focus' (Interview 2), 'what they wish to achieve or no common vision' (Interview 4; Interview 3), 'their process, scope and who is involved' (Interview 9). All three issues, however, indicate a consideration of macro-regional strategies according to their functional aspects rather than any territorial concern.

4.3 GOVERNANCE STRUCTURES¹

POLITICAL LEVEL

The highest level of macro-regional governance (political level) performs quite similar patterns across all existing macro-regions. More specifically, three main bodies inform the design and revision of macro-regional strategies, namely the European Commission, the European Council, and the High-level Group for macro-regions. Initially, the EC holds the strategic coordination and facilitation of macro-regional strategies through its various Directorate-Generals (DGs). Its role lies to highlight the functional character of macro-regional strategies by ensuring the efficient coordination of actors at the macro-regional level. Furthermore, the European Council is responsible to ensure domestic political commitment, facilitate the efficient allocation of tasks and participation of relevant institutions, and raise visibility of macro-regional actions. Accordingly, major political decisions such as the revision of Action Plans are made at this high-political level. Additionally, the high-level group plays an advisory role to EC and Council as well as facilitates the exchange of knowledge and experiences between macro-regions.

Up to date, the role of EC, and DG-Regio in particular, has been significant to the get the macro-regional strategies started as well as make them work. Empirical evidence supports the argument that EC held the role of strategic coordinator and main facilitator in existing macro-regions, especially during their initial stages. In the Adriatic-Ionian case, for example, extra efforts have been devised in order to set the governance mechanisms and help them produce their initial results. Furthermore, the European Council has played a role in initiating macro-regional strategies, endorsing European Commission's workings, raising key horizontal issues of macro-regions (such as governance) and ensuring political commitment in favour of the development of macro-regional strategies. A slight difference to this pattern of high-level processes is the Alpine case, which is the only macro-region with a General Assembly. In this case, the EUSALP Assembly is a political body composed by EC, national and regional representatives, and the Alpine Convention (as observer). Although it may suggest a territorial dimension in EUSALP governance, its main task is to set the general political guidelines for EUSALP.

COORDINATION LEVEL

At the coordination level, a mechanism of National Coordinators is assigned across all macro-regions with coordination and visibility tasks. The main tasks of National Coordinators are, for example, to represent their respective countries in official meetings, find the most relevant delegators of their national administrations to develop and implement macro-regional strategies, coordinate the workings of their

¹ The analysis under this aspect is formulated slightly differently than the previous aspects. This is because the basic framework determining the governance of macro-regions has been sketched by the EC in a recent report (EC, 2014b). This governance report can be considered a milestone because it establishes three distinct levels of operation, namely the political, coordination and implementation. Having this in mind, the governance structures of macro-regions are analyzed in this sub-section based on these three analytical levels (see also Tables 1 and 2, Annex) supplemented by some complementary remarks on specific macro-regions.

subjected mechanisms (e.g. policy area coordinators), and finally make the results visible to those involved and the public. In most macro-regional strategies, such a coordination structure was established after the actual launch of macro-regional strategies, except the Alpine case. In this particular case, the so-called Steering Committee was responsible to prepare the macro-regional strategy following the resolution and the mandate declared by the participating countries in 2012 and 2013 respectively (EUSALP, 2013; EUSALP, 2014). This distinctive approach shows a more territorial approach in the EUSALP, at least at its early stage.

In order to support National Coordinators in their tasks, additional coordination structures have created at the national level (e.g. EUSBSR, EUSDR, EUSALP) as well as new working structures have been emerged at the implementation level. (EC, 2016b: 10, 27-28, 47). An example of such structures is a pilot European Regional Development Fund (ERDF) managing authorities' network established in the EUSBSR in 2016. Nevertheless, the Danube and Adriatic-Ionian macro-regional strategies have requested the establishment of a mediatory body to support the coordination and implementation of their macro-regional strategies, namely the Danube Strategy Point (DSP) and the EUSAIR Facility Point. Lately, a similar discussion is under way in the EUSALP (EC, 2016b:48). Regarding the former body, the DSP was created to harmonize the coordination of national and policy area coordinators in several functions. These functions relate to support the implementation, communication and monitoring between EUSDR policy areas and National Coordinators as well as enhance linkages between EUSDR and Interreg programmes (Interview 2; Interview 5). With regard to the second body, it is envisaged as a support system to help governance and coordination between EUSAIR National Coordinators, EUSAIR implementation bodies and EC services (Interview 1). Interestingly enough, the DSP was realized within a very short period of time (approximately one year since its conception), whereas EUSAIR Facility Point is still in progress (almost two years after its conception). In spite of that, both the DSP and the EUSAIR Facility Point indicate a need to improve the functional dimension of macro-regional governance.

IMPLEMENTATION LEVEL

Lastly, the implementation level seems to be the most crucial part of macro-regional strategies, since the success at this level determines the continuity of the entire Strategies (Cretu speech, 2016). To support implementation, various implementation mechanisms have been established across macro-regions. These mechanisms reflect a functional type of governance (Blatter, 2004) because they are created in order to address policy-specific or action-specific issues (e.g. Steering Groups or Action Groups). Similarly, horizontal or cross-cutting issues are managed by similar type or organizations.

However, although creating and experimenting in new structures is evident, a number of organization dysfunctionalities still persist both at the coordination and the implementation level. A first issue is the lack of availability of funding sources. Statements such as 'not all countries have allocated sufficient resources' are illustrative to what is happening in the EUSBSR and EUSAIR cases (EC, 2016b: 16; Interview 1). A second issue is the differential support between the political representatives and the implementers of the macro-regional strategies. This issue can be observed in different occasions such as, in the EUSBSR, 'no clear mandates to representatives' or, in the EUSDR, 'a gap between the formal political support and the substantial support by national administrations' is recognized (EC, 2016b: 16, 31). Similar occasions hold in the EUSAIR case as well (Interview 1). A third issue is described by the lack of compatibility between the implementation structures of macro-regional strategies and the implementation structures of Interreg programmes (Interview 3, 4, 8). To illustrate this through the EUSDR, there is a 'gap between the Strategy and the programmes, which too often divides managing authorities and officials in charge for the EUSDR' (EC, 2016b: 32). Against this issue, actors have already warned that 'as long as existing institutions (EU, national, local) do not recognize the work done by macro-regional structures, macro-regional strategies will be struggling' (Interview 4). Finally, additional challenges arise with regard to the actors involved and the tasks allocated to them. For example, the allocation of tasks has been an issue for clarification both for coordination structures as well as those implementing actual projects. To resolve this issue in EUSBSR, the second revision of the EUSBSR Action Plan included a whole chapter to clarify tasks and responsibilities among actors.

5 CONCLUSIONS AND REFLECTIONS

This chapter aimed at providing an assembled analytical perspective of EU macro-regions. The main argument across this study is that EU macro-regions can be seen as hybrid models of organization which balance between territorial and functional interdependencies. Building on the distinction between territorial and functional spaces and informed by existing theoretical considerations, I attempted to illustrate the hybrid nature of EU macro-regions by looking into three analytical aspects (pre-existing institutions, substantive content of macro-regional strategies and governance structures).

Concerning the first aspect, the overall conclusion on pre-existing institutions suggests that the Baltic and Alpine macro-regions build on (rich) existing cooperation, where both territorial and functional dimensions are already established. In contrast, the Danube macro-region does not have long tradition of cooperation, except the domain of navigation, while the Adriatic-Ionian case enjoys limited pre-existing support coming only from political cooperation. More specifically, the EUSBSR is seen to reinforce and systematize the cooperation between pre-existing institutions in the Baltic region. In particular, its contribution is identified into improving policy coordination. In the Danube macro-region, the EUSDR has provided a new momentum for dialogue and regional cooperation. Although the main area of cooperation in the Danube was historically the functional area of navigation, the EUSDR provides new opportunities for political and economic cooperation among countries expanding from the core of the Danube river up to the Western Balkans. In the Adriatic-Ionian macro-region, cooperation of pre-existing institutions was provoked by the territorial need to make Adriatic and Ionian countries 'talk' again after a long period of disputes and conflicts. This issue still remains crucial, moreover the EUSAIR seems to build on experiences gained by the AI in order to create new cooperation arrangements driven by functional interdependencies (e.g. blue economy, environment and tourism). Lastly, in the Alpine macro-region, there is a significant heritage of cooperation. Pre-existing organizations such as the Alpine Convention and CIPRA together with national and regional administrations in the Alps do provide territorial and functional focuses to EUSALP, which therefore needs to ensure the balance between all them.

Considering the substantive content of macro-regional strategies, they all commence with a functional scope, which is to improve coordination and efficiency in a number of policy areas. However, territorial imperatives are also apparent in macro-regional strategies, especially the Danube and Adriatic-Ionian cases. This can be seen either by focusing on the integration process of non-EU countries in macro-regional projects or by looking at the involvement of multiple actors from different territorial levels in various macro-regional processes. In more detail, the EUSBSR was initiated as a 'European' project in order to 'Clean' the Baltic sea, but it soon broadened its pertinence to additional functional areas by incorporating non-EU countries. In the Danube macro-region, the main functional trigger was the issue of floods in the Danube river. Starting from this issue, EUSDR soon reflected a broader political vision towards building prosperity in the Danube region and opening its relations to the Western Balkans. Similar to the Danube case, the Adriatic-Ionian macro-region aims to promote economic and social prosperity as well as the accession and integration of Western Balkans. However, it was created from a different starting point. This starting point was pre-existing territorial relations under the AI, which are gradually developed in new functional forms of cooperation and networking. Obstacles to this trend seem to be the actual resources available as well as the political commitment of those involved. Turning to the Alpine case, the EUSALP is driven by a vision of prosperity which can be realized by a well-working functional coordination and governance. However, the realization of such a vision is threatened by incompatibility between EUSALP's goals and the available funding.

Concluding on the last aspect, the governance structures of macro-regional strategies are principally driven by functional interdependencies, while territorial interests are still evident. In particular, governance structures balance between high-level processes that ensure strategic supervision to the EU and national actors as well as operational processes by which governance mechanisms respond to policy-specific challenges. Certainly, the main logic in the architecture of governance structures may seem identical across macro-regions, since the main motivation behind it is to improve effectiveness at the high-political, national (coordination) and policy-specific (Implementation) levels. As a result, new governance mechanisms as well as working structures are created across all macro-regional strategies in order to solve organizational issues caused by different governance systems within participating countries. However differences in governance structures still exist depending on those involved and the resources available to them. Reasons explaining these differences are the limited level of commitment and leadership of actors, the limited allocation of human and financial resources and the gap between macro-

regions as strategy tools and the implementation of cooperation programmes under already established streams of funding. A side but still relevant issue explaining differences in governance structures is multi-level governance (MLG). According to empirical evidence, MLG works differently in each macro-region (Interview 4; 8). Moreover, MLG is linked to differences in governance structures either by pointing to different actors and how they affect governance processes or by challenging the bottom-up principle and how lower levels of government and policy implementation hinder governance processes in the higher levels (Interview 2; 3).

1 INTRODUCTION

The 21st century is when the globalisation of capital has found, as of now, its pinnacle. According to Sassen (2007), this phenomenon has been responsible for the destabilisation of past scale hierarchies, previously almost totally centred at the national level, depicted by the nation state figure. The proliferation of multinational capitalist organisations with their structures based on a network of branches spread across the globe with its strategic functions concentrated in a unique place (or in just a few of them) contribute to

the complexity of the world's multiscale configuration. This dynamic that involves the global capital puts under scrutiny the autonomy and centrality of the national sphere. Hence, other forms of spatial scales may rise to a more prominent role, such as the subnational (i.e. cities; regions), cross-border regions that include two or more subnational units, and supranational entities, like global electronic markets and free trade zones (Sassen, 2007).

That is the case of Eurometropolis Lille-Kortrijk-Tournai – ELKT (founded in 2008), which spans across the French-Belgian border and have been introduced in the global capital market through regional level politics, in a logic that is concomitantly transnational and subnational. To overturn the economic fortunes of a deprived region, this Eurometropolis seeks to benefit from an extremely strategic position in Europe's geography to put itself in the spotlight for the big international private capital and investments. Thus, ELKT's transnational governing committee has decided to make use of territorial marketing tools to promote the cross-border metropolis, investing in big cultural events and the subsequent reinvention of the region's image: from an underprivileged and charmless former industrial site into a new cultural bustling hub, open to creative and fresh talents. The idea behind such course of action is that the region must portray an attractive image for the foreign investors amid a 'locational war', boosted by the new hierarchy of scales, against other subnational and transnational entities.

Nevertheless, the strategies for this territorial marketing vary according to the position the city occupies in the global context. Cities with local or regional influence, like Lille – and by extension – the ELKT, need a more aggressive marketing approach so the range of its economic activities can be expanded. Braun (2008) states that it is a tendency that cities with industrial backgrounds start to delve deeper into territorial marketing tools in their quest for changing their image, both inwards (to the eyes of its own population) and outwards (for the investors).

Since 2004 Lille has been exploring this sort of experience. It has intensified after the formation of the ELKT in 2008, with an annual transnational arts festival called NEXT taking place in both sides of the border. The main goal of this initiative is to rework the image of the entire region that compounds the Eurometropolis and build a feeling of pride and attachment in their 2,1 million inhabitants over the fact that the 'industrial stigma' is now long gone and that they are embracing a thriving future based on arts and other dynamic related activities (e.g. creative industries and tourism). Thus, the main goal of this paper is to debate the role of big cultural and artistic events – and its inherent dimensions of identity and image – as a trigger for a transnational economic project such as the ELKT.

2 LITERATURE REVIEW

2.1 GLOBALISATION AND THE RISE OF CITIES AND REGIONS

The 21st century, as stated above, is when the globalisation of capital has reached its peak so far. Such a phenomenon has led to a new configuration of spatial scales, putting the classic centrality and primacy of the national level in a new perspective (Sassen, 2007). Multinational enterprises have proliferated around the globe, and their organizational structures lend a concrete contribution to the complexity of this multiscale world.

The global capital markets are, in fact, partially embedded in subnational places and move around intricate combinations of spatial scales. For example, the global capital markets are composed by electronic markets with global outreach and – at the same time – by locally rooted conditions, like financial centres and everything else they entail, from infrastructure to systems of trust (Sassen, 2007).

This dynamic of the global capital puts under scrutiny the autonomy and centrality of the national sphere (Sassen, 2007). As the 'national' is highly institutionalized and dense, the global structuration inside the national encompass a partial and generally very specialised and specific denationalisation of certain national components. Therefore, the new networks that connect cities through a variety of new activities and institutions are an example of a global scaling process constituted by the means of subnational places and the growing intensity of their cross-border transactions. Following the operationality and the logistics of the capital reproduction in this new configuration, subnational regions or cities are put in direct contact, ones with the others. That would allow the surging of other unities or spatial scales, notably the

subnational (i.e. cities and regions), the cross-border regions (which encompass two or more subnational entities) and the supranational cities (free-trade zones and electronic global markets).

Sassen (2007) also observes that these aforementioned phenomena have led to denationalised Estate agendas that are growingly managed in confluence with norms set by the big global private capital. Even though the geographical limits of the nation state territory remain largely unchanged, this movement changes the meaning of the exclusive authority of the Estate over its own territory, transforming its role in the face of the current scenario.

In a moment when virtually every Estate in the world adopts a governance that aligns to the neoliberal practices of economic competitiveness, it has become usual – specially from the 1990s onwards – the institutionalisation of ‘rights’ of the non-national enterprises. The deregulation of cross-border transactions and the influence or crescent power of some supranational institutions (big multinational enterprises, e.g.) have been reshaping the classic role of the Estate: confronted with the current global economic scenario, a self-diffidence in the regulation of its own economy can be observed, leaving gaps in its structure that will be eventually fulfilled – directly or indirectly – by the big multinational enterprises.

According to Sassen (2007), the analysis of this new ‘geography of power’ that the nation state face allows to identify and conceptualise a specific set of operations that take place in the interior of national institutions but that are now turned to subnational and transnational agendas. It is in this sense that territorial organisations with local, cross-border or supranational scale earns an increasing significance in the current global economic scenario.

2.2 GLOBAL CITIES NETWORK

Amidst the context exposed above (2.1), namely the rise of the strategic significance of local and regional spheres amongst globalisation and the subsequent dispute for market, GaWC (Globalisation and World Cities Research Network) has started, in 2000 (GaWC, 2000) to classify cities around the world in accordance to its insertion in the global network. This classification is based upon four ‘advanced producer services’: (i) accountancy, (ii) advertising, (iii) banking/finance, and (iv) law (Beaverstock et al., 1999). The GaWC inventory identifies three different levels of global cities and 12 sub-levels. Following the rankings of 2016 (GaWC, 2016):

- Alpha++ cities: are cities most integrated with the global economy. Examples: London and New York (the only two in this category);
- Alpha+ cities: are advanced service niches for the global economy. Examples: Sydney, Tokyo, Paris, Shanghai, Dubai;
- Alpha e Alpha- cities: are cities that link major economic regions into the world economy. Examples: Chicago, São Paulo, Moscow, Brussels, Mumbai (Alpha); Buenos Aires, Barcelona, Vienna, Seoul, Miami, Johannesburg (Alpha-);
- Beta (Beta+, Beta e Beta-) cities: are cities that link moderate economic regions into the world economy. Examples: Dallas, Lisbon, Berlin (Beta+); Rio de Janeiro, Oslo, Manchester (Beta); Lagos, San Diego, Bratislava (Beta-);
- Gamma (Gamma+, Gamma e Gamma-) cities: are cities that link smaller economic regions into the world economy. Examples: Guayaquil, Adelaide (Gamma+); Glasgow, Marseille (Gamma); Orlando, Sevilla, Porto (Gamma-);
- Sufficiency level cities (High Sufficiency and Sufficiency): are cities that have a sufficient degree of services so as not to be obviously dependent on world cities. Examples: Lille, Indianapolis, Belo Horizonte (High Sufficiency); Florence, San Antonio (USA), Jerusalem (Sufficiency).

The global cities network arises as a new terrain for politic-cultural debates as they create different geopolitics, parallel to that centred on the nation state, once they become ‘... a strategic site not only for global capital, but also for the transnationalization of labour and the formation of translocal communities and identities’ (Sassen, 2005, p. 38).

An exam of the globalisation through the prism of the ‘global city’ concept introduces a strong emphasis on the strategic components of the global economy beyond the broad, diffuse, and somewhat homogenising

dynamics to which we are habituated to associate globalisation with: the one of the consumer market (Sassen, 2005).

2.3 CITY MARKETING

City marketing, as a field of academic research, originates itself mainly from two perspectives: the first one, related to the expansion of the traditional Marketing and its applications; the second one from the disciplines that have studied the city, the regions and the development (Urban and Regional Economy, Economic Geography, Urban Planning, Social Geography, between others).

In the first perspective, cities are considered an object to which the marketing tools are employable. From the 1960s onwards, Marketing ceases to be conceived as something related strictly to business management activities: Kotler and Levy (1969) and Kotler (1972) were pioneers in expanding the concept of marketing. In the second perspective, marketing has been gaining significance for the cities because of the local and global processes related to globalisation described above (entailing, for example, locational competition). Cities and regions have been developing marketing politics as a result – or as an answer – to these processes, adapting themselves for different contexts and needs (respecting the particularities of each place).

Therefore, City marketing is the coordinated use of marketing tools supported by a shared customer-oriented philosophy, for creating, communicating, delivering, and exchanging urban offerings that have value for the city's customers and the city's community at large (Braun, 2008, p. 43).

The strategies for city marketing vary following the framing of the city in the global context. Global cities with high levels of insertion, centrality and influence (London or New York, for example) do not need aggressive city marketing strategies once their position in the world is already established, which guarantees a comfortable position in relation to the amount and quality of investments they receive from the global capital (Braun, 2008).

Nevertheless, cities that exert limited centrality and has the influence disseminated only up to the local or regional level necessitate a more aggressive marketing policy so they can expand the scope of their economic activities: "This strategy is more compatible with a business that aims to gain market share or fight its way into a new market" (Braun, 2008, p. 23). Hence,

... it enables a new approach to strategic planning in the public sector. City marketing enables a new level of quality within the local development policy in terms of comprehensiveness, creativity and flexibility. New resources in form of ideas, capital, and local knowledge are mobilised for local policy. In this way city marketing enables a strategic approach to public planning in collaboration with the private sector (Rainisto, 2003, p. 61).

2.4 IDENTITY AND IMAGE

In the globalised world, local identities can be regarded as 'hybrid identities': local reviews of global and globalising cultural inputs (Hall, 1996). The role performed by these 'new identities' is another aspect of the globalisation effects on society, specially minority communities (ethnics, religious etc.) living in a western centre; they serve as needles and threads that sew them to this society. This feature of the new identities is what Laclau (1992) named 'common axe of equivalency': it is their 'lowest common denominator', the core of what unites them ultimately.

This kind of identification is essentially politic: it unites individuals – despite ethnic and cultural differences – through the social reality to which they are subjected as an outcome of a process of cultural hierarchisation. The intrinsic dichotomies between the different ethnic groups that composes this type of identity are not annulled, but are suspended – at least for a while – whilst social equality is still to be claimed. This appeal for social equality is what validates this kind of identification: it starts from several particularisms (ethnic questions, religious, genre) that by themselves or alienated from universal values

would not succeed in finding validation, but when connected to the universalism of social equality, they do succeed (Laclau, 1992).

Fontanille and Zilberberg (1998) point out that there are cultures that are perceived as a unity and others as a mixture. This implies that two different mechanisms rule them: the exclusion and the participation principle, creating two systems through which culture operates. The first one (i.e. exclusion) operates via a sorting/selection mechanism; once this process is over, comes to the surface the confrontation between exclusive and excluded, pure and impure cultures. The second one (participation) operates via a mixture/amalgamation mechanism, resulting in a comparison between what is alike and unlike. The alikeness assumes interchangeable magnitudes; the unlikeness involve magnitudes that opposes themselves as superior and inferior, an entailed hierarchy not always surpassed.

It must be reinforced that identity is one of the features operated by the city marketing: it works and reworks the image and the identity of a city. According to Noisette and Vallerugo (1996), these two concepts – identity and image – are not equivalents and come into tension in operations of territorial communication: the real identity morphs into a projected identity that is, on the other hand, what constitutes an image, a representation that is sought and has monetary value.

3 METHODOLOGY

This paper is based, in its opening moment, on the review of literature that is relevant to the discussions proposed here about globalisation and global cities, city marketing, identity and image. (Laclau, 1992; Hall, 1996; Rainisto, 2003; Braun, 2008; Sassen, 2005, 2007; GaWC, 2000, 2012, 2016, amongst others). In addition, the observations in loco regarding the subject of the research – namely the Eurometropolis Lille-Kortrijk-Tournai as an economic development project looked at through its cultural perspective – stems from several fieldworks conducted by the researcher, mainly based on participant observation. To add a new edge to the research and confront the fieldwork findings, documental sources were also consulted, such as reports and other studies related to the theme (Thiard, 2007; Durand, 2015), in conformity with the research validity and reliability criteria proposed by Yin (2014).

4 THE CASE IN QUESTION

4.1 THE LILLE-KORTRIJK-TOURNAI EUROMETROPOLIS

The social and economic structure of Hauts-de-France region was constructed, historically, over mining – the coal extraction, specifically – and industry, notably metallurgy and textile industry. Nevertheless, a complex succession of events in the 20th century brought several difficulties to a once thriving region: this includes the two World Wars, the oil crisis in 1973 and again in 1979 (coupled with the transition between energy sources: from coal to oil), the loss of productivity of the local mines and the intense internationalisation of capital (Siffert, 2016). This eventful century for the region found its nadir with the closure of the last coal mine in 1990 at the city of Oignies, decreeing the unavoidable death of the mining sector in Hauts-de-France.

Facing a rather difficult period, the region was compelled to reinvent itself economically. The plan for achieving that was structured over its strategic geographical position inside Europe (Figure 1), investing in the internationalisation of the region in close partnership with nearby Belgian cities, which became possible mainly because of the Schengen Agreement in 1985. Convinced that the creation of a transnational metropolis would be the trigger for the local development, political and economic stakeholders from both sides of the border decided for the creation of Eurometropolis Lille-Kortrijk-Tournai.

Figure 1: Location of Lille in relation to major European centres. Source: Eurométropole (n.d.)

Thus, the ELKT is a binational metropolitan area centred on the French city of Lille and on the Belgians Kortrijk and Tournai. It covers three subnational regions: Hauts-de-France (Lille and its own metropolitan area), Flanders (with Kortrijk as the main axis and where Dutch is the main spoken language) and Wallonia (centred on Tournai and where French is more widely spoken). Overall, ELKT is composed by 147 municipalities and in 2008 it had circa 2.1 million inhabitants (Figure 2). The main goal of the Eurometropolis is to enhance the cross-border collaboration, to bring together the local stakeholders and the institutions involved in the project, and to develop a common strategy to overcome the daily problems for inhabitants on both the French and the Belgian sides.

The seed of ELKT traces back to the year of 1991, date when the Permanent Intercommunal Cross-Border Conference (Conférence Permanente Intercommunale Transfrontalière – COPIT) was created. The COPIT meetings resulted in the creation, in 2002, of the French-Belgian cooperation agreement signed by the Prime Ministers from both countries which installed a transnational parliamentary group of work. They were entitled to do an inventory of the cross-border problems and to formulate some initial guidelines for the cooperation between the countries.

Finally, as a result of this parliamentary cooperation, the ELKT is officially established in January 2008, with Pierre Mauroy – then Lille's mayor – as its first president.

Figure 2: Eurometropolis Lille-Kortrijk-Tournai and its main cities. The white line denotes the border between countries. Source: adapted from Ducuing (2008).

Durand (2015) points out in his study about the Eurometropolis Lille-Kortrijk-Tournai that the integration of a cross-border metropolitan could only be possible if multidimensional: (i) structural, (ii) functional, (iii) institutional and (iv) ideational. Amongst those dimensions, the one that interests the most in this paper is the fourth (i.e. ideational), once it is where culture, language and symbolism – as three of the main conforming features of an identity (Löfgren, 1991; Cuche, 2010) – are included.

Since 2001, Durand (2015) exposes, some efforts have been made seeking to create on the collective imaginary a sense of fellowship and attachment, specially through cartographic representations due to its symbolic force. We include in this same ideational category the big cultural festivals that grace the population with varied artistic performances. At the same time, those festivals can be a spark for the

conformation of an identity that proportionate a certain social cohesion for the inhabitants of ELKT (Siffert, 2016). For this reason, NEXT – International Arts Festival is going to be analysed in the next section (4.2) as a cultural event that contemplates Eurometropolis Lille-Kortrijk-Tournai.

4.2 NEXT – INTERNATIONAL ARTS FESTIVAL

Amidst the original themes proposed by the French-Belgian parliamentary working group involved in the ELKT creation and integration, no big scale cultural action had been previewed. However, artistic and cultural collaborations between organisations and stakeholders both sides of the border were something that had been happening beforehand, preceding the formal creation of the Eurometropolis. That contributed to encourage to some extent the inter-regional and international integration, even though it relied on scattered initiatives that lacked a more rigid systematisation.

Convinced that culture is an important tool to reinforce and promote the identity of Eurometropolis Lille-Kortrijk-Tournai, five cultural enterprises¹ decided – based on the experience of that previous cooperation – for organising an annual contemporary arts festival inside the cross-border domains of ELKT. This proved to be the cornerstone for the creation of NEXT, still in 2008. Such a cooperation was only made possible because of the legal assistance of Interreg IV², a device created by the European Parliament with the goal to help create political, institutional and economical basis for the integrations and development of cross-border territories:

NEXT was created due to financial support of INTERREG IV France-Wallonia-Flanders, the cross-border cooperative programme that seeks to reinforce the economic and social trades between the regions Nord-Pas de Calais³/Champagne-Ardenne/Picardie in France and Wallonia/Flanders in Belgium.

INTERREG – “Interreg erases the borders” – is for 20 years an important asset to the promising and innovative projects beyond the borders.

Four priorities are privileged by the programme: to favour the economic development of the zone; to develop and promote the identity of the cross-border territory; to reinforce the sense of attachment to a common territory; to stimulate the common management of the territory (NEXT, 2014, p. 47 –highlights not in the original).

Henceforth, and articulated with the guidelines of Interreg, NEXT – International Arts Festival was officially created, being quickly incorporated by the ELKT governors to their bigger economic project. Its first edition premiered already in 2008, between the months of November and December (NEXT, 2008a).

Formed by the cooperation between two countries and three subnational regions, ELKT is a territory essentially pluricultural. Therefore, a project that would contemplate this kaleidoscopic culture should take precedence in certain common values: the bilingualism, the interculturality and the European citizenship, features that would contribute to the appreciation of the territory and the rapprochement of its citizens (Eurométropole, n.d.).

According to the promotion brochure of the first edition of NEXT (2008b), the Festival is presented as a totally unique initiative, being ‘the first festival to laugh of the borders’ (p. 3). In the brochure, the public is summoned to cross unlimitedly the borders, themselves nothing more than attributes merely ‘inherited from history’, and to surpass the barriers of language, considered ‘invisible borders of the cultural differences’ (NEXT, 2008b, p. 3) between the three regions:

¹ The five cultural enterprises are : La Rose des Vents – Scène nationale Lille Métropole e Espace Pier Paolo Masolini – Théâtre Internationale à Valenciennes (on the French side); Kunstencentrum BUDA – Kortrijk, Cultuurcentrum Kortrijk e Maison de la Culture de Tournai (on the Belgian side).

² One of the main goals of Interreg is not to just stimulate the international cooperation, but to also to diminish the influence of national borders, favouring an equal and complete economic, social and cultural development of the territories that compose the European Union (Hamez, 2004).

³ Until 2016, the region now named Hauts-de-France was known as Nord-Pas de Calais/Picardie.

Strengthened by our long collaboration, inspired by the same demand and by the same will to touch the general public, we have the ambition to create an annual festival that will become an indispensable meeting of the Eurometropole's cultural life and an artistic event of international dimensions (NEXT, 2008b, p. 3).

And, beyond this cultural and artistic multidisciplinary ambition (embracing spectacles of varied natures), NEXT Festival was conceived, above all, as an important course for the promotion of cultural identity for the common territory, for its own inhabitants or to the outside of the cross-border zone (NEXT, 2011). After all, 'culture is one of the most efficient, the most visible and spectacular vector for building a sense of attachment to a common territory, to a common identity' (NEXT, 2011, p. 1). It is specially endorsed by the fact that NEXT events are spread across the whole Eurometropolis, between 18 structures (theatres, museums, maisons folies etc.) distributed both sides of the border, in addition to Valenciennes, that is not part of the ELKT but is annexed to the itinerary of the events.

As important as is to offer the spectacles, it is to guarantee the interurban transit (also interregional and international, in this case) of the festival attendees. To travel between cities is also a way for the inhabitants to get familiar with the Eurometropolis region and to build on the feeling of belonging and attachment. That is why since the first edition of the Festival 23 shuttle buses were put at the disposal, for free, of the general public connecting every city receiving an artistic event (NEXT, 2008a).

In 2013, the number of free buses put at disposal grew to 36 (NEXT, 2013); in 2014, a progress can be observed: 13 cities were contemplated with artistic events with 38 shuttle buses at disposal (NEXT, 2014). The boost in the number of buses offered by the NEXT Festival organisation between 2008 and 2013 sheds some light on the ever-growing concern in improving and expanding the transport structure. This significant increase, confirmed by the 2014 data, reinforce the key-role of the flux of the Eurometropolis inhabitants in the interior of its own territory.

In September 2016, NEXT received the EFFE Prize (Europe for Festivals, Festivals for Europe Prize): it was elected as one of the 12 most innovative festivals in Europe (La Rose des Vents, 2017). Having been chose amongst 760 candidates in 31 countries, NEXT was awarded for its creativity, '... its artistic programme, its "innovative perspective", its international partnerships, its values and its engagement with sustainable development' (idem, n.p.).

5 DISCUSSION

5.1 GLOBAL CITIES NETWORK AND THE POSITION OF LILLE: TERRITORIAL MARKETING APPLICATIONS

The simultaneous dynamic of geographical spread and concentration of activities is one of the key-elements in the organisational architecture of the economic global system. Nevertheless, Sassen (2005, 2007) observes that cities in the Northern hemisphere gather significantly more than half of the global capital market, being observed that the most robust part of the financial activities of the countries are concentrated of their biggest internal urban centres. In general, those are municipalities with greater insertion in the global cities network – the ones that are connected to major economic regions with extensive expression in the world economy – without necessarily being national capitals (GaWC, 2016). According to the 2016 GaWC ranking, those are the cases, for example, of Shanghai (Alpha+); Chicago, Milan, São Paulo, Los Angeles (Alpha); and San Francisco, Boston, Miami, Barcelona and Munich (Alpha-).

This proeminence of the local and regional spheres and the insertion in the globalisation context on different levels stimulate the competitiveness for the attraction of capital investment and deflagrate a true locational war, that also follows the basic law of supply and demand. The more places being sold (the bigger the supply), the higher will be the competitiveness between those places for capital.

To Braun (2008), it is exactly this improvement in competitiveness – and the complexity that it brings to the urban development hurdles – that urges the cities to adopt city marketing policies. According to the same author, this kind of marketing encompasses the coordinated use of the marketing tools, endorsed by a

philosophy oriented by creation, communication and the exchange of urban offers that have added value for both the city's stakeholders but also for its community at large.

The strategies for this city marketing, nevertheless, varies according to the framing of the city in the global context. To Braun (2008), global cities with high levels of insertion, centrality and influence (e.g. London and New York) do not need to implement such aggressive techniques of city marketing, once their positions in the world are already established and guarantees them a comfortable situation in relation to the investments they already receive from the global capital.

On the other hand, cities which exert limited centrality and which the influence is limited to the local or regional level necessitate a more aggressive marketing policy so that they can expand the scope of their economic activities. This kind of strategy is more recommendable to cities which seek to gain a bigger share of the international capital market or insert themselves in a new market niche (Braun, 2008). It is exactly the case for Lille, a city considered by GaWC (2016) to be of "high sufficiency" in services; it means that, by the standards stipulated, Lille is not a global city, but has services enough so it does not become overly dependent of other cities (GaWC, 2016).

THE DISTINCTION IN TERMS OF CITY MARKETING

(...) is between the cities that are well placed in the urban hierarchy with diversified economies, agglomeration economies, high quality amenities and embedded in productive global networks on the one hand, and the cities that still struggle to overcome economic decline with a relatively weakly diversified economy and a legacy of an industrial past that once symbolised the city but it is now associated with decline, on the other hand. The first is well endowed to compete in the knowledge economy and one can expect a consolidated marketing strategy; the latter has a stronger incentive to deploy a more entrepreneurial city marketing strategy (Braun, 2008, p. 27).

Cities with symbolic functions based on a past of industrial excellence and that have experienced a process of decline tend to sense a strong incentive to diversify and change the ways they are perceived through the adoption of city marketing policies. According to Braun (2008), the selling of post-industrial cities is directly linked to the decline of their former more prominent activities. It is a universal tendency that cities with an industrial past start to delve increasingly deeper in city marketing tools to attract investments in new structures and events in a quest to change their image. This is exactly the case for Lille, a city that from 1990 onwards started to face a situation of economic adversity in the wake of the extinction of what was the prime activity for the region during two centuries, namely the coal mining (Siffert, 2016).

The city marketing contributes to the underscoring of a region and serves, mainly, as a factor of differentiation of a specific region in relation to other regions that compete for the same market niche. In implementing this type of strategy – and based on that to conduct the NEXT Festival, a major scale event and with international publicity – the binational governing committee of the ELKT sought to internationalise the region with the aim of seizing the opportunities to capture the international capital. The final goal for that is promoting the economic dynamization and development of the whole region.

Between 2000 and 2016, according to the GaWC reports, Lille went from being a city with sufficiency to being a city with high sufficiency. That denotes, in some ways, a relative success of the internationalisation strategy adopted by governors; nevertheless, it is still out to be explored and measured (quantitatively) the influence of the cultural policies implemented and, specifically, to which extent NEXT Festival had an impact in this process.

5.2 NEXT ARTS FESTIVAL: IDENTITY AND IMAGE

The relative similarities in the historic and cultural roots both sides of the French-Belgian borders renders to the collaboration and exchanges between the two national populations. Yet, the linguistic barrier between the francophones (in France and Wallonia) and the Flemish (in Flanders) tends to set some obstacles in integration both at the individual perceptions level and the spatial practices towards the neighbours (Hamez, 2004).

The role of culture as a crucial agent for the development of the integration plan is clear: ‘... the artistic creation would have a fundamental place as the main driving force for the attractiveness of the territory and the well-being provided to the population’ (Eurométropole, n.d.). Furthermore, ‘culture is this indispensable link that sustains the conviviality’ (idem), this cement of the social cohesion of the Eurometropolis.

Culture, represented by the NEXT Festival, puts itself as one of the catalysts of the social change so hardly sought for Lille – the main hub of ELKT – and the whole region. More than this, those cultural events reflect the need to change the image of a city and a region in a way that would prepare them for the future, so they can become attractive to the international capital. This is perceived by the local governors as fundamental for the economic development of a regions that aims to overcome decades of hardship after the deindustrialisation. The project behind NEXT is, in sum, the project of Lille: it is the split up – if not total, at least radical – with the mining and industrial past towards a dynamic future that welcomes innovation, technology and the specialisation of services. The Festival is, at the same time, the path through where this image change is sought and the final product of this project of territorial and aesthetical metamorphosis.

NEXT Festival, henceforth, presents itself as an urban event that responds to the missions that the city marketing delegates to this kind of promotional action. Therefore, it is an instrument of internal communication that aims to reinforce in its inhabitants a sense of attachment to the Eurometropolis and externally it communicates the newfound ambitions of the city, positioning itself strategically amidst the increasingly edgy competition for international capital.

There is a distance, an offset, between the ‘image’ and the ‘identity’ (Noisette and Vallerugo, 1996) of the ELKT, where the urban image bears the representational dimension whilst the urban identity is more tied to the reality. The effects of this distortion between representation and reality, previously carefully avoided, seem to be systematically pursued by the stakeholders of the ELKT, because it is exactly the image of the city the saleable parcel of the urban product (Thiard, 2007).

Thus, based on what was exposed, it was possible to grasp that the cultural project is also the economic project conducted by important stakeholders for the region, politicians and capital investors. NEXT Festival is therefore a consequence of the communion between the interests of the public authorities and those from the private sector. This artistic event is not only the vector for the promotion of local identity, but also the promotion of political and marketing interests.

In brief, the cultural proposition of the ELKT is a project that is the outlining of a new common identity for its inhabitants, a fundamental part in the restructuration of the economy as envisaged by their own governors and investors. As it is based on three different cultural matrixes (following the subnational divides that compose the ELKT), it can be concluded that the project of the eurometropolitan identity has, at its core, the goal of amalgamating differences – avoiding the value judgement of what is pure and impure – on behalf of a new cultural reference (and, in this case, to be marketed as an image); that is what Fontanille and Zilberberg (1998) call “the culture as a mixture”.

6 CONCLUSION

The aim of this paper was to show how identity, even in rather transient times, is still something that holds strong meaning and power. On a moment where globalisation has, of now, found its pinnacle, new identities keep on emerging mainly as reinterpretations of already existing ones (Hall, 1996). The mechanisms for creating these new identities are presented in two ways by Fontanille and Zilberberg (1998): operating via exclusion and via participation. The second mechanism seems to be the one in use for the promotion of the Eurometropolis Lille-Kortrijk-Tournai project, once the cultural traits of inhabitants of three different subnational spheres are amalgamated together in a discourse that seeks the common ground between the three cultures – and the success of this discourse is pivotal for the broader economic project that entangles the ELKT region.

This course of action was spotted by the stakeholders – the political and financial ones – as the trigger for the rehabilitation of a deprived area in the wake of globalisation and in the aftermath of the crash of the former economic matrix, namely the coal mining. Using city marketing tools, they sought (and keep on

seeking) to promote the image of the region, aiming to put it in a prominent shelf at the 'shop window' of the city and regions that fight for the global market investment.

Nevertheless, there is still work to be done in this front: it is still out to be explored and measured (quantitatively) the influence of the cultural policies implemented in the Eurometropolis Lille-Kortrijk-Tournai and, specifically, to which extent NEXT Festival had an impact in this broader economic project for the region.

ID 1517 | CROSS BORDER COOPERATION IN WESTERN BALKANS- A COMPARATIVE ANALYSIS OF CROSS BORDER EXPERIENCES BETWEEN ALBANIA-KOSOVO AND ALBANIA-GREECE

Ledio Allkja¹
¹TU WIEN
ledioallkja@hotmail.com

ABSTRACT: The instrument for pre-accession assistance (IPA) is one of the main supporting tools for countries aspiring to join the EU. IPA II 2014-2020 programme strategy was approved and supports primarily Western-Balkan Countries in cross-cutting areas in order to prepare for EU-accession. As part of the strategy, territorial cooperation is also supported. Cross-border cooperation in the area is one of the main strands of territorial cooperation where different programs between the countries have been set. This paper investigates through a comparative analysis the experience of cross-border cooperation between Albania and Kosovo and Albania-Greece. The analysis spans not only at the analysis of the relative different projects and the ability of countries to make use of the program, but also looks at different and emerging themes in terms of cross border planning and governance. The analysis will delve into the first programming period 2007-2013 as well as the activities that have been held during the new programming period. The choice of the two different programs comes due to their distinctive characteristics, where on the one side one can find an EU member (Greece) cooperating with a non-EU member (Albania) and on the other side two non-EU states which have the same language, as well as Kosovo being a particular case study of state formation. The Albania-Kosovo case study is important to analyze also due to current development and cooperation between the two governments. So far, there have been two inter-governmental meetings between Albania and Kosovo to foster partnerships and greater collaboration between the two countries. Thus, it becomes very interesting to analyze whether the increase in cooperation between the two states is also reflected in the territorial cooperation programs, as well as their performance in terms of cross border cooperation.

KEYWORDS: territorial cooperation, cross border cooperation, spatial planning

1 INTRODUCTION

In 1991, as many other East-European countries, Albania gave an end to the dictatorial socialist regime. Very soon, the aspiration for joining the European Union and "becoming European" was articulated, forming the longest standing objective of every political party that has come into power in the country (Aliaj, 2008). Nevertheless, the road from a highly centralized and dictatorial regime towards an open and democratic one for sure has been a bumpy one. The "shock therapy" combined with political instability (Aliaj, 2008) (Aliaj, Shutina, & Dhamo, 2010), culminating in 1997, with the fall of "ponzy" pyramidal financial schemes (Aliaj, Janku, Allkja, & Dhamo, 2014) and the civil war in the country, have held the aspiration for joining the European Union back.

It was not until April 2006 in Tirana, when the agreement on Stabilization and Association was signed, which afterwards entered into force in 2009. This agreement marks the intensification of activities between Albania and the EU, culminating in 2014 with the candidate country status (Ministria e Integritetit, 2016). Now Albania is awaiting to open the negotiations, process which should begin once the Judiciary reform has started implementation (COM, 2016a).

In 2006, there are also changes in terms of the support that countries aspiring to join the EU receive. As such, the Instrument for Pre-Accession Assistance (IPA) was created. The latter is a single financial instrument which simplifies and designs the EU support for the period before accession (European Commission, 2014). It is important to notice that IPA substitutes previous instrument such as Poland and Hungary Assistance for the Restructuring of the Economy (PHARE), Sales and Purchase Agreements (SPA), Special Accession Programme for Agriculture and Rural Development (SAPARD), Community Assistance for Reconstruction, Development and Stabilization (CARDS) (European Commission, 2014). The aim of IPA is to increase efficiency of support through a single support framework which increases institutional capacities, cross border cooperation, economic and social development as well as rural development. During the first programming period (2007-2013) IPA was framed into five main components such as: transition assistance and institution building; territorial cooperation under the framework of cross border cooperation; regional development; human resource development and rural development.

Until receiving candidate country status, Albania could benefit only from the first two components, hence as part of IPA it has been engaged in different cross border programs with EU members (i.e Greece) and non-member states (i.e Kosovo, Montenegro, FYROM). These programs continue to be present also for IPA II programming period 2014-2020 (COM, 2016a). Albania-Kosovo CBC and Albania-Greece CBC are quite interesting based on the fact that between the first represents two countries with the similar identities composed of the same language, similar culture, belief, mentality and social norms while the second represent a cooperation between a more developed and experienced member state and a candidate country with less experience. Thus it becomes interesting to see whether there are any distinct changes between the implementation of the two programs based on two main factors such as regional identity and experience.

2 TERRITORIAL COOPERATION

The intensification of interrelations at the EU level has had great impacts also on border regions. Firstly, borders have lost their physical meaning and are becoming more and more only symbolic, and secondly they have become the platform for the development of greater territorial cooperation (Kramsch & Hooper., 2004). The EU itself is somewhat a system of cooperation and interdependence between different states and in order to reduce complexity of different bilateral arrangements they have decided to unite into a supranational body (Sousa, 2012). In this sense, integration is seen as "Europeanisation consists of processes of a) construction, b) diffusion and c) institutionalization of formal and informal rules, procedures, policy paradigms, styles, 'ways of doing things' and shared beliefs and norms which are first defined and consolidated in the EU policy process and then incorporated in the logic of domestic (national and subnational) discourse, political structures and public policies." (Radaelli, 2004, p. 3)

However, the degree of cooperation across borders varies due to different factors such as political, historical, economic, cultural and geographical. One of the main reasons for the different degrees of cooperation is also the fact that cooperation is based on a voluntary process where states, regions or other subnational units act together to achieve common visions and solve common problems. In addition, there are different EU initiatives which support greater cooperation between member states and especially across border. As such article 2.1 of the 1980 'Madrid Convention' defines trans frontier co-operation as: ... any concerted action designed to reinforce and foster neighborly relations between territorial communities or authorities within the jurisdiction of two or more Contracting Parties and the conclusion of any agreement and arrangement necessary for this purpose (Council of Europe, 1980). Some of the reasons for cooperation include but are not limited to: there is an overlap of interests; There is a shared historical memory; there is a strong interdependence between the two regions due to geographical or economic factors; there is a political objective for future joint action. (Committee of the Regions, 2009)

Borders have usually been underdeveloped areas, usually secluded which currently show high structural differences with other more central, urbanized and developed regions. This is even more true when it

comes to former Eastern Bloc countries such as Albania, where the paranoiac obsession of invasion from the capitalist forces, transformed border into heavily guarded and military areas (Aliaj, Janku, Allkja, & Dhano, 2014). Thus the objective is that through cooperation to foster a greater degree of development and allow for structural disadvantages to be reduced.

Although, cross border cooperation has been a process gradually evolving at the European level, sometimes also in parallel to the European Integration process, after the 1990s, the Commission took the lead in supporting different cooperation initiatives spanning from large-scale macro-regions encompassing two or more nation states, the development of inter-regional and transboundary urban networks; and the support of pan-European high-speed transport infrastructure aimed at moving Europeans, as well as cross border cooperation projects (Kramsch & Hooper., 2004)

3 CROSS BORDER COOPERATION IN ALBANIA

For the purpose of this paper two main programs of cross border cooperation are taken in consideration such as Albania-Greece and Albania Kosovo.

3.1 ALBANIA- GREECE

The IPA Cross border program between Albania and Greece for the period 2007-2013 was approved by European Commission in 2008 (European Commission, 2008). The eligible area consisted of the region of Epirus, Region of Western Macedonia and the Region of Ionian Islands in Greece, and the districts of Gjirokaster, Vlore and Korçe in Albania. The overall objective of the program was to increase “the standard of living of the population by promoting sustainable local development in the cross border area” (European Commission, 2017).

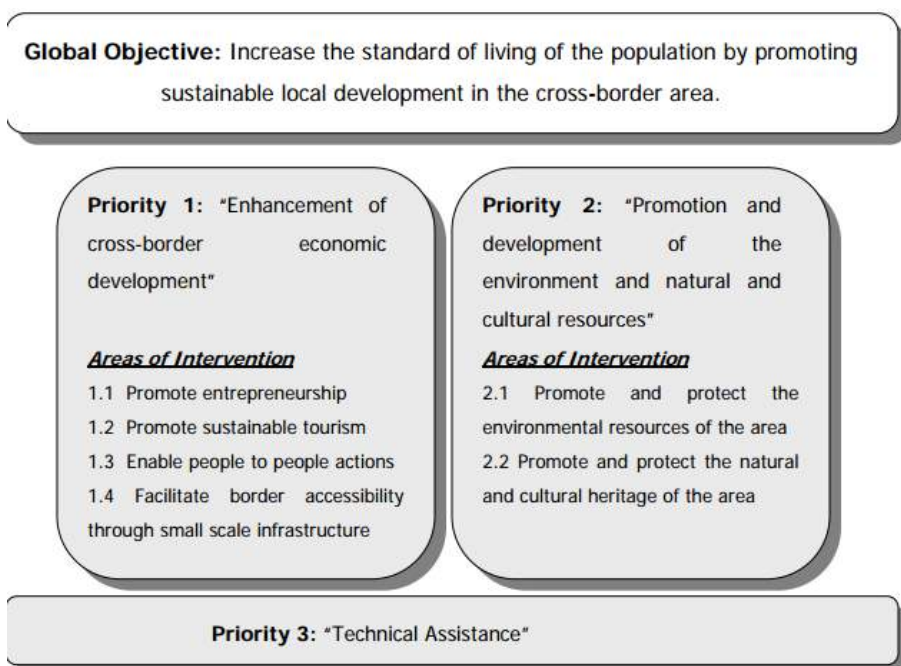

Figure 1 – Objectives and Priorities

In order to achieve the main objective three priority axes were set. Two of them had development concerns (90% Of budget share) at their focus while the latter was a cross cutting priority aiming to increase institutional capacities (10% of budget share) (ibid). A common feature of the program, although it has been quite successful is the fact that most of the projects are led by Greek actors. Out of 44 projects in the area, only 4 of them are led by Albanian partners while the rest are all Greek institutions. Meanwhile, out of the 4 Albanian leader none of them are governmental institutions, they are either Higher Education Institutions or NGOs (CBC GREECE/ALBANIA, 2017). On the other hand, across the Greek border there

is a greater balance between the governmental institutions taking Lead and the non-governmental ones. In this sense it shows that Greece, as a member state, having greater institutional capacities and experience with European projects plays a driving role in the program. Projects have primarily focused on tourism development, especially eco-tourism initiatives. Meanwhile, in terms of environmental initiatives most of the projects have focused on waters such as the Prespa lake or the Vjosa river (CBC GREECE/ALBANIA, 2017).

Although several projects have been implemented on both priority axis, they still do not have had any strong impacts in redefining the issues and challenges of the cross border area. The reason is due to the limited amount of available finances which do not allow for large scale investments. Projects usually aim at knowledge and technological transfer and distribution or establishment of partnerships and networks which are actions that needs longer timespans in order to show meaningful results. In addition, most projects need to work in synergy with other, larger, investments projects in order to increase results. Therefore, it becomes imperative to have greater coordination and collaboration between central and local governance levels.

Meanwhile cooperation continues also for the programming period 2014-2020. The program has set three main priority axis such as "Promotion of the environment, sustainable transport and public infrastructure", "boosting the local economy" and "technical assistance" (CBC GREECE/ALBANIA, 2017). The eligible areas have not changed which show greater stability of the program. However, the administrative reform in Albania has reshaped the borders of local authorities, thus requiring time for the re-establishment of new networks and increasing capacities at the local level again. In addition, it is worth to mention that the program has built on the results and experiences of the first programming period showing greater stability and coherence when compared to the Albania-Kosovo program.

3.2 ALBANIA- KOSOVO

The IPA Cross border cooperation between Albania and Kosovo was planned to be established in 2007 and entered into force in 2010. The initiative took 2 years to start the implementation phase in order to allow for the institutional setting to be set in place. Both countries, and especially Kosovo which only achieved its independence in 2008. The IPA cross border cooperation was seen as a special program established between the two countries also due to the status of Kosovo (Ministry of European Integration; Ministry of Local Governance, 2010). The program area consists of two units in Kosovo, the southern economic Region and the west economic Region, while for Albania is represented by the districts of Kukes, and the two adjacent areas composed by the districts of Shkoder and Diber. The programme area has a contrasted geographic profile. It is rich with mountain ranges, plains, valleys, rivers and lakes. The total population in the programme area was of 1,292,595 composed by 64% of population living in Kosovo and 36% in Albania (Ministry of European Integration; Ministry of Local Governance, 2010). Nevertheless, the majority of the population is composed by inhabitants of Albanian origin, while the rest were ethnic minorities, including Montenegrins, Serbs, Bosnians, Turks, Romas, Ashkaelias and Egyptians (RAE).

From the very beginning the program faced several challenges in implementation such as poor regional and local government organisational structures; no clear division of competencies and tasks between central and regional/local administrations; potential beneficiaries from the private and public sectors in rural areas had limited capacity in project identification and preparation, strategic planning and project implementation. The overall strategic objective of the initiative was the sustainable development in the cross-border region while specific objectives included strengthening of capacities, protection of environment, socio-economic development and increased partnerships and networking. There were two main priority axis such as promotion of sustainable economic, social, cultural and environmental development of the region and technical assistance. The latter was extremely important as both countries show weak institutional structures and capacities for programing and managing the projects.

The program was met with great enthusiasm by actors on both sides of the border. Several projects have been implemented during the period 2010-2013 and some are still in the final stages (CBC ALBANIA/KOSOVO, 2017). Nevertheless, it is important to note some factors such as, projects have been primarily focused on environmental issues and tourism development. In the region there are different non-governmental actors which have shown greater capacity in programming and implementation of such projects. On the other hand, (public) institutions have shown weaknesses in terms of application and

project management, especially at the local level. In most cases, project leaders were from the central government, meanwhile when local authorities were engaged they had a partner role. In few occasions they have managed to successfully lead projects. This is supported by the data on the projects awarded for the period 2014-2015, where there are Project leaders from the “governmental sector”, and mostly the leaders are from Albania (CBC ALBANIA/KOSOVO, 2017).

The cross border programme for Albania-Kosovo continued also in the IPA II programming period 2014-2020. The CBC bodies coordinating the programming and implementation process on the respective sides of the border are the Ministry of European Integration, Directorate for Cross-border Cooperation and Transnational Programmes, Albania and the Ministry for Local Government Administration, Department for Cooperation and Regional Development, Kosovo . In this case, the eligible areas for Albania have changed and are now composed by the district of Kukes and the district of Lezha, while for Kosovo they remain the same. The Programme aims at providing assistance for cross-border cooperation in the following thematic Priorities (TP): protecting the environment, promoting climate change adaptation and mitigation, risk prevention and management; encouraging tourism and promoting natural and cultural heritage; investing in youth, education and skills; technical Assistance (CBC ALBANIA/KOSOVO, 2017).

Nevertheless, it is also important to highlight some other activities which have occurred outside of the EU umbrella but might have impacts on cross border cooperation. In 2013, the Territorial Administrative reform was carried out in Albania which reshaped local authority boundaries in the country from 373 municipalities and communes towards 61 municipalities. This was considered as a highly necessary reform which would increase local authority capacities in territorial management and development (Kuvendi i Shqiperise, 2014). However, the period when the reform took place, between 2013/14 meant that the local authorities are still focusing on understanding and adapting to the new situation, so no real impacts can be seen as yet in terms of the cross border program. In addition to the territorial reform, in 2015 in Albania, 4 regional development agencies were established (Keshillimi i Ministrave, 2015). The latter are expected to increase coordination between central and local level in terms of development issues. The rationale is also that these institutions will also help in the preparation and increasing capacities for dealing with ERDF in the future. Currently they are also eligible for cross-border cooperation activities. Nevertheless, it is too soon to see any impacts yet on the program.

Other important activities include the opening of the local office of the Albanian development fund in Kosovo in Gjakova in 2015. This office will also support cross-border. Meanwhile, the respective central level governments have established an ambitious platform for bilateral cooperation. Three high-level meetings have been held between the two governments with the aim of developing joint programs and projects. However, results have been very minimalist and the enthusiasm of the early stages has now started to fade away. In addition, it is worth also to mention the cooperation between the Ministry of Urban Development of Albania and the Ministry of Environment and Spatial Planning in Kosovo. The ministries after several joint technical meetings also opened a call for young architects and urban planners to draft a vision and cross border projects. It is also worth to mention, that as part of different spatial planning activities in Albania and Kosovo, the homologue institutions now are invited as part of the different consultation phases. Nevertheless, although there is a positive increase in institutional activities both at the central and local level and the institutionalization of new channels of communication, the impacts on cross border projects seems relatively low. The latter is also related to the institutional capacities for programming and implementation of projects.

3.3 CHALLENGES OF CROSS BORDER COOPERATION

Several challenges have been observed which have not allowed for an effective attraction of IPA funds during the 2007-2013 programming period and still remain as a challenge also for the 2014-2020 period, although changes have been made to the program. As such it can be mentioned:

1. Covering of VAT expenses. In the agreement between the EU and the Albanian government, specific articles sanctions that the cost of VAT will not be covered by the EU grant, but from the beneficiary institution. Considering that cross border projects reach high values (for Albanian institutions) also the value of the VAT is quite high. Therefore, becomes very difficult to cover these expenses through other financial means.

2. Covering the cost of co-financing. The agreement between the EU and the Albanian Government foresees that no less than 15% of the total value of the project need to be covered by the beneficiary. In many cases, Albanian (public) institutions find it difficult to cover the costs of co-financing, sometimes leading towards the missing of project deadlines.
3. Government priorities change. The process of winning an EU cross border project goes through 2 main phases: Programming and Implementation. The first process is strongly related to government priorities. Hence, in Albania, where there are very often changes in the political priorities, especially after elections, have also an impact in the programing process. The process is that same and there is no difference between national and local level changes in priority. Although, a shift in priority at the national level has greater impacts, it is argued, that also in cases of changes of priorities at the local level, projects are put at risk.
4. Coordination between national and local level. The programing process is an exclusivity of the central governance, while in the implementation phase local authorities are eligible to be part of the process. The main problem of non-coordination between the two different levels regards investments and priorities in infrastructure development. Although Albania has drafted the General National Spatial Plan, approved in June 2016, it is too soon to draw any conclusions on the improvement of the coordination. Nevertheless, it can be argued that the increase of communication between the two different levels are expected to produce better results. However, as previously mentioned, the high differences between the different political parties in charge of different authorities can become an inhibiting factor also in this case.
5. Changes in the modalities of implementation. In the financing contract of the project are also defined the ways of implementation. In many cases these predictions signed in the initial contract are non-appropriate, therefore very often become subject to changes. However, changes in the initial contract require a long time, which bring delays also to the implementation of the project. Thus, due to issues like this, sometimes, authorities find it too time consuming and time wasting to deal with these projects opting for other less bureaucratic opportunities.
6. Delays from the programming phase to the implementation one. From the moment of programing to the moment of implementation, there is a considerable amount of time, in some cases between 6-8 months. During this time, the programed project may have lost credentialed and its problem priority reduced, or even be resolved through other means, as well as cases where the situation has degraded so much that there is little the project can solve.
7. The qualification of the staff working with CBC projects are not appropriate. The institutional capacities at the central and local level in Albania are low, especially at the local level. As IPA regulations are continuously changing, gaps can evolve in the programing and implementation of EU CBC projects. Difficulties can be seen in both phases such as programming and implementation. IPA is an instrument in continuous evolution with regard to the way and regulation of implementation. This usually happens as the EU Commission tries to improve the program, efforts which have not given the desired results. This evolutionary process has implication on the different institutional settings in charge of working with IPA projects, thus, considering also the relatively low capacities, the challenge becomes even bigger.
8. Sustainability of projects. Based on rules, the donor (EU) is present until the finalization of the project, afterwards it is the duty of the Albanian government to guarantee the sustainability of the project as well as continue building on it. In practice, several projects are neglected after implementation, thus the impacts start declining very soon after the implementation.
9. Non- Leader role of the Local Institutions. Local governments in Albania are used to expect "financing" and investment from the central government. Very often, they refrain from taking a leader role in issues of development and investment. This is also obvious in CBC projects, as very often, local governments are reluctant on being in the driving seat. The latter comes also as a result of the disparities in institutional capacities between the central and the local level.

4 CONCLUSIONS

The aim of this paper was to analyze cross border cooperation initiatives between of Albania with two different types of states such as Kosovo and Greece. In general, although there is great enthusiasm for the cross border cooperation initiatives challenges are big and very often hinder the development and implementation of projects. The reason why this two different programs were chosen was to see whether there were any differences between cooperation with a country with similar historic, cultural and economic development background (Kosovo) and a country which is a member state and has higher experience and institutional capacity such as Greece.

Albania and Kosovo have shown a greater degree of cooperation also outside of the EU framework encompassing higher degree inter-governmental meetings, creation of new institutions, and joint initiatives to improve cross border activities. However, the results have not been as expected. These activities have not had any impacts (yet) on the programming and implementation of cross border projects. In addition, compared to the Albania-Greece cooperation, in this case it is mostly NGOs and other actors outside of government structures that seem to be the drivers of success.

Meanwhile, the Albania-Greece cooperation seems to be more structured and better equipped to deal with the high techno-bureaucratic requirements of IPA. The greater experience and capacity of the Greek part has shown its impact also on the program and the projects. As previously mentioned, the projects are dominated by Greek partners leading the way, while Albanian ones are usually followers. Thus the challenge in this case is to increase capacities of Albanian partners to start leading projects.

In addition, there are also some more technical and coordinative challenges that are not fully met and cannot be fully met only by the program but require a greater sense of commitment and political will. Firstly, due to the nature of financing of IPA, there are financial challenges. Especially on the border between Albania and Kosovo which is composed by some of the poorest local authorities. The second challenge is that of coordinating IPA cross border projects with other priority investments done by the central governments. The coordination initiatives initiated by the Albanian and Kosovo government seem to be a good start, however with little results yet. Thus in this case, drafting a (spatial) strategy or an action plan between the two countries for the cross border region would be one of the recommendations and seems possible also due to the very good relationships between the two governments. A similar approach can be done also in the area between Albania and Greece.

T10 | HOUSING AND URBAN REHABILITATION AND QUALIFICATION FOR PLACES OF DIGNITY

CO-CHAIRS: ROELOF VERHAGE; IVAN TOSICS; DIOGO MATEUS

The rehabilitation of urban areas in order to improve living conditions is a central concern of urban policies. Over the years, the objectives of urban rehabilitation have extended from the improvement of the quality of the dwellings, via the improvement of the quality of buildings, public space and facilities, to the improvement of “quality of life” in the broadest sense, including notions of socio-economic development, environmental wellbeing, and social cohesion.

Since the 1990s, under the influence of the retreat of the welfare state, and of cuts in public spending, urban rehabilitation projects have become more and more dependent on private investment. Public interventions have become indirect, focussing on incentivising private investment in deprived areas.

In the current situation, after the Great Financial Crisis, this approach to urban rehabilitation is challenged. Private investors have become more selective in their investment decisions, and more reluctant to invest in the rehabilitation of deprived areas. As the public budgets are also decreasing, new ways have to be found to rehabilitate those areas.

In this context, participative practices, and the stimulation of citizen initiatives in order to improve living conditions are considered as innovative ways to approach urban rehabilitation. But what are the capacities of such approaches to actually regenerate deprived areas? How to mobilise citizens to participate actively in the improvement of their neighbourhoods? What kind of economic model to invent in order to translate citizen involvement into investment? What is the most appropriate role of the public sector in this context?

The aim of the track is to explore these and related questions on the relation between urban rehabilitation, citizen initiatives, private investment, and public sector activities. The track would welcome papers focusing on theoretical reflections, and applied analyses of urban policies and projects dealing with these issues.

ID 1327 | NEW MECHANISMS OF INTERVENTION IN THE EXISTING CITY: RECUALIFYING THROUGH DEGROWTH. OBJECTIVE: A RESILIENT CITY THROUGH A CIRCULAR URBAN PLANNING

Gorka Cubes¹

¹Escuela Técnica Superior De Arquitectura de Madrid. UPM.
gorkacubes@me.com

ABSTRACT: It is becoming widely accepted that the future of urban planning and the place of the satisfaction of our needs in our cities, will be based on urban redeveloping and regeneration, instead of continuing with the unlimited consumption of virgin land. Therefore, the challenge is to qualify and intervene on the existing city, otherwise we run the risk of incurring into greater inefficiencies and resources shortages. Hereby, urban qualification is understood as a model of efficiency, effectiveness and sustainability. Once it is accepted the goal of effective intervention on the city, we must confront the systemic problem which concerns urban planning: the practical impossibility of intervention in the consolidated city, except by injecting public money (that we don't have, and will not have) or by programming artificial re-densification. Both procedures cannot be considered as feasible methods. While the city is still growing and consuming large quantities of virgin land, there are no opportunities to generate the added value needed so that the existing city can reinstate the redeveloping process. Therefore, we must catalyse urban redeveloping by limiting expansion and generating value. Reducing urban growth does not only diminish the ecological footprint, but it generates an increase in value in the already altered land, that facilitates the regeneration of the existing city. Concentration of value through physical net degrowth that generates net value growth. In other words, this approach provides a new mechanism to intervene in the existing city: active and programmed urban degrowth acts as a generator of value and as a redeveloping catalyst. This land use approach is the first step towards resilience and circular urban planning (brand new concept provided in this paper, as the closure of life cycle in land use). As a matter of fact, resilience can never be fully achieved if mechanisms that facilitate urban degrowth are not effectively implemented. Degrowth is itself resilient: In fact, the response of degrowth should be viewed as the most resilient of all. The background is the theory of the circular economy and the philosophy of cradle to cradle: waste should be understood as a food of a new parallel process. Garbage is food, as well as degrowth generates value.

1 STATE OF ART: SYSTEMIC CRISIS

There is no doubt about the fact that the urban network and the built-up building park around us, is close to reach its logical life cycle. It needs interventions to improve efficiency and sustainability; substitution, rehabilitation, redeveloping, regeneration and urban renewal that allow to realize for all, its social purpose. Operations of adaptation to the standards of sustainability, quality, comfort and accessibility.

We must be able to combine this need for renewal, with urban regeneration and the improvement of public endowments and facilities. In short, in improving the quality of space and urban land. As stated in the Leipzig Charter on sustainable European cities (UE 2th May 2007), and in the Toledo Declaration (URBAN Intergroup at the European Parliament 2010) a new urban alliance is needed to implement the strategic commitment towards integrated urban redeveloping.

Some of the foundations that have constituted the urban model that we have all met, with their lights and shadows, must be rethought and overcome. The model does not work 1. As Eduard Fúhr points out: Over the last few years the concept of 'shrinkage' has developed to a central category for urban design and planning 2. Concepts such as benefit, equidistribution, value, ownership model, how to finance urban conversion, relocation, insolvencies, public and private scope of action, gentrification and maintenance cost of the city, together with a context of flat population growth, are the basic elements of a reflection around the city, its state and its derivatives, which must be rethought in order to facilitate that urban planning fulfills its social purpose 3. The maintenance of the system in the current terms in urban planning and development, is a guarantee of more urban degradation and impoverishment for many, and more to come.

The urban planning as we know it has to undertake a paradigm shift, a deep and courageous change, because there is no other solution that is based on alterations to the current model. We must intervene or encourage intervention. Solutions based on continuing an expansionist city model cannot, and should not, continue to leave behind an inefficient, costly artefact that cannot be altered.

The public administrations do not have and will not have money to regenerate the city, it is impossible. Neither should they, it is not fair. We cannot continue to consume resources as if they were unlimited. We cannot wait, because there is nothing linked to the time that can be remedied, but to the contrary; aggravate. Waiting for the economic cycle to recover is denying the root problem: a way to make that is exhausted.

On the other hand, we should not persist in dysfunctional intervention models, such as subsidies, the non-application of the essential duty of conservation linked to the ownership and the indissoluble linkage of the use itself with the right of use of the land should not be persistent. The true cost of the maintenance city must be faced and clear out who and how must face it. We should not continue with this imperative model and move to a participatory and co-responsible model, going deeper into alternative modes of housing, tenure and ownership, typology, transformation and collaborative urban planning.

1.1 THE ECONOMIC UNSUSTAINABILITY OF THE URBAN PLANNING MODEL.

How is the regeneration financed? The question is: who pays redeveloping? 4 . We are witnessing the end of expansive urban planning that pays at its expense, and based on its own capital gains, the construction and maintenance of the city. It is an exhausted model. We must assume the conceptual shift from the analysis and the criterion of economic viability to the criterion of economic and long term sustainability of what we plan.

Urban redeveloping will be the central goal of urban action from now on, and one of its fundamental elements is the economic sustainability and assumption of financial charges. Who pays for redevelopment? It is usual to assume that the city is self-financing. The change of focus that urban redeveloping brings us, inevitably faces this question. The city has degraded with the use, has been consumed. Does the city really self-finance?

The answer is NO. Expansive urban planning, with its burdens, endowments and assignments, has financed the construction of the city, but when it comes to dealing with regeneration and redevelopment, the model does not work. In order to tackle the issue in its entirety, we must overcome the barriers of the scope itself and approach the intervention from the collective, putting collective rights before the individuals. The real challenge is: How can urban conservation be adopted as a strategic approach to spatial sustainable development? 5 How can we make it? How can we finance it?

2 SENSEMAKING.

2.1 DEGROWTH AND SOCIAL CHANGE. 6

Inexorably, in addition to start to think about articulating systems for the enhancement of urban land and reducing the ecological footprint, those two concepts must be combined with the necessary reflection on the limitation of expansion, mobility, uses mixtification and the study of the optimal urban density. Only from this profound reflection can we optimize the model and justify the effective and full fulfillment of the social goal that corresponds to urban planning.

This social purpose, and therefore that of urban regeneration, has a scope that goes beyond the simple spatial transformation and refers to the reorganization of social relations. We live in fragmented cities, due to the social differentiation in the use of space. How to rebalance this social-spatial distinction of the centre (with its different concepts of centrality) and the periphery, must be the motor and objective of the urban redeveloping strategies to be implemented. In this way, the implementation of these rehabilitation, redeveloping and urban renewal strategies will generate positive impacts that, in turn, can serve as an essential lever for the economic and social development of the city and its citizens. But the underlying problem is deeper: Should we satisfy demand or manage supply? Societies will have to learn to deliberate

under uncertainty within the scope of flexible management and to stop planning oriented either towards growth or decline, but towards the well-being of people.

The question on the one hand lies in the concept of finitude, of the existence of limits, in the reciprocity work and the implications for the formation of social capital in a context of degrowth. It is a mere physical, empirical question. And on the other hand -the fundamental one -the key is to increase in this context the welfare of the people. For this, the key is cooperation as a theoretical root, as an attempt to explain the concept of degrowth: the work of reciprocity 7 and the implications for the formation of social capital. in a context of degrowth 8. Facing the paradigm of the dominant sustainable development, the hypothesis of the sustainable degrowth 9. But degrowth not only as a decrease in consumption as we know it 10, but with the idea of strong and sustainable consumption 11.

It is possible to interpret this movement not as a depressive factor but as a catalyst 12 for the true fulfilment of the social function of urban planning. The argument is that -from an evolutionary perspective-, the fact that there are some potential elements for conscious social change, can be substantiated (one could imagine a democratic refoundation in the perspective of the decline, which includes ecological, social and anthropological challenges 13) even in a degrowth era 14.

The different variants of the strategies of degrowth 15, as an emerging concept, share the perspective of a greater democratization besides the environmental conscience 16. The degrowth is presented in this way as a way of transition towards a socially and ecologically sustainable future 17. Thus, the approach to degrowth is more fundamentally raised as questions relating to the relationship between material prosperity and individual and social well-being 18. The Cohousing movement, for example, is a model for making life more social and greener in an urban context. Cohousing fits perfectly well with economic theories and good practices of degrowth 19.

The key is whether this is possible without traumatic changes in the institutional framework 20. Under what conditions can it be socially sustainable? 21 An interlocking cultural and political shift is needed that embraces degrowth as positive social development and institutional reform. Therefore, sustainable degrowth is not only a structuring concept; is a political and social project that offers a new grouping motto for a social coalition built around the aspiration to build a society that lives better with less 22 23.

In the literature on degrowth, relocation in relation to the mobility of people towards overcoming urban petrification is widely considered as a strategic approach for the transition towards a society of decline. Spatial decentralization can lead to social and environmental consequences that confront the goals of a decrepit society. The maintenance of localization and the change only of the decentralization of decision-making in the planning process, do not necessarily lead to a just and sustainable society. It is essential to have multi-scalar transitional strategies, with careful steps 24, in the context of planning to pursue the urban renewal, based on the mobility of localization. This shows the complex relationship between paradigmatic social transformation and spatial development, and the significant role that urban planning can and should play in the transition to degrowth 25.

In short, the key is the degrowth as defined by Schneider 26 as "An equitable reduction of production and consumption that increases human well-being and improves local and global ecological conditions in the short and long term".

2.2 PARADIGM SHIFT

We operate with a model based on constant expansive growth that does not work when urban redeveloping must be faced. We are not prepared to assimilate and manage both the degradation of the urban environment, and the urban decline itself, because the natural (we think) is that the city grows as long as it does not meet its physical limits. Therefore, when we get signals that do not fit the paradigm we do not stop until we find the cause that allows explaining such behaviour against nature without having to question the paradigm. But the system does not respond. The change must be systemic, it must be total. The objective should be refocused and redefined purposes. That is, the need is to replace the traditional expansive model, for the regeneration of the current urban system.

To do this, new ways of proceeding should be programmed, and at the same time make citizens aware of their obligations and responsibilities, not just their rights. New models of strategic planning instead of shortened planning and millimetre definition. Regarding the way to approach the planning, the procedures and basic methodologies (ideas) that will have to be applied, will be:

- a. Prospective planning. That who aims to show the opportunities and benefits of linking territorial foresight tools to urban planning procedures.
- b. Management planning. The one that not pretends a direct relationship between needs and spatial display. The fact of granting specific intensities and uses to each and every part of the territory, in fact limits its development to that specification. It is necessary that the planning establishes the objectives, but without limiting their spatial development, in such way, that through that flexibility can be effectively implemented with greater effectiveness the determinations of the purposes of urban planning. Urban planning legislation has no obligation to guarantee the activity of speculators; on the contrary, it has, or must have, the obligation to avoid it. Therefore nothing forces to attribute in detail the buildability to the land. It could (and in my opinion, should) move to a goal-oriented model where the emphasis is on the goals pursued for the city without fossilizing the media. It is necessary to overcome the cult of the plan itself -which is only a mean-to work on planning. This would allow avoiding that the means substitute the ends, to adapt the means to the circumstances of each moment.
- c. Continuous planning. Scrum planning. Based on: adopting an incremental development strategy, rather than complete product planning and execution. Basing the quality of the result more on the tacit knowledge of people and the local people involved in self-organized teams, than on the quality of the processes employed. And overlapping the different phases of development, instead of performing one after another in a sequential or cascade cycle.

In addition to emphasizing the objectives, it is necessary to reconsider them regularly and at high frequency. Social needs evolve rapidly and undergo changes that were unpredictable very recently and are elements that drastically condition social configuration. The capacity of adaptation of the urban activity to the new problems is null. It is not about putting planning upside down every four months, it is about outlining the variable parts so that the whole serves better the quality of life of the people.

Regarding the key ideas and concepts of the paradigm shift should be the following, and should guide the nomenclature of urban action in the coming years:

2.2.1 THE EFFECTIVENESS VS EFFICIENCY

The concept of efficiency is commonly accepted. Efficiency understood as optimization or maximization of work done. However, the concept of efficiency forgets the purpose for which the work is developed, so that its ultimate object is better understood by the concept of efficiency. Work can be very efficient, but not effective for the defined purpose. For this, it is critical to link the optimization of the work to the intended end, of the plan to the goal, because in the process of maximizing the performance, effectiveness can be lost if the functionality of the work is not taken into account: its usefulness.

Above and beyond any technological advance, it is necessary to press on the need for efficiency, as a step prior to effectiveness, an idea that dismantles the paradox of efficiency -Jevons paradox 27 -which stated the final increase in the aggregate consumption of the system. The dilemma is between satisfying demand and managing supply. Only by acting, either from both sides, or only from the incentive of demand, goals can be achieved, never only from the stimulus of supply. Focusing on increasing efficiency implies the assumption of the obligation to satisfy demand, even though it may be growing steadily. An approach from sustainability must replace the satisfaction of the demand for the management of available supply, in our case, talking about available and buildable land. The key concept is to overcome efficiency for effectiveness. Because strategies that aim to satisfy the demand cannot be sustainable, ecological or viable.

2.2.2 THE RESILIENCE

Resilience is a dynamic process that ends with a positive adaptation in contexts of great adversity. Resilience is also the term used in ecology to indicate the ability of a system to absorb disturbances without significantly altering its structure and functionality characteristics; being able to return to its original state once the disturbance has finished. Factors that foster an ecosystem's resilience give way to sustainability.

What does this have to do with the urban question? Urban resilience is the ability of a city exposed to a threat to resist, absorb, adapt and recover from its effects in a timely and efficient manner, including preserving and restoring its basic structures and functions. This resilience concept is linked to the dynamic concepts of urban development. In this sense, resilience is a process and not an immediate response to adversity. Being resilient has little, if anything, to do with being invulnerable, but with learning and adaptation. Resilience is the key response to climate change, and in that context, education, learning and training must be taken as a key element in strengthening the response to climate change.

What holds the present article as a novel concept is that the degrowth is itself resilient. As a reaction to aggression, the response of retraction must be considered as the most resilient and feasible of all. This is why a holistic approach to designing, planning and managing resilience is essential, including an assessment of the cultural dynamics and processes within cities as well as their physical elements.

The critical issue is what cities and their urban communities must do to move toward a more resilient state in the future. The concept of "urban governance", contributes to the comprehensive management of urban resilience. There is a significant need for a new approach to urban governance to address uncertainties and future environmental and climate change challenges.

2.2.3 CRADLE TO CRADLE³⁶ . CIRCULAR ECONOMY. CIRCULAR URBAN PLANNING

In the ecosystems of the planet, there is no garbage, there is a complete closure of material cycles. Our societies can do the same by designing all the products so that the materials are recycled in the same use, or recycled "upwards", meaning that the next use has the same or more value than the current one. The paradigm shift will success with the idea that in any productive process, garbage should be understood as the food of a new parallel process. Abundance and diversity can and should be celebrated whenever the process is closed and the residue of a process serves either as a biological food of that same process, or as a technological food of a parallel process, but always in a circular feedback scheme system.

To understand this concept, in terms of urban land consolidation and therefore planning, it is essential to link with the obvious, but often infrequent: "the time". Space and time must be linked, that is to say, occupation, land use and its schedule, and its expiration. The planning parameters and their value should be linked more strongly with the validity of the plan itself in their temporal scope and not beyond, and especially linked to the effective use of the land. The urban plan classify the land, but only in what they are in force, although we seem to forget it. The temporal dimension is not rigorously applied and must be indissoluble. The plan should be reviewed from time to time and give flexibility to land use. This is the first step towards resilience and circular urban planning understood as the closure of the life cycle of land use.

Circular urban planning: This new concept deals with incorporating the concepts of circular economy and circular production into urban planning and land use, with the aim of creating intelligent cities that are able to adapt and learn from their own mistakes: resilient cities. Definitely in the planning we must consider this flexibility, the end of life of the buildings, the linkage of the effective use of the classification of the territory, and the closing of the life cycle of the use of the land and to flee of the linear models. In order to reach it, the land must be able to occupy and vacate with the same ease. We must work for it.

2.2.4 SUSTAINABLE MOBILITY VS SUSTAINABLE ACCESSIBILITY: CONNECTED SELF-SUFFICIENCY

Capital in all matters relating to urban planning is the problem of mobility. How to face it? There are only two ways. The first is to mitigate through means of transport of greater environmental efficiency and social efficiency, in particular, the enhancement of collective transport. The second is to reduce the

environmental and social consequences of traffic by reducing physical mobility but increasing other means of connection.

Mobility seeks to bridge the gap between the members of a community and the places where they meet their needs or desires, that is, to enable accessibility. That is to say, accessibility is the objective that, through the means of transport, seeks mobility. The usual logic that equates mobility with accessibility. The confusion of both terms is the basis of the accepted formula that "greater mobility greater accessibility". Under this simplification we have been planning; a criteria that, without improving accessibility -and often worsening it -have had a main impact on mobility problems.

Accessibility not only has one variable -the transport-but it is the result of the interrelationship of multiple variables in which spatial planning and socio-economic organization play a fundamental role. Accessibility is a concept linked to the places, the spatial layout, and the territory.

The objective to be guaranteed should not be to have many means of transport that reach ever greater distances, but to have access to goods and services. Accessibility, therefore, is valued either in relation to the cost or difficulty of movement required to meet the needs, or in relation to the cost or difficulty of the supplies or customers reach the place in question.

Sustainable accessibility thus becomes a more far-reaching approach than sustainable mobility. By facilitating reflection on needs, it facilitates reflection on the construction of urban relations and, therefore, reflection on the city model.

To this end, it is not enough to improve and expand the transport system, it is also necessary to question the spatial or geographical level in which the inhabitants develop: increasing accessibility can only be achieved by increasing the proximity between the inhabitants and of these to their needs. Factors with a critical impact on the processes of construction of the city, in short, concepts that express a new model of society towards which we are headed. In this new scenario, the level of self-sufficiency of regions, cities, neighbourhoods, and buildings is a critical issue.

Everyone should try to solve most of their needs on their site in their territory. In the first place the energetics, but not only them. Cities must work with nature, not against it is the new paradigm. Urban processes will be more stable, the more integrated they are in natural processes and in biological cycles that feeds back.

Connected self-sufficiency ³⁷ is a concept that seeks to opposite the established dynamics, breaking the limits and the usual practice of waste, and oppose the notion of freedom that is linked to the right to waste and abuse natural resources, processes that can forget the links between economy and nature. Connected self-sufficiency understood as optimization of the use of all existing resources, with a tendency to close the cycles of materials and energy in the sites themselves, and as a search for the balance between the logic of natural processes and the advantages of network interrelation.

3 THE IDEA: DEGROWTH GENERATES VALUE.

We are accustomed to deny certain realities: Housing prices never go down; the city expands by its own nature... Jew-Christian culture has taught us to conceive history as a linear progress, so we do not know how to read properly, and less to digest, the phenomena that do not fit in that conception. Other cultures focus on the cyclical aspect of history and are better equipped to understand phenomena that do not correspond to the linear progression paradigm.

Reality shows us that in order to mobilize consolidated urban land, any urban redeveloping operation must plan an increase in urban buildability in that concrete area (an added value), in order to be able to carry out and assume the cost inherent to the dismantling of the existing artefact, and to build the next one.

Given that it is necessary a contribution of an added value to achieve the intended mobilization (putted away the increase of buildability, nor of the public subsidy), taking into account the dispersion and effective loss of the urban critical mass of the periphery, a new mechanism of intervention arises as a way of contributing to that necessary increase of value that switch it on. Indirectly: and if that additional value, that increment, or question of opportunity, comes to be given exogenously?

The line of research that this article advances, matrix of development of the PhD thesis of the author, tries to contribute with a different answer, a new mechanism of intervention in the existing city: the degrowth as generator of value. Active and programmed degrowth as a means of concentration of demand, through the restriction of supply and catalyst of urban redeveloping.

For there to be intervention in the existing city there must be a profit, and as long as it continues to grow and consume virgin land, there will be no possibility of generating an added value in the existing city, so we must intervene in supply not only limiting expansion, but even reducing the occupation. Thus we can generate expectation and added value in the consolidated and non-consolidated urban land which may catalyse its redeveloping. As Brent D. Ryan notes, "Accepting the inevitable decline and abandonment of some neighbourhoods, while rebuilding others as new neighbourhoods with innovative design and planning, can reignite modernism's spirit of optimism and shape brighter future shrinking cities and their residents" 38, to which I add that not only with this resigned acceptance but proving it as a means of generating such added value.

Degrowth, not as a hygienic need or only to reduce the ecological footprint, but applying its effects as a method to generate an increase of value, which rise to the opportunity of redeveloping of the existing urban network. Degrowth not of value, but in terms of consumption of net land and built roof. A form of concentration of value, through the physical net degrowth, but net growth in terms of the resulting final value holistically measured. The challenge is to use the degrowth as a means to generate an increase in urban value and urban qualification.

The investigation will focus on the search for qualitative formulas and catalysts, which excel the increase of value and urban qualification, through land and built areas abandonment in parallel with retraining and integrated efforts in others. The purpose is to demonstrate that resilience and circular urban planning can be achieved through degrowth in the existing city. The ultimate aim should be the requalification to effectively fulfil the social purpose associated to urban planning.

The claim, logically is not to give a panacea that solves all the problems inherent to the sustainability and efficiency in our cities, but to propose a new path that contributes to the achievement of the intended accomplishment and serves as a catalyst for integrated actions.

The challenge is how to increase the quality of life in a context of degrowth 39. This is the real challenge: that degrowth may serve to increase the quality of life of people.

4 RESEARCH OBJECTIVES

The research delves into the search for qualitative elements that facilitate the implementation of hypotheses and catalytic formulas to achieve this; and the study of its consequences. The objectives of the research are:

1. Formulation of the hypothesis and the sensemaking process followed to reach to that conclusion.
2. Identification of boundary conditions that might change in order to allow the implementation of this theory, identifying current and future catalysts.
3. Identification of benchmarks, establishing weighting relations for a holistic and global calculation, necessary for identification of feasible actions to implement the scenario.
4. A real case of implementation study and its consequences: Bilbao and its next step of urban transformation. Contrast between actual growth plans and the application of this theory.
5. The study of cities in rebound: cities in which active hygienic degrowth programs were implemented in the recent past, and now are growing again. Where are they focusing their new growth? It's interesting to see if this new resurgence is applied in the redeveloping of the consolidated but empty city.

The PhD thesis advances different qualitative aspects on which to influence in order to create the conditions and the appropriate ecosystem for the effective development of the hypothesis. Such as: 1) The review of the property rights. New models.

- A. Differentiation between land property rights and built property rights.

- Between built property rights and its use. 2) Sustainable construction. Prefabrication and industrialization. Light construction. 3) The new concepts of urbanization (land transformation), occupation and land use. 4) New concept of relocation in urban redeveloping areas. 5) Investment vs. speculation. 6) Urban planning and foresight. Management planning 7) Continuous planning: Programmatic indeterminacy. Stratification of functions: flexible multiplication and mixed urban uses. 8) The non-place as work space ergo the non-place as living space.

The following are elements that may constitute factors of acceleration catalysts or triggers that facilitate the application of the hypothesis and are part of the PhD research:

1. New concept of the participation of the community in the capital profit of the urban action.
2. New concept of the distribution of benefits and charges in land transformation.
3. New concept of the delimitation of the distribution areas. New zoning.
4. Temporality of the classification of the land's uses.
5. Reuse. Valorisation of the debris.
6. The duty of conservation by the owner.
7. The duty of disassembly after the use's end.

5 CONCLUSIONS

Any reflection on Sustainable Urban Planning must start from these two basic assumptions: that growth has limits, and that we have already surpassed them, or we are very close to it. And therefore lead to an immediate corollary: we must stop growth. Degrowth is inevitable in physical terms in order to achieve a sustainable, efficient and effective urban balance. There is no technical solution to the problem 40.

There is an invertment in the pyramid of the population in our society and even a net degrowth in population in many cases. This downward trend has been maintained over time for decades, and all data point to a progression of this trend by the low birth rate. The next generations, those that will occupy what we plan today, will (must) generate a much lower demand for buildable land and buildings. If the empty housing stock data is joined, we will arrive at the rapid conclusion that the city runs the risk of diffusing its critical mass, within a consolidated urban network with multiple dotational deficiencies and low efficiency. We must try to turn this threat into an opportunity.

Likewise, the ecological crisis is a direct consequence of the current social and economic model, based on the exploitation of the resources of the planet beyond any limit. An economic model built on the absurd belief that perpetual and unlimited growth is possible. This is the real Gordian knot that must be eradicated 41.

The question of urban density linked to efficiency, sustainability and the mixtification of uses in the search for a rationalization of transport mobility, inexorably leads to start to think of articulating systems to give added value to the urban estate and to reduce ecological footprint. The problem has much to do with the inadequacy of our cities to the new requirements and demands, and with the lack and the physical deterioration of the endowments in urban land. The challenge is not only due to the intervention in the existing city, but also through the requalification of consolidated and non-consolidated urban areas. Requalification understood as the valorisation of the urban areas in all its extension and measure holistically in all its transversality of disciplines.

The basic question is how to act in the existing urban network. Taking only the paradigm of efficiency through density, the urban redensification must inevitably pass through the liberation of part of the already built areas. It is not materially possible to achieve efficiency by increasing urban density, without achieving in parallel the liberation of the non-dense, or unconsolidated, otherwise the net built area of the urban system as a whole would be grown, obtaining the opposite effect of loss of efficiency (Jevons paradox). But it is not only efficiency the paradigm to follow.

We must reject the traditional urban development schemes: the consolidation of land transformation. Urban petrification should be attacked connecting it with land use. The objective should be to achieve the raise of the quality of life of the people. Urban planning is a public function with an inherent social purpose,

which should be no other than to end socio-spatial inequalities and the system that generates them. We must face the systemic problem that impinges on current urban planning: the practical impossibility of effective intervention in the existing city. Any urban redeveloping operation must plan an increase in urban buildable capacity resulting from the specific area in order to be viable. So we can be able to start assuming the costs of disassembling the existing artefact, in addition to the assignments of the future artefact, taxation and later the new development and buildings. In the current conditions it is necessary to program in the particular area an additional value to the previous one to be able to mobilize it. The new idea that this article presents, focuses on articulating a method that leads to the necessary increase of value, that generates the opportunity of action, allows the viability of the processes of urban redeveloping and makes them possible; through the active degrowth, through the liberation of the urban land and of the buildable areas, as a means of concentration of the demand, by reducing the supply and availability, that concentrates the opportunity, grows the value and catalyses the process of redeveloping.

The ultimate objective is to re-qualify and demonstrate that resilience and circular urban planning (understood as closure of the life cycle in land use) can be achieved through degrowth in existing and consolidated urban areas. Degrowth is itself resilient: Resilience is a process and not an immediate response to adversity. As a reaction to aggression, the response of retraction should be considered as the most resilient and feasible of all. The challenge is to degrowth, not as a hygienic need or only to reduce the ecological footprint, not as an action of mere collateral expense to the system, but as a method to generate an increase of value, that gives rise to the opportunity to the redeveloping of the existing urban network. A form of concentration of value, through physical net degrowth, but net growth in terms of final result value. That is to say:

- a. The degrowth as a generator of value. Active and programmed degrowth as a means of concentration of demand, by restricting supply, acting as an urban redeveloping catalyst.
- b. The key concepts of philosophy "cradle to cradle" are intuitive and rooted in the imitation of nature: garbage is food, as well as degrowth generates value. Circular economy, circular urban planning.

ABSTRACT: Recent (European) comparative studies in the fields of housing policy and spatial planning have been dominated by taxonomical approaches (attempts at categorising systems and temporal stages of state action) and measures of the ‘maturity’ of national systems. In this paper, we adopt a genealogical perspective and consider (national and local) cultures central to the shaping of policy (differences and convergence). We set out a long-term, in-depth exploration of the planning-housing nexus in Portugal – a case that helps adding nuances to mainstream theorisation – and focus on the Programa Especial de Realojamento (PER; Special Programme for Rehousing), a programme that has had changing roles (from a financial instrument to a core component of policies of urban regeneration) in connection with political and planning cultures changing in time and space. Our goal is contributing to making sense of the intersection between planning cultures in transition and changing housing policy, namely the generalised shift toward regeneration and concurrent retrenchment of state action – and the relation among housing as welfare (‘social housing policy’) and housing as urban policy (‘social policy for housing’).

KEYWORDS: planning cultures; comparative planning studies; policy diffusion; policy generation; Lisbon.

1 INTRODUCTION

In late 2014, while we were preparing the bid for the research project from which this paper stems, most people we talked with – Portuguese scholars with extensive experience in housing, planning and urban research – were quite surprised of our decision to study a programme they considered to be virtually concluded, somehow outdated and indeed not central to the political and academic discussions of the time. The Programa Especial de Realojamento (PER; Special Programme for Rehousing), had been launched in 1993 to provide financial instruments to the municipalities in the metropolitan areas of Lisbon and Oporto to rehouse the thousands of households living in informal settlements, often out-and-out slums. Despite having never been formally concluded, the PER had had its acme during the late 1990s; and much had been written at that time. All in all, most of our contacts seemed almost to suggest that housing, and policies thereof, were not really a central topic in a country undergoing harsh austerity measures – most of which prompted by the memorandum of understanding signed in 2011 when the country was bailed out by the ‘Troika’ made up of the European Commission, European Central Bank and International Monetary Fund.

The scarce scholarly interest to the PER was surprising in a way. In the wake of the global financial crisis, housing, and its crises, had come back to the centre of international attention (see, e.g., Aalbers, 2016; Madden and Marcuse, 2016; Garcia-Lamarca and Kaika, 2017). In Portugal, it was eventually the recovery, rather than crisis and austerity, to trigger the national debate about housing. While the economic recovery of Lisbon and Oporto, materialised since 2015, has been driven by a boom in tourism and real estate, touristification and gentrification have become central to academic, political and media debate. Habita, a group of activists born in 2005 and constituted as association in 2012, had long been denouncing growing housing problems in the country and evictions of households living in precarious settlements in various municipalities of Lisbon Metropolitan Area (hereafter LMA), made in name of the PER itself. In 2016, Habita succeeded in bringing the UN Special Rapporteur for Adequate Housing to visit Portugal. The report of the visit (Fahra, 2017) highlighted both the risks stemming from gentrification and touristification, and the permanence of situations of precarious housing in informal settlements. In March

2017, the centre-left majority in the national parliament voted a recommendation to the national government, asking a systematic evaluation of housing needs and urgent policy action¹.

We should not be surprised by cycles of scholar and political attention to (issues such as) housing. The recent 'return to housing' has reverted a long-cycle, started sometimes around the 1970s/1980s, during which housing, rather than a central component of welfare, had been considered primarily a commodity to be delivered by the market – see Madden and Marcuse (2016) on the double nature of housing as 'home' and 'commodity'; while the focus of public policy shifted toward promoting the regeneration of the built environment – of which housing would be one, among many, elements. In this paper, we are concerned with the nexus between housing policy, on the one hand, and planning policy, on the other – and the relation among housing as welfare ('social housing policy') and housing as urban policy ('social policy for housing')². All in all, we see, in the sequence of cycles of scholar and political attention, a failure to understand housing holistically, through integrated approaches capable of considering the need for the state to lead both the provision of decent and affordable housing, and the regeneration of the built environment.

As such, this paper is located at the intersection of the (European) fields of comparative studies about housing and planning systems; and uses this intersection to provide a more nuanced framework for their understanding. Both fields have been dominated by 'taxonomic' approaches: housing studies have been dominated by attempts at categorising housing systems and temporal stages of state action; while comparative planning has been especially concerned with measuring the 'maturity' of national systems (see next section)³. Our theoretical hypothesis is that such taxonomic approach often fell short from understanding in-depth the dynamics of policy generation and diffusion in a field, housing, which is characterised by complex intersections between policy areas and levels of governmental action.

Indeed, this seems to be the case for Portugal, which we deem a particularly useful field of exploration. Baptista (2013) and Tulumello (2016) consider Portugal a place at the 'borderlands' of, and hence useful to enrich, urban theorisation. With regards to planning system, Campos and Ferrão (forthcoming) have noted that Portugal has an awkward place in comparative studies – possibly a component of the broader difficulty to fruitfully include 'southern perspectives' in the EU debate on planning (Janin Rivolin and Faludi, 2005).

Against this background, we adopt a genealogic approach (cf. Campos and Ferrão, forthcoming) to the issue, in that we consider the long-term perspective, and the production of 'thick narratives' (cf. Flyvbjerg, 2004), fruitful instruments to unravel the relations between multiple levels and scales – e.g. between European pressures in the field of housing and planning, and local planning cultures – in the making of local and urban policies. We shall use the case of the PER, understood within its national context, for our exploration for two main reasons. First, because it is a good example of multi-level policy – the national government provided the funding instruments and general regulations, while local authorities were in charge of planning, design and implementation. And, second, because it allows us to explore the tension between the two dimensions of housing provision and urban regeneration – and between social housing policy, and social (and urban) policy for housing. All in all, the PER can be said to constitute an 'incipient regional plan', in that it is a policy that restructured the regional built environment significantly – in LMA, about 20,000 households were rehoused – but in absence of a proper planning instrument. As such, the extent to which the provision of housing was integrated with larger concerns for urban regeneration was dependent on a set of factors, including the municipalities' approaches and the different phases of governmental action.

The paper is structured as follows. Section 2 reviews existing comparative literature on housing and planning systems in Europe to emphasise the dominance of taxonomic, and static, approaches. In sections 3

and 4, we respectively summarise the recent histories of the Portuguese planning system and housing policy, to provide the backdrop to the study of the PER. Section 5 sets out a genealogical reconstruction of

¹ We collect news about developments in this area on the blog of the project exPERTs, <https://expertsproject.org/>.

² Using a distinction suggested by an interviewee (cf. section 4).

³ The fact that the ongoing process of comparative analysis of planning systems funded by ESPON is still concerned with the measurement of the maturity of national systems (Nadin et al., 2016, 10) shows how the dominant approach has remained quite stable in time.

the conceptualisation and implementation of the PER, focussing on the legislative framework and on the relations between the national government and local authorities. Concluding remarks are set out in section 6. The paper is based on two main sources of evidence: i) review of the original policy documents (laws, decree-laws, reports, governmental programmes...); and ii) a set of in-depth interviews with key informants (scholars, politicians, and civil servants and officers)¹.

2 HOUSING SYSTEMS VS PLANNING SYSTEMS IN EUROPE

This section briefly reviews the European comparative literature on planning and housing systems, emphasising the coexistence of national differences with processes of convergence amid 'Europeanisation' (cf. Börzel, 2002). It should be preliminarily reminded that the EU has never been granted formal responsibility over spatial planning and housing policy; and that convergence is thus the result of less formal processes (e.g. inter-state cooperation), or stems indirectly from convergence of other policy and regulation areas (e.g. finance and macroeconomics, energy, transportation...).

The Compendium of Spatial Planning Systems (CEC, 1997) marked an interest by the EU in understanding differences among member states' planning policies, fostering the burgeoning of comparative planning studies (e.g. Farinós Dasí, 2007; Stead, 2013). The Compendium divided EU planning systems in four 'traditions' (CEC, 1997, 33-37): the regional economic approach (typical of France), the comprehensive integrated approach (Denmark and Netherlands), the land use management (UK) and the urbanism tradition (Italy and Spain) – with other national systems falling in between two or more traditions. The Compendium and most comparative works were interested in emphasising the 'maturity' of the systems; and fostering convergence toward those considered more mature. Maturity was broadly defined in terms of the 'degree of public acceptance of the need for planning', of the 'provision of up-to-date policy instruments', of the 'degree of vertical integration and cooperation between levels of administration', and of the 'existence of transparent and productive consultation mechanisms' (CEC, 1997, 35).

More recently, some doubts have been cast over the dominance of studies about (static) planning paradigms and traditions (see Getimis, 2012; Tulumello, 2015). The field of planning cultures emerged, in many respects, as a different take on comparative studies. Sanyal (2005) adopted a global perspective with the aim of contributing to the deparochialisation of planning studies – in line with post-colonial approaches to urban studies (see Roy, 2009). In Europe, Knieling and Othengrafen (2015) developed the 'culturised planning model' to explore the trajectories of planning policies and processes among EU member states, by way of looking into 'taken for granted assumptions' and 'unwritten patterns of power' (ibidem, 2135). With respects to processes of harmonisation of planning systems amid Europeanisation, Knieling and Othengrafen conclude that: 'adaptational pressures, for example Europeanization, obviously result in the customization of existing structures, frames and policies ("planning artefacts" and "planning environment") but do not necessarily touch the underlying core cultural traits ("societal environment")' (ibidem, 2144).

In the same way, the field of housing and housing systems presents a variegated number of different situations around Europe. Comparative studies (see, from different perspectives, Lundqwist, 1992; Harloe, 1995; Kemeni, 2001; Allen et al., 2004; Alves, 2016; Di Felicianantonio and Aalbers, 2017) have focused on two main dimensions: first, the overall composition of housing systems (types of tenure, weight of public/private/non-profit sectors, quality of the built environment...) and, second, the (national) policy approaches to housing.

This field is marked, despite the differences originated in the phases during which welfare systems had been built before and after the world wars, by processes of convergence in the last few decades. Comparative studies agree on a set of generalised trends, considered crucial components of the transformation (and retrenchment) of welfare state since 1980s amid neoliberalisation. The shift from state-provided social-rented housing towards stimulus of homeownership, support to private/charity social housing, and privatization of public housing stocks are the main trends emphasised. Doling (2006) exposed the development of a (deficient) EU 'housing policy by stealth', made up of the effects of

¹ All translations documents, texts and interviews in Portuguese are ours.

statements about desirable housing outcomes – made explicit in the Kok report (EC, 2004). All in all, the increase of levels of homeownership and private renting (hence decrease of social housing) seems to be 'desirable' for EU policies/politics – i.e., there seems to be a role of EU in the promotion of withdrawal of state from housing provision¹.

At the same time, the shift from provision to regulation and support of private/charity developments has been considered consistent with the transition toward a focus on 'regeneration' of the built environment (Cameron, 1992; Gómez, 1998) – as opposed to the new developments (and modernist planning) in the era of public housing provision. We are interested in making sense of the intersection between planning cultures in transition and changing housing policy, namely the shift toward regeneration and concurrent retrenchment of state action, for both external constraints (including European pressures and recurrent crises) and internal political, if often silent, decisions (e.g. that to favour homeownership over other forms of tenure). In this respect, the Portuguese case, which we shall now turn to, offers many insights.

3 THE PORTUGUESE PLANNING SYSTEM

Historically, spatial planning has had a weak status in Portugal – a situation that is reflected in its relative weakness as a discipline². Despite a brief rush of modernization in the 1930s, until the early 1970s the disciplines. For the most part, spatial planning continues to be taught in Portuguese universities as a sub-discipline within larger academic fields (engineering, architecture, geography, landscape design, law, etc.) (forthcoming).

Portuguese system had maintained three of its key historical features, namely i) a 'urban' perspective through which spatial planning was managed by the governmental branches and was considered the purview of architects and engineers; ii) the lack of a sound reference framework for spatial planning at the regional level; and iii) a centralized nature, in a context where, however, state initiative and leadership were scarce and the impact of regulations remained relatively weak in confronting the interests of the real estate sector.

Between the end of 1960s and the democratic revolution of 1974 things started to change. The Third Development Plan (1968-1973) is a first example of proactive development scheme based on a regional approach – although it hardly challenged the prevailing perspective or offered any meaningful role to the municipalities. The revolution (followed in 1976 by the first election for local authorities) introduced a dialectic between the tradition of centralism represented by the Directorate for Urban Planning (Direção Geral do Planeamento Urbanístico, DGPU) and the more active Portuguese municipalities such as Lisbon and Oporto. The introduction in 1982 of the municipal masterplan (Plano Director Municipal) signalled the adoption of a more integrated approach and a recognition of the role of the municipalities; however, the masterplans were de facto put on hold by the Directorate since a new law, in 1990, made them mandatory.

Against this background, the decade that preceded the enactment of the PER and the years that immediately followed it (from the early 1980s to the late 1990s) was a period of significant steps toward a more integrated planning perspective at the regional level. A number of different factors contributed to this trend. Politically, this was a period of relative stability, which was also reflected in the long tenure (1985-1995) of Valente de Oliveira as ministry of Planning and Administration of the Territory. Despite the delay in their implementation and the still prevalent focus on urban growth, the municipal masterplans 'introduced into public consciousness the idea that urbanisation and construction had to follow rules [...] [and] created, for the first time, a market for specialists in urbanism and spatial planning' (Campos and Ferrão, forthcoming). Local planning cultures were also changing: in 1982 the first master's programme in urban and regional planning opened in Lisbon; while a new, interdisciplinary approach, which conceived housing as a key component of urban planning and development, was developing in centres such as the National Laboratory of Civil Engineering (Laboratório Nacional de Engenharia Civil) (interview, former secretary of state for Spatial Planning and Cities). During the 1990s, professionals trained in geography brought for the first time 'an important contribution to affirming spatial planning as a counterweight to the

¹ For instance, the memoranda of understanding signed with Portugal and Greece by the European Commission and European Central Bank for the recent financial bailouts include provisions for the liberalisation of the housing market.

² Campos and Ferrão note that planning's 'multiple affiliations and [...] recentness as a technical and scientific domain help explain the absence of any autonomous academic or professional community or associations that represent its various

more “urban” approach traditionally promoted by architects and urban engineers’ (Campos and Ferrão, forthcoming). Finally, the influence of Portugal’s adhesion to the European Community in 1986 was felt also in the field of planning: among other things, Campos and Ferrão (ibidem) cite the European Spatial Development Perspective (ESDP, 1999) and Portugal’s participation in EU programs such as Urban and Urbact as significant factors in the development of Portuguese planning culture and urban policies.

A set of new planning instruments and bodies were introduced with the goal of consolidating the planning system, and inspired to a more integrated and strategic approach in spatial planning, such as the Regional Spatial Plans (Planos Regionais de Ordenamento do Território, PROT, introduced in the early 1980s), while in 1990 municipal masterplans became a mandatory requirement for municipalities to apply for EU funds and expropriate land – a single act that allowed Portugal to move, in a decade or so, ‘from a situation in which the existence of mandatory land-use plans was the exception to one in which the entire country was covered by such plans’ (Campos and Ferrão, forthcoming). In 1994, the Programme for Consolidating the National Urban System and Supporting the Implementation of Municipal Master Plans (Programa de Consolidação do Sistema Urbano Nacional e de Apoio à Execução dos PDM - PROSIURB) introduced strategic planning. In 1998-1999, the new ministry of Infrastructure, Planning and Territorial Administration, passed a comprehensive reform of the planning system (Spatial and Urban Planning Policy Act, Law 48/1998) which defined and regulated spatial planning as an autonomous policy area; introduced for the first time a clear-cut distinction between the statutory and developmental arms of the planning system; and harmonized Portuguese planning law with key principle derived from ESDP process.

Finally, some local experiences were important in this general trend toward a more integrated planning perspective. In Lisbon, the new socialist mayor, elected in 1989, created a Strategic Planning Department, which oversaw the preparation of the municipal masterplan (approved in 1994) as well as of Lisbon’s Strategic Plan (1992); at the same time, a regional plan for the LMA was approved (PROT-AML, 1991) (Oliveira and Pinho, 2010, 411-414).

Even during the 1990s, however, and despite the progress we have described, the planning system remained marked by serious imbalances. In their review of Portuguese urban policy in that decade, Domingues, Portas and Sá Marques (2007, 312, 318) note that:

[a] paradoxical framework thus exists, in which initiatives with greater urban incidence are a result of the central government’s sectoral policies or of special programmes and projects, which are limited in scope and articulation [...]. If we exclude the exceptional character of EXPO’98 [...] everything else can be summed up as sectoral investments commanded by the central government, responding to basic priorities providing infrastructures and expanding the coverage of social policies (new facilities, rehousing programmes, combating poverty and intervention in critical areas).

This is certainly the case of state intervention in the field of housing, and of the PER specifically, that will be discussed in the next sections. Carmo et al. (2014) point to the difficult relations between housing policy, housing system and spatial planning, emphasising the weakness of statutory instruments, incapable of regulating urban growth but at the same time too rigid to allow for the regularisation and upgrade of the growing number of informal settlements; and pointing to the excessive dependency of municipal authorities on the issuing of building permits as a source of financing.

4 HOUSING POLICY IN PORTUGAL

The Portuguese housing system is consistent with dimensions highlighted for the Southern European context (Allen et al., 2004; Costa Pinto and Guerra, 2013; Di Felicianantonio and Aalbers, 2017): high levels of private ownership and low levels of social rented housing; high proportion of secondary homes; strong role of families in access to home; and significant role of self-promotion in the production of housing.

Allen and colleagues (2004) suggest to go beyond simplistic explanations of such characters, according to which Southern European countries are ‘lagging behind’ in the implementation of (public) housing when compared with more ‘advanced’ European countries. Allen and colleagues instead suggest to use a more complex understanding grounded on the concept of ‘public action’, that is, ‘a way of looking at housing issues and housing policies as the outcome of a system of relationships among the different actors

involved' (ibidem, 157). The absence of a large social rented sector in Southern European countries is thus explained on three main factors (ibidem, 166): i) 'a strong political inclination in favour of home ownership', considered to be an effective way to achieve social sustainability; ii) the sale of the public rented housing stock as a result of institutional difficulties to manage it; and iii) an orientation of public administration toward 'implementing rules to control private initiative, rather than developing "entrepreneurial attitudes" within the public sector'. Focusing on the case of Italy and Spain, Difeliciantonio and Aalbers (2017) trace the 'pre-histories' of Southern European housing policies in the fascist era. These approaches are relevant for our purpose in that they focus on the intersection between contextual peculiarities and common trajectories, including those of neoliberalisation and globalisation.

Sketching the historical trajectory of the Portuguese housing policies, and its peculiarities amid the aforementioned Southern European context, will help us make sense of the way the housing system has been shaped at the intersection of policy, planning and wider trends.

Similarly to what we have emphasised with regards to planning policy (cf. previous section), multiple contradictions characterise Portuguese housing policy (Allen et al., 2004, 165). Public housing was introduced in early 20th century and a significant stock has been built in major metropolitan areas during time; however, this has been constantly sold to tenants willing to buy. Housing policy during the dictatorship (1933-1974) was characterised by the primacy of private intervention and paternalistic public interventions to accommodate dramatic situations and prevent potential conflictual situations (Serra, 1997). All in all, public housing and housing market were not capable of accommodating population growth and rural-urban migrations. In early 1970s, the situation was dramatic in Lisbon and Oporto metro, where dozens of thousands of households were living in informal settlements, in conditions of overcrowding or in houses without decent conditions.

With the end of the dictatorship, housing emerged as a major public issue, with the proliferation of protests, occupations and self-organisation practices (Santos, 2014). The 'right to housing' was included in the democratic Constitution (art. 65). Programmes to implement social housing and improve informal settlements were launched, the most famous being the Local Mobile Support Service (Serviço de Apoio Ambulatório Local, SAAL) (Portas, 1986; Bandeira, 2007). Though such programmes are the first attempts at making housing policy a core element of urban policy (interview, researcher and former IHRU board member), they were insufficient in scale and time to bring about structural transformations. All in all, public action was not capable of taking the lead in regulating urban growth and housing promotion (Serra, 1997). Since the 1970s, three channels existed to access housing (interview, researcher and former IHRU board member): private construction oriented toward homeownership (by large the most important), public housing to rehouse from illegal settlements, and co-ops.

Toward the end of 1980s, the shortage of housing was still a major problem, for a set of reasons (Ferreira, 1988, 55-56): absence of a comprehensive national housing policy (also because of the 1977 intervention by the International Monetary Fund, which froze the launch of public housing developments); relevance of land property in processes of accumulation – this being quite typical of Southern European countries (cf. Salzano, 1998; Garcia, 2010); a model based on big developments (public and private); weaknesses of the financing system; and scarce technological and organisational development in building industry.

Public action shifted progressively further away from housing provision in the following times. The transition is considered to have been completed during the governments of Cavaco Silva (1985-1995). The building sector was liberalised, paving the way for the boom of investments in real estate and construction after the adhesion to the European Community. Since then, housing policy was primarily shaped through a series of mechanisms for stimulus and subsidising of homeownership (Serra, 1997; Allen et al. 2004, 165; Santos et al., 2014), which were provided by the Department of Finance, rather than that of Housing – a 'concealed' housing policy, according to a former secretary of state for Housing (interview). Overall, between 1987 and 2011, 17.9% of public expenditure in housing was used for provision (basically, the PER), while 73.3% was funnelled to subsidies to homeownership and 8.7% to subsidies to rent (IHRU, 2015, 4). The housing sector and housing policy (including the state) played a crucial role in the financialisation of the Portuguese society and its 'semi-peripheral' economy, characterised by a weak welfare state balanced by a strong 'family welfare' (Santos, 1985; Santos et al., 2014).

Amid retrenchment of state action in housing promotion, a growing emphasis on urban renovation and regeneration is found (see, e.g., Guerra et al., 2005). One of our interviewees, a civil servant responsible

for several projects of renovation in Lisbon, suggested that one should more properly talk of public support to private renovation (see also Tulumello, 2016, 122-124). Indeed, the investment in this area was always a minimal quota of total expenditure (cf. IHRU, 2015).

The most comprehensive attempt at structuring housing policy within urban policy in tight relation with regeneration was made by the socialist government in charge between 2005 and 2009. For the first time no secretary of state for Housing was appointed, and the competence over housing given to the secretary of state for Spatial Planning and Cities. An expert, one of the most known professors of geography and spatial planning in the country, was appointed. The attitude of the government was signalled by the transformation of the National Institute for Housing (Instituto Nacional da Habitação, INH) into the Institute for Housing and Urban Regeneration (Instituto da Habitação e Reabilitação Urbana, IHRU).

The former secretary of state for Spatial Planning and Cities, interviewed, stressed that his goal was transitioning from 'social housing policy' (política de habitação social) toward 'social policy for housing' (política social de habitação) – i.e. articulating the right to housing within the right to the city and housing provision within urban regeneration. This made particular sense, in his opinion, in relation to the rigid subdivision of responsibility for housing in the country. After 1974, with the creation of local power and processes of decentralization (but in a framework of a centralised state; cf. Seixas and Albet, 2012), housing policy was considered a proximity policy, to be led by municipal authorities. At this level housing policy tends to be considered an urban policy, in close connection with urban planning—"the 'land rights statute' passed by parliament in 1976 and other complementary land policy instruments approved in subsequent years, aimed at applying the constitutionally enshrined rights to housing and to an orderly territorial development" (Campos and Ferrão, forthcoming)¹. At the state level, instead, housing is mainly considered an issue of financing and public works – 'giving people a home' (dar casa às pessoas) in the words of many of our interviewees. Indeed, INH and its predecessors have basically been financial institutions.

The former secretary of state admitted that he found many pushbacks of institutional and political nature, among which: the difficulty to transform the IHRU from a financial institution toward a promoter of housing/regeneration policy (this being confirmed by the president of IHRU appointed by the secretary of state, interviewed); a bipartisan consensus on the importance of homeownership; and processes of alienation of public housing stock already ongoing when he took charge. The former secretary of state also admitted that the failure to pass a national strategy for housing policy made most reform attempts vain.

All in all, it is hard to find a general consensus over the Portuguese housing policy. For one interviewee, professor in sociology and urban studies: there has never been a housing policy in Portugal. There have been packages [pacotes] [...]. Why packages? Because one can control goals, and funds allocated to it, better. Now, an integrated housing policy, thinking of housing needs and solutions, this is something... There was the strategic plan², but, how you perfectly know, it was praised, but remained in the drawer. It has no influence whatsoever.

This is an idea shared by many of our respondents (former secretary of state for Spatial Planning, professor of urban sociology). However, another interviewee (researcher and former IHRU board member) believes that the Portuguese experience with housing policy shows a 'path', in which some ideas, generated more or less consciously during earlier eras (like with the SAAL) consolidated in later stages (like during 2005-2009).

In the years following the economic crisis, the centre-right government – amid the pressures of external borrowers who bailed out the country in 2011 – enforced a harsh austerity agenda (Pedroso, 2014; Seixas et al., 2016), clearly steering away from the previous reforms: during those years housing policy was marginal to the governmental agenda. As of today, according to an interviewee, professor of urban sociology, housing policy is exclusively 'local', in that virtually no state intervention exist. However, amid political and public pressures following the visit to Portugal of the UN Special Rapporteur for Adequate Housing (see introduction), members of the new centre-left government and parliamentary majority

¹ On this distinction there are different interpretations. For instance, one interviewee, researcher and former IHRU board member, agreed that 'not much [of housing] falls in the state's competences'. However, two other interviewees, former secretary of state for Housing and a professor of sociology and urban studies, referred that communist municipal governments did not want to cooperate into the PER because they believed that housing policy (or, at the very least, funding thereof) is a state responsibility.

² The reference is to the aforementioned attempt made in 2005-2009.

(including a congresswomen we interviewed) have referred to ongoing processes for the promotion of a general housing law.

5 THE PER AND/AS URBAN REGENERATION

In this section, we shall discuss the role of the PER, launched in 1993 and not formally concluded, in the aforementioned framework. The PER has been the main – at least in terms of funding – program of housing provision in the democratic Portuguese history. Its goal, stated in its instituting Decree-Law 163/1993 was that of ‘getting rid of shacks’ (erradicar as barracas). As we noted before, the incapacity of housing policy and market to accommodate housing needs resulted, among other problems, in the production of following waves of informal settlements – where settled rural-urban immigrants before 1974 and, afterwards, mainly populations (of both Portuguese and African descent) migrating from the liberated colonies. Understanding the extent to which the goal of ‘getting rid of shacks’ has been a component of wider attempts at urban regeneration – or rather a sectorial housing policy – is the main question we shall try to answer. In order to do so, we adopt a ‘genealogic’ approach (cf. Campos and Ferrão, forthcoming), reconsidering the history of the PER and of regeneration policies in the light of the context sketched above.

5.1 BEFORE 1993: INFORMAL SETTLEMENTS AND EARLY POLICY RESPONSES

Before 1993, some policies for the regeneration and refurbishment of the built environment had provided some responses to the problem of informal settlements, still falling short of ‘solving’ it. In 1985 the socialist government launched the Programme of Urban Refurbishment (Programa de Reabilitação Urbana, PRU), expanding to public spaces the interventions on degraded housing stock that had took place under the Programme for the Recovery of Degraded Buildings (Programa de Recuperação de Imóveis Degradados, PRID). The PRU made available additional financial resources and foresaw the creation of local technical committees¹, as well as the ‘temporary rehousing of the building to be recovered [...] [or] their permanent rehousing whenever needed’ (Ruling 4/SEHU/1985, line c, point 4), integrating housing policy in the broader framework of urban policy. The PRU did not identify a specific field of intervention; not being restricted to intervention in the historical centres (Pinho, 2009, 846), the PRU could cover rehabilitation projects in any degraded area, including informal neighbourhoods. However, a few months later, the publication of the Decree-Law 366/1985 established ‘the guidelines for investments by municipalities and the state to promote programmes of social housing, in areas of the country that are especially in need of interventions and are destined to rehouse the population living in informal settlements’.

During the decade of centre-right governments led by Cavaco Silva, urban policy developed with the goal of defining ‘programs to counterbalance the macrocephaly of the largest urban centres’ (Program of X Constitutional Government, p. 29); in this context, the government’s program mentioned the ‘rehabilitation of the illegal urbanisations through the cooperation with local authorities of the metropolitan belt’ (idem). This was the only intervention of urban regeneration defined by the government in this first phase.

Cavaco Silva’s electoral campaign of 1991 seemed to mark a turning point in this respect (Ferreira, 1993a, 4). Pressured by the public opinion and the opposition parties², the prime minister acknowledged the relative neglect of pressing housing issues in the previous years; and promised a more incisive action in the field of housing policy in his next mandate (idem). This promise, however, remained forgotten until 1993, and public investment in housing policy remained stagnant until that date (idem).

A few months before the enactment of the PER, an experts’ committee was formed on the initiative of various organization operating in the field of housing. The committee published the influent White Paper on Housing Policy in Portugal (Livro Branco sobre a Política de Habitação em Portugal; Ferreira, 1993b). The White Paper called for a ‘500,000 houses plan’ (Ferreira, 1993a, 51-52), and the creation of a publicly owned stock of lands to be destined to the plan. Out of the total of 500,000 houses to be built, some

¹ Local technical committees had been part of the initiatives launched after the democratisation to support decentralisation and improve technical skills in municipalities (Pinho, 2009, 837).

² For instance, the socialist administration of Lisbon launched a campaign to advocate more funding and technical support to municipalities with the goal of solving the problem of informal settlements (see CML-DGSPH, 1990).

60,000 (Ferreira, 1993a, 17) were indicated as instrumental to the 'provision of socially rented housing on an appropriate scale, in order to allow for the elimination of the informal settlements and illegal urbanisations existing the metros of Lisbon and Oporto' (ibidem, 45). This social housing stock was supposed to adopt an investment and management model characterized by (ibidem, 45, 52): partnerships between central and local authorities; the 'creation of regional housing companies, especially in the metros of Lisbon and Oporto, collecting financial and other resources from the central administration and the municipalities'; the establishment of residents' associations; the adjustment of the rent levels of the social housing sector to market value; the refurbishment of the public housing stock; and the introduction of the possibility to sell public housing units to tenants.

The White Paper also suggested the integration of the programs for rehabilitation of the existing public housing stock into a wider refurbishment programme including 240,000 housing units (ibidem, 16), which was also expected to contribute to reducing the need for building new social housing developments. In short, the White Paper sought a more systematic integration between the goals of housing provision and urban regeneration; an integration that was however absent in the PER and its surrounding policies launched by the centre-right government – whose discussion we shall now turn to.

5.2 1993-1995: PER AS A FINANCIAL INSTRUMENT

Amid a growing public and political debate about the pressing housing issues, in 1993 the government launched six different measures, announced as a comprehensive 'housing package' (pacote da habitação) – the Decree-Law 163/1993, which established the PER in the metropolitan areas of Lisbon and Oporto, being part of it. The PER followed the suggestions presented in the White Paper in relation to the need to 'getting rid of shacks' and rehouse the families of residents; to the cooperation between central and local authorities; and to the adoption of a system of subsidised rents. However, differences between the Decree-Law and the White Paper were significant, and especially: in relation to the nature of the funds financing the programme, because the White Paper's suggestion for the creation of a national fund for housing with the contribution of workers and private companies was discarded; with regard to the modality of rehousing, insofar, in addition to new developments, the PER envisaged the possibility to purchase on the market, while the White Paper focused on refurbishment; and because the Decree-Law of the PER did not provide any guidelines as to the management model of the new neighbourhoods.

The emphasis on the complementarity between new construction and the purchase of housing units on the market is a significant illustration of Cavaco Silva's housing policy. The PER aimed at stimulating the 'contribution of the market' for the development of the social housing sector – something that was made possible without specific policies supporting private initiatives towards that goal. For this reason, equally important to the PER was a second Decree-Law launched in the context of the 'housing package', designed to reform the legal regime of the contracts for the development of housing (Decree-Law 165/1993) – contracts signed by public institutions and private companies for the construction of affordable housing units. In short, the new regime made easier for private developers to participate in the development of the social housing sector and public facilities.

The land policy, one of the cornerstones of the White Paper (Ferreira, 1993a, 59), was completely forgotten in the PER and in the 'housing package'. Though another Decree-Law (164/1993) acknowledged the 'lack or relative scarcity of land that would allow construction at affordable prices', interventions on this issue remained limited to allocating publicly-owned land for construction – and did not include, for example, an effort to counter speculation in real estate. Similarly, the only dimension of 'urban regeneration' included in the Decree-Law was the obligation to demolish the shacks once the rehousing had been completed.

In the words of an interviewee, former secretary of state for Spatial Planning, In my opinion, the PER was a financing instrument based on an agreement with local authorities. What happened is that some local authorities had a more strategic vision and included the PER in wider [urban] interventions, others [did not] [...]. Let us be crystal clear, the PER was a funding instrument. Nothing more than that. The ways it was adopted by each local authority may have been different [...]. Virtually no one in [the field of] spatial planning considered the PER a spatial planning instrument.

5.3 1995-2001: STEPS TOWARD AN URBAN POLICY?

The socialist government that took charge in 1995 prioritised speeding up the implementation of the PER. In an interview, the secretary of state for Housing of that government considered that the previous government had virtually not acted to implement the rehousing. Indeed, the rate of expenditure accelerated dramatically after 1995, peaking in 1999 (IHRU, 2015, 8). The PER was amended and further new regulations approved (Law 34/1996; Decree-Law 79/1996; Diploma 420/1996; Decree-Law 30/1997; Diploma 371/1997). On the one hand, the obligation to demolish the settlements was extended to the shacks included in the surveys but abandoned by the households before the rehousing (hence often inhabited by households not eligible for the PER) – a situation that, according to some civil servants we met during the fieldwork, is affecting many households still today. On the other, the so-called PER-Famílias (PER-Households) was introduced to allow individual households to use the financial instruments of PER to enter the private housing market. Two subsequent socialist governments (1995-1999; 1999-2002) operated to make the PER more flexible. During the tenure of the first socialist executive, many significant measures were implemented to that goal; indeed, for the first time in the history of democratic Portugal the housing portfolio was placed in a ministry responsible for urban and regional planning, the ministry of Infrastructure, Planning and Territorial Administration – although the next executive reformulated the organizational chart separating once again the portfolios for planning and housing.

Looking at those years, and especially those of the first socialist government, we can make sense of the relationships between the rehousing process, on the one hand, and urban regeneration goals and spatial planning policies, on the other – in that the overall governmental strategy had to be mediated, and was possibly even contrasted, by local political and planning cultures.

As for the integration of PER with urban regeneration goals, in the first stage, having the PER being designed basically as a financial instrument, the decision whether to make the rehousing a component of a wider policy of urban regeneration was delegated to local authorities. According to the report on the state of the PER released in 1999, only six out of 18 municipalities of LMA had included urban refurbishment and regeneration among their goals (Guerra, 1999, 57). The same report emphasises that ‘only a fraction of the municipal authorities involved looked at the PER as part of a broader strategy of territorial regeneration’ (ibidem, 60). Importantly, the report highlights a different attitude in Oporto metro, emphasising the importance of local politics and planning cultures in the shaping of the implementation of PER.

In absence of interest of local authorities to act beyond the simple provision of housing, the socialist government signalled a different attitude, starting to work with local governments and deciding to use EU Structural Funds to complement the rehousing process with the provision of public services and businesses (interviews with a former secretary of state for Housing and a civil officer in the national Department of Housing). In 1996, the sub-programme Operational Intervention for Urban Renewal (Intervenção Operacional Renovação Urbana, IORU), originally designed by the previous centre-right government to buy land and build infrastructures, was reformulated to allow for the construction of open spaces and public facilities, and to support the establishment of small private enterprises (Coutinho, 1997). By widening the offer of programmes intended to complement the PER’s limitations¹, the socialist government also established a more integrated approach in relation to the goals of the housing policy: the socio-economic integration of the rehoused families was therefore seen also in its territorial dimension and in the context of the urban planning and development.

A 1997 survey, included in the abovementioned report (Guerra, 1999), indicated that the IORU was the complementary programme that municipalities used the most, followed by the sub-programme Integrated Operational Interventions (Intervenção Operacional Integrar, IOI; a component of the Health and Social Integration axis of the second EU Community Support Framework, 1994-1999), and then by the Anti-Poverty Programme (Programa de Luta Contra a Pobreza). This situation illustrates the strong dependency of the PER-related urban regeneration processes to the dynamics of EU funds. Once again, a more systematic use of European funds to integrate urban regeneration actions with the PER was found in Oporto metro (ibidem, 66-68). Among the other programs that complemented the PER, and beyond the

¹ The Decree-Law establishing the PER only referred to the Anti-Poverty Programme (Programa de Luta contra a Pobreza).

abovementioned examples, we can mention the Urban initiative – following the report, in 1997 only two municipalities had applied for these funds, one in the Lisbon and one in Oporto metro (ibidem, 67).

As for the relation between the PER and spatial planning policy, another dimension highlighted by the report (Guerra, 1999) is a lack of any significant influence of the PER on planning policies in the LMA – and, more broadly, on local policies at municipal level. The authors of the report argued that this situation had two reasons (ibidem, 60): first, the acknowledgement, by local municipalities, of those problems that the PER intended to solve was still not a central policy goal; and, second, the PER was implemented when the municipal masterplans had been already completed. Indeed, for half of the municipalities, the PER arrived in a late phase of elaboration of municipal masterplans, which were mostly approved between 1993 and 1994. For the other half of the municipalities, however, the two processes developed more or less in the same years, with the municipal masterplans approved between 1995 and 1999. Following Guerra (ibidem, 71), in 1997 the municipalities that were developing PER actions of average scale (in relation to the number of rehoused households) presented the highest rate of progress with respect to the established timeline (>25%). This observation led the authors of the report to conclude that the presence of either a relatively large or a relatively small number of households to be rehoused was a factor in delaying the action of municipalities. However, we may wonder – for example in the case of Sintra, a municipality implementing a medium-scale PER action, which had attained in 1997 the highest rate of progress in the northern part of LMA (46.20%, against a national average of 20%) – whether the pace of implementation was not also speeded up by the lack of a valid municipal masterplan.

The Decree-Law 156/1997 introduced more flexible procedures for introducing changes in municipal land use regulations in areas interested by rehousing programs destined to the residents of informal neighbourhoods. Through the provisions of this Decree-Law, the municipalities were allowed to change their land use plans whenever these changes were required for the construction of rehousing sites, even if this implied introducing changes to previous destinations of use, building regulations and development plans. Indeed, the following two years were the two with most budgeted operations (IHRU, 2015, 8). Surprisingly, this provision, which created a ‘quasi-emergency’ state for the implementation of the PER, has not been noticed by academics and policymakers and none of our interviewees remembered such possibility – the only notable exception we could identify is a brief mention in a 2006 article on urban planning and social cohesion (Fernandes, 2006).

5.4 2002- DEMISE AND REBIRTH OF THE PER

A new phase for the story of the PER opens up in 2002 with a new change of government from centre-left to centre-right. In the structure of the new government, housing and planning are separate again, and for the first time a ministry of cities is created (Ministry of Cities, Spatial Planning and Environment). The program of the new government (Program of XV Constitutional Government) adopts a discourse in line with the ‘European’ mainstream. The key objective of housing policy became the creation of incentives for the refurbishment of existing buildings and the revitalization of the rental market (vs. the previous emphasis on new constructions and homeownership); as far as social housing was concerned, the main goals became the definition of policy instruments for the renewal of the existing housing stock and ensuring the progress of the PER.

In line with the governmental goal to ‘reduce the role of the State in the development and management of housing provision’ (Decree-Law 199/2002), the new ‘urban policy’ (política para as cidades) had urban regeneration at its core – despite the lack of national resources invested in this field, whose development, with the exception of the programme POLIS, remained almost completely dependent on EU funds and private investments (cf. Baptista, 2013). The PER followed this pattern, shifting away from construction and toward regeneration by a new set of amendments (e.g. the Decree-Law 271/2003), which opened up the possibility to sell municipal housing units built with the PER or other municipal programmes. Also, for the first time the municipalities were allowed to use PER funds to build public facilities and services. In 2004, the new PROHABITA programme was launched (Decree-Law 135/2004), providing a broader framework for rehousing interventions outside of the metros of Lisbon and Oporto (previously endowed of limited funding under the provision of Decree-Law 226/1987) and extending the provision of the law to all situations of severe housing stress (while the PER had been limited to interventions in informal settlements).

Despite the introduction of significant conceptual, legal and operational changes in the field of housing policies, however, the national budget approved for 2003 introduced a set of limitations on the municipalities' ability to borrow funds. While it did not affect the projects already budgeted, the new provision rendered virtually impossible the signing of new contracts for PER developments. At the same time, stricter budgetary requirements pushed the municipalities to sell out the council housing stock to fund new developments. Even before the passing of the 2003 state budget, various municipalities had voiced their concerns about the possible demise of the PER (see Morais, 2002; Lusa, 2002); indeed, this proved to be the case after 2003, with the expenditure for rehousing plummeting in the following years (IHRU, 2015, 8) – and a parallel rise of critical voices (see Simão, 2003; Felner, 2003).

After a parenthesis of three years the Socialist Party took back control of the government in 2005. Under the goal to integrate housing policy in the broader framework of urban and regional planning (cf. section 4), the government vowed to conclude the implementation of existing rehousing programs, and to promote a policy of regeneration within and beyond these programs. Two flagship initiatives were launched. First, a pilot programme for the regeneration of 'critical neighbourhoods' (Iniciativa Operações de Qualificação e Reinserção Urbana de Bairros Críticos, IBC). Second, an amendment to the PROHABITA programme (Decree-Law 54/2007) was introduced to address the cases of households not originally included in the PER and subsequently evicted from demolished settlements (a problem which has recently been at the centre of activist mobilization; cf. introduction). This last intervention constituted an emergency measure rather than a long-term solution – a constant in recent Portuguese history, in which a trade-off existed between the urgency of the process of slum clearing and the rights of the residents that were not included in the original PER survey of 1993.

The PER seemed to have reached its final stop after 2010, when the global financial and economic crisis of 2007-2008 started to hit Portugal. A year later, the socialist government was forced to ask for international financial help, and on June 2011 a new, centre-right government took office. Under the new government, marked by a policy of austerity (Seixas et al., 2016), rehousing programmes progressively came to an end, while demolitions and evictions multiplied – in the vast majority of cases, without any housing solution being offered to the evictees – especially in the municipalities of Amadora and Loures. It was only after the return of the Socialist Party to the government (as majority stakeholder of a parliamentary coalition including the Left Bloc and the Portuguese Communist Party), that a new phase for the PER and Portuguese housing policies seems to be opening. Indeed, in the context of the renewed attention to housing, left-wing political parties have asked not just new policies but precisely a 'new PER' to solve, once and for all, the issue of precarious settlements in Portugal (Henriques, 2017).

6 CONCLUSIONS

Twenty-four years after its launch, and a decade or so since it has been considered de facto a dead policy, the PER seems to be reborn from its own ashes. Its history is useful to add some nuances to consolidated ideas about housing and spatial planning in Portugal and, by extension, Europe.

All in all, there is general agreement that the PER, influenced by some longstanding feature of the Portuguese system, ultimately 'failed to establish genuine city policies' in the same way previous programs did (cf. Campos and Ferrão, forthcoming). The main reasons for this failure may be identified among two main lines: first, the lack of top-down coordination and, second, a strong dependence on local planning cultures and changing national governmental goals; in other words, the missing institutionalisation of the programme into a 'plan' with cogent and regulatory power. On the one hand, this confirms to some extent that the Portuguese planning system is not 'mature' according to the mainstream definition of the Compendium (CEC, 1997; cf. section 2). But, on the other, a careful historical reconstruction shows how the static understanding provided by the 'maturity' framework does not help much in casting light over the complex political and multi-scalar dimensions through which a complex policy such as the PER is implemented in a period of time of almost a quarter of century; and confirms the need to integrate taxonomical comparison with in-depth, genealogical analyses.

Indeed, the history of PER casts some shadows over traditional interpretations of the relative underdevelopment of Portuguese (and Southern European) welfare, namely the stress on the temporal 'delay' with respect to European transformations (see, e.g., Giannakourou, 2005; Seixas and Albet, 2012). At a first sight, the PER was a (late?) policy against the mainstream, so to speak, in that it was a massive

programme of housing provision, in a time in which states were abandoning the provision of housing in the first place. However, we saw how the big chunk of funding for housing in Portugal since the 1980s was made up of the subsidies for homeownership – in line with the pressures by global and European institutions – even in the years when the expenditure of PER peaked; perfectly in line with European trends more widely. As such, our case reinforces the idea that the study of policy ‘paradigms’ only partially helps making sense of processes of policy conceptualisation and diffusion, in that it conceals what is more often characterised by conflict among permanence and changing patterns, and tensions among different levels and scales (cf. Getimis, 2012; Tulumello, 2015).

With regard to the relation between ‘social housing policy’ and ‘social policy for housing’, the PER has had an ambiguous, multifaceted nature. Created as a financial instruments for provision of public housing (by a government whose goal was reducing state intervention in housing), the PER became a pivotal element of attempts (by different governments) at shaping and institutionalising a national urban and regeneration policy; and back and forth, following the alternation of governments and their political goals. At the same time, the various phases were mediated by the relation with local authorities and local planning cultures. This story unravels many of the tensions between provision and regeneration; in that the shift to regeneration seems to be, at the same time, a necessary complement to previous policy approaches and a rhetorical instrument in the context of state retrenchment. A perfect example of this are the reforms by the centre-right government in 2002/2003, which made possible using PER funding to provide public services and stimulating urban regeneration, at the same time as they virtually killed (or, better, hibernated) the programme through financial provisions. All in all, the relation between housing policy proper (as conceptualised and implemented in connection with urban and planning policy) and economic and financial policy seems to be a fruitful field for further discussion – e.g. by way of exploring the way housing policies have often been ‘concealed’ as financial supports to homeownership while housing policy proper was being cut in the name of sound national finances.

ID 1374 | CONTRIBUTION OF SPATIAL PLANNING TO AFFORDABLE HOUSING IN AUSTRIA

Arthur Kanonier¹ ; Arthur Schindelegger¹

¹TU Wien

arthur.kanonier@tuwien.ac.at ; arthur.schindelegger@tuwien.ac.at

1 INTRODUCTION

Developing the affordable housing stock is an ongoing political and social challenge with great relevance for ensuring equal living conditions and social peace. With the aim of providing a certain share of low priced dwellings, planning authorities seek to mobilise suitable plots of land and support developers with subsidies. These mechanisms are complex and therefore the coordinating board for planning in Austria, the Austrian Conference on Spatial Planning, started a so called 'partnership' by bringing relevant stakeholders together to evaluate the actual contribution of spatial planning to affordable housing. As a result, recommendations were formulated that now serve as policy guideline for the further development of planning instruments towards a flexible and demand orientated Affordable Housing production. The paper sums up the stakeholder discussion and depicts the current challenges and potentials spatial planning faces in Austria. Thereby, the paper contributes to the international discussion of developing planning instruments and approaches.

2 AFFORDABLE HOUSING IN A PLANNING PERSPECTIVE

The production of a building stock holding affordable dwellings for people with low income or in difficult social situations represents a continuous and challenging state assignment. The political approaches and regulatory frameworks differ widely among countries and spatial planning has therefore a variable importance for Affordable Housing. Nevertheless, the provision of adequate housing gets discussed from international to local level and experiences large media interest. In 2016, the HABATIAT III conference in Quito, Chile reinvigorated the global commitment to a sustainable urbanisation and set the focus to the implementation of the 'New Urban Agenda'. This agenda got adopted in the end of 2016 (United Nations, 2016) and emphasises a sustainable urban development which amongst other goals aims to provide affordable and sustainable cities to foster prosperity and quality of life for all. Affordability plays an important role throughout the declaration and is also strongly associated with spatial planning to for instance facilitate a social mix. The subscribers also declare to "... encourage the development of policies, tools, mechanisms and financing models that promote access to a wide range of affordable, sustainable housing options ..." (United Nations, 2016). The New Urban Agenda illustrates the global commitment but needs ambitious national implementation now.

The European Union as a supranational organisation is authorised by the member states of to set union wide regulatory frameworks for sectoral subjects to foster economic cooperation and growth. Housing though is fully reserved to the member states and their national regulations. That also accounts for spatial planning which is an individual responsibility of the member states.

The Austrian approach to 'Affordable Housing' is strongly linked to political ideologies and the social, political and economic developments that have taken place in Vienna in the beginning of the 20th century. The liberal land market in the then empire lead to large scale real estate speculation, mass accommodation and terrible living conditions. The scarce housing supply combined with poor working conditions was a fertile soil for the social democratic movement. The doctor and publicist Victor Adler contributed with his reports strongly to a raising awareness and a political turnover (e.g. Adler, 1888). After the foundation of the first republic on 12th November 1918, Jakob Reumann became Vienna's first ever social democratic major. Part of a holistic social democratic reformative programme was a large-scale housing programme to end the drastic housing scarcity in Vienna and improve the hygienic conditions in the capital city (Podbrecky, 2013, p. 13). The federal state as well as the city of Vienna were almost broke after the war, therefore a new tax on luxury goods was introduced und tax revenues directly used for the housing programme. In the years 1919 to 1934 the city of Vienna was able to build 61.175 flats until the civil war ended the social democratic reign in Vienna (Podbrecky, 2013, p. 17). The city continued building

dwellings after the 2nd World War and as a result, the municipality of Vienna owns today 27 per cent of the city's housing stock (Rumpfhuber et al, 2012). Throughout Austria, a system of subsidised housing production which is strongly influenced by the Viennese example, was established. Municipalities or limited-profit developers are getting large-scale subsidies for housing production but are at the same time bound to sell or rent dwellings at fixed prices considerably below the market level (Reinprecht, 2014). People in Austria spend on average less than 30 per cent of their income for housing.

In the whole discussion on Affordable Housing, the meaning and understanding of 'affordability' poses a challenge itself, because there is no mutual or common understanding amongst stakeholders and authorities. Nevertheless, the term is omnipresent in policy papers, guidelines and legal acts. The typical analysis taking only 'ratios' of household incomes that are spent on living into account, cannot be used as a basis for well justified judgements, because incomes differ widely (Paris, 2007). The paper does not explore the concept of 'affordability' any further, but simple points out that although an intensive discussion took place in Austria and recommendations for Affordable Housing were formulated, the concept of 'affordability' remains to be fuzzy and lacks in definition.

The Austrian regulatory framework for subsidised housing production is beyond doubt sophisticated. Numerous legal acts on different legislative levels as well as many public authorities and private stakeholders form a multi-actor and multi-level framework, in which spatial planning in the narrow sense of allocating land uses, has a crucial strategic role. Ideal locations need to be identified, land needs to be zoned according to the actual demand and the development within certain planning horizons has to be secured. In case of Austria there is in fact no lack of building land in most regions that face an ongoing population growth.

The actual demand for dwellings could theoretically easily be satisfied but most of the undeveloped building land is simply not available on the market, because land use titles do not need to be claimed within a certain period of time. More than a quarter of the whole zoned building land in Austria is at the moment not developed and used for speculation or as an asset (ÖROK, 2014a). This building land is often centrally located, has a proper public infrastructure but is difficult to mobilise. At the same time, an expropriation title for housing exists, but is so far not applied and easily conflicts with the constitutionally guaranteed sacredness of property. Spatial Planning struggles on the one hand with existing land use titles that are consummated without any public consultation completely in the interest and perspective of the owner/s. On the other hand, building land is needed desperately and planning has to zone in appropriate amounts of land in the right locations. This happens predominantly on the municipal level, with a lack of regional coordination. Planning faces manifold challenges in its vital contribution to the provision of sufficient affordable dwellings and an evaluation of constraints as well as possibilities seems to be necessary.

3 EVALUATING SPATIAL PLANNING IN HOUSING PRODUCTION

Every 10 years the 'Austrian Conference on Spatial Planning' publishes the 'Austrian Spatial Development Concept' (ÖREK) which serves as a national policy guideline in planning but has no legal liability for the provinces or municipalities. Nevertheless, the last concept in 2011 (ÖROK, 2011) addresses besides other current issues also Affordable Housing. Action 2.3 emphasizes a 'Quality-based approach to coping with growth' (ÖROK, 2011, p. 56) and Action 3.3 a 'Sustainable development of settlements and free space' (ÖROK, 2011, p. 70) both aiming for the implementation of integrative perceptions and policy implementations. To achieve this, an essential backbone of the ÖREK 2011 is the establishment of so called 'partnerships' involving relevant public authorities and stakeholders for specific topics in a discussion process.

The 'partnership' for Affordable Housing was established in 2013 involving the Austrian Federal Chancellery, the Federal Ministry of Science, Research and Economy and 8 provinces as well as special interest groups (Austrian Economic Chambers, Chamber of Labour, Austrian Association of Cities and Towns, Austrian Contribution of Spatial Planning to Affordable Housing in Austria Association of Municipalities, Austrian Trade Union Federation). The lead management was performed by the Federal Chancellery as the topic of Affordable Housing is essential on a national policy level but needs strong cooperation and specific adaption on provincial level. The fundamental aim was the formulation of recommendations and a policy guideline based on the analysis of the contribution of spatial planning to

Affordable Housing with an evaluation of the legal situation and regulatory framework. The result of the partnership process were two studies, one on the connection of planning law and Affordable Housing and another on the role of civil planning contracts in planning, complemented by a set of recommendations. The actual implementation now relies strongly on the provinces that need to adapt their legal framework and supervise and support planning activities especially on the municipal level.

The carried-out evaluation of the contribution spatial planning has on Affordable Housing and which measures could be taken in the near future, is based firstly on the mentioned studies and secondly on the contributions of stakeholders in the discussion. The eventual recommendations were adopted consensually by the members of the 'Austrian Conference on Spatial Planning'. It needs to be mentioned that therefore the described outcomes are not based on a holistic scientific analysis but rather based on a political discourse and decision making process. Spatial planning in Austria is a provincial assignment, which means that the federal state only holds the competences for certain sectoral planning activities enumerated in the Federal Constitutional Law. Residual planning tasks are carried out by the single provinces, which also means holding the responsibility for planning legislation and executive assignments. Due to this fragmentation, there exist 9 planning laws regulating spatial planning and development. In detail the goals, tool sets and procedures are alike among the provinces but differ considerably in detail because of the absence of a framing legal planning act on federal state level. At the same time, there does not exist any national binding concept for spatial development. This institutional and legal set up leads to a complex and diverse structure and inventory of planning instruments as well as strategies that also serve to support the provision of people with affordable dwellings.

3.1 PUBLIC AUTHORITIES IN AFFORDABLE HOUSING PRODUCTION

The federal state regulates the tenancy act as well as the condominium act and has therein certain possibilities to steer market prices for renting and selling dwellings. For example, there is a fixed maximum rent in large parts of the building stock deriving from before 1945. Public Housing is also settled at federal state level and targets less well-off population groups, while housing subsidies are a responsibility in regulation and execution of the single provinces. The planning and building laws are passed by the provincial parliaments, but the actual execution of land use planning and the issuing of building permits is set on municipal level.

Figure 1: Responsibilities and Institutions for housing and spatial planning

As indicated in Figure 1 relevant responsibilities for Affordable Housing are disperse which poses a challenge to politicians and public authorities in coordinating their actual actions in this field. The federal state holds the responsibility of regulating most of the essential legal framework and the single provinces receive tax money from the federal state to invest in housing subsidy programmes. In 2012, the provinces altogether spent about 2.5 billion Euros on loans and direct subsidies for housing production and restoration (Amann and Lugger, 2013). The municipalities have no direct influence on the regulatory framework but are nonetheless essential stakeholders for planning the built environment. The distribution of the state assignments within the federal republic is tightly set by the constitution and it is very unlikely that political majorities for alterations will be achieved in the near future. Therefore, improvement within the existing legal structures of administration and subsidies appears to be the ultimate strategy.

Austria has due to its federal structure a tradition in splitting up state assignments and allocating them to different public authorities and levels. As there does not exist a self-contained constitution, the Federal Constitutional Law (Bundes-Verfassungsgesetz, BGBl. Nr. 1/1930) assigns the legislative powers over public affairs to the federal or provincial governments. Public Housing – Volkswohnungswesen – is by Art. 11 Federal Constitutional Law to be regulated by the federal government and further executive laws to be adopted by the provincial governments. This means a common responsibility with a basic formulation of the goals and instruments on the upper and the executive legislation on the lower level. In 1974, the Land Acquisition Act (Bodenbeschaffungsgesetz, BGBl. Nr. 288/1974) was adopted by the parliament to define a regulatory framework for public housing. The Land Acquisition Act holds an expropriation title to obtain land for social housing production and provides thereby a valuable instrument in negotiations with land owners and for price regulation. Due to legal concerns the Land Acquisition Act was never put into practice by the provinces. This leads to the paradox situation that centrally located, zoned and undeveloped land Contribution of Spatial Planning to Affordable Housing in Austria could theoretically be claimed for Affordable Housing but not a single attempt was undertaken to use the regulations in the Land Acquisition Act to actually secure land for Affordable Housing projects.

3.2 FIELDS OF ACTION TOWARDS AFFORDABLE HOUSING IN SPATIAL PLANING

The mentioned partnership of authorities and stakeholders on Affordable Housing identified urgent fields of action in spatial planning to enhance a more effective and efficient provision of land for housing production. One essential outcome of the 'partnership process' is a set of recommendations based on the analysis of the status quo of planning in combination with an expert assessment and listing of the measures at a glance as follows (ÖROK, 2014b, pp. 15-19).

- a. Affordable Housing needs to be established as a goal in spatial planning law,
- b. Affordable Housing needs to be perceived as a regional planning-responsibility,
- c. Specific land use categories for Affordable Housing should be established, the experiences be shared and criteria be defined,
- d. Other planning instruments should support Affordable Housing by making appropriate densities possible,
- e. Evaluation and enhancement of the role of civil contracts to acquire land for Affordable Housing,
- f. Acquire suited undeveloped plots by a diverse set of instruments; limited dedication of building land; introduction of regulations for financial fees for infrastructure installation and maintenance; establishing the legal basis for land consolidation,
- g. Evaluation of the responsibility for public housing and adaptation for actual implementation.

Complementary measures should be undertaken in the field of subsidies for Affordable Housing and tax incentives for owner to sell preferably to limited-profit developers should be taken into account. The recommendations illustrate the urgent need for a holistic perspective in planning. Single improvements will have only small positive effects while the true capacity lies in an integrative and coordinated development. Goals and political aims need to be clear and stable on all levels and should then be legally adopted. Measures in different fields need to be undertaken simultaneously to have a maximum impact. The following chapter discusses several highlighted fields of action from a planning perspective and depicts the status quo and potential of certain instruments and measures.

3.3 PLANNING INSTRUMENTS FOR AFFORDABLE HOUSING

Spatial planning is executed in Austria by the provinces as well as by the municipalities. Interestingly the municipalities hold a planning monopoly penetrated only by topics of superior public interest. This leads to a strong position of the municipal councils in planning decisions and to a local planning focus bound to administrative boards. But people have a certain flexibility in their choice of residence depended on manifold reasons that are individually taken into consideration. Housing has therefore not a municipal but for the majority of people a regional quality. So the discussion of planning instruments should be set on regional as well as municipal level to illustrate the actual possibilities of authorities to contribute to Affordable Housing.

3.3.1 INSTRUMENTS FOR AFFORDABLE HOUSING AT PROVINCIAL LEVEL

The provinces are responsible for the planning legislation and are therefore the essential authority in defining the planning instruments and setting the planning goals. Each planning act contains overall goals for the intended spatial development and some refer to housing provision explicitly. One common goal in all provinces aims to satisfy the actual housing demand. Some laws specifically state that land should be affordable, the housing quality up to date and the share of residential use well-balanced to commercial use. But generally, the goals do not promote Affordable Housing as a priority field of action in planning. In operative planning, the provinces have the possibility to establish holistic or sectoral planning programmes and concepts. Some have already development concepts which explicitly refer to Affordable Housing but the discussion is still a basic one and besides overall aims and goals Affordable Housing plays an inferior role. The regulation of Housing subsidies plays an essential role for Affordable Housing, but is not directly combined with planning measures referring to land use categories and titles or the provision with a sufficient technical infrastructure. Terms for financial aid are referring to the income situation of applicants or building characteristics and qualities. The actual location within villages or cities and the infrastructural characteristics don't get considered in subsidy regulations. The same accounts for planning strategies concerning the densification in city districts.

A fiscal instrument that some provinces have already introduced are taxes for the provision with infrastructure (roads, sewer network, water network etc.) that are also payable without a developed plot of land and get calculated by a basic cost multiplied by the square meters of the particular plot. The administration of this tax though is the responsibility of each municipality and an initial evaluation is just underway but no results so far available.

Another provincial instrument to assume a long term active role on the land market, is the installation of land funds. These funds help municipalities to buy land suitable for the construction of subsidised dwellings but operate strictly within the boundaries of economic feasibility and are not supported by tax money. Nevertheless, such funds can help to promote Affordable Housing in central locations with high living standards by providing money at the right time without any benefit interests.

3.3.2 INSTRUMENTS FOR AFFORDABLE HOUSING AT MUNICIPAL LEVEL

The municipalities itself are in charge of forecasting their own future need for building land based on population prognosis and are responsible for land use planning and development plans. This means that municipalities are the key actors in steering the actual location of housing production on a local level. Due to the absence of a regional demand calculation and distribution mechanisms, municipalities are in fact carrying out their planning tasks independently and without a compulsory coordination. The housing production is Contribution of Spatial Planning to Affordable Housing in Austria therefore dependent on the existing land use, the disposability of land on the market and the existence of an investor. Steering this process in a temporal dimension while achieving the production of a certain share of Affordable Housing is a challenging task that municipalities perform by using a set of planning instruments. Land use planning represents the backbone of spatial planning which is offering exclusive land use categories to the owners of parcels. Planned constructions need to be according to the legal dimensions of such land use categories, but the decision, when and whether to develop building land is in the hands of the owners only. Establishing firstly land use titles for Affordable Housing and secondly ensuring the actual development poses therefore a challenge for municipalities.

A possible strategy is the use of the specific land use category "Reversed Areas for Affordable Housing". Given that there is no expropriation title on the municipal level such reserved areas imply the reservation for the intended use for 10 to 20 years. The owners have the possibility to offer such plots to the municipality or limited-profit developers. The prices are due to the restricted use normally significantly lower. Nevertheless, the zoning of such areas always needs an actual demand and proper argumentation as a basis and cannot be simply used on a large scale to apply pressure on land prices. Four provinces have already introduced this land use category and others are discussing to do so as well.

A rather new measure in land use plans is the temporary zoning of building land. For newly zoned building land a certain time frame for the permitted development gets defined. This should put pressure on the owners either to sell or request a building permit themselves. The experience with this new approach is so far low and it's not yet possible to judge on the effect on land prices.

Another instrument on local level are land consolidations. Unfavourable plot shapes and a lack of public infrastructure pose a challenge to an effective development of certain areas. Consolidations exist meanwhile nearly in all provinces and are executed with increasing efforts. The main advantage is a costefficient consolidation for the participating land owners and safe-guarding a sufficient infrastructure. For responsible authorities, the procedure poses considerable costs and a positive completion can be at risk at any time, if participating owners impede the consolidation draft. A possible improvement to land consolidations in the future could be the compulsory dedication of a certain share of land to Affordable Housing projects according to subsidy regulations.

The nowadays perhaps most attended instrument in municipal spatial planning are planning contracts. Achieving certain goals by using time consuming and circumstantial administrative procedures faces its limits. Additional contracts based in civil law are meanwhile widely possible throughout Austria and are an important planning tool for municipalities. Via contracts the actual development within certain time frames can be assured and actual land uses commonly agreed on. The essential condition is the interdiction of a causal connection between the zoning act and content of the contract. Generally, the conformity with constitutional requirements is challenging if municipalities are using planning contracts on variable cases and furthermore contracts are so far often not applied in a transparent way. Nevertheless, such contracts have a great potential to help foster Affordable Housing and can contribute to secure quality standards and realisation of actual projects.

As shown, municipalities have a variety of planning instruments to contribute to the provision of Affordable Housing. They can decide on project locations and indirectly influence land prices. The biggest challenge remains possibly the local perspective of planning authorities not taking regional developments into account.

4 CONCLUDING REMARKS

As the title of the article states, the contribution of planning to Affordable Housing is without doubt a big one. Real estate market logics and subsidies also have a crucial role in housing production, but are strongly linked to titles established by land use plans and planning restriction. The 'partnership process' and the formulated recommendations based on the 'Austrian Spatial Development Programme 2011' state clearly that there is already a wide variety of planning instruments but in many provinces the tool kit still needs to be expanded. The true benefit of the 'partnership process' was forming a communication platform, bringing different public authorities and stakeholders to a discussion table.

The evaluation of the planning contribution to Affordable Housing did furthermore clearly show that planning itself has no overall power but needs the coordination with other public sectors. Although legal regulations might pose the essential basis for the execution of efficient policies, the starting point is clearly the coordination and discussion among relevant stakeholders and introduction of a governance process. The presented ongoing discussion in Austria could be perceived as a possible approach to assess and develop the regulatory framework for Affordable Housing and improve planning measures. The discussion and evaluation based on a national effort served as a starting point and politicians and authorities in the provinces and municipalities hopefully perpetuate this effort. Recent amendments of planning acts take the recommendations into account and indicate that the 'partnership process' was fruitful. An effective contribution by planning to Affordable Housing can especially be achieved by combining the listed instruments. This needs ambitious efforts on all political levels and a further holistic discussion on the regulatory framework for Affordable Housing.

ID 1376 | RENEWED NEIGHBOURHOODS: REQUALIFIED AND DIGNIFIED NEIGHBOURHOODS? EXEMPLES OF DISTRICTS IN REGION AUVERGNE RHÔNE ALPES (FRANCE)

Paulette Duarte¹

¹Grenoble Alpes University

paulette.duarte@univ-grenoble-alpes.fr

ABSTRACT: In France, for 40 years, a public policy called policy "of the City" has been implemented to act globally on the social and urban exclusion. Since 2003, this policy has known an important change and tries through actions of urban renewal to transform profoundly the neighbourhoods of social housing. By improving social housing, public places, facilities, by demolishing and building housing and by attracting private investments to diversify housing and population and by diversifying the functions of these neighbourhoods, it is a question of making of these stigmatized districts, "banal" districts. After more than ten years of urban renewal, we can wonder about the effects of this policy on these areas in terms of requalification and dignity. Are these neighbourhoods less stigmatized, really requalified? Did they acquire a better image? Are they dignified to be inhabited for the inhabitants of these neighbourhoods and for the inhabitants or the citizens generally? If the first evaluations of the policy of urban renewal show that the living environment was improved, that the inhabitants feel better, and that they consider these neighbourhoods as "banal" neighbourhoods, dignified to living there, they also suggest, with regard to the difficulties met in certain neighbourhoods to attract private investments and actors, and new inhabitants, that these neighbourhoods are still far from being requalified in the public opinion. After having presented the policy of urban renewal, its emergence and its objectives, we shall return on the results of evaluations of the urban transformations led on all the concerned neighbourhoods, and we shall show, by analyses led in renewed neighbourhoods of the region Auvergne-Rhône-Alpes, that it is advisable to be very careful as for the requalification of these neighbourhoods.

1 A POLICY OF URBAN RENEWAL IN THE STIGMATIZED DISTRICTS

1.1 A BRIEF HISTORY OF THE POLICY OF URBAN RENEWAL

In France, for 40 years, a policy called "city and urban renewal" was organized. This policy aims at handling the social, economic and urban problems concentrated in the districts of social housing, and at revaluing these districts which suffer from a bad image and which are thus stigmatized in the French public

opinion. If the policy "of city", which claims to act globally on the social and urban exclusion, is an old policy, that of urban renewal, which aims at transforming the space, expanded these last fifteen years.

Four big phases give rhythm to the policy of "city and urban renewal":

- A first phase, said "experimental", from 1973 till 1981. Conceived from experimental way, resting on circulars, and exceptional, contractual and incentive tools and means, this policy allowed an awareness at the various actors (political actors, companies managing the social housing) problems met in districts of social housing, and an improvement of the built and the urban planning in these districts.
- A second phase, called "operational", from 1981 till 1988. This second phase is the one of an operational policy which is equipped with diverse tools to fight against the social and urban exclusions, with more consequent financial means, national and local authorities to govern this policy, and which benefits more and more districts.
- The third phase, that said "of the maturity ", since 1988. This third phase is the one of a reached maturity policy, which is equipped with legislative texts and with a ministry, and which acts on the problems of these districts in a global way and in various territorial scales (district, town and suburbs).
- And the fourth phase which, according to certain researchers, would have begun in the end of 1990s. We see the change of a policy of rehabilitation of the housing into a policy of "urban renewal ", requiring and justifying the appeal to the demolition of social housing.

This development of the policy of "urban renewal" was gradually made through 15 big urban projects, GPU (Grand Projet Urbain) at the beginning of the 90s, then with 50 big city projects, GPV (Grand Projet de Ville) since 1998, and 70 operations of urban renewal, ORU (Opération de Renouvellement Urbain) in 2001. The actors of the social housing refused for a long time that the demolition of social housing is a justifiable way of management of the social housing stock, in particular in the districts where the urban planning had been considered stigmatizing. It will be necessary to wait for 1998¹, 2001² and 2003³ so that are thrown the bases of an ambitious policy of urban renewal, which the program of the demolition is an "essential element"⁴.

In 2003, Jean-Louis Borloo, Ministerial Delegate for the city and the urban renovation, wishes to intervene massively in the stigmatized districts, to renew them in depth and to simplify the management and the application of the policy of "the city". He implements a national program of urban renewal, PNRU (Programme National de Renouvellement Urbain), over 5 years between 2004 and 2008, having for objectives to realize 530 projects of urban renewal before 2013, in particular to demolish 200 000 social housing⁵, to offer 200 000 social renting housing, by reconstructing housing on their place or by putting back on the market the vacant housing, to rehabilitate 400 000 social housing, and to make blocks with 400 000 social housing. He suggests to centralize the financing State of the policy of the city by creating in 2004 a single window, the national agency of urban renovation, ANRU (Agence Nationale de Rénovation Urbaine)⁶, and allows actors other than the State to finance this policy, in particular by the association "Foncière Logement"⁷.

¹ Particular financing for the demolition and the change of use of social renting housing.

² Circular N 2001-77 of November 15th, 2001 relative to the devolution of the decisions of financing for demolition and change of use of social renting housing.

³ Law of 2003 on the programming of the city and the urban renewal.

⁴ Law of 2003 on the programming of the city and the urban renewal.

⁵ It is the rule of 1 for 1: for 1 demolished social housing, it is 1 reconstructed social housing, but the latter is partially reconstituted in the district and for another part outside of the district. That allows the construction of private housing in the district.

⁶ The ANRU is an industrial and commercial public institution. Within it, there are representatives of the State and the local authorities, representatives of the social housing, and personalities qualified regarding the policy of the city.

⁷ The Foncière Logement is an association created in 2002, for districts in urban renewal and the municipalities were submitted to the article 55 of the law of Solidarity and Urban Renewal of 2000. It aims at implementing the social mix. Financed by the "Action Logement" (1 % housing collected by collectors, grouped in the "Union d'Economie Solidaire pour le Logement"), it intervenes as investor. It can acquire of the built or not built land to build of social housing for the municipalities which have to build of the social housing, and housing with free rent in districts in urban renovation which want to diversify their populating.

This policy of urban renewal is inspired by previous policies led in France, the United States and United Kingdom (Le Garrec, 2006). So, it is inspired by French actions of urban renovation led from the end of 1950s in deteriorated old centres of the cities which consisted in demolishing the unhealthy and dilapidated housing and in reconstructing new housing. It also resumes the contents of the policies of "urban renewal", which means urban revival, and which is a policy led in the USA in the 1950s and 1960 to accompany the demographic and economic decline of the dense American city centres and the scattering of the populations in more and more spread "suburbs". This policy consisted at first in leading specific actions of renovation of the built by means of the inhabitants, without moving, then actions of spectacular and expensive demolitions with moving of the inhabitants and the gentrification of these city centres. Finally, it is similar to the policy of urban regeneration of United Kingdom from the end of 1970s which consisted "in making live again" the old industrial cities by demolishing and by reconstructing totally or partially to allow the mixing of the functions and the economic development of these urban spaces.

By actions of urban renovation, or of operations of demolition-reconstruction of housing and morphological transformations of districts, this policy aims at promoting the mixing of the functions by allowing the development of economic activities and the facilities, the social mix, by developing a new offer of housing (social home-buying, renting free), to attract employees, less precarious populations and new inhabitants; and at revaluing the image of districts.

1.2 A FIRST EVALUATION OF THE NATIONAL PROGRAM OF URBAN RENEWAL

The national program of urban renewal, which was translated at the end of 2011 by the demolition about 145 000 housing, the reconstruction about 140 000 others, the rehabilitation of 325 000 housing and the making blocks of 236 600 housing, was estimated these last years. These evaluations tried to measure the effects of the urban renovation at the same time on the housing and living conditions of the inhabitants of districts, and on the functioning of districts and their attractiveness.

So, the effects of the urban renovation on the housing conditions and the lives of the residents of districts are rather positive. The local and national political and professional actors questioned by the committee of evaluation and follow-up of the ANRU agree on the fact that the urban renovation restored some dignity to the inhabitants, by bringing them the proof of a reinvestment of public authorities and by offering them a prospect of positive evolution of their housing conditions and life (Regards Croisés sur l'évaluation de la rénovation urbaine, 2014). And the inhabitants tell to be globally satisfied by the urban renovation. Indeed, several studies give evidence of this satisfaction of inhabitant. An investigation of the institute of survey, CSA, realized for the ANRU in January, 2013 shows that 78 % of the questioned households say themselves very satisfied (29 %) or satisfied (49 %) with renovations realized in their district, 59 % declare to have the feeling that life in their district evolved for the better, or still 59 % of them declare to be very optimistic (12 %) or optimistic (47 %) for the future of their district (Dix ans de Programme national de rénovation urbaine : Bilan et perspectives, 2013, p.54). Another study led by the Social Union of the Housing confirms the feeling that the requalification of the living environment is felt in a strongly positive way by the inhabitants. The latter emit the idea according to which they have found a certain dignity. The transformation of their districts restored them the feeling to be a full citizen of their city, and restored their trust in institutions (Idem, p. 55). Also the expressions of the inhabitants collected in actors' exercise books of the national dialogue on the future of the policy of city confirm the feeling of an improvement of their quality of life at the end of the urban renovation. Quality of the new built, the improvement of the living environment, green spaces and public places are so advanced (Idem, p. 55). Finally, a study of the committee of evaluation and the follow-up of the ANRU realized on 8 renewed districts show that 62 % of the questioned inhabitants estimate that their district is " better than before " (Mon Quartier a change, 2014, p. 16).

However, criticisms are formulated towards the housing conditions and towards the life during or after the urban renovation. They concern the length and the succession of the works, which cause nuisances, and also on the weakness of the dialogue around the projects or still on the persistence of the social problems at the end of the urban renovation. Others explain that the urban renovation did not benefit in the same way all the inhabitants. Indeed, as far as to live well in housing represents for the most part of the tenants the priority concern, those who benefited from a rehabilitation or who were able to reach on the spot a new housing appreciate realized improvements. However, the inhabitants less directly concerned by the urban

renovation, because they live in the part of the stock not rehabilitated or not renewed, live that as an injustice (Regards Croisés sur l'évaluation de la rénovation urbaine, 2014, p. 56).

As for the effects of the urban renovation on the functioning of districts and their attractiveness, they are rather mitigated. The urban renovation was not able to favour enough the diversification of the functions of districts and populating, and to revalue the image of districts.

If the urban renovation allowed to rehabilitate facilities, to build a new offer of facilities and amenities, and to re-revitalize the convenience stores, it rarely allowed the implementation of a real economic development project. Few economic activities became established in districts.

The diversification of the statuses of occupation of housing and consequently the populating was low on the renovated districts. It represents between 6 and 7 % of the total initial stock of housing. The ANRU considered that approximately 80 in 85 000 housing except social renting housing had been delivered on the renovated districts, in the term or beyond the duration of the agreements. This volume of housing so decomposed:

- Approximately 50 000 housing dedicated to the entry, among which 15 000 for the social entry and 7 800 beneficiaries of a bonus ANRU, - Approximately 19 000 housing produced by the Foncière Logement, - About 7 500 housing in PLS (Prêt Locatif Social)¹ or intermediate renting, - About 1 800 housing in free renting, - About 2 500 housing from the construction of residences aimed at specific public (students, elderly). In this housing, was added about 2 800 housing put on sale. (Dix ans de Programme national de rénovation urbaine : Bilan et perspectives, p.76).

In the majority of districts, thus the weight of the social housing remains important, of the order of 70 in 80 %, and decreases on average from 5 to 10 points. This low diversification tended to be rather made on zones in limit of the renovated districts, in geographical areas with strong visibility and in joint with the other districts, which contributed to the preservation of the mono-functional characteristics of the district of social housing in their hearts. It is due to the slowness of realization and the uncertain marketing of certain property deals. The new inhabitants are still afraid of settling down in these districts and the promoters hesitate to invest in operations which seem consequently risky.

The renovated districts still suffer from difficulties in terms of image. They are considered as districts of social housing, mono-functional and thus remain still little attractive.

2 RENEWED DISTRICTS IN LOOKING FOR REQUALIFICATION

To illustrate this looking for requalification, let us stop on two districts in region Auvergne-Rhône-Alpes which were the object of urban renewal: the district of La Monnaie of Romans-sur-Isère and the district of Teisseire in Grenoble.

2.1 THE DISTRICT OF LA MONNAIE (ROMANS-SUR-ISÈRE)

The district of la Monnaie was built on the east zone of the city of Romans-sur-Isère, on an off-centred tray, in border of a main road, in two phases, between 1957 and 1974: a first phase which corresponds to the district of Ancienne Monnaie, and the second phase which is the one of Nouvelle Monnaie.

¹ Prêt Locatif Social means social renting loan.

Figure 1- Maps of area
Source: Town of Romans-Sur-Isère

This district is an area of exclusively social housing with 1830 housing all properties of the “Office Public de l’Habitat du Pays Romanais” (OPHPR), and distributed in 47 buildings of type bars and towers, benefiting from wide public places. Very quickly, this district became the district of social housing the most

stigmatized in the department of the Drôme and benefited from the policy of City from the 1980s. After a program “Habitat et Vie Sociale”, the neighbourhoods is the object of a “Plan Local de Développement Social in 1983, then of operation of “Développement Social of Quartier” in 1989; and from 1993, the City of Romans integrate this district in the approach of “Contrat de Ville” (Duarte, 2011). In the early 2000s, the strong specialization of this territory in social housing and the low urban quality (mediocre public places, enclosing) are perceived as partially responsible for the loss of residential attractiveness of the district. In 2000, the recommendations of an urban and social study confided to the cabinet Philippe Panerai serve as base of reference to the implementation of an “Opération de Renouvellement Urbain” (ORU). Then, in 2003, a diagnosis of the Workshop Franck Huillard, identifying the urban and social stakes in the district, is used as support to the candidacy of Romans in the registration with the ANRU.

Figure 2- Pictures of La Monnaie
Source: Town of Romans-sur-Isère

In December, 2004, an agreement of Urban Renovation is signed between the State (ANRU), the town, the OPHPR and the Association of local authorities of the country of Romans as contracting authorities of the operations, as well as by all the financiers (Rhône-Alpes Regional Council, General Council of the

The municipality of Grenoble, to face the problems of degradation of this neighbourhood, implemented urban policies: a first operation of rehabilitation via the procedure "Habitat et Vie Sociale" between 1979 and 1984, a "Contrat de Ville" of Grenoble between 1994 and 1998, a "Contrat de Ville" of urban area between 2000 and 2006, and a "Grand Projet de Ville" between Saint-Martin-d'Hères and Grenoble, from 1994, which will be afterward inserted into the program of the ANRU.

The Teisseire project is not, strictly speaking, an ANRU "project". The project is widely previous at the same time to the ANRU (on 1994, the district is registered on the "Grand Projet de Ville") and based on principles taken away enough from the national recommendations (by emphasizing in particularly the making blocks or the rehabilitation rather than on the demolitions recommended by the ANRU). The choice of the making blocks was imagined in answer to a diagnosis of district: to thwart a rather negative image, it was a question of transforming "large sets" into "residences"; in the face of a cutting gives a complex of the public / private space, the making blocks aimed at improving the conditions of management of spaces ; in answer to the conflicts of uses put by the presence of young people in foot of tower, the making blocks had to bring more reassurance of the entrances of buildings. Among the surprises of the urban renovation to Teisseire represents the arrangement of the ZAC Teisseire-JO. In the launch of the project of urban renovation, the future of the brownfield Schneider was not decided yet. The planners seized the opportunity of this liberation of space to revitalize the North of the district Teisseire and propose a diversification of its housing.

Before the urban renovation, Teisseire consisted of 1200 social housing. About 250 housing was destroyed, an equivalent number of new constructed housing, 430 housing was rehabilitated and 18 created residential units. In parallel of the operation ANRU, 460 housing was delivered on the ZAC of Teisseire-JO (which $\frac{3}{4}$ in social entry). In the end, the district knew an important diversification of housing: 75 % in social housing against 100 % before (Duarte, 2011).

Figure 6 – Pictures after urban renewal
Source: Monographie territoriale du quartier de Teisseire, Grenoble, 2015, p.4 and p. 27

The results of the evaluation¹ realized in 2014 by the team "Trajectoires-Réflexe" on the housing conditions and the living environment of the inhabitants and on the attractiveness and the image of the district are mitigated.

Those concerning the housing conditions and the living environment show that 40 % of the inhabitants of Teisseire consider that their district improved with the urban renovation and more particularly with the rehabilitated buildings, the new constructions, the green spaces, the playgrounds for children, the businesses, and the making blocks, and that the important interventions on parks, green spaces and playgrounds were particularly appreciated for 80 % of the investigated people. However, when we question them more specifically about the housing, a third of them, even 38 % of the tenants of social housing and 42 % of the oldest inhabitants (20 years and more), declare to meet difficulties and to be dissatisfied. Among the motives for dissatisfaction, we find: the cost of the housing considered too expensive, a lack of cleanliness of the common spaces, the dilapidation of the non-rehabilitated housing, the problems of squats near their housing or a size of housing considered unsuitable.

¹ I participated as expert in the methodology of evaluation.

Concerning the functioning and the attractiveness of the district, it seems that the neighbourhood is more mixed socially and that it attracts new inhabitants. The PRU allowed to cross from 100 % of social housing to 75 % (with the construction of the ZAC of Teisseire-JO) and thus to diversify socially the housing. The data which we have on the sociological profile of the inhabitants of the social stock show that the district Teisseire tended to become impoverished less: even if Teisseire remains a district of big precariousness, the part of the most modest fell, including among the recent moved in the social stock. In 2000, 90 % of the recent moved made parties of the poorest of the stock, while this rate comes down to 75 % in 2014. Besides, the inhabitants of the social stock income of which improves leave less systematically the district (75 % of them stay on the district while the average in the other districts from Grenoble is 45 % of moving with equal resources). The origin of the buyers in social entry on the ZAC of Teisseire-JO also confirms this impression that it is possible to go up in the social scale while remaining to live on the district (several owners of the street Bourette in particular, arise from the district). However, the choice of a localization of the new housing for the middle classes in the borders of the district questions the social mix and the attractiveness. On one side, this choice of localization showed itself strategic: among the choices of acquisition on the district, the inhabitants quote in particular the fact that buildings "were not really in the district". Of other one, it emerges from survey than these inhabitants become integrated little into the life of district and look rather towards the outside. Even if they frequent certain facilities (library, shops), they prefer for the greater part to put their children outside the district.

In 2003 and 2007, the Barometers¹ of the neighbourhood Teisseire paint a portrait of the district in "the fragmented and contrasted image", divided between a population of old nostalgic of a golden age of the district (workers stemming from the immigration Italian and from the Maghreb working on the factory Schneider), and for whom the district had stop degrading, and a population settled more recently, and which does not seem to want to stay there. These inhabitants consider that Teisseire is "dangerous" neighbourhood, "where we burn cars ", "gangrened by a gang warfare held by families of the district ". The survey driven with the inhabitants in 2014 allows to draw up an evaluation in halftone on the image of the district. When we question the inhabitants about the image which they had of Teisseire before fitting out there, only 39 % of them had a positive image of it, against 37 % a negative image. In the question: "now that you live in the district, you would say in a general way that it is pleasant to live?": 65 % of them answer positively this question. Thus the point of view of the inhabitants changes when they live to Teisseire but no radical way. In parallel, other data confirm that the reputation of the district improved: the rates of vacancy or rotation in the social stock widely fell (apartments have fewer difficulties in being rent).

Nevertheless, this image remains fragile in and the outside the district. In the district, 54 % of the questioned inhabitants of Teisseire declare to wish to move outside the district in the shorter or longer term. This rate is particularly important for the inhabitants who moved into the district for less than 5 years (60 %) and for the youngest (less than 40 years). This rate is also not insignificant for the present inhabitants in the district for more than 20 years (46 %), for the oldest (36 %) and the owners (48 %) who are nevertheless generally inhabitants more anchored in their housing and their district. Outside the district, the inhabitants interviewed within the framework of Barometers have still a bad image of the district (Duarte and Leard, 2012). Teisseire remains a "dangerous" district, "insecure", which explains the absence of its requalification.

3 CONCLUSION

In France, the national and local evaluations of the program of urban renewal show that the effects of this policy on the phenomena of requalification and dignity of the districts of social housing are mitigated. On one side, the results of these evaluations demonstrate that the housing conditions and the living environment of the inhabitants of these districts improved. The urban transformations, in particular the quality of the new housing, the improvement of the green spaces and the public places, had positive effects on the image of districts. The inhabitants consider these places as dignified to be inhabited. On the other side, the urban, often partial renovation, did not diversify completely the functions of these districts,

¹ The Barometers of districts are surveys led by the laboratory ROMA, then the laboratory Pacte of the University of Grenoble Alps in connection with the Agency of Town planning of Region from Grenoble on various districts of the urban area since 2002. The principle is to go to interview the "silent inhabitants ", those who are not usually heard on their urban way of life.

and did not attract only some private real estate investors and new populations that in the renewed margins of districts. This lack of functional and social diversity and attractiveness explains or is understandable by the image still stigmatized of these districts at certain inhabitants and in the public opinion. With the current implementation of the second national program of urban renewal which has for objective to renovate a little more the "hearts" of districts, shall we attend finally a requalification of these districts?

ID 1377 | URBAN REHABILITATION AND SUSTAINABLE MOBILITY OPTIONS FOR RESIDENTS - AN EXAMPLE FROM SOCIAL HOUSING IN VIENNA

Eva Favry¹

¹Rosinak & Partner ZT GmbH

favry@rosinak.at

1 INTRODUCTION

The City of Vienna, a very important owner of social housing complexes built from the 1920ies onwards, has for some years carried out several renovation projects with a focus on thermal-energetic redevelopment measures. Presently the renovation and modernization of social housing blocks originating from the 1950ies to 1970ies is a challenging task for Vienna, as for many other European metropolises, too.

Considering the expected population increase, technological progress and lifestyle changes, and responding to ecological goals it will be necessary to adapt municipal housing rehabilitation procedures and to exploit potentials unused until now. A recent co-operative exploratory project (Smart City im Gemeindebau, 2016), aiming at the initialization of a smart modernization process, dealt with a wide range of themes: How to provide high-quality and affordable living conditions? How to integrate the residents in planning procedures? How to consider new accommodation needs due to demographic and societal changes? How to make use of new technologies? How to improve the residents' mobility options, the traffic situation and the quality of the urban environment?

Although mobility and traffic are important topics for the concept of smart and sustainable cities, until now they have scarcely been considered in social housing rehabilitation projects in Vienna. During such projects people living in social housing complexes could be supported with various measures to improve their daily mobility. This paper presents selected results from the above-mentioned project, concerning mobility and traffic themes.

2 FACTS ABOUT MUNICIPAL HOUSING (“GEMEINDEBAU”)

Vienna municipal housing has a long tradition since the 1920ies and is internationally often considered best practice for social housing. Unlike other forms of social housing, the municipal flats in Vienna are owned, rented, administered and renovated by the city itself. Vienna always kept up the policy not to sell municipal flats, and presently the municipality-owned company “Wiener Wohnen” (Vienna Housing) administrates about 220.000 rented apartments housing approximately 500.000 persons. The allocation of municipal flats to new tenants is bound to criteria such as housing needs, income limits and a minimum period of residing in Vienna.

While many of the residential complexes built in the 1920ies and 1930ies have already been renovated and modernized, the task is still impending for the bigger parts of the large stock of after-war flats built until the 1970ies. About 40 residential complexes are being rehabilitated per year. With the aim of reducing heating costs and improving the fabric of the buildings as well as the comfort for the inhabitants, standard rehabilitation procedures consist of various measures, the most substantial of which is thermal insulation.

Due to the wide spread of the sites of municipal complexes, which is demonstrated by Figure 1, municipal housing rehabilitation is an important factor for urban development, quality of life and building trade in Vienna.

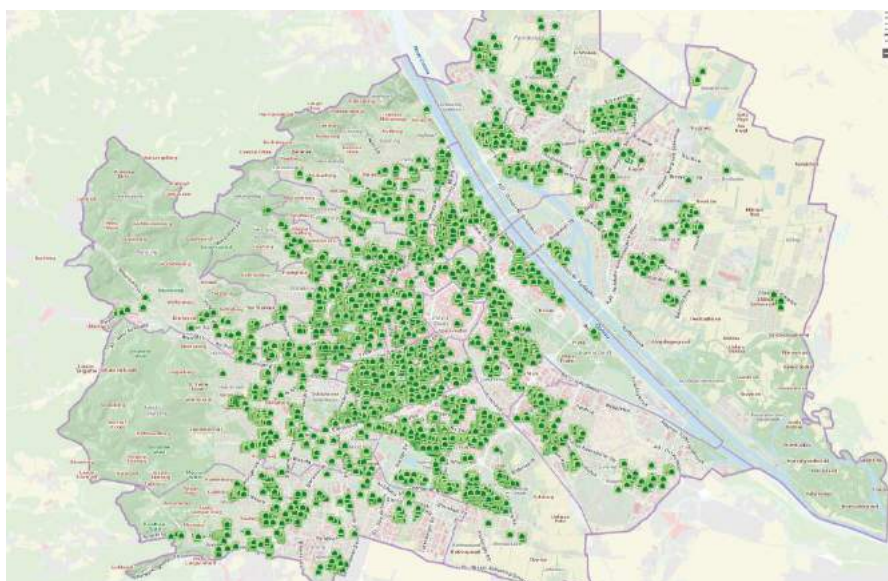

Figure 1 – Dispersal of municipal housing complexes in Vienna
 Source: Stadtplan Wien, <https://www.wien.gv.at/stadtplan/> (10.05.2017)

However, the common municipal housing rehabilitation practice still offers a high potential for better implementing urban development and mobility policies.

3 URBAN DEVELOPMENT STRATEGIES IN VIENNA

The Smart City Vienna Framework Strategy (Magistrat der Stadt Wien, 2014) declares three main goals which have to be implemented by developing the sectors energy, mobility, buildings and infrastructures: (1) strict preservation of natural resources, (2) high and socially balanced quality of life, (3) development and productive use of innovations and new technologies. Unlike other smart city approaches focusing on the technology dimension, the Vienna strategy considers also the social dimension of innovation. Among others, the strategy highlights that organizing mobility in a resource-efficient and socially compatible way is a core subject of smart cities, and formulates goals concerning mobility: By 2030 a high share of motorized individual traffic will be shifted to public transport and to bicycle and pedestrian traffic, and new propulsion technologies such as e-mobility will be established.

We conclude that if, according to the ambitious goals of the Vienna strategy, existing urban areas are to be transformed, municipal housing rehabilitation requirements must go beyond the state of the common practices. Among others, it would be necessary to systematically deal with the refurbishment of public and semi-public spaces, the improvement of the traffic situation in the surroundings of the housing blocks, and the improvement of mobility options for the residents.

The Vienna mobility concept (Magistrat der Stadt Wien, 2015) describes the realistic steps for influencing the traffic system and achieving the smart city goals relating to mobility. The mobility concept describes several fields of action, e. g. fair distribution of public spaces, mobility management, car-sharing and bike-sharing concepts.

The urban development plan STEP 2025 (Magistrat der Stadt Wien, 2014) postulates that customized concepts for architectural and functional improvement of residential areas dating from the period of the 1950ies to 1970ies should be elaborated, based on analyses and assessments of the sites. According to the presently observed population increase in Vienna, the development plan highlights the question of how to exploit potentials for re-densification of the buildings.

4 INNOVATIVE SOLUTIONS FOR HOUSING AND MOBILITY

The way how residential buildings are integrated into the urban structures, the design of infrastructures for walking and cycling and the number and situation of parking lots strongly influences the mobility behavior of the residents.

The parking regulation introduced in the 1960ies in Vienna, obliging developers by law to construct as many parking lots as apartments, doubtlessly contributed to a steady increase of car traffic for the next decades. Coming along with policy changes towards the goal of a sustainable traffic system, the legal obligation to construct parking lots has been lowered some years ago; presently a parking lot must be provided per 100 m² habitable surface, and for specific cases the authority may lower the ratio.

From innovative mobility solutions related to housing, the concepts of car-free or car-reduced residential areas is best-known and has successfully been executed in diverse European countries for nearly twenty years. Car-free and car-reduced residential areas usually offer good bicycle parking and cycling infrastructures, sometimes also car-sharing and bike-sharing facilities. Several examples are presented on the website “Plattform autofrei / autoarm wohnen” from Switzerland. In Vienna a car-free housing site with 250 apartments has been established in 1999. Since the tenants and owners of flats are bound by contract not to possess a private car, the Vienna car-free housing site, like several others, addresses ecology-minded citizens above all.

For the last years, several innovative mobility services have become more user-friendly by new technologies, e. g. by giving easy access to shared vehicles or carpooling, by comfortable reserving and billing facilities. These new possibilities are increasingly used for mobility services within new buildings or new urban development areas. The City of Vienna supports the provision of “mobility points” with several sharing services in urban development areas such as the new quarter “Seestadt Aspern”, and recently has also opened new ways of financing such investment: As presented by the website of the City of Vienna “Fonds für umweltfreundliche Mobilität”, a new municipal mobility fund, supplied by contributions from developers and investors, aims at providing environmentally sound mobility solutions in urban development areas.

But even if innovative mobility solutions may be applied for new urban quarters or new buildings, this is not the case for already existing quarters and for urban rehabilitation projects. Practical examples are missing of how sustainable mobility can be enhanced through social housing rehabilitation projects.

5 CASE STUDY KROTTENBACHSTRASSE 40-46

The above-mentioned research project (Smart City im Gemeindebau, 2016) highlighted several options for action that might be implemented in accordance with a social housing rehabilitation project, by the example of a municipal housing complex in Vienna.

While working on the traffic and mobility part of the project we interviewed the inhabitants about their mobility, thoroughly analyzed the traffic situation of the block and the adjacent streets, and observed the way people used the semi-public inner courtyard and the public spaces around. On this basis finally we defined options for action.

5.1 CHARACTERIZATION OF THE STUDY AREA

The perimeter block at the fringe of the densely built urban area was constructed between 1958 and 1970, and has 150 apartments, a post office and two small shops. The five-storey building is made accessible by 12 staircases, all of them opening to the inner courtyard. There are 28 parking lots rented to tenants, 12 of them located in the inner courtyard and 16 outside, in an adjacent parking area. The photos in Figure 2 give an impression of the housing complex.

Figure 2 – The case study complex: View from Krottenbachstrasse (1), inner courtyard (2 and 3)
Photos: Andrea Weninger

As shown in Figure 3, the residential area north of Krottenbachstrasse dating from the period before 1914 is characterized by its grid-like road network, but also by several municipal housing complexes built after 1955. South of Krottenbachstrasse the character of the area changes significantly: the terrain rises, and some recreational facilities and residential buildings are situated on the hillside. The housing complex under study is quite well-supplied with nearby shopping opportunities and health, education and recreational facilities. Many destinations can be reached by foot within short time.

Figure 3 – The surroundings of the case study block
Source: Stadtplan Wien, <https://www.wien.gv.at/stadtplan/> (10.05.2017)

5.2 INTERVIEWS WITH INHABITANTS

The interviews were carried out in November and December 2015 by "wohnpartner", an organization who attends to the communication within municipal housing complexes on behalf of the City of Vienna. The extensive personal interviews aimed at gaining information and at detecting potentials for a "smart" rehabilitation project. They were based on a questionnaire which, among others, also contained questions about the mobility behavior, the traffic situation and the urban environment, as well as about related needs and wishes of the inhabitants.

A third of the households were reached, and detailed interviews with 50 inhabitants and two shopkeepers took place. Among the 50 questioned inhabitants there are 32 women. All age groups are represented – from "20-30" to "over 80"; the strongest age group is the 51-60 years olds. Two thirds of the interviewed persons are living in one- or two-persons-households, nearly one third in households with children. About half of the interview partners are retired – some of them because of disability or illness, a quarter are employed, and 9 persons are out of work.

As regards mobility behavior, walking by foot and traveling by public transport are most important, a large majority of the interviewees doing so frequently, followed by riding in a car driven by someone else. In contrast, the options of driving a car oneself or riding a bicycle are used only by a minority of the interviewees. Accordingly, 30 persons dispose of an annual ticket of Vienna public transport. 28 persons (more than half of the interviewees!) do not possess a car, and still 20 persons live in a household where nobody holds a driving license. From the 22 car owners 13 are parking in the public streets, and 9 on a rented parking lot of the housing complex. Only 14 persons have a bicycle, most of them keep it in their own cellar compartment. None of the inhabitants has an electric car or an e-bike. Although cycling

presently is not a common mode of transport, two thirds of the interviewees consider that providing bicycle parking facilities when renovating the housing complex would be a good thing. Altogether, the questioned inhabitants are rather satisfied with their living conditions and urban environment. But more than a third of the interviewees consider that road safety is “poor” or “very poor”.

The major problem is that pedestrians feel uneasy when crossing the adjacent highly frequented road (Krottenbachstrasse).

5.3 ANALYSIS OF THE TRAFFIC SITUATION AND OF PUBLIC SPACES

The public transport connection, ensured by a bus line in the adjacent main road, with a bus stop directly in front of the block, and a nearby urban railway line, is rather satisfactory. Anyway, the intervals during off-peak-hours are rather long, and the nearby bus stop is lacking comfort and has no waiting time display.

The conditions for pedestrian traffic in the surroundings are quite good, but still offer a lot of room for improvement. Foot paths leading through the council housing complexes supplement the grid-like road network north of Krottenbachstrasse. People use the semi-public spaces of the inner courtyard of the case study block for passing through, but rarely for staying. In the study area many destinations can be reached within walking distance. But the street layout favoring parked cars makes the sidewalks often very narrow. The Krottenbachstrasse can be crossed on a crosswalk (without traffic lights) in front of the apartment complex. But due to its high traffic volume and the increased risk of accidents, the Krottenbachstrasse is a considerable barrier to pedestrians. The rising terrain opposite the investigated apartment complex can be accessed by a public staircase leading to some recreational facilities, but it has no ramps and cannot be used by people with mobility limitations.

Since there is no cycling infrastructure in the study area, cycling is not an attractive option for residents. However, the 30 km/h zone north of Krottenbachstrasse allows biking in mixed traffic with cars, but bicycle traffic is bound to the one-way system of this zone and cannot profit from exceptions which are common in other districts of Vienna. The Krottenbachstrasse is unattractive for cycling and even rather dangerous, due to the high traffic volume and the high speed, the bus traffic and the one-sided cross parking. Correspondingly, the number of cyclists on Krottenbachstrasse currently is low. The area south of Krottenbachstrasse cannot be reached easily due to its steep slope. In the vicinity of the apartment complex, there are almost no parking facilities for bicycles in the public space.

The number of car parking spaces within the public streets is high, with a very high level of capacity utilization. Unlike other similar quarters of Vienna, in the study area the public parking space can be used free of charges. In the 30 km/h zone cars are usually parked lengthwise on one side, and angular on the other. The remaining space for walking and cycling is severely restricted. The narrowness of many sidewalks punctually is even reinforced by waste collection containers or other street furniture.

Within the examined housing complex 28 car parking lots are available and leased to tenants. Compared to the high capacity utilization of the public parking spaces, the personally reserved in-house parking spaces seem underused.

The photos in Figure 4 illustrate the analyzed conditions of the neighborhood, such as the narrowness of sidewalks, the lack of cycling infrastructures, the reserved parking lots, a semi-public passage through the case study block, the public staircase and the crosswalk across Krottenbachstrasse.

Figure 4 – Infrastructures for parking, cycling and walking in the neighborhood
Photos: Andrea Weninger

From the baseline study we conclude that there is a high potential for improvement. In a first phase of collecting need for action the space for ideas stayed wide open:

- Making pedestrian crossings in Krottenbachstrasse safer
- Redesign of the inner courtyard, maintaining and re-designing the public pedestrian passages, taking into account the requirements of barrier-free accessibility
- Securing and further improving the dense pedestrian network in the study quarter, including the much-used routes through the municipal housing complexes, which constitute a special quality of the study area
- Safeguarding sidewalks of 2 meters minimum, by changing road design in favor of pedestrians
- Increasing the usability of public space for people with mobility limitations by providing stairs with ramps or elevators in steep terrain
- Providing high quality bicycle parking facilities in the housing complex, well integrated into the redesign of the inner courtyard
- Improving the cycling infrastructure in adjacent streets, in particular in the Krottenbachstrasse
- Finding solutions for the establishment of collective garages for several blocks, replacing the parking lots assigned to the case study complex, and using the potentials for high quality design of the inner courtyard and the public space.
- Providing car-sharing and other mobility services like rental of an e-bike or a bike trailer for the residents ("mobility station")
- Providing traffic and mobility information for the residents, e. g. by installing a digital bulletin board which can also be used for reservation of mobility services
- Rebuilding street furniture with high quality design (waste bins, bus stop)

5.4 CONCLUSIONS FROM THE CASE STUDY

The above list of potential for improvement contains three different types of measures:

- A. Edificial measures within the municipal housing complex. Responsibility for implementation: Owner and property management organization ("Wiener Wohnen")
 - Re-construction measures within buildings and open spaces
 - Utilization changes for existing spaces
 - Furnishings for common rooms and open spaces
- B. Accompanying participatory, activation and organisation measures Responsibility for implementation: There are various options – the responsible organisations must be commissioned by "Wiener Wohnen" or the City of Vienna
 - Participation procedures for accompanying re-design measures, e. g. for the inner courtyard

- Activation and motivation of inhabitants, support for self-organization
- Business models for (commercial or self-organized) mobility services
- Traffic information and mobility management measures
- C. Traffic measures, street design measures and edificial measures concerning the surroundings of the housing complex Responsibility for the implementation of measures: Diverse municipal departments, district authority and other organisations (transportation-company, property developer etc.)
 - Traffic measures, safety measures
 - Design of the public space, street design and re-allocation of functions
 - Public transport measures
 - Development and construction measures on nearby properties (collective garages)

It is evident that many of the above-mentioned measures are strongly interdependent. For example, if convenient bicycle parking facilities for the residents of the case study block are constructed, they will be more appreciated and asked for, if at the same time a bicycle route in the adjacent main road is provided, and maybe even more if additionally, residents can run a self-organized bicycle repair shop.

However, the approved procedures of municipal housing renovation projects presently do not include aspects of the urban environment, and residents' participation in renovation is not carried out systematically. Taking this into consideration, the above-mentioned project (Smart City im Gemeindebau, 2016) was finished by developing practical guidelines for measures that might be implemented by the property managers themselves, especially the construction of bicycle parking facilities.

6 SUSTAINABLE MOBILITY OPTIONS

With the aim of stimulating sustainable mobility, people living in municipal housing complexes could be supported with various measures that might be carried out during renovation projects. The residents should be able to cover their daily journeys in an efficient, cost-effective and environmentally friendly manner. They should have more individual choices and should be able to use technological and social innovations for their mobility, for instance by using a car now and then without possessing an own car. Such innovative mobility solutions might make people more satisfied with their residential situation.

Independent from the above-mentioned case study, in a more general way, and taking into account current literature on housing and mobility (Raum & Kommunikation, 2014; Arbeitsgemeinschaft Fussverkehr Schweiz, 2014; VCÖ, 2015), several options for action, that might be implemented in accordance with municipal housing renovation projects can be identified.

CREATE GOOD CONDITIONS FOR CYCLING:

The construction of sufficient convenient bicycle parking facilities during a renovation project may be a strong factor for motivating the residents of municipal housing complexes to increase the use of this efficient, healthy and environment-friendly mean of transport. Bicycle parking stands may be situated in the open space of the housing complex or in under-used ground floor rooms or, if lift transport is possible, even in upper floors near to the apartments. It is important to guarantee a good practical usability by implementing quality criteria like direct access from the street, short distance to the stairway entries, protection from weather conditions and from theft. For the access and locking system smart technological solutions may be used. In Vienna, housing companies can obtain public funding for raising bicycle parking stands.

PROVIDE MOBILITY SERVICES AND RENTAL:

The residents will find cycling even more attractive, if they can rent an e-bike, a bike trailer or other equipment, and if a compressed air pump and a toolkit for repair are available nearby. For implementing such services in municipal housing complexes there are still some open questions to be answered: What is the adequate organization form – commercial service or self-organization, what is the best size of the

service provider? Is the target group limited to residents of the complex, or is there open access? What is the adequate reservation system?

PROVIDE ACCESS TO CAR-SHARING FOR RESIDENTS:

If the tenants of municipal flats get used to car-sharing they can increase their options for their everyday mobility and maybe they can more easily do without an own car.

There are several possibilities of how to support car-sharing among the residents: The housing company or a commissioned organization may limit itself to inform the residents about existing car-sharing systems, or it may try to get a car-sharing station within or in front of the housing complex by negotiating with the car-sharing companies. The creation of an own municipal housing car-sharing system all over Vienna would be most ambitious; a detailed business model would be needed.

IMPROVE THE FOOTPATH NETWORK:

Many municipal housing complexes offer the possibility to pass through, and thus are significant parts of the quarter's footpath network. When securing and improving these passages the municipal housing companies can contribute to supporting the active and healthy mobility form of walking. Especially the attractive design of the entrances as interfaces between public and semi-public spaces, including lighting, is important. For the redesign of the inner courtyards and other open spaces of the housing complexes a participation procedure for the residents is recommended. Possible conflicts between the openness to passing through and residents' wishes to close the complexes for security reasons must be discussed during such participation procedures.

RELOCATE PARKING LOTS INTO COLLECTIVE GARAGES:

One of the most ambitious aims of the Vienna Mobility Strategy is the aspired redesign of public streets in favour of walking and cycling. The relocation of parking space to collective garages would open up the scope of action not only for the public streets but also for the renovation of municipal housing complexes. In our case study example the inner courtyard which presently offers 12 parking lots (with a weak degree of capacity utilization) could be redesigned in favor of a resting place or a small children playground – facilities that were missed by the questioned residents.

7 CONCLUSIONS

The implementation of measures in the fields of action set out above requires a lot of coordination and cooperation between different departments and organizations. While the responsibility for construction activities within the housing complex clearly lies with "Wiener Wohnen", the responsibility for the implementation of accompanying, activating participatory action has yet to be determined. The residents' participation and mobilization for self-organization from the beginning would be necessary for the implementation of measures. Furthermore, for really improving the residents' mobility situation a combination of measures, both within the housing complex as well as in the surroundings will be adequate.

This approach would require focused cooperation between the housing organization and municipal departments responsible for traffic and urban space, as well as private companies and organizations. Suitable cooperation mechanisms presently are lacking and should be established.

We have to be conscious of the fact that municipal housing complexes are widespread over Vienna's territory and that adapted procedures for municipal housing renovation have the potential not only to improve the quality of living for the resident, but also to contribute to the ambitious mobility goals of a sustainable city.

ID 1382 | ROLE OF THE RUMORS DURING THE URBAN TRANSFORMATION PROCESS IN ISTANBUL GECEKONDU SETTLEMENTS

Gizem Aksümer¹

¹Mimar Sinan Fine Arts University
gizem.aksumer@msgsu.edu.tr

1 INTRODUCTION

This paper is a product of the PhD thesis focusing on the urban transformation process into gecekondu¹ neighbourhoods (the special name for informally, DIY-constructed building groups constructed only in Turkey) in Istanbul and focuses on the rumours flowing mouth to mouth before and after the urban transformation project.

This paper is endorsed on Deleuze and Guattari's arguments about flows, assemblages, and machines. Urban transformation is taken as a machine and the information is the key element of this machine. Rather than the rules, procedures or laws about the urban transformation process, words are moving faster. We always watch on TV or see in the newspapers advertisements about new transformation projects, or professionals' comments about the necessity of the processes. In addition to this, urban transformation in gecekondu does not only happen by the law or by the projects called urban transformation projects. Any kind of luxury residence projects, big shopping malls or big transportation projects can initiate the urban transformation process. This is not an operation that is determined step by step. Communication and negotiation with the inhabitants one by one are very important and at this point, rumours come into the

¹ Gecekondu is an informally constructed house which is built autonomously by the people who uses it. Gecekondu houses come together and make big neighborhoods. For further details: (Karpat, 1976), (Erman, 1997, 2004), (Ergün, 2008). For a Deleuzian Perspective on informal settlements: (Co Villanueva, 2012)

play. On the gecekondu neighbourhood scale – where the neighbourhood relations are very close - information about the prospective urban transformation projects are influencing the area spreads from mouth to mouth and transforms into rumours. Rumours canalize desire flows making some spaces more attractive, some others less, and affect the daily life of gecekondu inhabitants and their decision process.

In this context, the aim of this paper is to follow the information flows related to urban transformation from the macro scale of Istanbul region to the micro scale of gecekondu neighbourhoods by analysing the news, advertisements, speeches of public authorities and listening to gecekondu inhabitants' stories. Focusing on gecekondu inhabitants, this study demonstrates how information transforms into rumour, the ways it flows through the gecekondu neighbourhood, and finally how people react to these rumours before, during and after urban transformation processes.

The words flow will be followed from macro (Istanbul) to micro (gecekondu) scales and the main aim is to find out how urban transformation works with words. In this paper, first, the theoretical background of the research will be revealed. In the second part, the methodology of the paper will be presented. As a macro scale, discussions about the urban transformation law, the importance of the seismic risk in Istanbul, and the rumours about the demolition threat in gecekondu areas will be introduced. Secondly, focusing on Istanbul -Sarıyer gecekondu neighbourhoods, the two steps of urban transformation will be analysed. The first part will show the rumours flowing into the gecekondu areas before any project is declared. Rumours about the demolition of the neighbourhood start even before any urban transformation project becomes concrete. The second part will demonstrate what is happening after urban transformation is completed. After the project triggering gecekondu transformation, most inhabitants move to mass housing areas which are assigned for them, and there, they still continue to discuss who paid how much for the new house or who had the most advantageous flat and so on.

2 THEORY AND METHODOLOGY

Urban transformation emerged in the beginning of 2000s not only in scope of “urban transformation projects”, but especially for creating new urban project areas by focusing on gecekondu regions. While there are technical reasons such as seismicity and necessity for transformation, urban transformation has taken place in the form of demolishing especially gecekondu, and building shopping malls, large transportation projects of luxury residency areas, particularly in large metropolitan cities such as Istanbul. The most differentiating aspect of the transformation process experienced in gecekondu neighbourhoods in comparison to other urban transformation projects is that it is usually carried out without planning, over piece by piece projects and based on negotiations. The most emergent issue in this process is the news on the media and rumours flowing across the neighbourhood. It may be stated that various different people, institutions and groups on all scales need to have a say on urban transformation, and there is a bombardment of information regarding urban transformation because of this. The new social organisation proposed by Hardt and Negri (2012) as “the mediatised” may be discussed. This new form is described by Hardt and Negri (2012) as a type of information society, and the information flowing in the media is joined by the people who live in the image world established by this information. They argue that the people of this world has no problem about not being able to say much, but on the contrary, they suffer from the abundance of expression, as well as communication. Hardt and Negri (2012: 22), citing Deleuze, stated that: “the issue is no longer having people express themselves” says Gilles Deleuze, “it is to create small seclusion and calmness intervals at the end of which they may find something to say. Oppressive powers are not preventing people from expressing themselves, on the contrary, they are forcing them to express themselves. Such a privilege to have nothing to say, and the right to say nothing; because, only then there is an opportunity to catch the thing that is rare, the thing that is even rarer, worth saying.” Considering information bombardments and the issue of the mediatised in terms of urban transformation, it is seen that rather than hiding information about a subject, there is the issue of constant circulation of new information, documents and images. Hardt and Negri (2011, p. 111) defend the idea that today’s dominant production system produces “intangible goods” such as ideas, information, ways of communication and relationships. These intangible goods may be significant indicators of urban life. The city becomes the space for all these flows. Similarly, we may argue for urban transformation that it does not only produce buildings, but also new urban lifestyles and forms of information. These new lifestyles whose images are shown in the mass media, actually take an important place for this article and reminds us a quote from Deleuze (2003, p. 30): “A dream is a terrifying desire for power. All of us are more or less victims of other people’s dreams. Even worse, even though the one whose dream you are caught in is the sweetest, most beautiful girl in the

world, she may become a monster – not with her soul, but via her dreams. Keep away from others' dreams, because if you are trapped in the dream of the other, you are fucked.”

In the process of urban transformation, information turns into rumour and can move fast via ambiguity. These micro information flows usually develop with the support of the media or different capital groups, and move through the word of mouth about the initiation of a law or a future foundation of a mega project. These urban transformation rumours whose source is usually unknown may arise from not only the citizens, but also contractors, professionals in the sector, or statements by the public authority. Wright (2008) indicated that it is not important for a rumour to be true or false. In addition to this reference, we may talk about how rumours work. In the process of urban transformation, a rumour about a provisory investment in a neighbourhood may lead inhabitants to sell their houses. At this point, rather than the truth or the lie, it is important that rumours can mobilise people. Secondly, Wright (2008) stated that although rumour is considered “false information” by its nature, it contains true and false information together. In this context, in the urban transformation process, rumours arise related to an investment, or demolition coming to a gecekondu neighbourhood. While these may partly be true, there is no certainty on when they will happen. The function of rumour here is to speed up the process, and allow citizens to develop ideas on a predetermined tendency against potential situations. Additionally, rumour does not proceed as a straight line, but it forms connections, moves like a rootstalk by changing itself during connections.

It may be stated that the fundamental methodology of the study inspired by the approach of Deleuze and

Guattari. This method that we may describe as handiwork by joining the material in hand was applied by Deleuze and Guattari by borrowing the term ‘bricolage’ from Levi-Strauss (Deleuze & Guattari, 2012). Considering it in terms of cultural studies, bricolage may be thought of as installation/interpretation of objects, forms, expressions or relationships that are not directly related by recombining them. For the first part of the research, more than 6,000 news pieces in 3 major national papers (Sözcü, Zaman and Milliyet) and TV advertisements about urban transformation were located and analysed. In the second part, in-depth interviews were conducted with 20 gecekondu inhabitants from 3 different neighbourhoods in Sarıyer (a district experiencing urban transformation), who had moved to mass housing areas. The interviews were made in the mass housing areas located in peripheral areas of Istanbul (Kagithane, Kartal and Guzeltape). Superimposition of these two scales shows us the circulation of ‘words’ from the citywide narratives to the mouths and actions of inhabitants.

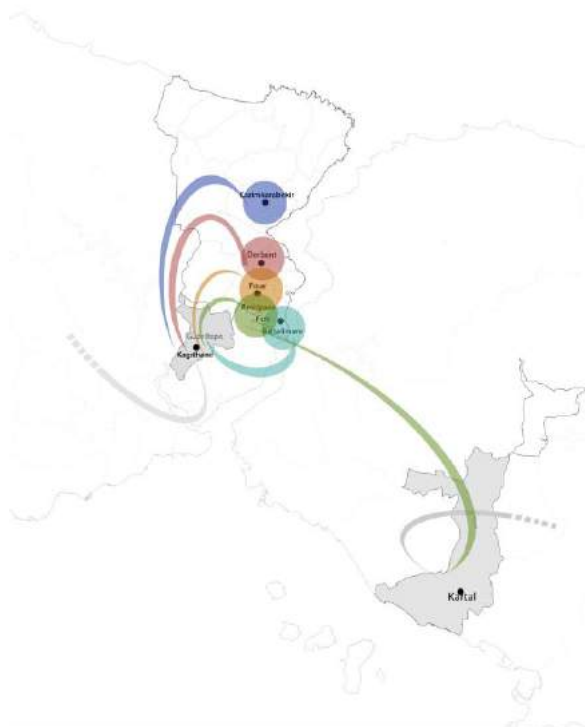

Figure 1. Map of the Sarıyer Gecekondu Neighbourhoods Moving to Peripheral Areas

3 FIRST RUMOUR: URBAN TRANSFORMATION LAW

Consecutive laws, executive orders and law changes are starting to be seen in the news, advertisements and all types of media. Thus, it is seen that rather than in-depth research about the law, the information about this is spreading around. Therefore, in the urban transformation process, law suddenly becomes fluid and turns into information, which flows. In 2005, discussions on an urban transformation law started in the public sphere and the Chamber of City Planners launched a press conference regarding “the Draft Law for Urban Transformation.” The statements were in the lines of the idea that the draft law had the potential to create new problems (ŞPO, Mart 2005)(Chamber of City Planners, April 2005). In the statements, the Chamber of City Planners, argued that, although there was the claim that the law was prepared based on scientific data, it was formed in ignorance of science and protection councils. On the other hand, the

chamber of profession stated that old city areas and those that lost their characteristics were devolved "Urban Transformation and Development Areas" in a way that may be a subject of all kinds of speculation later, and this law would create areas of rent. In this process, a perception of suspension of this law was created given the potential that there is an opposition and various opposing scientific ideas. Nevertheless, not so much later, June 2005 faced the initiation of the law for "Protection of Damaged Historical and Cultural Immovable Assets by Restoration and Usage of These by Reanimation." While the name of the law cannot be related to urban transformation, it is known as the first law of urban transformation that proposes urban transformation in historical neighbourhoods. During these debates, while the changes in the law of TOKI (the Housing Development Administration) were not reflected in mass media in a way that would explain what changed one by one, TOKI's authority and activities constantly appear in front of us with the term urban transformation. TOKI's size and many houses built by this institution usually appear on the news.

It is seen that from the start, especially the private sector and the public authority have an important call in terms of urban transformation. However, in the first stage, urban transformation is presented as a process to "get rid of" gecekondu and "illicit" housing, and it is focused rather on very poor neighbourhoods. A news article published in the daily Milliyet in 2007 emphasised this: "Illicit buildings will become "normal" with the law of transformation zones." Increasingly intensified circulation of discussions on earthquakes in the city is one of the most important factors that allow urban transformation to work fast. Relating urban transformation to this issue of earthquake is a significant pushing power. Another important rumour that emerges in the urban transformation process is the law of "transformation" or "urban transformation" that is expected to "come into power." It is seen that the law that firstly appeared in the news in 2006 as "the Draft Law for Transformation Zones" has been started to be discussed as the law for converting gecekondu areas into legal status. The news article in Milliyet entitled "Looting Would Become Legitimate", described the law known as "the Draft Law for Transformation Zones" as a law that provides gecekondu owners with the opportunity of buying a residence with payment term of 20 years.

Before the "Law for Transforming Areas of Disaster Risk" came out in 2012, as opposed to the laws in previous years, there was a positive reaction in the whole society and the newspapers. It is seen that a statement was made about this law in the news by Kadir Topbas during the opening of AKP Bahçeşehir Municipality Office. It is an important indicator that a statement was made about urban transformation during the opening of an AKP municipality office, and this statement was made by the Mayor of Istanbul. It is seen that, in this sense, the urban transformation law was meant to stay as an operation of the AKP as an organisation. Again, in the daily Zaman, news pieces were seen regarding families who "were saved from gecekondu life" by moving from gecekondus into mass housing project as a result of urban transformation in the period right before the parliamentary discussion on "the Law of Urban Transformation."

Considering the style of providing the news pieces after the approval of the law, the pro-government nature of the newspapers was slightly influential. As opposed to the case in Zaman where the positive aspects of the law were emphasised, on the same day the law came out, the daily Sözcü used the title of "Urban Transformation Law Final" to provide an objective and non-critical language. That the "law was final" ensures the perception that this service has been provided and it is a good service. By the law came into force, we see for a few months that newspapers included very intense amounts of pieces reporting that urban transformation is now started town by town. This issue of initiation was paid a great importance, and the opening speech by the period's Prime Minister Recep Tayyip Erdogan was made during the urban transformation process of the Esenler Airport area by determining a starting date (5 October 2012). Transformation of the law into information, rather than being for information of the public about the laws, is operated with the aim of mobilising the society regarding urban transformation. All these rumours of a law, whether they have a trace of truth or not, create great excitement and make it easier for desires to flow in the direction of urban transformation.

4 EARTHQUAKE RUMOUR

Rumour of earthquakes has a place especially in the initial stages of urban transformation in detailed processing of the imposition in gecekondu neighbourhoods to demolish buildings and transition to mass housings. In this sense, rumour of earthquake creates an axis of ridding people of their place and home. One of the arguments for sustaining an entire urban transformation process is which parts of the city, an

Istanbul earthquake will affect, which may also initiate the formation of urban transformation projects. It was not a coincidence that the years in which the construction sector started to rise correspond to the aftermath of the earthquake in Izmit in 1999. This issue does not stay as a statement that only comes from official offices to the people and only affects poor groups of people, but it has a place in daily life that increasingly moves towards middle-classes. Çiçekoglu (2015, p. 22), in her book on an analysis of insurrection threshold in movies regarding urban life, described the idea of emphasising the destructive nature of the urban transformation process and usage of earthquake rumours as an excuse for wealthy neighbourhoods by “in the days of ‘construction by destruction’ that surrounded the city again after 40 years, Fenerbahçe is being demolished again using the possibility of an earthquake as an excuse.” This rumour may be traced back to a statement in 2004 in the daily Milliyet by Kadir Topbas, who then had been Mayor of Istanbul for only 5 months, based on rumours where such an earthquake would affect as “I will demolish. Let them call me evil” (Milliyet, 6 September 2004).

With this statement made by Kadir Topbas as soon as he started his job, the post-2004 process based on “urban transformation” in Istanbul started especially in a way to “empty city centres.” However, we see that Kadir Topba still did not use the term “urban transformation” based on this article.

In the early 2000s and in parallel to the timeline of these statements, it is seen that the word flows regarding an earthquake were rather on the level of technical information and they usually involved statements by architects and engineers. Considering the changes in the people and institutions speaking about earthquakes in that time, it is seen that the period of 2000-2006 where academics with technical knowledge were visible was followed by a period of the public authority or people of the law spoke about earthquakes, and were joined later by contractors.

It is seen that the news pieces about buildings in most towns in Istanbul not being resistant enough for earthquakes were more frequent after 2006. It is also seen that the interviews with engineers about fault lines and possibility of an Istanbul earthquake before 2005, left their place for a discussion on “weakness of buildings” led by TOKI and private sector firms. The argument for urban transformation that started over stability and life safety increasingly evolved towards cultural transformation or construction of luxurious buildings. It appears that images used in this article and similar ones usually consist of ruined buildings, cracked walls or aerial views of crammed up city textures, and therefore strengthen the information provided by the news in this context. The news of the instability of buildings in Istanbul and that they carry a risk of collapse in case of an earthquake appeared in certain intervals in newspapers.

Until the Law No. 6306 in 2012¹ came into force, it is seen that the term “disaster” was not used in relation with an earthquake or urban transformation. Additionally, the concept of “risk” we almost did not see at all till 2008 started to emerge in the news after these dates. In the form, it is reflected in the media, it is thought that the responsibility of the public authority is limited to public buildings, and single buildings are considered in the responsibility of the property owner. Again, the same point of view may be seen exactly 5 years later than this news piece in the Law No. 6306, where the responsibility of urban transformation was left to the property owner. Therefore, the process starting with the 2000s and reached 2015 does not work by instant changes through legislation, but is cooked in the media, government statements, developed, added and related, eventually reaching the Law No. 6306.

It started to come out in the newspapers that “Earthquake-Centred Urban Transformation” was initiated in the old gecekondu neighbourhood of Zeytinburnu Sümer. Ali Agaoglu, one of the significant investors in the urban transformation process who has been popular since 2007, confessed in 2009 that the buildings in Bagdat Avenue were constructed using sea sand and scrap metal, and created anxiety in higher-class residents rather than gecekondu citizen. This example clearly demonstrates the process of very technical information such as seismicity or construction quality turning into a rumour. After Agaoglu’s statements, it is seen that initiatives took place regarding the construction activities in Bagdat Avenue and surrounding areas. Again, Agaoglu, stated in 2010 that Istanbul should be demolished not by an earthquake, but by construction firms. It may be argued that these statements in two consecutive years played an important role in carrying the urban transformation process from the particularity of gecekondus into the lives of middle and higher income groups.

¹ The Law For the Risky Areas

The image above used in the news piece regarding Agaoglu's statement is a significant example of the idea of a building and a city in the aftermath of urban transformation. The high-rise building in the form of a skyscraper with a helipad represents the interpretation that urban transformation is not being implemented only for building stronger structures, but it is also used for creation of a new urban lifestyle. After the approval of the "Law for Transformation of Areas Under the Risk of Disaster" on 31 May 2012, more striking news pieces about the risk created by earthquakes started to appear in the media, and newspapers used the argument of urban transformation as the only solution more often. The piece whose image is shared above emphasised especially that urban transformation is not only about refurbishing buildings and the issues of society and environment should be in the process, and showed that there is a move towards more theoretical argumentation than in the previous piece. In the image used in the news article, the human silhouette covered with windows seems to relate the "ideal human" with urban transformation by providing a reference to Da Vinci's Vitruvian Man.

Consequently, the argument that urban transformation is a must for preparation for earthquakes started after the 1999 Izmit earthquake became increasingly dominant in the entire media, and the people and institutions expressing this argument changed through time. The process, which usually progressed through scientists and academics in the beginning of the 2000s, started to be spread over the statements of the public authority later. The function of the central government components and the Metropolitan Municipality to distribute information on earthquakes started to be left to private sector components by the early 2000s. The information that progressed through risk, disaster and destruction and evolved towards earthquake-centred urban transformation brings us to the definition of social democracy by Ulus Baker (2010, pp. 343-344): "a regime, and even social-democratic regime individualism, is absorbed in the body of an imaginary 'potestas' that is intended to solve problems in the name of the people who are assumed to be 'innocent' and have the necessity of being 'governed'; government becomes a service". The emphasis is on the desire of the state to pursue the best interests of the public by implementing urban transformation whether the public wants it or not.

The argument of urban transportation that spreads not only in terms of seismicity but also in many fields, or discussions over the common good, also become frequent in the case of gecekondus. The issue of "public interest" that is reached by debates on "occupation" that are carried out considering the property issues in gecekondu areas seems important for reaching consensus in many layers of the society regarding gecekondu demolition.

5 RUMOURS OF DEMOLITION

Gecekondu neighbourhoods have continued their existence by constantly considering the possibility of demolition since their first stages of establishment. In this sense, rumours of demolition are not new for gecekondu neighbourhoods, but it is a mechanism that has been familiar with for more than 50 years. On the one part, it may be argued that these rumours increase the power of solidarity among gecekondu-dwellers in terms of supporting each other and collecting stories in which they stand against demolitions all together (Gizem Aksümer, 2010; Murat Cemal; Yalçınan & Çavuşoğlu, 2008; Yücel & Aksümer, 2011). On the other hand, rumours of demolition entering gecekondu neighbourhoods become a driving force of the urban transformation in the 2000s.

In this context, it may be seen that the reflection of urban transformation debates in the 2000s on gecekondu neighbourhoods did not start with a single urban transformation process, but the process was significantly pushed forward by the re-emerging rumours of demolition that were more intense. Even before the revelation of urban transformation or a project that affects gecekondu neighbourhoods, urban transformation enters the neighbourhoods as a "rumour of demolition." Sometimes, there is no urban transformation project at all, but instead, investments around, transportation projects, and shopping malls lead to a group of gecekondus to be demolished. Important findings include that small-scale projects and plans that only affect gecekondu neighbourhoods do not find a place in the media, and government statements related to these do not appear. Only news pieces about the Derbent neighbourhood took place in the media for a few times as the project was "showcased" abroad. On the other hand, gecekondus usually appear on the news in cases related to resistance against demolition or crimes such as fights. The news pieces that concern the issue of gecekondu the most, those related to mass housing areas, are only carried out over the issues of where these housings are built, whether lotteries are drawn or not, or the number of residences. In the article on how rumour works, Wright (2008) emphasised that rumours

strengthen solidarity and sense of community. We may see this in gecekondu residents supporting each other during demolition stories and keeping watch to prevent demolition teams entering the neighbourhood. On the other hand, stronger solidarity and sense of community brings about faster spread of rumour in the community. Progression of rumour does not happen in a straight line, but takes place in a net-like, rootstalk-like formation, and information is usually spread through multiple different sources with different interpretations rather than a single source. This rootstalk-like operation seems suitable for the gecekondu neighbourhood, where social relationships are also rootstalk-like. Therefore, starting rumours is a factor that speeds up the operation of urban transformation. In this context, in order to see the working mechanism of information flowing from various channels on the adjustment of gecekondus, this section will investigate in detail the rumours of demolition in the Fatih Sultan Mehmet, Baltalimanı and Resitpasa neighbourhoods of the Sariyer district.

Demolition has been a part of daily life for gecekondu residents since 1950s, that is, since they built their gecekondus. Nevertheless, newspaper articles show that the first encounter of Sariyer's gecekondu neighbourhoods with urban transformation after 2005 occurred with the demolition in the Derbent neighbourhood. In the article "Sarıyer'de Yıkım Savaşı" (Demolition War in Sariyer) (Milliyet, 2006) it was reported that actually only one building was demolished in scope of urban transformation, and again in this scope, neighbourhood residents opposed the issue with a violent reaction and established barricades in the neighbourhood due to the rumours that their homes would be demolished¹. In this sense, the emphasis is significant on the report that the demolition team that entered the neighbourhood with the police and anti-riot water cannon vehicles did not intend to demolish the houses in the neighbourhood, and the people were agitated about "false rumours."

In the same article, it was reported that tear gas canisters were fired near the elementary school and the student were taken to the hospital. 2006 was a period where especially the concept of urban transformation became popular by emphasis and worked over gecekondus, while it had the characteristics of attempts of violently implementing projects with gecekondus. Another article about gecekondu transformation was published in September 2013 in Milliyet. The period after 2010 was a period where a discussion as "transformation on site" emerged about urban transformation. In this article, it was stated that it is possible for gecekondu residents to enter urban transformation without payment and stay in their location.

In parallel to this information, one of our interviewees, Ayse stated that there has been rumours about demolition in Baltalimanı for very long, and "the people are fed up with it." Similarly, Mehmet (Ugurmumcu Neighbourhood, 50-55) said he knew about the rumours of demolition in FSM since his young days, and the residents have slackness due to the idea that "they will always say there will be a demolition, but they will never demolish it." Accordingly, such slackness made it easier for 35 buildings to be demolished in FSM.

Gecekondu residents who face a new demolition rumour or possibility every year have lived through long-lasting rumours of "they say demolitions will take place" during the course of the process of urban transformation. The news that demolition will take place in the neighbourhoods of FSM, Baltalimanı, Resitpasa and Pınar where the interviewees who moved to mass housing previously lived, reached them even before the project was known publicly. In addition to shopping malls, mixed-usage residencies, luxury residential complexes in old villages, and mega projects such as large transportation investments in Sariyer, the roads, bridges or green areas that are the extensions of these projects lead to a partial process of destruction and transformation in gecekondu neighbourhoods. It is seen that rumours, speculations and the direction of information flow are highly important in cases where the neighbourhood is not completely a subject of urban transformation, but only some plots are in the demolition zone.

It is seen that demolition rumours in FSM, Baltalimanı, Resitpasa progressed until the construction of the second intercontinental bridge. Halil, an interviewee who moved out of Baltalimanı, stated that the rumours that these neighbourhoods would be demolished, became more prevalent after the construction of the bridge: "The second bridge was opened in Hisarüstü, and it passed between Baltalimanı and Hisarüstü. It may be 1990, I am not sure. There was the rumour for years that Hisarüstü would be removed and

¹ For further details about the opposition of gecekondu neighborhoods to the urban transformation process: AKSÜMER, G. 2010. Luttet Contre La Transformation Urbaine Des Quartiers De Gecekondu D'Istanbul: Etude De Cas Du Quartier Kazimkarabekir. Master Recherche, Galatasaray Üniversitesi.

Baltalimanı and Armutlu would be expropriated.” Ibrahim, who also moved out of the same neighbourhood provided a parallel argument: “It is not about the rumours, but these (projects) were always ready. I was buying a flat in Hisarüstü. When I went there, the man showed me a map of the location and said the situation is complicated there. It was 1998. Hisarüstü, Baltalimanı, Armutlu... I could not trust these places and but a flat there.” That these rumours may be traced up to the end of 1990s, shows that there was a period of demolition rumours until 2005 for 10-15 years.

Again, Mehmet from FSM, who was affected by the same projects (Ugurmumcu, Male, 40-50) stated that such rumours came into the neighbourhood before they received the official notice of demolition. Such rumours in the form of gossip that may arise in coffee houses and women’s house gatherings are also seen in Baltalimanı and Resitpasa. Halil coming from Baltalimanı even stated that they were informed about the road to be constructed in the neighbourhood with the official notices, but in this process, negotiations were made with many people beforehand. He shared his doubts that preliminary negotiations were made with some residents and those residents were informed beforehand. Tekin said most residents learned about the demolition process from Kadir Topbas speech in the neighbourhood. In this stage, speculations or newspaper articles about the negotiation meetings of construction companies also become the first source of information about the process.

While the interviewees had various complaints about these new mass housing areas and especially women missed their old neighbourhoods, the weariness from the threat of demolition and the unsustainability of the process provides a sense of satisfaction from living in a flat. Housewife Ayse, who moved out of the Baltalimanı neighbourhood (Güzeltepe Konutları, 50-55) stated that she is very sorry to have left the neighbourhood, but added her satisfaction from having a legitimate home here, as “I am thankful that we no longer have this issue of demolition.” Waiting for long times for a demolition is an exhausting process for the residents. These households that are in the middle and lower income group are starting to quit painting their houses or dealing with other issues in the neighbourhood as soon as rumours of demolition start. The previous section emphasised the most important characteristic of gecekondu-type housing as these are not constructed at once and they are turned into liveable, usable, nice houses by modifications through the years. Therefore, sustainability of gecekondus and neighbourhoods consisting of gecekondus depend on constant small repairs and refurbishments. Disruption of the refurbishment process in the household or the neighbourhood leads these places to get unusable over time. Passage of time increases the desires of the residents to leave the neighbourhood.

6 AFTER THE URBAN TRANSFORMATION

The circulation of rumours continues for urban transformation or the gecekondu neighbourhood even after the demolition is carried out. Rumours about who received how much money or who got the better house continue after demolition. This process that works over various assumptions where everyone introduces different information for circulation is a simple product of another ability of rumour, the ability to cause arguments. Wrieth (2008), emphasised that rumours may have a political role in playing people against each other and presented the roles taken by various media organisations during the massacres of Kosovo and Rwanda as examples. While the outcomes are not this heavy, especially the rumours that are introduced in the beginning stage of demolitions in the urban transformation process, the rumours that the person who gets to demolish first will receive more money or the person who leaves will gain more, lead to divisions among gecekondu residents. Newspaper articles reported that, following demolitions, a solution satisfying all neighbourhood residents was achieved in gecekondu neighbourhoods and various informal neighbourhoods. One of the first examples of these was about the transformation project that was planned for implementation in the Neslisah and Hatice Sultan neighbourhoods, also known as Sulukule. Many media outlets reported about this project that all residents wanted the project to be carried out, and no one could not wait for their new mass housing home.

The rumours arising in the neighbourhoods are generally reduced to 3 main questions in the minds of the residents: how many buildings will be demolished, whose building will be demolished, and who will earn what in this process? In this context, different rumours are often related to issues such as where the demolition take place and how many buildings will be demolished, and different numbers are discussed about everything. With rumours, a process of ridding people of their homes is started, and a sort of slippery slope is formed. No one is completely sure about any number or where the demolition will take

place. Even today, statements by different interviewees about demolition of different numbers of buildings are important indicators of this uncertainty.

In the case of FSM, the rumour that 300 buildings would be demolished after the road project started to circulate, the Municipality reduced this number to 260 after various negotiations, and eventually, only 35 buildings were demolished. Since the possibility of the demolition of 300 buildings to the reduction of 35 buildings, about 2-3 years passed, rumours multiplied by variation in this process, and the residents were forced to consider multiple possibilities together in this process. In the case where only 35 buildings were demolished, applications for reconstruction of the buildings in the neighbourhood could not be considered, and 35 households moved to mass housing areas. An administrator in Sarıyer Municipality, Sükrü Muhtar, described the road project to be carried out in Baltalımanı. While describing it, he stated that 60 buildings received notices of demolition in the years 2004-2005, but it was previously estimated that a much higher number of buildings would be demolished. Investigation was made after an expert was appointed in 2005, a “pro-people” report came out, but right after this, about 260 houses were demolished with the presence of 5000 police officers. After a year following the demolition of the buildings, the court cancelled the plan. Therefore, the number of buildings to be demolished was unclear even until the buildings were demolished.

Another group of rumours in the neighbourhoods is who is/will be given how much money or who will be able to receive how many houses where. Ahmet from Baltalımanı (Güzeltepe Konutları, 45-50) stated they learned that early negotiators were given more money, while late ones were given less. Sükrü Muhtar from the Gecekondu Administration at Sarıyer Municipality stated that people whose houses were in danger started negotiations even before the houses were demolished, and it was guessed that some people had already agreed. Thus, who received what or agreed when, always constitute suspicious information.

7 DISCUSSION

This study emphasised that urban transformation does not happen only by laws, projects of capital movements, but is also may be led by affections created in citizen. Word flows are not merely tools to read the situation, but the mechanism of urban transformation works via word flows themselves. In this sense, the word flows in the urban transformation process were traced in different stages from the scale of Istanbul to the scale of gecekondu neighbourhoods. It was found that there are arguments that appeal to emotions such as fear, desire, excitement in the urban transformation process, and the machine is working this way. The process was thought out as a relation of powers as Deleuze meant: “a power relation is a function in the form of “starting, inciting, combining...” In the case of discipline societies, the following holds: dispersing, serialising, combining, normalisation” (Deleuze, 2013a, p. 48). All axes of fear including the laws or the created turbulence and destruction carry the quality of an “initiation function”. New residence typologies we encounter through advertisements, arguments that emphasise how nice urban transformation is, or the context that does not provide gecekondu residents with an option other than mass housing, “incite” the machine and rejoin gecekondu owners in the peripherals of the city.

As the work flows regarding urban transformation get intense, the arguments by chambers of profession and academics converge and more connections may be made, urban transformation starts to be seen as an “unequal tool for sharing rent”, and the side of the government and the public authority resorts to arguments such as that urban transformation is the only way to solve the threat about an earthquake. In this context, it was seen that opinions about an earthquake were presented to the media by scientists, geophysicists and geologists in the early 2000s, but statements of contractors that the earthquake will destroy the entire city took the stage beginning with 2006, and scientists disappeared from the media regarding the issue of urban transformation. Thus, horrifying earthquake scenarios and collapsed building photos, unhealthy and bad representation of gecekondu, and as opposed to these, the new, modern buildings as objects of desire, appeared in the media very frequently. On the other hand, the argument made over the importance of large projects and the unhealthy nature of gecekondu pushed gecekondu away and praised mass housing areas that are being constructed in the peripherals. The two axes related to the flow of words are technical knowledge and legal knowledge that circulate in connection to each other. A third axis is that this knowledge is turned into information, divided into small pieces and converted to rumour. As a result of interpretation of a passed law or transformation about various speculations, rumours of “destruction” come to gecekondu neighbourhoods. Simultaneously, the media and even the public authority manage process due to bombardment of such information. In addition to small scale

pieces of information such as which project will be implemented where or which neighbourhood will be demolished, many words of mouth go into circulation about when the law of urban transformation will come into force, and this issue influences the process greatly. Consequently, we encounter the bombardment-like circulation of word and ambiguation of it by transformation into rumour by cristallisation as an important way of mobilisation that turns the gears of urban transformation, even after the process of moving to new houses.

ID 1383 | STUDY ON LIVING SPACE AND COMMUNITY ATTACHMENT OF THE THREE GORGES MIGRANTS - A COMPARISON BETWEEN MIGRANTS RESETTLED NEARBY AND RELOCATED OUTSIDE

Wang Zhihan¹; Zhao Chunyu¹

¹College of Architecture and Urban Planning, Tongji University
wangzhonri@outlook.com ; 1194093492@qq.com

ABSTRACT: China has a large number of migrations organized by the government, mainly for engineering, ecology and poverty alleviation. The project of resettlement has great significance in politics, economy, society and other aspects. Previous research on migration is mostly based on the survey of economic income and social adaptability, instead of living space and community attachment. These fields have a bearing on the vital interests of migrants, and play definitive roles in the living quality and dignity after relocation. The migrants of the Three Gorges are chosen as the object of study, because of their symbolic significance and the large number of migration samples. The migration is divided into two modes: 79% are resettled nearby, and 21% are relocated outside (Shanghai, Zhejiang, Sichuan, Hunan and so on), then four groups of sites are selected as the research destinations. The study records the forms of living space of the migrants' present and original residences, (the submerged areas are consulted according to the surrounding villages.) and induces residential features, street forms, housing forms, social and economic characteristics. Furthermore, communications with migrants show their living conditions and community attachment, and the evaluation of living space before and after the migration. The investigation of the two modes of migration reflects the great influence of the living space and community attachment on the stability of migrants. The living space of migrants resettled nearby changes to a lesser extent, thus leads to faster life adaptation, but there are still problems of integration into city life; migrants relocated outside face obvious differences in living space, difficult community culture, hence the lifestyle changes significantly. The humanistic construction method of the immigrant community, as well as the adjustment of the social psychology, determines the success or failure of the migration project, and the maximization of the dignity of the migrants, in order to properly arrange this special group.

KEYWORDS: Living Space, Community Attachment, Migration Project, Dignity Maximization

1 INTRODUCTION

1.1 RESEARCH PURPOSE

In China, governmental migrations, mainly for engineering, ecological migration, poverty alleviation and so on, are very common, and the resettlement of migrants is of great significance in politics, economy, society and other aspects. The form of living space and community attachment of migrants, which are related to their vital interests, have a decisive role in the quality of living environment after the migration.

Maladjustment of living space, inharmonious neighborhood are two widespread issues caused by migration. For example, an investigation on resettlement of migrants of Qingshanzui Reservoir in Chuxiong

City, Yunnan Province in 2012 showed that, though the migrants' living condition has been improved, there is still inadaptability in the conversion from the vast rural space to the relatively cautious urban space, while following problems also occur in social interaction: living restructuring, neighborhood defamiliarization, sense of relative deprivation, residential concentration, neighbor intrusion and so on. (Ran Qizhu, 2014)

The huge number of migrants involved in the Three Gorges Project, whose relocation destination covers several provinces, are facing diverse living space and complicated resettlement situation. Centralized communities and individuals are placed in towns and villages at the same time. At present, the research on the ontology of the Three Gorges migrants is mainly based on the investigation of economic income, social adaptability and social relationship. (Li Zhe, 2016) This paper examines the residential patterns and community attachment of the two types of migrants, hoping to explain the great impact of living situation and space forms on their stability and integration.

1.2 RESEARCH SITES

After the impoundment of the Three Gorges Dam, there are two cities, 11 counties, 116 towns that need rebuilding in whole or in part. (Ji Changhua, 2007) And the migrants are resettled in two ways: 79% are resettled nearby (resettled locally) and 21% relocated outside (moved to Shanghai, Guangzhou, Zhejiang, Shandong, Sichuan, Hunan and other places).

Figure 1 - Urban area of Three Gorges Reservoir Area (Zhao Wanmin, 1999)

As one of the resettlement provinces for migrants relocated outside, Sichuan has a few differences in geographical climate from the Three Gorges area, and there are many changes in living habits, residential environment and interpersonal communication after the migration. Chongqing is the resettlement site for migrants resettled nearby, which means fewer discrepancies on these aspects. Chongming County, Shanghai is another resettlement area for migrants relocated outside, with diverse climatic conditions and cultural environment. For a more comprehensive understanding of living space and community attachment in different resettlement situations, and the comparison between two types of migrants' living conditions, the following sites are selected as research destinations. Though a great number of original residences has been basically submerged by the rising water level of Yangtze River, or abandoned, the visit to towns and villages nearby can also clearly reflect the corresponding living situation and forms.

The specific relationship between the present and original residences is shown in the figure:

	Present Residences	Original Residences
Relocated Outside One	Panxi Village, Chongming District, Shanghai	Zhoudu Village, Kai County, Chongqing
Relocated Outside Two	Caichang Town, Dayi County, Chengdu	Wanzhou District, Chongqing
Resettled Nearby One	Kai County New Town, Chongqing	Kai County Old Town, Chongqing
Resettled Nearby Two	Baidi Village, Fengjie County, Chongqing	Baidi Village, Fengjie County, Chongqing

Table 1 - Research destinations of present and original residences

2 LIVING SPACE

Living space forms, living social space and residential groups are the three elements of urban living space, and the residential group is the link between space forms and social space. After a long period of construction, the living space of the Three Gorges migrants has undergone tremendous changes, and reconstruction has been a significant feature of spatial succession, having a lot of internal correlations with the socio-economic process of migration. Different forms of living space for both migrants resettled nearby and relocated outside, like work unit communities, individual migrant communities, and mixed residential areas in old towns, have their own characteristics in functions, streets and facilities. Factors, like the commercial management and housing mode, housing distribution reform, the resettlement system and so on, which are related to culture and other socio-economic aspects, promote the continued reconstruction of migrants' living space.

2.1 RESIDENTIAL FEATURES

"The Three Gorges Project Migration Ordinance (2001)" makes clear that the migration implements the combination of local and outgoing, centralized and decentralized resettlement, while the migrants could figure out their own moving ways along with the government's measures. Migrants ought to be resettled nearby in the original county or district as priority, or else they will be relocated outside in or out the original province. And the migration of the latter follows the principle "relatively concentrated, scattered placement", that is concentrated relocation in certain counties and districts, and dispersedly dwelling within the area. (Su Hong, 2002) Living characteristics of the two types of migrants can be summarized as the following four categories:

	Present Residences	Original Residences	Space characteristics
Relocated Outside One	Country of water town	Country in mountain area	Mixed residential area
Relocated Outside Two	Town in plains	Town in mountain area	Shop front housing estate
Resettled Nearby One	New town in mountain area	Old town in mountain area	Gradual changing estate
Resettled Nearby Two	New house in mountain area	Old house in mountain area	Traditional residential area

Table 2 - Settlement characteristics of present and original residences

2.1.1 MIXED RESIDENTIAL AREA

The migrants relocated outside in Chongming County, Shanghai are dispersed to different villages, thus form mixed residential areas with local residents. The migrants own a certain amount of contracted land and household plots assigned by the government. And their housing standard follows Shanghai planning per capita standards. This kind of arrangement represents a major resettlement method for a large number of migrants relocated outside - that is, preventing the formation of aggregated migrant communities in order to facilitate their adaptation to new settlements, which also allows local residents to participate in interaction with migrants. Residential planning is always the continuation of the normal style of present residences.

Figure 2 - Panxi Village in Chongming, Shanghai, a present residence of migrants relocated outside

2.1.2 SHOP FRONT HOUSING ESTATE

Caichang migrant residential area in Chengdu, Sichuan Province is another form of centralized resettlement of migrants relocated outside, where the houses and farmland are separated from local residents, and some of the public facilities are shared together. There is one important feature that the residential and commercial functions overlap in space - the bottom of residential buildings is designed for commercial use, arranged along roadsides. This design concept tries to improve the employment of migrants as the starting point, while the phenomenon of vacancy of these shop fronts are not rarely seen in migrant residential areas, which means the actual demand for business services is not matched with the scale and amount provided.

Figure 3 - Caichang migrant residential area in Chengdu, Sichuan Province, a present residence of migrants relocated outside

2.1.3 GRADUAL CHANGING ESTATE

Cities and towns in Three Gorges Reservoir area are undergoing the gradual process of urban renewal, dually driven by the relocation of migrants resettled nearby and urban redevelopment. The retained area and new migrant settlements, represented by old town of Kai County and new town of Wanzhou District, have emerged with the gradual expansion of commercial function and the decline of residential function along with the city's development. Business permeates into the neighborhood and spreads along the streets. Roadside buildings are remodeled or rebuilt, which separates the once contiguous residential neighborhoods with the enclosures of commerce. Migrants resettled nearby from towns and villages are rapidly placed in the process of urbanization.

Figure 4 - Scenery of new and old town of Kai County, Chongqing

2.1.4 TRADITIONAL RESIDENTIAL AREA

The living environment and lifestyle of the majority of migrants resettled nearby has not changed much after the migration. Above the flooded old houses and villages, the new communities continue the original residential form and relationship among the neighborhood. Influenced by the mountainous terrain of the Three Gorges area, a patchwork of landscape often occurs in the villages and towns.

Figure 5 - Relics and new buildings of Baidi Village in Kai County, Chongqing

2.2 STREET FORMS

2.2.1 STREET SYSTEM SCALE

The living space of both migrants resettled nearby and relocated outside is composed of different scale of street systems. There are massive streets and lanes for vehicles and pedestrians between buildings in shop front housing estates and gradual changing estates, to guide the traffic flow to shop fronts of residential areas, resulting in the small-scale street system for the diversity of functions. As a result, green space between dwellings is relatively reduced, and in fact, forms borderless settlements which are easy to cross.

Figure 6 - Small-scale street system in old town of Fengjie County, Chongqing | Figure 7 - Big-scale street system in Caichang County, Chengdu

In contrast, big-scale street system is, on one hand, due to the demand of some migrants for the comfort of living environment, and on the other hand, because of the traditional form of residential areas that meets basic living needs. This system means the relatively concentrated, or even absent commerce in communities. In general, migrants are low-income groups, whose survival needs are still at the first place. The two scales of street systems fit different socio-economic status of the living groups.

2.2.2 VERTICAL STREET SPACE

Before the construction of the gam project, there have been a large number of urban vertical streets that connect the altitude difference in terrain. These vertical street space, as an important part of urban collective memory, is not only the traffic channel of residents, but also the unique commercial ladder space of cities along the Yangtze River. The settlements of migrants resettled nearby also continue the design of vertical ladder space, but the field research finds that there are situations where some shop fronts are vacant, and degenerate into a single function of the pedestrian walkway. The reasons behind include the lack of diversity in new urban areas and other planning and design factors.

Figure 8 - Street space of Wanzhou District and Kai County, Chongqing

2.2.3 DIFFERENTIATION IN CENTER AND EDGE

The flooding degrees of urban area within the Three Gorges are different, causing the mixture of migration resettlements and original residential areas. From the vigorous developing Wanzhou District, to the relatively stagnant Kai County, the urban social space has shown a mode of differentiation in center and edge.

(Gao Shangwu, 2016) The center area gathers business, finance, transportation hub, catering and entertainment, public square and other public urban functions, and provide a rich and colorful modern atmosphere of the city life to the migrants and indigenous residents, where especially many migrants resettled nearby live with their work units. More rural migrant groups live in urban fringe areas and small towns.

Figure 9 - New-built residential buildings in downtown of Wanzhou District, Chongqing

Figure 10 - Old town of Fengjie County, Chongqing

2.3 HOUSING FORMS

In the process of migrant housing building, first the local government is in charge of planning, surveying and infrastructure construction. After the reform of housing system in China, the resettlement groups are no longer divided into work unit migrants and individual migrants. The construction of settlements also develops from the organization by the government, of design, building and distribution at the beginning, to new ways of self-building by groups or individuals of migrants. Consequently, there are two main modes of settlements formed: residential areas built and distributed uniformly, where migrants only participate in the final election; and self-built resettlements sited and planned by the government, and designed and constructed by migrants. (Guo Chunxia, 2009)

The richness of construction modes increases the rights of migrants and give more decision in building cost control, residential house types and sizes, fund raising and other aspects. The change of policy eases migrants' major dissatisfaction with cost and design. Housing demolition compensation funds are also allocated to individuals in accordance with the rural housing compensation standards, used by migrants for housing construction.

	Housing form of present residences	Housing form of original residences
Relocated Outside One	Courtyard house, determinant layout 	Courtyard house, zonal distribution along the mountain 
Relocated Outside Two	Row dwelling, zonal distribution along the street 	Courtyard house, zonal distribution along the mountain 
Resettled Nearby One	Multi-story building, enclosed residential area 	Multi-story building, mixed residential area 
Resettled Nearby Two	Row dwelling, zonal distribution along the street 	Courtyard house, punctate distribution along the mountain 

Table 3 - House forms of present and original residences

Due to the mountainous terrain within the Three Gorges Reservoir area, rural areas are generally difficult to form large residential areas, so the buildings and roads usually show zonal distribution, while in some small blocks, there may be row and enclosed dwellings. Insufficient depth creates the strip distribution of buildings along roads. And buildings in urban areas traditionally follow zonal or punctate distribution. Height difference in terrain forms a patchwork of landscape.

In newly-built migrant communities for migrants resettled nearby, there is a wide range of residential types which contributes to the mixture of multi-story and high-rise buildings. In recent years, the construction of skyscrapers has also enriched residential block types. A certain degree of autonomy is given to migrants relocated outside on the specific housing construction, while block forms are still in accordance with the local residential form, and form mixed communities with local residents according in different geographical conditions.

Domestic scholars have conducted extensive research on migrant housing adaptability, including surveys of the Three Gorges migrants in Jiangsu, Guangdong, Shandong province by Ma Defeng (2005), Cheng Yu (2005), Xia Yongxia (2009) and other scholars. The results of visits show that the living quality of migrants has generally been improved, and benefit from the improvement and upgrading of infrastructure. But for the changes like moving out of bungalows, sharing public space, migrants also reflect certain inadaptation.

2.4 SOCIAL AND ECONOMIC CHARACTERISTICS

From the beginning of the migration, helping migrants for achievement of employment is a win-win method to attract migrants to move and to solve their practical difficulties. In the reality of urban industrial emptiness (Xu Jingjing, 2006) and the lack of knowledge and professional skills of migrants (Zhao Wei, 2007), the government often turns to the third industry to seek employment opportunities. Therefore, as the basic space for business activities, shop front is considered as potential jobs. This opportunity for employment also become a means to promote migration and relocation. In the process of such interaction between local government and migrants, a large number of communities are created with mixed commercial and residential functions.

On the other hand, migrants are involved in the rapid Chinese urbanization process. The participation of market capital contributes to the function replacement in mixed residential areas of old towns. And the increment of commercial profit and living comfort brought by the development of the society also cause the movement of migrant groups in different socioeconomic status. The Three Gorges Project has given the local government countless opportunities of direct participation in the reconstruction of urban space, which promotes a greater degree of succession and expansion of residential areas in relevant cities and towns. The impact of urban housing demolition, employment, education and other factors, as well as the pursuit of a higher living standard, are major reasons for multiple movement of some migrants resettled nearby and relocated outside.

3 COMMUNITY ATTACHMENT

Community attachment is an important factor affecting the existence and development of communities. For the Three Gorges migrants, their sense of belonging to the community is more embodied in the psychological state into a new cluster, including confirmation of their new identity, and emotions of their investment and evaluation in communities. The construction of migration communities is the key project to promote the resettlement, so it is of great significance to grasp and adjust their community attachment. (Shan Jingjing, 2006)

3.1 INFLUENCE OF NEIGHBORHOOD INTERACTION

The interaction between migrants and local residents has the most important influence on their social adaptation. (Feng Xiaotian, 2006) And changes in community communication are particularly evident for the decentralized arrangement of migrants relocated outside. Migrants resettled nearby and some of those

rules and characteristics of their living behaviors should be regarded as the basis for planning and landscape.

Figure 12 - Phenomenon of stalls and farming around migration resettlements

3.3 INFLUENCE OF GOVERNMENT POLICY

Three Gorges Migration is a national project, and the corresponding policy system is made up of pre-compensation, subsidies and post-support, trying to ensure that the living standard of habitants involved is not reduced, whilst to protect their legitimate rights and interests, and satisfy their demand for living and development. (Liang Fuqing, 2012) In the survey, it is hardly avoided to find that the economic benefits of some migrants have been violated for some reason in the implementation of specific policies. And the dissatisfaction of the local government also reduce their community attachment to some extent. Unfortunately, this point is not within the scope of this article.

In general, the government policy determines the ownership of urban public and community resources. In terms of fairness, a large number of migrants resettled nearby are arranged in new towns, districts and villages, which brings relatively better public services and the ownership of more resources, including commercial, cultural, medical, educational, sports areas and public transport, compared to those migrants relocated outside who generally moved to the edge of urban areas. At the same time, the local government is bound to put in unequal construction funds on city centers and surrounding areas over a long period of time, resulting that the difference in green environment, public space, service facilities and other aspects, between the local residents and migrants relocated outside is hard to narrow. Some migrants resettled nearby imply that the infrastructure construction which start from the very beginning, cannot keep up with the pace of the migrant influx into new towns.

Figure 13 - Interview of migrant living situation

There is also a clear correlation between the community attachment of migrants relocated outside and the economic level of relocation sites, which is reflected in the compensation policy. (Li Huaquan, 2007) Migrants relocated in Chongming, Shanghai, for example, supported by land and employment aid policy of the local government, maintain satisfactory revenue and achieve general improvement in living conditions, for families who continue farming, as well as who change into the secondary and tertiary industries. On this basis, their relationship of neighborhood and sense of identity is maintained at a better level. Relatively speaking, those relocated outside who moved to Sichuan, Hubei and other economically weak areas, have more complaints about the migration life, which is the direct result of the difficulties encountered in related areas.

4 CONCLUSION

The Three Gorges is the largest control project in the history of water conservancy, with the relocation of amounted to over 1,100,000 migrants. Habitants in the reservoir area lost their original farmland and houses, even the familiar neighborhood and the means to earn a living. Their faster adaptation to new environment and transition from migrant to settler, is not only related to people's livelihood, but also determines the success or failure of the project.

Migrants relocated outside need a longer transition period than those resettled nearby. Some scholars divide the role-transforming process of migrants relocated outside into three stages: the label phase during the first and second years after migration, the learning phase during the third and fourth years, and the assimilation and comparison phase after the fifth year. (Liu Chengbin, 2007) With the conversion of roles, migrants' consideration points also develop from the comparison with original living at the initial stage, to the differences of economic income level, identity and other important factors from local residents.

Objective material conditions are the basis for the migration life, which varies in economy, culture and urban construction level among resettlements. For all migrant groups, the sharing of interests is the fundamental goal of the reconstruction of their living space. And the differences in the quality of living environment, public facilities, neighborhood communication will exist for a long time between two types of migrants and the local. Migrants' efforts of integration into local life should be based on the appropriate community environment, and the policy aiming to guarantee their living standards. Furthermore, aiming at the psychological particularity of this group, migrants' community attachment needs improving in three aspects: promotion of neighborhood communication, reasonable space design, and adequate political guarantee. The otherness caused by the migration status could be ultimately reduced or eliminated.

ID 1387 | IMPACTS OF THE NEW URBAN LEASE LAW AND THE NON-REGULAR RESIDENT TAX REGIME ON HOUSING AFFORDABILITY AND URBAN REGENERATION IN LISBON'S HISTORIC CENTRE

Iago Lestegás¹; João Seixas²; Rubén-Camilo Lois-González³

iago.lestegas.tizon@gmail.com ; jcfseixas@gmail.com ; rubencamilo.lois@usc.es

ABSTRACT: The adoption of the euro accelerated the dependent financialisation of the Portuguese economy, which remained structurally backward despite its integration into global finance. The flow of foreign credit towards the real estate, infrastructure, and construction sectors since the mid-nineties fueled the suburban expansion of Lisbon and the abandonment of its historic centre until the crisis of 2008. After the collapse of that model of urban development, Lisbon's historic centre became a space of opportunity for global real estate investment offering high profitabilities in the international short-term-rental and premium markets. With thousands of abandoned dwellings and tenants paying very low rents, the rent gap of the historic centre was enormous. Since many residents of that territory were tenants paying controlled rents, it became necessary to change the lease regime in order to rapidly and easily evict them and let investors engage in the transformation of the area. The new urban lease regime liberalised the rental market and triggered the actualisation of rents above the capacity of many tenants in a context of rising demand for rental housing and strong austerity policies —and evictions multiplied. The non-regular resident tax regime was implemented by the Portuguese government to attract foreign high-skilled professionals and pensioners. Under this special regime, foreign citizens benefit from a reduced flat personal income tax rate of 20% and any pension income generated abroad is totally tax exempt —even when not taxed in the country of origin. As a corollary, housing supply for conventional use has dropped significantly and prices have increased dramatically in the historic centre as tourist apartments proliferate and foreign investors multiply. Urban regeneration fuelled by tourism and international investment has not stopped the loss of residents in this area, while the impossibility for many locals to find affordable housing there constitutes a worrying outcome of Lisbon's commodification. Keywords: gentrification, commodification, touristification, austerity, public policy, Portugal

1 OBJECT AND METHODOLOGY

Lisbon's historic centre is an interesting case for the study of urban commodification in the financially dependent periphery of the Eurozone due to the combination of two factors. On the one hand, Lisbon is the capital and largest city of a semiperipheral country that joined the European Economic Community (EEC) in 1986 and therefore has been a member of the European Union (EU) since 1993. Furthermore, Portugal adopted the euro as soon as it came into circulation in 2002, and experienced a profound process of dependent financialisation and alleged modernisation until the global crisis of 2008. However, Portugal is one of the European countries that have suffered most the impact of the latter, and austerity has been imposed there with special harshness. On the other hand, Lisbon's historic centre is worth analysing because it is currently experiencing a deep and rapid transformation that, fuelled by foreign real estate investment and a remarkable tourism boom, started and developed while the country was subject to austerity under the increasing burden of sovereign debt.

The urban transformation and commodification of Lisbon's historic centre is an ongoing process that takes place in the context of the equally ongoing crisis of the periphery of the Eurozone. Therefore, the case-study methodology has been chosen in order to guide its analysis, since it allows the examination of "[...] an existing, real-life situation in all its complexity, exploring it as close to the people concerned as possible, describing the situation in as much detail as possible, and finally explaining the findings in a clear and comprehensible way." (Kyburz-Graber, 2004, p. 54). The case study is supported by a general macroeconomic contextualisation emphasising the dependent financialisation of the contemporary Portuguese economy, as well as by a short review of the rent gap theory of Neil Smith (1996).

The research included the conduction in Lisbon, between June and September 2016, of 12 structured interviews with the stakeholders listed in Table 1, who were asked a common questionnaire. The interviews were held in Portuguese and the answers have been translated into English when quoted.

Public Sector	Private Sector	Civic Sector

2 GENERAL MACROECONOMIC BACKGROUND

The insertion of Portugal into the European Economic Community (EEC) in 1986 deepened and accelerated the dependent financialisation of its economy. The abundant inflow of foreign credit that followed, channelled towards non-tradable sectors such as construction, real estate, and infrastructures that were less subject to international competition at the expense of manufacturing, did not improve the structural conditions of the former. Instead, it materialised in the combination of a backward economic framework and a modern globalised financial sector. As it encouraged mortgage-based homeownership through subsidies and tax breaks while failing to create a comprehensive public housing system, the State encouraged private indebtedness, fuelled suburban expansion, and stimulated the construction and real estate sectors (Reis, 2016; Rodrigues, Nunes, & Teles, 2016).

Since their emergence when the Portuguese financial sector was starting to be liberalised in the mid-eighties, the sustained expansion of real estate investment funds has been according to Rodrigues et al. (2016) one of the major symbols of the tightening nexus between housing and finance in the country. The number of real estate investment funds operating in Portugal increased from 48 to 242 between 1996 and

2016. The most remarkable expansion, however, took place between January 2005 and December 2009, when the number rose from 66 to 253. The historic maximum of 265 registered funds was reached in June 2011 and, since then, this indicator has followed a slightly negative evolution. Between 1996 and 2016, the total net asset value increased from 2,301.5 to 11,068.9 million euro, with a historic maximum of 13,067.4 million euro reached in January 2014 and a negative evolution thenceforth (Comissão do Mercado de Valores Mobiliários, 2016).

Figure 1 – Portuguese public debt, % of GDP (International Monetary Fund, 2016)

Figure 1 – Portuguese public debt, % of GDP (International Monetary Fund, 2016)

Figure 1 shows the evolution of the Portuguese public debt between 1970 and 2015. It shows that the public-debt-to-GDP ratio increased in Portugal at a rather constant pace between the end of the dictatorship and the integration into the EEC. While in 1974 that ratio was of 13.5%, in 1986 the public debt represented 56.9% of the country's GDP. In a context of local and global economic instability, the IMF intervened the country twice in 1977 and in 1983, and imposed fiscal austerity programs that would trigger economic stagnation, rising unemployment, and impoverishment (Mamede, 2015).

The country's integration into the EEC motivated a remarkable economic dynamism that materialised in the rapid expansion of its GDP. Figure 1 shows that public debt remained relatively stable between 50% and 60% of the GDP between 1985 and 1995. The constitutional reform of 1989 enabled the reprivatisation of public assets that had been nationalised in the seventies during the brief revolutionary term. The process started with the banks and insurance companies, continued with the industrial firms and energy utilities, and then involved virtually all other public assets in Portugal (Mamede, 2015).

An ambitious privatisation programme was launched in 1996, its revenue being essentially used to reduce the public debt (Baklanoff, 1996). The effect is visible in the temporary decrease of the public-debt-to-GDP ratio between 1995 and 2000 from 58.4% to 47.9% that is displayed in figure 1. However, this was paralleled by a dynamic of growing private indebtedness due to the abundant credit offered by the banking system to Portuguese firms and families. The volume of loans granted to the private sector increased from 66,000 million euro in 1995 to almost 155,000 million in 2000 due to the combination of financial deregulation and privatisation with low interest rates. Families —particularly middle class ones— were getting indebted usually to buy a home, and 40% of the liabilities of Portuguese firms were owed in that term by real estate and construction firms in a context of increased access to home ownership, abundant public investment on infrastructures, and emerging real estate speculation (Mamede, 2015).

Figure 1 shows that public debt increased in Portugal at a relatively moderate pace from 47.9% of the country's GDP in 2000 to 71.7% in 2008. Mamede argues that this was consequence of the rising social expenditure by the State due to the erosion that both the growing unemployment and the dropping tax revenue from economic activity were producing on the public budget. "Contrary to what many suggest, the degradation of public finance was not the cause of the crisis: it was, above all, the reflection of an economy that was showing obvious signs of exhaustion." (Mamede, 2015, p. 37). Figure 1 shows that the Portuguese public-debt-to-GDP ratio was lower than 70% until it started to grow extremely fast with the contagion of the subprime crisis in 2008, reaching a historical maximum at 130.2% of the GDP in 2014. According to Mamede, as a consequence of austerity "Portugal became [...] a poorer country with little optimistic perspectives about its future. Besides indebtedness of firms and families [...], the country faces today high levels of public debt, less employment, and less salaries after successive years of weak productive investment." (pp. 39-40).

Since the signing of the Memorandum of Understanding between the Portuguese government and the Troika in 2011, and in the name of fiscal austerity, deficit reduction, and competitiveness, GDP has fallen, unemployment has grown, profitable public assets have been privatised, value-added tax (VAT) has increased, labour regulations and protections have been loosened, and wages of public workers have been cut to adjust the balance of payments by reducing internal demand (Rodrigues and Reis, 2012). According to Louçã (2011), wages have also been indirectly reduced by the State as it has cut social protection while simultaneously rising regressive taxes and prices of services that constitute a big share of the families' spending —e.g. health and education provision, transport, or energy.

3. THE RENT GAP THEORY

The rent gap theory (Smith, 1996) addresses the land-and housing-market dynamics and the role of investment and disinvestment in gentrification. It suggests that the latter starts when the difference between actual and potential rents is wide enough to encourage investment:

The rent gap is the disparity between the potential ground rent level and the actual ground rent capitalized under the present land use [...]. The rent gap is produced primarily by capital devalorization (which diminishes the proportion of the ground rent able to be capitalized) and also by continued urban development and expansion (which has historically raised the potential ground rent level in the inner city). [...] As filtering and neighborhood decline proceed, the rent gap widens. Gentrification occurs when the gap is sufficiently wide that developers can purchase structures cheaply, can pay the builder's costs and profit for rehabilitation, can pay interest on mortgage and construction loans, and can then sell the end product for a sale price that leaves a satisfactory return to the developer. (p. 65).

This theory succeeds to interpret urbanisation, urban restructuring, and gentrification as the spatial materialisation of capital accumulation and macroeconomic restructuring. It links the production of urban space to broader dynamics of capitalism and to the cyclical movements of capital, under the assumption that uneven urban development is inherent to capitalist expansion and devalorisation is necessary for future revalorisation (Mendes, 2014). While Smith (1996) develops the rent gap theory to understand urban restructuring within the logics of capital accumulation, Harvey (2005) deals with the concept of monopoly rent to explore the relationship of culture —which he argues that despite being a commons has become a commodity— with capital accumulation. According to Harvey, monopoly rents derive from the exclusive control and exploitation of a given tradable, unique and non-replicable asset by a private owner or group of owners.

4 ABANDONMENT AND DEPOPULATION OF LISBON'S HISTORIC CENTRE

"The historic centre was empty, it was dead at night", said the coordinator of Lisbon Tourism Observatory in his interview. Meanwhile, the marketing manager of Habitat Invest explained that "[...] most buildings [in the historic centre] were abandoned and degraded a few years ago; they were collapsing with no maintenance at all." Table 2 shows that 32.4% of the dwellings in the parish of Santa Maria Maior, 26.8% of those in Misericórdia, 23% of those in Santo António, and 20% of those in São Vicente were empty when the latest national census was elaborated in 2011 (Instituto Nacional de Estatística, 2016).

Parish	Occupied	Empty	Total	% Empty
Misericórdia	7,671	2,811	10,482	26.8%
Santa Maria Maior	7,289	3,498	10,787	32.4%
Santo António	6,541	1,952	8,493	23.0%
São Vicente	8,229	2,056	10,285	20.0%

Table 2 -Occupied and empty conventional family dwellings (Instituto Nacional de Estatística, 2016)

Figure 2 - Four parishes of Lisbon's historic centre

The evolution of the total number of registered voters between January 2002 and December 2015 confirms the demographic decline of the municipality of Lisbon and evidences a more significant population loss in the historic centre —paralleled by an opposite trend in Lisbon Metropolitan Area (AML). As shown in table 3, the total number of registered voters decreased during that term by 27.3% in the historic centre and 11.5% in Lisbon, while it grew 7.5% in the AML. Within the historic centre, the decline has been greater in the parishes of Santa Maria Maior and Misericórdia, which lost 32.8% and 30.3% of their registered voters respectively between 2002 and 2015 (Ministério da Administração Interna, 2016).

	AML	Lisbon	Lisbon's historic centre	Misericórdia	Santa Maria Maior	Santo António	São Vicente
Jan. 2002	2,239,214	563,318	67,013	17,453	17,008	15,296	17,256
Dec. 2015	2,407,947	498,775	48,701	12,169	11,422	11,918	13,192
Variation	+7.5%	-11.5%	-27.3%	-30.3%	-32.8%	-22.1%	-23.6%

Table 3 – Evolution of the nr. of registered voters, 2002-2015 (Ministério da Administração Interna, 2016)

The rent controls that were enforced by the dictatorship and motivated the payment of low rents by traditional tenants until the legal reform of 2012 are often appointed as guilty of the abandonment of Lisbon's historic centre. They are generally accused of having made maintenance impossible and triggered the deterioration of the built environment. However, the president of APPA argued that “[...] tenants were paying very low rents, but it was them taking care of the houses. If buildings were not collapsing it was because of them; landlords were doing nothing but speculate. At most, they were maintaining the façades.” According to the president of Habita, the abandonment of the historic centre is actually consequence of the speculative model of suburban expansion that was in force until the financial crisis of 2008. Meanwhile, the president of ALEP pointed at the typologies of the historic centre's housing stock as a significant factor behind the area's demographic decline, and added that moving out of old neighbourhoods like Alfama has often been seen as “[...] part of the story of family success.”

5 THE NEW URBAN LEASE LAW

The Novo Regime do Arrendamento Urbano (NRAU) [New Urban Lease Regime] was passed by law number 6/2006 (Diário da República 41, 2006), revised six years later with law number 31/2012 with the stated objective of dynamising the Portuguese rental market (Diário da República 157, 2012), and slightly altered again two years later with law number 79/2014 (Diário da República 245, 2014). According to the official site Portal da Habitação (2017) of the Instituto da Habitação e da Reabilitação Urbana (IHRU) [Institute of Housing and Urban Regeneration],

[...] the urban lease reform of 2006 failed to provide a sufficient response to the main challenges faced by urban rental —especially those related to the contracts with rents previous to 1990, with the difficulty of carrying out refurbishment works in leased buildings and with a complex and slow eviction procedure.

The amendments introduced to the law number 6/2006 in 2012 were a condition included in the Memorandum of Understanding that was signed between the government and the Troika in May 2011:

In particular, the reform plan will introduce measures to: i) broaden the conditions under which renegotiation of open-ended residential leases can take place, including to limit the possibility of transmitting the contract to first degree relatives; ii) introduce a framework to improve households' access to housing by phasing out rent control mechanisms, considering the socially vulnerable; iii) reduce the prior notice for termination of leases for landlords; iv) provide for an extrajudicial eviction procedure for breach of contract, aiming at shortening the eviction time to three months; and v) strengthen the use of the existing extrajudicial procedures for cases of division of inherited property. (European Commission, 2011, p. 31).

The amendments made to the urban lease regime in 2012 flexibilised the duration of the contracts, eliminated the minimum rental terms, and established a by-default length of two years for residential and five for non-residential use in absence of further specifications. Additionally, by virtue of the new legislation, the automatic renovation of a contract may be avoided by the landlord by notification to the tenant at least 60 days in advance for contracts between six months and one year; at least 120 days in advance for contracts between one and six years; and at least 240 days for longer leases. Furthermore, residential contracts signed before 1990 became subject to a rental-renegotiation mechanism between both parties —with the only exception of tenants older than 64, vulnerable, or severely disabled. The process of adaptation of older contracts to the new regime was shortened and simplified, and rents of residential properties are now subject to update after five years of occupancy —the Social Security being generally in charge of the problems that may derive from the overhaul. The NRAU also facilitates the eviction of non-compliant tenants, as well as the extinction of the contracts when major refurbishment works are planned (Diário da República 157, 2012; Portal da Habitação, 2017).

JLL Research (2016, p. 11) indicates that the amendments made to the urban lease regime in 2012 were motivated by the need to “normalise rents” and, “[...] along with a special eviction procedure that enables leases to be terminated more quickly in cases of default by the tenant, has already started to produce results.” Indeed, according to this source:

Thanks to amendments made to the urban lease law, thousands of degraded buildings in our cities have become interventional. And therefore today, we have developers from all over the world rebuilding the historic centres and changing Lisbon and Oporto's urban landscapes at a steady pace. Buildings in ruins are being replaced by quality projects. Thus, life in our cities is being completely transformed, gaining unstoppable momentum, creating an energy that attracts both people and trade. Streets are reborn, as buildings are inhabited by Portuguese, as well as many foreigners from so many origins who, every day, buy homes in Portugal. (JLL Research, 2016, p. 4).

In her interview, the president of APPA defined the NRAU as “the eviction law”. Both the general manager of EastBanc Portugal and the president of Habita highlighted in their interviews the fact of the removal of rent controls on commercial and residential property being one of the conditions of the Troika's bailout in 2011. The former highlighted the fact of this legal reform having “[...] unlocked lots of spaces that were closed and allowed new things to be opened and investors to invest”. In contrast, the latter argued that this policy was included as a part of what she defined as “the Troika's blackmail” —despite the fact of the liberalisation of the property rental market having “nothing to do” with the public budget. After the collapse of the model of suburban development and the stop of the credit flow towards the Portuguese middle class in 2008, Silva argued that real estate investors turned the attention towards the historic centre, which “[...] offered high profitability opportunities based on luxury regeneration and high-end developments. But since most of the residents in the historic centre were tenants, it became necessary to change the lease law to rapidly and easily evict them [...]”.

The coordinator of Lisbon Tourism Observatory argued that the NRAU “[...] had a great impact on the historic centre. There was a shift from being able to do nothing to being able to do anything. Tourism has been crucial for urban regeneration and this reform was very important to stimulate it”. According to member of the Citizenship Academy Leonor Duarte, “residents are being evicted in the historic centre. Buildings are sold and the new owners only need to say that they’ll refurbish them—even if it’s false, because nobody checks—and they can end the contracts.” Meanwhile, the marketing manager of Habitat Invest explained that the NRAU allows landlords to come to agreements with old tenants—who were paying “derisive” rents—and proceed to the refurbishment of their properties. This is consistent with the view expressed by the president of ALEP, who argued that the most important effect of the NRAU was to allow the renegotiation of old rents. Due to the fact of landlords who do not live in their own properties but lease them instead being predominant in Lisbon’s historic centre, he indicated that the impact of this new legislation was especially remarkable in that territory:

properties were empty and 12% were second homes, so 42% of the 15 thousand properties in the four parishes of the historic centre were not permanent residences. Low rents were passed on from parents to children and landlords refused to do any maintenance. It was a tacit agreement, since tenants knew they were paying extremely low rents, but there was always pressure to get rid of tenants paying 40 or 50 euro.

In 2012, according to the president of ALEP, all those landlords who were able to start the rent-update process under the NRAU did so, but there is still a large elderly population above 65 years of age and many low-income tenants who remain relatively protected under the new law:

There were tenants paying 60 euro who had returned to their hometowns but kept their apartments in Lisbon to come sometimes. So in 2012 landlords wanted to get rid of their tenants even if they had no specific plans for the property; it was preferable to empty it and then see what to do, because otherwise they couldn’t sell it, they couldn’t lease it, they could do nothing with it. Thousands of rent-update processes started. There was a transition period of five years and then rents were liberalised. 2017 will be a crucial year because that period will end for many—but not for those above 65. For those below 65, the tenant had to make a proposal and the landlord had to make another one. In absence of agreement and in order to extinguish the contract, landlords had to pay the tenants a compensation worth “x” times the rent they had proposed. The higher the rent a landlord would propose, the higher the indemnisation he would have to pay to remove the tenants. But still, many found it worth it to pay; others activated the transition period that will end now in 2017.

In April 2016, the Portuguese Parliament introduced a new amendment to protect the historic shops, threatened by soaring rents and eviction orders as a consequence of the liberalisation of the rental market. The period of transition for old rents to adapt to the new legislation was extended 10 years until 2027 for those establishments of cultural and historic interest and older shopkeepers were protected from eviction even if refurbishment was planned by the respective landlords. In summer 2016, the three parties supporting the Portuguese center-left national government agreed to extend the five-year transition period that was initially considered in the NRAU of 2012 until 2022.

6 GOLDEN VISA PROGRAMME AND NON-REGULAR RESIDENT TAX REGIME

Since it was launched in 2012, the Golden Visa programme awards the Portuguese residence permit and the right to move freely within the Schengen area to those foreign citizens making significant investments in Portugal. JLL Research (2016) estimates that 90% of the investment received through this program was allocated to the real estate sector. According to the information available from the Chamber of Commerce Portugal-India (2016), the Golden Visa programme applies to investment on real estate property worth at least 500 thousand euro acquired free of charges or mortgages after October 8, 2012 and before the application for the residence permit. The requirements of this scheme include a minimum stay of seven days during the first year and two weeks during the following periods of two years. The residence permit—which must be applied for within a maximum of three months after the entry in Portugal—is initially issued for one year and then renewed for periods of two years. After five years, the permit becomes permanent and one year later the Portuguese citizenship may be issued. However, the Chamber of

Commerce Portugal-India specifies that the properties bought under the Golden Visa scheme may be freely rented and let for commercial, agricultural, or tourism purposes. In case of acquisition and refurbishment of properties that are more than 30 years old or located in designated urban regeneration areas, an investment of 350 thousand euro is enough for being eligible for a Golden Visa (JLL Research, 2016).

In September 2009, the non-regular resident tax regime was implemented by the Portuguese government with the stated objective of attracting foreign high-skilled professionals and pensioners and their wealth. Since then, this scheme has been available for those citizens who are deemed resident in Portugal for tax purposes but have not been so during the five years prior to the year that will be taxed under that regime. According to the legislation, fiscal residence is available for those citizens spending a yearly stay of more than 183 days on Portuguese territory; for those having a dwelling and the intention to maintain and occupy it as their habitual residence; for the crew of airplanes and ships of companies based on Portuguese territory; or for the expatriate employees of the Portuguese State. Under this special regime, non-regular residents benefit from a reduced flat personal income tax rate of 20% for a non-extendable maximum period of 10 consecutive years as long as the fiscal requirements are met throughout that term. The list of high-added-value professionals that may apply for a special non-regular resident tax includes architects and engineers; visual artists, actors, and musicians; auditors; doctors and dentists; teachers; psychologists; liberal professionals, technicians, and alike; and investors, managers, and directors.

While the income obtained in Portugal from the listed activities by non-regular residents is taxed at the reduced rate of 20%, any income obtained abroad that is taxed by the source state is totally exempt from taxation by the Portuguese authority. In the case of employment income, this holds even when conventions to eliminate double taxation do not exist but the former has been taxed by another state. Self-employment, capital, real estate, and surplus incomes obtained abroad are totally exempt from taxation if they have been taxed by the source state when conventions eliminating double taxation are in force, or if they have been taxed by any country other than those included in the list of tax havens of the Portuguese State—even when conventions do not exist (Autoridade Tributária e Aduaneira, 2016). Furthermore, since January 2013 any pension income generated outside the Portuguese territory—even if it was not taxed in the country of origin—is totally tax exempt under the non-regular resident regime. JLL Research (2016, p. 11) indicates that “[t]he competitiveness of the Portuguese regime compared with similar regimes in other countries has resulted in important investments in the national real estate sector.” According to this source, “[s]everal foreign citizens, mainly French, have purchased a house in Portugal, attracted by the advantages of Non-Habitual Residents Benefits and also by the quality of life that Portugal offers.” (p. 12).

Asked during his interview about the impact of the Golden Visa programme and the non-regular resident tax regime on Habitat Invest's activity, Ernesto Portugal said that both programs—added to the removal of rent controls—have significantly increased foreign investment and this has materialised in more urban regeneration. Indeed, he mentioned those three policies as the most crucial public decisions behind the ongoing transformation of Lisbon's historic centre: “A large part of our customers are Golden Visa holders. The non-regular resident tax regime has had more remarkable impacts on the French and Scandinavian markets, but I think it still has a lot to deliver”. According to partner at ERA Chiado/Lapa Nuno Martins, the Golden Visa programme has been especially useful for attracting Chinese investment but the non-regular resident tax regime has a more significant impact nowadays: “Three or four years ago, the Golden Visa was very important. Then, due to some irregularities that were identified, it dropped while fiscal incentives skyrocketed. Since the beginning of 2016, the Golden Visa programme has grown again”.

While acknowledging that the Golden Visa programme has absorbed housing stock and thus increased prices in benefit of all real estate investors, the general manager of EastBanc Portugal stated a more favourable opinion on the non-regular resident tax regime:

I don't like the Golden Visa programme too much, but I think the non-regular resident tax regime is good. It attracts Europeans who are culturally closer, and a higher social layer of people who will open businesses here, who will bring entrepreneur initiatives... the Golden Visa attracts people with half a million euro—now they only need 350 thousand—who arrive here and then don't show up again. They spend here, what, seven days a year? I don't find that very interesting, I don't think it's positive for the country. I think the non-regular resident regime is. It brings people with higher educational level, many entrepreneurs who must stay here at least 50% of the time and

therefore will be doing something here. And it's very-high-income people. With the crisis we lost lots of brains. Whoever was able to leave, left. So now Portugal needs to attract smart people with initiative and training.

In his interview, president of ALEP Eduardo Miranda explained that the Golden Visa programme had a great impact on the housing stock at Parque das Nações —usually known as the Expo since the area was developed to host the International Exhibition of 1998. Since 2014, once that real estate stock had been sold out, Golden Visa investment would focus on the prime area of Chiado. Both areas meet the requirements of the type of investor that is usually attracted by this scheme:

Chinese and Brazilians tend to like good, modern, large apartments. Chinese investors used to be taken to Alfama and then to the Expo. After seeing those tiny flats in Alfama, they were willing to buy anything at the Expo. They were horrified; those millionaires don't want to live in tiny apartments. That was the marketing strategy.

The property type that Golden Visa applicants often seek in Lisbon is very expensive in the historic centre and, according to Miranda, that programme has even inflated the prices of real estate properties targeting this group of wealthy investors: “Properties worth 350 or 400 thousand euro went up to 500 thousand. Then it inflated the prices of those worth 200 thousand, because the purchase of two properties worth 250 thousand each is also accepted. For them it's cheap anyway”. The current crisis in Brazil and the traditional linkages of the Brazilian elites to Portugal was also mentioned by Miranda as a key factor to be taken into account in order to understand the phenomenon of real estate investment under the Golden Visa scheme. Those elites, he argued, are worried about the situation in Brazil and seek “[...] a B plan to protect their wealth. They want value outside the country in case everything goes wrong, and assume that real estate property in Portugal will always gain value”.

According to Miranda, the Golden Visa programme brought a total foreign investment of 500 million euro during the first semester of 2016 —450 of those having been invested in real estate property. However, he also argued that it has not been the Golden Visa scheme attracting the greatest share of foreign investment towards the Portuguese real estate market. This took off in 2014, he indicated, with the non-regular resident tax regime that allows foreign investors to

[...] pay 20% instead of up to 50% of tax. If they earn 4,000 euro, they save 1,000 just from taxes. Before 2013, it was required to be a fiscal resident here —i.e. to spend at least 183 days in Portugal— to be eligible. Since then, those purchasing a property to be used as permanent residence are also eligible. Even if they're still working on its refurbishment and still live in, let's say, France, the fiscal residence is already here. But some have been required by the French State to sell their home there to be allowed to be taxed in Portugal. This programme is the core, the engine of urban regeneration in Lisbon. It encourages Belgians, Scandinavians... and mostly French to purchase property in Portugal. Some 25 thousand French are estimated to have come to live here in the last years. It's them who have changed the real estate market in Alfama, Mouraria, Bica... and boosted refurbishment. It's very difficult for a Portuguese to find properties to buy there now because they're all being sold to foreigners.

7 THE RISE OF HOUSING PRICES

President of APPA Maria de Lurdes Pinheiro argued that only the wealthy can afford an apartment in Alfama since the liberalisation of the rental market in 2012. During his interview, Miguel Coelho expressed serious concern about gentrification in Santa Maria Maior: “Many of the residents are not reaching the benefits of this [urban] transformation. Urban regeneration is neither bringing more residents nor delivering more comfort to the existing ones. In fact, the opposite is happening: it's forcing them to leave”. Focusing on the neighbourhood of Mouraria, Inês Andrade explained that “we lose population because people can't afford a house here anymore; prices have increased a lot”. According to Leonor Duarte, “inhabitants are disappearing from the historic centre, which is planned to be left just for tourism and luxury housing. The population loss is constant and the attempts to secure the existing population are unsuccessful because the housing issue is not solved”.

Figure 3 -Average value (€) of traded dwellings (Instituto Nacional de Estatística, 2017b)

The number of housing sale/purchase contracts increased 22.3% in Portugal and 105.9% in Lisbon between 2012 and 2015 (Instituto Nacional de Estatística, 2017a). As shown in figure 3, the average value of the traded dwellings was 26% higher in 2015 than in 2011 in Lisbon and 18.2% higher in Portugal as a whole (Instituto Nacional de Estatística, 2017b). Urban regeneration explains the new dynamism of the Portuguese real estate sector, “[...] owing to greater demand from international investors, fuelled by the potential of tourism and the international public’s growing interest in high and medium-high quality housing products.” (Cushman & Wakefield, 2016, p. 14). In Lisbon’s historic centre, the average housing price increased 22.3% only in 2015. A total of 2,199 sales worth 709 million euro were registered that year in that urban area —11% and 37% more respectively than in 2014 (Confidencial Imobiliário, 2016). According to the consulting firm Cushman & Wakefield, the average asking price in Lisbon was close to 3,000 euro per square metre by the end of 2015.

Housing supply for permanent residence has dropped significantly due to the proliferation of tourist apartments and the multiplication of global investors attracted by the profitability of urban regeneration. The incapacity for most locals to afford housing in that area expands demand and pushes prices up also in the periphery. Miguel Coelho indicated that in 2013 a one-bedroom apartment in Alfama costed between 80 and 150 euro a month and three years later it costs between 1,000 and 1,500 euro. Ernesto Portugal indicated that in 2013 Habitat Invest was selling apartments for 3,000 euro per square metre and now they are doing so above 6,000: “There has been a general sustained growth and I believe this trend will continue in the next years, because we’re still far from the values of other European capitals”. For Eduardo Miranda, any improvement in those areas where rents had been kept very low triggers gentrification: He argued that “even without the foreign market and the tourists, those rents were unsustainable; they would rise to 350 or 400 euro. Students have paid 250 euro for years and pay 300 for a room in good condition”.

Pedro Miranda highlighted that “if you’re paying 200 or 300 euro and the rent suddenly rises to 1,000 —if the landlord wants to lease the apartment on a monthly basis at all—then how can you afford that?” Nuno Martins indicated that prices have become really high in some areas of the historic centre —upto 10,000 euro per refurbished square metre in the most expensive ones: “that’s very high for the national reality, it’s brutal, but there’s a small percentage of the population with lots of capital who can reach that”. He identified a “growing disequilibrium” between high demand and low supply in the real estate market of the historic centre. Martins also indicated that, in little more than one year, the price of the refurbished square metre increased from 2,500-3,000 to 3,000-4,000 euro in the area between Infante Santo avenue, Áurea street and Príncipe Real —with the exception of the premium areas of Chiado and Lapa. “This has obviously made housing less affordable in Lisbon; prices were 30% lower just one year ago”, he argued.

According to André Moura, “prices have risen, of course, but that’s the market law: if something becomes more attractive it automatically becomes more expensive —unless there are public policies of price control, which may work during a given period”. He argued that some years ago “[...] people didn’t want to come [to the historic centre] because it was old, it wasn’t interesting, it wasn’t appealing. Now they want to because it’s beautiful and appealing, but what’s beautiful is more expensive, that’s the current model.”

Ernesto Portugal interpreted the increase of real estate values as a positive phenomenon stimulating a market that used to be stagnant. He acknowledged that “access to housing may be more difficult” now, but

highlighted that degraded dwellings in derelict buildings are being replaced by a high-quality refurbished apartments.

According to the president of Habita association, “urban regeneration is good, but this regeneration is expelling the inhabitants because it's not for the people who live here”. Councillor for Housing and Local Development Paula Marques argued that “it's a fact that urban regeneration has created a disequilibrium when it comes to social mixture. We shouldn't demonise tourism because it generates economic activity and employment, but the imbalances that it generates must be addressed”. She added that “a city needs to be inhabited by a diverse population. Tourism and tourists are welcome —we're also visitors elsewhere. Mixture is welcome —Lisbon has always been inhabited by very diverse people”. However, she highlighted that “[...] we need to address the issue of real estate speculation that is linked to the Golden Visa programme and to foreign investment that isn't focused on residence but on speculation”.

8 CONCLUSION

The ongoing global commodification of Lisbon's historic centre is stimulated by a highly investor-friendly legal framework designed in the context of economic crisis and austerity to attract foreign capital towards the Portuguese economy. Specific policies with strong influence over Lisbon's derelict urban fabric were implemented that include the new urban lease law, the non-regular resident tax regime, the Golden Visa programme, and several fiscal and administrative incentives to facilitate urban regeneration.

Despite its undisputed success in bringing foreign investment, boosting the refurbishment of derelict buildings in the historic centre, and dynamising the construction, real estate, and hostelry sectors, that legal framework has triggered new forms of gentrification. As it stimulates demand on external markets with greater purchasing power, it is a crucial factor of the rise of housing prices above the financial capacity of the local population in a context of crisis and austerity. Moreover, properties purchased and refurbished by global investors are often used by their new owners not as residences but as commodities.

Against this background, grassroots movements claiming the right to the city have emerged in Lisbon and are actively advocating housing affordability to counteract the identified trends and its inherent threats. Not only are they demanding policy changes but engaging in the public debate and participating in the elaboration of urban policy alternatives. Social movements flourish at the local scale under neoliberalism and austerity, and Lisbon is not an exception as the local community starts to organise against the commodification of the city and to elaborate specific alternative policies prioritising the social function of housing and the right to the city. With local elections to be held in October 2017 and the transformation of the historic centre occupying a central position in the agenda, it remains to be seen how much influence these and other initiatives that may emerge will have on urban policy in the near future.

ID 1402 | LOW INCOME HOUSING PRODUCTION IN THE NEIGHBORHOOD OF SANTA IFIGENIA IN SAO PAULO, BRAZIL

Denise Falcao Pessoa¹

¹Centro Universitario Belas Artes de Sao Paulo

denise.pessoa@belasartes.br

1 INTRODUCTION

This paper deals with the analysis of the production of Social Housing provided by private investors and public agencies in the neighborhood of Santa Ifigenia, a neighborhood located downtown São Paulo, State of São Paulo, Brazil. The time span corresponds to the administration of former mayor of the city, Gilberto Kassab, between March 2006 and December 2012.

The studied area corresponds to 10 blocks defined as Special Zones of Social Housing Interest (ZEIS). The ZEIS were created with the aim of controlling land value in certain areas of the city in order to be accessible to low-income people. The area is a very deteriorated portion of downtown Sao Paulo and, despite being occupied by tenement housing, it is in a historic district surrounded by areas where the land value is high due to the full urban infrastructure and job offer.

Plans to revitalize the area were strengthened during Kassab municipal administration. However, the private sector resists to participate in the process because it believes that the area designated for low income housing is too large (about 25% of the total) and that this discourages private investments. Developers have been pushing the municipal government to change the zoning of this area and to designate the ZEIS as a predominantly commercial area.

The area adjacent to the ZEIS has already been transformed and has been receiving significant investments from the public sector, such as the restoration of the Luz Train Station and the creation of the Museum of the Portuguese Language (partially destroyed in a fire in December 2015 and now undergoing restoration), the construction of a concert hall at Julio Prestes Train Station, and the creation of Estação Pinacoteca Exhibition Hall. (Fig.1)

Figure 1-Santa Ifigenia neighborhood showing the State Art Museum and Julio Prestes Train Station in the foreground and the ZEIS in the background left. Photo By Agnaldo Bertolo, March 2009

This paper deals with relatively recent housing policy provision, so literature about the subject is scarce. For this reason, the research method was mainly based in fieldwork and in an investigation of all housing projects that were approved for construction by the municipal government.

This study focuses on the perimeter defined by the 2002 Master Plan of about 10 hectares zoned as ZEIS 3, which correspond to a total of 5 complete blocks and 6 partial blocks. The goal of this study is to analyse the effectiveness of these ZEIS in the process of revitalizing the area and to determine whether or not the purpose of building housing for low income people has been reached.

2 ZEIS IN SAO PAULO MUNICIPALITY

The 2002 Strategic Master Plan (PDE-Lei n° 13.430/2002) established 686 ZEIS in Sao Paulo, with the purpose of reserving areas for the construction of social housing, in order to guarantee the permanence of low-income population where they already live, albeit in precarious conditions. Therefore, areas occupied by slums, illegal lots or tenement houses should continue to house the poor but in decent houses to be built by private or public development. Some underutilized areas were designated as ZEIS with the aim that urban property fulfil its social function, considering that Sao Paulo County had a deficit of 380 thousand housing units at the time of the elaboration of the Master Plan, when the population of the city was 10,4 million.

The 2002 Master Plan established 4 types of ZEIS (ZEIS 1, 2, 3 and 4). ZEIS 3 is located in central areas or adjacent to the railroad where transformations are in progress for several reasons. ZEIS 3 was set up in degraded areas that need immediate recuperation and this is one of the main guidelines of the Master Plan. The railroad border was also designated ZEIS 3 since the area has potential for transformation in view of the deindustrialization. Therefore, the ZEIS 3 designation came to meet the need to avoid gentrification, a process that frequently occurs when there is urban revitalization. (Pessoa, 2009) This is an effort to maintain low-income people in areas where there is good urban infrastructure rather than dislocate them to the periphery of the city, where infrastructure is insufficient. The ZEIS 3 also intends to avoid urban sprawling encouraging densification of the city. The population today suffers with a low-density occupation, facing problems such as waste of time in commuting or lack of urban equipment like schools or health facilities.

In ZEIS 3, at least 40% of the built area must be designated for Social Interest housing (HIS) and the units are to be sold for families whose income is lower than 6 minimum wages (about 1470 euros). UP to 40% of the units can be designated for Popular Market Housing (HMP), reaching a population that has a family income of up to 16 times the minimum wage per month (about 3.900 euros). The real estate market considers ZEIS 3 attractive to HMP but not to HIS. Therefore, developers have no interest in building in these areas.

3 SANTA IFIGENIA NEIGHBORHOOD

By the end of the 19th century, the Santos-Jundiai railway was built. This significantly altered the urbanization of the city of Sao Paulo. From then on, many farms on the border of the railroad were urbanized. The Swiss Frederico Gleite and the German Victor Northman acquired the Maua farm and parceled the land with streets larger than the ones of the "triangle" (the oldest area of the city), giving origin to the neighborhoods of Campos Eliseos and Santa Ifigenia. (Toledo, 1983)

Major urban transformations occurred during the administration of mayor Joao Teodoro Xavier (1872 to 1875) such as the Luz Garden, which was at that time the main park and leisure area of the city. The Luz train station was built during the decade of 1900, in the same place of the former station built in 1867. The new station, a steel structure, was fabricated in England and for quite some time was the main building of the city, symbolizing progress and the coffee production of the state which was at that time Brazil's main export commodity.

From the decade of 1930 on, the area began to decline because of the coffee crisis. Other facts also contributed: the construction of a bus terminal, the high-income population that lived in the neighborhood moved to other parts of the city and, later, the displacement of downtown activities to the Paulista avenue. By the end of the 20th century the area was occupied by homeless and drug addicts, reinforcing the decay of the region. At that time, Santa Ifigenia neighborhood was named Crack Land, in allusion to crack addicts that live in the area. Many efforts were made as an attempt to reverse this trend with no success.

4 NOVA LUZ [NEW LUZ]

Because of the deterioration of Santa Ifigenia neighborhood, the region became the focus of requalification proposals, considering that it is a place with good infrastructure, good transportation system and is part of downtown urban fabric. In 2005 Gilberto Kassab, vice mayor during Jose Serra administration, delimited an area defined by Maua street and Casper Libero, Ipiranga, Rio Branco and Duque de Caxias avenues, totalling 105.000m² as a public utility area. The idea was to attract private enterprises to invest in the area as an attempt to recuperate it, considering that it is one of the most degenerated in the city. In this occasion, 23 companies applied. (Souza, 2010)

The area was informally renamed as Nova Luz, which is thought to be an attempt to disqualify the neighborhood and the old region that carries an important part of the history of the city. In December 2005, Jose Serra passed the Municipal Law 14.096 that grants tax incentives for the companies that registered to invest in the area. (Souza, 2010)

In March 2006, Gilberto Kassab became major of Sao Paulo and soon afterword announced that he would expand the Nova Luz project design area, including avenues Rio Branco, Duque de Caxias, Prestes Maia, Ipiranga and Alfredo Issa square, totalling 27 blocks that could be subject to intervention and expropriation. The new perimeter totalled 26,9 hectares. A few months later, an area was expropriated to build the Technology, Information, and Communication Center of Sao Paulo (PRODAM) and also for the Metropolitan Civil Guard. (O Estado de São Paulo, p. C3, March 10, 2007) The Odebrecht Construction Company, among others, said it was willing to invest in the region but had difficulty in acquiring real estate because the buildings had many owners and the area was very fragmented. The Patronal Housing Union (Secovi) lead a group of developers interested in the area, with the purpose of implementing the urban design project conceived by Jaime Lerner, former mayor of Curitiba, Paraná. The project advocated by Secovi Vice President, Claudio Bernardes, proposed a new occupation for the blocks with low-rise buildings. Their central patios would have semi-public commercial areas, while blocks with only residential apartments would have private central patios. In the perimeter, 80-storey towers would be built, exploring the maximum construction potential of the blocks (coefficient of utilization equal to 4 and exemption from onerous granting).

The tenants and building owners were surprised at this design project, which was developed without their participation. This adversely affected the municipal purpose, because even though the area is very degraded, it is not abandoned and there is economic activity. On the contrary, the electronic equipment trade in Santa Ifigenia Street and surrounding area is a very intense economic activity and is the second source of municipal taxes for the city. At that time, the Santa Ifigenia Merchants Association (ACSI) was established, in order to discuss issues related to the Nova Luz urban design project. (Souza, 2010)

5 THE CONSORTIUM URBAN DESIGN PROJECT

In May 2010, the news about the enterprises that formed the consortium in charge of the revitalization of Santa Ifigenia neighborhood came to public. They were: City Company, Concremat Engineering, Aecom Technology Corporation, and Getulio Vargas Foundation. (OESP-11/05/2010) The City Company, originally an English company, is well known in Sao Paulo since the beginning of the XX century because of the design of neighborhoods of Jardim Europa, Pacaembu and Alto de Pinheiros among others. The City Company was also responsible for the master plan of the 2012 London Olympic Village. At the time, the municipality granted private companies the right to apply the urbanistic concession allowing the private sector to expropriate areas. This was the cause of strong complaints from the owners of the buildings. This issue will be addressed later in this paper.

In December 2010, the consortium presented the design project for the area surrounded by avenues Casper Libero, Ipiranga, Sao Joao and Duque de Caxias and by Maua Street, totalling 45 blocks qualified in 5 sectors. (Arcoweb-28/03/2011)

6 ZEIS AT NOVA LUZ

The 8 hectares area that comprehends the ZEIS at Nova Luz was defined by the 2002 master plan, aiming to maintain in the neighborhood the population that already lived in the area (in precarious homes and tenement houses) and to improve their living condition. The ZEIS is seen by Claudio Bernardes as an obstacle to the implementation of Jaime Lerner's urban design project, because in ZEIS only 20% of the area could be used as non-residential area. It is implied that a large area reserved for low-income people would not be attractive for real estate investors who were only interested in risk-free profit.

"The map of the concession area indicates that the core of the polygon – which includes Rio Branco, Ipiranga and Duque de Caxias avenues and Maua and Casper Libero streets – is formed by ZEIS 3. In this area, the local government guideline provides for the construction of up to one thousand low-income housing units – two lots totalling 15 thousand m² have already been expropriated for that purpose at Aurora and Vitoria streets.

"But the investors sided with the housing syndicate (Secovi) considered that this amount of low income housing units should be spread out rather than concentrated in only one area, which could limit the middle-class interest in living downtown.

"Nova Luz was conceived to disseminate a new growth pattern for the city, mingling various uses in the same region. The proposed pattern is not interesting for the real estate market. Our design project was conceived by Jaime Lerner and he will not participate in the competition anymore" says Bernardes.

"He still refutes the urban planners' critical comments that the market does not want to build low income housing for low profit. "We want to build but in a spread-out way." (OESP October 2009)

Once again, a ZEIS in a central area (Fig.2) is seen as a depreciation factor that discourages investments, as in other areas of the city the ZEIS apartments are being built but units are being sold for middle class population rather than for families earning up to 6 minimum wage income. A search in the county website in July 2011 showed that no permit for construction of low-income housing was requested. It seems that all activities ceased while awaiting the Nova Luz urban design project definition. At Santa Ifigenia's ZEIS, the only building that started to be built was a self-help construction organized by Compamare, a cooperative of the paper and recyclable materials collectors. The building was not finished and the construction was paralyzed.

Figure 2-ZEIS at Rua do Triunfo showing a well-preserved old building. Photo by the author, December 2015

7 URBANISTIC CONCESSION

The consortium project keeps the ZEIS as it is, considering that it is part of the Zoning Law of the city and cannot be altered. Stephen Engblom, an American architect and one of those responsible for the revitalization design project of Luz, believes that the areas reserved for low-income houses may repel some investors. On the other hand, he advocates the idea that people should not live in segregated places and sees social diversity as a positive factor. The master plan of the city aims to avoid gentrification and was therefore conflicting with mayor Gilberto Kassab and the main investors.

Gilberto Kassab was elected mayor of Sao Paulo in October 2008, defeating Marta Suplicy. In November, he announced his plan to expand the urban policy instrument named Urbanistic Concession for Santa Ifigenia neighborhood. This instrument must be approved by the Municipal Council and then applied in Santa Ifigenia area. Since then, many mistakes were made by the municipality and by the press, misinterpreting the instrument and its application in view of the Statute of the Cities, a law that regulates policy instruments.

“The Statute of the Cities never provided for Urbanistic Concession (Federal Law 10.257/2001), although the media, politics and civil entities frequently misinterpret it as it is made clear in public hearings.” (Souza, 2010)

Even worse is the fact that the municipality was aiming to use the urbanistic concession at Santa Ifigenia area, allowing private companies to expropriate with the excuse of implementing an urbanistic project, and then later invest in real estate enterprises in the expropriated lots, and profiting from this action. The previous owners of the buildings would be excluded from the process. That would be a very negative precedent, considering that expropriation is a prerogative of the public sector, with very rare exceptions.

“This provision refers to public service concessionaires that execute services for the public sector under a public concession or permission, after a bidding process, pursuant to article 175 of the Federal Constitution. That includes electric energy supply services, communication services, water and sewage supply, urban public transportation services etc. (Harada, 2009)

The concessionaires offer services in exchange for the granting of the concession (Union, States, Federal District, or County) and are authorized to charge users a fair tariff for the value in the winning bid. The question is: can the concessionaire execute public service and charge for this service? Is there a legal provision that allows private enterprise to expropriate and pay compensation with non-public resources in order to implement urban revitalization design projects? Can the private sector profit by selling units resulting from the expropriation? In practical terms, the bill of law is creating the institute of concession of real estate speculation, which is prohibited for the public sector. It is not possible to expropriate with the purpose of reselling. (Harada, 2009)

In 2011, the Electrical Material and Home Appliances Retail Union filed a Direct Action for Declaration of Unconstitutionality (ADIN) against the Urbanistic Concession Law (Law 13.917/2009).

According to the urban planner Lucila Lacrete, of the non-governmental organization Defenda São Paulo (Support Sao Paulo), the Federal Constitution, article 182, 4th paragraph, says that the Municipal Government is authorized, under a specific law and for an area included in the master plan, to require, under the terms of the Federal Law, that the owner of no-built, underutilized or not-used urban land promote its proper use. Breach of the law results in the payment of progressive property tax and further expropriation. What is clear is that the proprietors should participate in the urbanization project. Nevertheless, none of the real state owners were notified by the municipality to participate in the revitalization process in the analysed time span. This is an extremely serious failure because it excludes the landowners and gives to private investors the possibility to profit with the process. What is proposed in the bill of law is compulsory expropriation, even when the landowner is willing to participate in the urban renewal process. In the revitalization, the investor shuns the proprietor by paying the current market value, which is low because of the degradation of the area.

In April 2011, the Courts suspended the Nova Luz project, but in August of the same year, the ruling was reversed, and the ADIN was dismissed.

8 CONCLUSION

The starting point of this research was to understand the reasons why the construction of social housing in the Santa Ifigenia neighborhood did not occur despite the great need in central areas. In the course of the investigation, what was found is that there is a complex game of power where the municipality takes the side of the large construction groups, disrespecting the rights of the landowners or tenants of commercial or residential units. Once again, an urban area is treated as merchandise that generates high profit for small but powerful groups while the concept of "social function of the city", recently introduced by the Statute of the City remains ignored.

ID 1405 | IMAGE AND QUALITY OF LIFE IN NEIGHBORHOODS WITH RENEWAL DEMAND – CHALLENGES IN THE COOPERATION BETWEEN URBAN PLANNERS AND HOUSING PROVIDERS: THE CASE STUDY WÜRZBURG

Sinning, Heidi¹

¹ISP - Institute of Urban Research, Planning and Communication, Erfurt University of Applied Sciences
sinning@fh-erfurt.de

This paper focuses on residential neighborhoods that are located in or near the city center and characterized by a negative (external) image as a result of demographic, social and economic transitions. Using the case study of Würzburg-Zellerau as an example, it will explore approaches to improving a neighborhood's image with a view to enhancing quality of life and to identifying potentials as well as limiting and success factors.

1 BACKGROUND

This paper is based on the research project "ImiWo – Images of Inner-City Residential Quarters." Using two neighborhoods, one in Berlin and one in Würzburg, as case studies, the project identified framework conditions, influencing factors and relevant stakeholders along with their specific impact on the development of neighborhood image. In addition, the role of public-sector housing providers and

municipalities within this process, as well as their scopes of action in regard to enhancing quality of life, were explored in cooperation with municipal housing associations.

Economically weak and socially vulnerable neighborhoods with urgent demand for renewal can be found in many cities in Germany and elsewhere. The German federal government set up the funding program Soziale Stadt ("Social City") with the specific goal of promoting integrated approaches to developing such urban neighborhoods that encourage extensive citizen participation. By upgrading the quality of housing and public spaces and taking the improvement of safety and ecological considerations into account, they aim to create a more attractive residential environment in order to increase quality of life for residents of these neighborhoods – and thus ultimately increase the educational and economic opportunities open to them, as well. The program seeks to improve infrastructure and provide good living conditions for children, families and elderly residents in order to contribute to a diverse social structure and promote a sense of community among the neighborhoods' residents. (cf. BMUB, 2014; Eltge and Kocks, 2015; Häußermann, 2006)

The paper provides an overview of the various approaches to improving quality of life in urban neighborhoods and takes a closer look at the strategies implemented by the City of Würzburg (125,000 inhabitants) to increase quality of life in the inner-city neighborhood of Zellerau (12,000 inhabitants) and improve its image. A media analysis showed that this neighborhood was stigmatized for years by the use of disparaging terms such as "Little Moscow," "Broken-Glass District" and "social hotspot," and the paper will demonstrate how Zellerau's image has evolved up to the present day.

1.1 METHODOLOGY

Würzburg-Zellerau was selected based on the fact that it is an inner-city neighborhood in which structures were in place for cooperation between housing providers, the municipality, urban planners and various other institutions and stakeholders, such as citizens' groups and NGOs, in the field of urban renewal.

Research conducted on Zellerau included an analysis of reports in the media and of available literature and documents, interviews with urban development and housing experts, and an extensive survey of inhabitants of Würzburg in general, and Zellerau residents, in particular. (cf. Berndt and Sinning, 2016: 5ff)

2 NEIGHBORHOOD IMAGE AND QUALITY OF LIFE – A DEFINITION OF TERMS

NEIGHBORHOOD When it comes to defining the term "neighborhood," I refer to the definition proposed by Schnur, which emphasizes everyday life: "A neighborhood is an area embedded in a specific context that lacks clearly defined boundaries, but is rather socially constructed through various actions taking place inside and outside it and serves as a focal point for residents' daily lives and individual social spheres, which intersect and overlap within a relatively small-scale residential environment providing the spatial framework for identification" (Schnur, 2013: 31).

The significance and development of neighborhoods include structural, physical, social, economic, political, symbolic and historical dimensions that imbue them with specific characteristics as a "complex spatial and social setting" (ibid.: 30).

In summary, a neighborhood as understood in this paper can thus be characterized as a socially constructed (rather than administratively defined) area that is small enough to offer the potential for partial social identification and interaction (cf. ibid.: 31).

IMAGE An image is a mental concept formed by individuals based on the sum of their objective knowledge, subjective feelings, experiences, notions, assessments and prejudices relating to the object or entity in question. (cf. Johannsen, 1971: 35; Leser et al., 1989: 264). In other words, an image is not merely a reflection of reality and objective conditions, but is rather always colored by personal judgment, attitudes and experience (cf. Berth, 1959: 124f). Thus an image "incorporates both objective und emotional components into a dynamic overall impression of objects, spaces, people etc., which is formed based on first-hand information and the personal perceptions of the respective individual as well as information and perceptions conveyed by others" (Wiest and Wörmer, 2012: 3).

2.1 NEIGHBORHOOD IMAGE

Based on these definitions of the individual terms, "neighborhood image" can be described as "a concept created collectively by individuals and their social practices (the image) regarding a multi-faceted part of a city without clearly defined boundaries (the neighborhood)." (Berndt and Sinning, 2016: 11)

2.2 IMAGE AS A FACTOR IN THE DEVELOPMENT OF NEIGHBORHOODS

The question of neighborhoods' image is of more than merely academic significance. It impinges directly on how neighborhoods form and change over time and on their potential for development. A neighborhood's image is decisive for those who live there. Whereas an address in a "good" neighborhood can open many doors and be a source of positive identification, living in a "bad" part of town" can negatively affect how its residents are perceived by others, the opportunities available to them and their quality of life, which can ultimately propel the entire neighborhood into a downward spiral.

Thus it is vital to improve the image of negatively perceived neighborhoods. However, in order to avoid economic and social segregation and the displacement of residents in the process of gentrification, it is crucial to strengthen residents' connections to their neighborhood and to ensure stable development and attractive residential environments in all parts of the city.

Changing the image of a neighborhood affects its development and vice versa. As can be seen in Figure 1, it is possible to distinguish between different types of neighborhoods based on how they are perceived by residents and by outsiders, but such perceptions can change over time depending on the specific dynamics of a particular neighborhood's development.

2.3 QUALITY OF LIFE

As used in this paper, the term "quality of life" refers to a multi-dimensional concept of wellbeing that "includes both material and immaterial and both objective and subjective aspects of individual as well as collective welfare and emphasizes quality over quantity (Noll, 1999: 3). In the context of collective welfare, it is used to describe conditions allowing a good life for everyone (cf. Berger-Schmitt and Noll, 2000: 33f) based on economic growth, security, order, justice, freedom and high quality of life as primary principles of a modern society (cf. Jochmann, 2010: 92f). Quality of life, social cohesion (i.e. decreasing disparity within society and strengthening social bonds among its members) and sustainability are the three pillars of collective welfare (cf. *ibid.*).

Image Types	External Image positive +	External Image negative -	Trend
Internal Image positive +	<p>Type A: Gentrified Neighborhoods</p> <p>Established neighborhoods consisting largely of buildings dating to the decades prior to WW I that have been modernized according to the highest standards.</p> <p>Characterized by a high share of owner-occupied apartments, socio-economically privileged residents, upscale restaurants and shops etc.</p>	<p>Type B: Emerging Neighborhoods</p> <p>"Hip" neighborhoods on the brink of gentrification, usually located near the city center, with a building stock dating largely from the pre-WW I period and rents that are still fairly moderate.</p> <p>While these neighborhoods are often characterized by a high percentage of residents with working-class and/or immigrant backgrounds, an influx of artists and other pioneers attracted by low rents and the central location typically ushers in a period of rapid change in social and household structures, increasing investment pressure, and rising rents due to the neighborhood's growing popularity.</p>	<p>↑↑ <i>Upgrading</i></p> <p>Increasing attractiveness</p> <p>>> Danger of displacement of long-standing residents</p>

	Type C: "Ordinary" Neighborhoods		→ No specific developmental-dynamic
	<p>Mostly middle- and upper-middle-class residential neighborhoods: consisting of single-family houses, townhouses, or apartment buildings from the pre-WW I period</p> <p>Characterized by fairly stable demographics and development over several decades</p>	<p>Generally residential developments dating to the post-WW II era</p> <p>Characterized by stable demographic and social structures, with largely (lower-) middle-class residents</p>	
Internal Image negative	Type D: Forgotten Neighborhoods	Type E: Neglected Neighborhoods	<p>↓↓ Downgrading</p> <p>Stigmatization</p> <p>>> Danger of a downward spiral</p>
	<p>Primarily mixed-use neighborhoods near the city center</p> <p>Characterized by a downward trend in the local retail base (i.e. a large number of vacant stores etc.)</p>	<p>Mostly large-scale housing projects built from the 1960s through the 1980s, although some of these neighborhoods are made up of older buildings</p> <p>Characterized by increasingly weak socio-economic structures/residents</p>	

Fig. 1: Different types of neighborhoods based on image and developmental dynamic (Berndt and Sinning, 2016: 31; translated from the German)

In this understanding, quality of life is regarded as arising from an interaction of objective and subjective factors (cf. Greiffenhagen, 2003: 362), i.e. favorable conditions and subjective welfare across various domains of life (cf. Zapf, 1984: 25). As such, it is a multi-dimensional concept based on a constellation of objective and subjective perceptions of wellbeing. Individuals' objective circumstances are determined by factors such as income, living and working conditions, family relationships, social contacts, health, social and political participation, and the natural environment (cf. Jochmann, 2010: 93), while their subjective sense of wellbeing results from their personal, emotional assessment of their particular circumstances and attitude towards life in general. (cf. Noll, 1999: 10). Quality of life is a decisive factor in terms of how neighborhoods are perceived. Thus improving subjective and objective quality of life is key to boosting a neighborhood's image and attractiveness.

3 IMAGE AND QUALITY OF LIFE AS ELEMENTS OF AN INTEGRATED APPROACH TO NEIGHBORHOOD REVITALIZATION

An integrated approach to urban development – i.e. a comprehensive strategy aiming to ensure a livable, affordable, and socio-economically diverse neighborhood – can contribute significantly to enhancing quality of life and revitalizing urban neighborhoods. More specifically, providing better quality housing, upgrading public spaces and creating an environment that is safer, more ecologically friendly and more attractive overall can have a major impact by improving quality of life for a neighborhood's residents, which in turn ultimately leads to better educational and economic opportunities. In addition, providing an infrastructure that meets the needs of children, families and senior citizens can contribute to promoting a diversity of uses and social cohesion in the neighborhood. (cf. Drilling and Schnur, 2012; Jochmann, 2010; Kaltenbrunner and Schnur, 2014)

3.1 COURSES OF ACTION AVAILABLE TO URBAN PLANNERS AND PUBLIC-SECTOR HOUSING PROVIDERS TO ENSURE LIVABLE NEIGHBORHOODS

Figure 2 shows the basic approaches that can be taken within an integrated strategy aiming to revitalize neighborhoods by enhancing their image and attractiveness and how public-sector housing providers and urban planners can contribute to changing the way neighborhoods are publicly perceived. Which approaches are the most suitable in a given case depends largely on the type of neighborhood (see Fig. 1) – i.e. the current state and public perceptions of the respective neighborhood – but other factors may also play a role, such as framework conditions in the municipality as a whole that affect the scope of action

available to planners and others involved in the image enhancement process. However, although the point of departure may be different for the various types of neighborhoods distinguished in Figure 1, the overall aim is always to foster diversity and create a livable, mixed-use neighborhood. This means providing conditions conducive to local businesses, creating public spaces offering scope for experimentation and social interaction, and encouraging community involvement, citizen participation, and individual responsibility. (cf. Bürgin, 2013: 137).

Mix of Approaches in Integrated Neighborhood Development					
Communicative Approaches	Social Approaches	Approaches Based on Planning Legislation and Housing Policy			
		Construction Measures	Financial Instruments	Planning Legislation	Housing Policy Instruments
<ul style="list-style-type: none"> Marketing the neighborhood as an attractive location for businesses and tourist destination Campaigns to redefine the neighborhood's image and appeal, e.g. by creating new attractions/landmarks Neighborhood branding Public relations campaigns involving the local media (press, local TV stations etc.) Encouraging citizen involvement and participation 	<ul style="list-style-type: none"> Outreach work to promote a sense of community and social capital Fostering involvement and empowerment Promoting self-organization and political representation through community organizing and participation committees Intermediary neighborhood management Close monitoring of sociodemographic developments within the neighborhood Provision of professional counseling and arbitration for neighborhood residents on tenants' rights, social problems and other relevant issues 	<ul style="list-style-type: none"> Construction of new housing Modernization and refurbishment of existing housing Redesign and upgrading of public spaces Measures to improve infrastructure and the residential environment for specific target groups Creating communal/public spaces for social encounters and interaction 	<ul style="list-style-type: none"> Demand-side subsidies, i.e. the provision of housing allowances for low-income groups Purchase of residential properties by public-sector housing providers Funding of modernization measures Supply-side subsidies, i.e. funding for the construction of new housing PPP investments in infrastructure (BIDs, HIDs, NIDs) Public funding (i.e. funding provided according to Article 164 of the German Federal Building Code, by the EU, and by the German development bank KfW) to promote urban development measures Subsidies/Funding for housing cooperatives 	<ul style="list-style-type: none"> Zoning by-laws governing the residential use of properties and the number of stories allowed Regulations prohibiting the use of residential properties for other purposes and the conversion of rental housing into condominiums By-laws on rent caps and the share of modernization costs that can be allocated to tenants to control increases in housing costs Statutes governing the percentage of subsidized housing for low-income groups and the preservation of the social environment Bilateral agreements between municipalities and investors on the socially responsible and just use of land Modernization and redevelopment statutes Modification of zoning regulations and local development plans Preemptive right-to-buy for public entities 	<ul style="list-style-type: none"> Strategic municipal concepts to ensure an adequate supply of affordable housing Measures to reduce tenant turnover Fines to prevent the use of residential properties for other purposes Sale of publicly-owned properties to the investor with the best concept rather than the highest bidder Measures to control rising rents (i.e. rent caps, restrictions on admissible rent increases for existing leases, and hardship provisions to protect tenants from steep raises in rent once subsidies cease) Stipulations committing investors to include a given percentage of subsidized housing in new construction Strategic alliances for social housing policy Occupancy management

Fig. 2: Overview of Instruments and Measures of an Integrated Approach to Urban Development (Source: ISP 2016 based on Berndt and Sinning, 2016: 111)

Thus the mix of instruments and measures urban planners choose to effect the desired change in a neighborhood's image will depend on the specific situation and goals in the particular case. A good example of what such a mix can look like is provided by the case study of Würzburg-Zellerau, which is presented in more detail in the following.

4 WÜRZBURG-ZELLERAU – A CASE STUDY

Located near the city center of Würzburg, the Zellerau neighborhood is delimited by the river Main to the north and a belt of green spaces to the east, south, and west. A printing-machine factory, a steam laundry and a large brewery were the main providers of employment to the local residents up until 1945, and Zellerau is perceived as a working-class neighborhood to this day. The fact that it was the site of military barracks for decades additionally contributed to its negative image. Currently Zellerau is home to approximately 12,000 inhabitants and includes a higher than average percentage of low-income households and residents with immigrant backgrounds.

Fig. 3: Sociodemographic data for Zellerau compared to the city of Würzburg overall in 2013
(Source: City of Würzburg, 2013)

For many years, derogatory terms such as "Little Moscow," "Broken Glass District," "social hotspot," and "slum kids" were used to refer to Zellerau and its inhabitants. The program Zukunft – Leben in der Zellerau ("Living in Zellerau in the Future") was launched in 2007 as part of the German federal government's Soziale Stadt funding scheme in order to develop Zellerau with a view to providing better quality of life and healthier living conditions as a key to boosting the neighborhood's image. An analysis of media reports on the neighborhood show that these efforts have succeeded in improving Zellerau's image (cf. Berndt and Sinning, 2016).

4.1 QUALITY OF LIFE IN ZELLERAU

A recent survey of Zellerau residents showed that their perceptions and assessments of the quality of life in their neighborhood are rather varied. Zellerau's green infrastructure, local supply, close-knit community and cultural diversity are regarded favorably. Moreover, it appears that especially older residents identify strongly with their neighborhood and take a predominantly positive view of it, although many in this age group, in particular, are concerned about safety and cleanliness.

Positive opinions regarding the local infrastructure are especially evident in regard to the excellent quality of medical care and facilities for senior citizens and those requiring care. On the other hand, due to the high percentage of residents with low incomes, demand for food banks and similar organizations offering aid to the poor is high, both among the general population and among senior citizens. This indicates that the number of elderly residents living below the poverty line is likely to increase in the future and is a trend that planners need to take into consideration.

4.2 INSTRUMENTS AND MEASURES AIMING TO BOOST ZELLERAU'S APPEAL AS A LIVABLE NEIGHBORHOOD

Figure 4 illustrates the different instruments and measures implemented in developing Zellerau with the aim of creating better social conditions and the relative weight given to the various approaches.

As can be seen in Figure 4, refurbishment and construction measures were the predominantly employed approaches, while instruments provided by planning legislation and housing policy played a minor role. Strategies designed to foster empowerment and community involvement were also of particular significance. The emphasis given to these approaches partly had to do with the fact that funding was

provided by the program Soziale Stadt, which stipulates that efforts during the first phase focus on eliminating substandard housing and tackling social problems.

The mix of instruments and measures described above proved effective in the first phase and succeeded in promoting Zellerau's transition from a "Type E" to a "Type B" neighborhood over the past decade or so. Future efforts will focus on stabilizing this positive trend and continuing to develop Zellerau into an affordable, attractive neighborhood with a healthy demographic and social mix. It will be necessary to evaluate whether the instruments in place are suitable to achieving this aim and determine if they need to be modified or supplemented with additional ones.

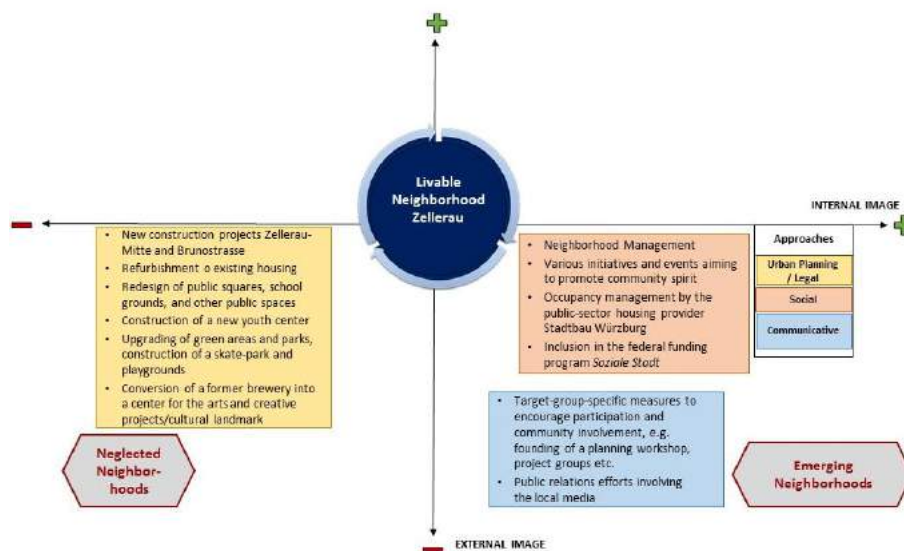

Fig. 4: Measures implemented in the development of Zellerau from a Type E to a Type B neighborhood (Source: ISP 2016)

5 CONCLUSION

Although its residents confirm a high quality of life and have a positive opinion of their neighborhood, the image and perceptions of Zellerau among outsiders are still predominantly negative. However, the results of a recent survey of residents provides a more differentiated view, with the neighborhood's green infrastructure, local supply, close-knit community and cultural diversity being regarded favorably. Older residents, in particular, identified strongly with their neighborhood. Zellerau's negative image, technical infrastructure and safety concerns were seen as the neighborhood's main drawbacks.

In order to improve the neighborhood's image and quality of life over the long term, the city of Würzburg launched a wide-reaching plan for cooperation among multiple stakeholders, including urban planners, city administrators, public-sector housing providers, and neighborhood management, as well as NGOs, social institutions and citizens.

This collaborative approach appears to be particularly relevant because it has the power to produce the broad, profound impact required to effect real change and truly boost a neighborhood's image and quality of life.

In addition to extensive cooperation, using a mix of instruments as shown in the example in Figure 2 proved to be an effective strategy. The city of Würzburg and the municipal housing association Stadtbau GmbH, in particular, played a central role in upgrading the Zellerau neighborhood by building housing and strategically selecting tenants to ensure a healthy mix in terms of age, household size and income. Stadtbau's strategy of

"Creating, Maintaining and Allowing for Diversity" is key to counteracting unhealthy social structures and making the neighborhood more attractive overall, while at the same time ensuring that rents remain at moderate levels (cf. Berndt and Sinning, 2016: 169 f).

Continuous monitoring of social, economic and demographic data with a view to the neighborhood as a system, its demographic structure and residents' needs could be helpful in identifying potential problems early on in order to adapt strategies accordingly and thus ensure the quality of neighborhood development over the long term.

Although some urban development concepts take the aspect of improving image into account, relevant approaches and measures are hardly ever integrated in a strategic manner, or even at all. This may be due to a lack of knowledge on how to deal with the issue of negative neighborhood image.

The case study of Würzburg-Zellerau can contribute to a better understanding of the complexity of interrelationships between quality of life, integrated development strategies and neighborhood image. However, the results also show that there are still a number of issues to be addressed in further research, e.g. a more differentiated analysis of goals, strategies and instruments relating to image building and the specific roles of the various stakeholders within this process, and the connection between boosting neighborhood image and gentrification, as well as possible measures to prevent or at least limit the displacement of residents due to rising rents.

In any case, rather than rejecting efforts to improve neighborhood image out of hand as paving the way for gentrification, they should be regarded with an unbiased eye, and the chances and risks inherent in developing a certain neighborhood should be analyzed and weighed against each other objectively.

ID 1414 | EMPTY HOUSING: CRITICAL REVIEW ON THEORETICAL EXPLANATIONS OF HOUSING VACANCY

Ifigeneia Dimitrakou¹

¹Politecnico di Milano

ifigeneia.dimitrakou@polimi.it

ABSTRACT: The issue of housing vacancy as a spatial phenomenon, as an outcome of urban restructuring or as part of a rhetoric developed around urban generation, has been considerably debated in the fields of housing and urban studies and policy-making. However, the definitions and the conceptualizations of empty, underused, vacant or abandoned housing in urban agglomerations as topics to look into, as well as the theoretical frameworks developed to understand the procedures and the reasons behind their emergence, are diverse and sometimes controversial, depending on the disciplinary origins and epistemological paradigms adopted. The essay attempts to provide a better understanding of the various types of urban housing vacancy through a critical review on key theoretical frameworks in the fields of housing economics, housing studies, geography and spatial planning to identify key points and assumptions between various disciplinary perspectives; as well as to reflect on whether more or less multi-dimensional explanations are able to grasp the complexity of the phenomena, which as it is argued, occur in many different contexts for many different reasons. For the purposes of this paper, the most prevailing concepts and theories used and translated by planners and researchers in urban studies to explain housing vacancy phenomena, are explored. The review focuses on literature dating back to the 1960's and attempts to cover the debate on housing vacancy, with a reference mainly to North-American and European cases, through the following three conceptual frameworks: i. housing vacancy as mobility "opportunity" ii. vacancy as demand variation and iii. vacancy as a "shrinkage". Four key concerns are discussed in detail regarding each of the conceptual frameworks: the extent of attention paid to spatial aspects and to cross-scalar relationships, to actors' role and impacts, as well as the understanding of vacancy as part of context-dependant historical processes. The paper concludes with a more general reflection on whether these commonly used theoretical frameworks are able to touch upon the complex social, economic, political and cultural relationships embodied in housing and conceptualize housing not only as a "composite commodity".

1 INTRODUCTION

Over the last decades housing vacancy and abandonment have been thoroughly examined in academic literature, either by means of providing a descriptive-analytical view on the phenomenon or its measurement (Hillier et al. 2003, Yin and Silverman, 2015, Accordino and Johnson, 2000) or incorporating the vacancy issue in a wider debate on urban restructuring, policy change, neighborhood transformation and gentrification (Marcuse, 1985, Häußermann and Clock, 2004). Conceptualizations of empty, underused, vacant space as well as explanations on the reasons behind its emergence have not been agreed (Morckel, 2014). The article focuses on the latter aspect and provides a critical review on three key conceptual frameworks which, albeit developed under different historical, political, circumstances and socio-economic conjunctures and referring to different housing systems and urban settings, are often used for the analysis of vacancy process in different contexts. The aim of this article is to contribute to a better understanding of the diverse mechanisms, reasons and phenomena intertwined to housing vacancy and reflect on whether underlying disciplinary logics might restrict the views only on certain facets of complex vacancy issues.

The article examines three conceptual frameworks: i. housing vacancy as part of the supply-demand link and as a necessary condition for residential mobility, as shown in filtering and vacancy chain models; ii. vacancy as a result of changing demand for specific tenures or neighborhoods, investigated through the theories of tenure residualization and the low-demand hypothesis and iii. housing vacancy as the outcome of universal patterns of demographic and economic restructuring explored by the "global" framework on urban shrinkage. After a brief review of the main definitions and the key points addressed by each concept, three key concerns addressed by all frameworks are critically discussed and disciplinary limits are presented. Considering that housing vacancy has been seen as a social or/and a spatial phenomenon, the first key point examines to what extent theories provide a spatial understanding of the phenomena. In this sense, spaces as well as scalar relations are key points on the basis of which concepts are compared. The second point concerns the potential importance of the physical space has in the explaining reasons for housing vacancy. The third point addresses the role of actors in the process of vacancy and raises questions on whether and when housing vacancy is structural or a result of aggregated individual attitudes. The paper concludes with a more general reflection on whether these commonly used theoretical frameworks are able to describe complex social, economic and political issues intertwined to housing vacancy, on whether contextual specificities play a role and the way the various conceptualizations of the issue of vacancy highlights different values which when translated into policies might lead to highly diverse approaches.

2 CONCEPTUALIZATIONS OF HOUSING VACANCY

2.1 VACANCY AS OPPORTUNITY: FILTERING & VACANCY CHAINS

Filtering is a concept, developed primarily for the US and UK context, to model the operation of housing markets and the nexus between housing supply-demand and household mobility patterns. This theoretical model, explored in depth by post-war scholars in housing economics, has its roots in early urban ecological perspectives, with the study of (Gibb, 2003). In the following part a brief presentation of North-American literature on filtering will address the origins and the main concepts around filtering models and their links to vacancy.

Classical filtering models assume that higher income households and their demand for "better quality dwellings" drive urban growth and that wealthier households' movement towards the outskirts, their increasing demand for housing triggers construction while creating vacancies in the existing housing stock. Vacancies along with suburban expansion decrease market values and render second-hand dwellings available to the next lower income group (White, 1971; Grigsby, 1963). In this regard, vacant housing constitutes an "opportunity" (Ratcliff, 1949; Turner, 2008) for low-income households who can improve their living standards without increasing their costs. Prior conceptualizations focus on the relation between supply and market prices and assume that households' conditions and income remain unchanged. Framing filtering solely as occupancy change, the excess in housing supply and therefore vacancy is linked to housing affordability (Ratcliff, 1949). When the decrease in market value is quicker than the decrease in quality, households can access better dwellings without extra costs (Grigsby, 1963). Recent

conceptualizations suggest that instead of housing units "filtering-down" the social hierarchy, households tend to improve their living quality while moving up the housing hierarchy (Marullo, 1985; Bier, 2001).

In first filtering explanations, aspects of heterogeneity, spatial fixity or durability of housing commodities have not been taken into consideration. The submarket hypothesis (Grigsby, 1963; Sweeney, 1974) and the development of vacancy chain models provided insights on the structure and the interdependencies between parts of the housing market and better explained supply-demand dynamics and relations between flows of housing resources and rent (Galster and Rothenberg, 1991). Vacancy chain models made the measuring of degrees of mobility in a given housing market and the evaluation of distributive effects and vacancy occurrence during the process of filtering possible. Chains conceptualize the way in which material resources or social positions are distributed in a housing system (Chase, 1991 p. 134). Similarly, filtering these models suggests that chains are initiated with the creation of new housing units and ended either when new actors join the system, or when the last units in the chain are destroyed, merged or abandoned (Marullo, 1985).

Irrespective of the diverse methodological assumptions in measuring the impact of new construction, most empirical studies claim that every new unit generates multiple additional vacancies and increases housing choices for other households (i.e. see Turner, 2008). However, the extent and the type of vacancy supply, the "optimal" allocation of new resources in submarkets as well as the "effectiveness" of the market in delivering "better" housing services to low-income households have been debatable. Most empirical findings demonstrate that higher vacancy rates tend to concentrate in the lower parts of the market (Ratcliff, 1949; White, 1971; Malpezzi and Green, 1996), although the reasons are not clear. Certain authors speculate that new dwellings introduced in higher submarkets remain available longer and change hands more often than units introduced in the middle or lower ranks (White, 1971; Skaburskis, 2006), or find correlations between vacancy chains' length and tenure (Turner, 2008). Others identify the problem with the time-span in which better dwellings trickle-down the market hierarchy, suggesting that filtering is effective when new dwellings address middle-income household demands (Ratcliff, 1949). Most studies on filtering distributive effects assume that an increased supply facilitates households' upward mobility independently from their position in the market (i.e. see Bier, 2001). Interpreting surplus and vacancy as a higher degree of mobility opportunities is rather inconsistent and research is needed on the type of "opportunities" found at the lower level, or on whether resources are accessible (Clark, 2006) as well as on the probabilities for low-income households to experience upward mobility (see Chase, 1991; Marullo, 1985; Galster and Rothenberg, 1991).

2.2 VACANCY AS DEMAND: RESIDUALISATION & "LOW DEMAND"

Housing vacancy phenomena, manifested in Europe and primarily in the UK context in the 1970's and the 1980's, have been long-debated in the fields of social policy and housing studies. The following part draws on the UK experiences and comprises the analysis of the debate on housing vacancy for both the private and public sector through the concept of "residualization" and the concept of "low-demand" for housing.

"Residualisation" describes a set of parallel, more or less interrelated, processes operating at a global, national or local scale with impacts on national macro-economic, political/ideological, policy and social dynamics and between others, on the social structure of the housing consumption as well as on the role of social housing. This process refers to a wider social economic and political transformation which led to the relative shrinkage of the social rented sector, its de-prioritization from social policy agenda and its conversion into a "residual service" solely for the needs of the lower-income groups (Forrest and Murie, 1983; Malpass and Murie, 1999; Lee and Murie, 1999; Hall et al., 2005).

Global economic changes of the 1970's had an important impact on local dynamics of growth, labor market, employment and income, affected housing consumption and altered the scope of social policy (Harloe, 1995). Global competition, the new international division of labor and the tertiarisation of the economy have resulted in the increase of unemployment among the lower-skilled workers in several European advanced capitalist economies. The distribution of the aftermaths, however, has been uneven for both parts of the population, social classes and in areas (Forrest and Murie, 1983; Ball, 1983), with the regions dependent on manufacturing facing a "decline". As it is argued, long-term unemployment have fostered income-polarization between economically active and inactive households and led to their economic and political marginalization (Forrest and Murie, 1983). In this context an increasing, non-causal

though, correlation between income and tenure, linked either to labor structure or to consumption practices, has reflected a "polarization" between tenures and social classes (Hamnett, 1984). The shrinkage of the formerly "mixed" private rental sector, the expansion of owner-occupation in size and scope and the considerable concentration of lower income groups in housing estates have been only some of the indications (Hamnett, 1984). Policies played an important role in the process as well. The promotion of homeownership since the 1960's (Lee and Murie, 1999; Clapham et al., 1990), the subsequent "right to buy" policy (Kemeny, 1995; Allen 2008) and the expansion of the mortgaged markets, rendered homeownership an "attractive" as well as feasible option for middle-class households. The increasing maintenance costs-to-rent ratio in the social housing sector was coupled with an overall decreased funding directed to council housing and a shift in the system of financing, according to which subsidies were channeled to individual beneficiaries fostered the process of residualisation (Malpass and Murie, 1999; Harloe, 1995).

The expansion and the relative social diffusion of homeownership and the cross-tenure socio-economic and ethnical divisions, raised questions on whether "tenure" is a relevant analytical tool for understanding changes across parts of the housing system (Lee and Murie, 1999). This fact coupled with the persistence of "decline" and abandonment in specific geographical areas and its emergence in private sector housing (Kennan et al. 1999) have led to the adoption of "all-embracing" conceptual models on neighborhood change (van Beekhoven et al. 2005). Theoretical perspectives on "low-demand" provide a spatial understanding of the process of housing provision and focus on specific locations usually associated with "poverty" and "deprivation". Early research is influenced by the US debates on "neighborhood change" and "decline", and by the "social exclusion" policy debate in the UK (Lee, 2010; Watt and Jacobs, 2010). Recent contributions investigate micro-dynamics and the role of individual perceptions and choices in housing consumption and in the process of "decline" and redevelopment.

Hypotheses on the role of economic, social and policy restructuring remain relevant and incorporated in the analysis. Some contributions stress that the uneven distribution of housing demand across England is the projection of the long-standing regional disparities and divisions (Lee, 2010). However, they pay particular attention to the way in which these tendencies have been consolidated in inner-city neighborhoods of former industrial centers in England. As suggested, inner-city "decline" is the result of culminated events and processes. The gradual, later more rapid, "de-skilling", de-population and poverty concentration, is assumed to affect the "popularity" of inner-city neighborhoods and to lead to the stigmatization of their inhabitants. Local communities, experiencing multiple levels of distress (i.e. unemployment, low quality services, fear and crime) have often lost their sense of belonging. State-initiated decentralization (Lee and Nevin, 2003) on the one hand and delayed policy responses (Keenan et al., 1999), mismanagement of council housing or even renovation and demolitions programs (Jones and Watkins, 2009) on the other, have fueled household moving, vacancy and resulted in a generalized decline (Power, Mumford, 1999; Goodchild et al. 2002). Additional studies have considered the relationship between low-demand and changing "consumer preferences" and suggested that in order to understand the reasons behind "unpopularity" a more thorough look is needed on local experiences (Goodchild et al. 2002), individual perceptions on homeownership (Lee and Nevin, 2003), or on the meanings attributed to suburban lifestyles (i.e. safety, family and quality) (Townshend, 2006).

2.3 VACANCY AS SHRINKAGE: "DECLINE" IN GLOBAL PERSPECTIVE

Urban shrinkage, albeit its metaphorical use in former studies on "urban decline", is considered to be a relatively recent conceptualization of disruptions in the urbanization process linked to demographic and economic shifts. More precisely, the analysis on "urban shrinkage" concerns a macro-scale view on urban development process and explains spatial transformation as the interplay between demographic and economic drivers examined, in most of the cases, through the prism of globalization. The term "shrinking cities" refers to cities or urban agglomerations experiencing important population losses due to structural economic changes, political and rarely environmental crisis and as a phenomenon has often been associated with processes of deindustrialization, economic restructuring, suburbanization and urban sprawl, with demographic change being the main driver or the most prominent aftermath (Haase et al., 2016; Turok and Mykhenko, 2006). These urban transformations have been long-researched in the North-American context since the 1970's and in (Easter)Europe mainly after the 1990's. Nevertheless, there is no consensus about whether "urban shrinkage" addresses a new condition or constitutes a re-conceptualization attempt.

The theoretical and conceptual underpinnings of "urban shrinkage" can be found in literature about urban change with more recent contributions claiming to offer an alternative view on "urban decline". In recent years, a number of writers questioned the main assumptions of cyclical development theories, such as the staged nature of urban development and the "inevitable" succession of "decline" by redevelopment (i.e. see Friedrichs, 1993), while proposing that shrinkage is a long-term component of urban development (Fol and Cunningham-Sabot, 2010). Growth and decline are seen as structural and relational components of urban development that in the context of globalization evolve simultaneously (Bontje and Musterd, 2012). This asymmetrical relation between locations of growth and shrinkage has been explained as the spatialization of processes linked to the expansion, reproduction and crisis of capital accumulation in and through space (Harvey, 1982; Harvey, 2001) which, among others, consolidate in the spatial and functional re-organization of production globally (Massey, 1994) and has numerous consequences for local economic and social dynamics in several old industrial economies.

In a similar vein, the development of "global cities" (Sassen, 1991), characterized by the spatial concentration of financial-service businesses, information and communication networks and an advantaged location in terms of infrastructure, institutional development, economic and cultural production (Scott, 2008), evolves in parallel with the expansion of "shrinking cities", which face difficulties while adapting to the post-Fordist condition (Bontje and Musterd, 2012; Wiechmann, Pallagst, 2012) or coping with international competition for investment. Although these relations are fairly unexplored empirically, researchers argue that the level of integration of localities to global networks and their ability to attract capital and labor, is the key for understanding growth and shrinkage patterns at a global scale (Cunningham-Sabot et al. 2014).

Apart from the interactions of capital and labor flows in the context of global economy, demographic change and population decline in Europe has been associated with low fertility rates and population ageing. Long-term change in population structure is considered a driver of shrinkage as well, with numerous effects on the households' structure (i.e. size, number) and on the labor force (Haase et al. 2016). Research suggests that demographic shrinkage, although in place since the 1960's, has been further intensified by structural economic and political changes (i.e. post-socialist state) and the subsequent out-migration, having cumulative effects on local economy and taxation revenues, housing markets, public service delivery and physical manifestations with housing vacancy being a "typical" indicator (Wiechmann and Pallagst, 2012). Nevertheless, micro-scale or rather contextual housing-related issues such as housing vacancy, apart from some relevant contributions (i.e. Haase et al. 2016; Couch and Cocks, 2013; Häußermann and Glock, 2004) have been rarely examined in depth, probably because of the general focus on the macro-scale causalities of shrinkage.

3 DISCIPLINARY LIMITATIONS IN COMPARATIVE PERSPECTIVE

3.1 OBJECT OF STUDY AND DISCIPLINARY BOUNDARIES

The main difference between the conceptual frameworks and theoretical underpinnings analyzed above is the way in which the core object of study is defined. Although all three address a certain, short-or long-term, housing-related process or transformation with social and spatial impacts, the main focus as well as the lenses through which this change is explained may differ. Filtering and vacancy chain models, being primarily concepts of housing economics, conceptualize moves and transactions in the housing markets, while "residualisation" with a strong influence on political-economic approaches, investigates shifts in class structure and divisions in relation to changing institutional forms and meanings (i.e. property or state). On the contrary, "low-demand", with links to sociological traditions, investigates the nexus between preference, place and community and "urban shrinkage", a more recent conceptualization with roots in the fields of geography, regional science and urban planning, searches for universal (spatial) patterns concerning the way in which globalization forces interact with demographic and capital flows and impact on territories. Despite the fact that common intellectual developments, philosophical and social theory influences can be identified (i.e. global-local debate or post-modern views on individuality), or common theoretical understandings (i.e. theories of cyclical development, theory of "spatial fix") each of these frameworks is to a certain extent limited by disciplinary lenses. In the following part, main assumptions and common points between theoretical frameworks will be critically analyzed. Special attention is paid to

socio-spatial considerations, multi-scalar dependencies and collective / individual actors' roles in the framing of each concept.

3.2 SOCIAL, SPATIAL PHENOMENA AND SCALAR RELATIONS

Key distinctions between the three analyzed frameworks lie in the ways in which vacancy is explained in social or spatial terms, with priority given to economic, social or cultural aspects and in the ways scale is conceptualized. Housing economics investigation of filtering and vacancy chains focus on market spaces and instead of relations, investigates "positions" of actors and assets in the housing market. The phenomena are described in economic terms while space-related aspects are limited to spatial attributes (i.e. "spatial fixity", "durability" and "location"). The necessary simplifications implied by econometric modeling, and the nature of quantitative methods (i.e. data limitations), restrict the complex spatial and cross-scalar considerations and discard the social reality, political and institutional conjunctures in and through which housing markets operate. In this regard, instead of using space to explain economic processes, filtering use spatial characteristics and boundaries (i.e. administrative) to rationalize dynamics, which may operate beyond the confined metropolitan limits.

Although the systemic understanding of social change provided by the analysis of residualisation, relations between macro political-economic processes and socio-spatial configurations are not always strong. More specifically, "tenure" as an analytical tool might provide an aggregated understanding of complex patterns of social change, thus causalities between class and tenure restructuring can be misleading (Somerville, 1991). Furthermore, the notion of tenure does not involve per se spatial considerations, while it refers to specific material settings (i.e. council estates). Socio-spatial patterns of housing provision in residualization debate are not always central in the residualization debate. In this sense, a scale-gap can be found between macro-level explanations (i.e. national / regional) and the micro-level considerations focusing on the physical characteristics of council estates (i.e. condition, typology, morphology etc). Similar issues can be identified in the analysis of "low demand". In this case, a more elaborated area-specific framework of analysis provides insights on the ways in which communities, neighborhoods and individual perspectives and cultures interact with economic and political changes operating outside the neighborhood. Nevertheless, structural changes are usually a background since cross-scalar links between regional disparities and "neighborhood decline" are often assumed.

Urban shrinkage is problematized primarily as a spatial phenomenon. Its explanation, linking global economic networks to local effects, such as population loss, is supposed to offer a "relational" and scalar understanding of growth and decline in urban agglomerations (i.e. Martinez-Fernandez et al., 2012). As suggested, the reasons that part of the empirical research conducted have not traced the manner in which specific macro-scale dynamics relate to context-dependent aftermaths might be linked to the centrality of demographic / quantitative view, as well as to the rather generic operational definitions of the "shrinkage" issue (Bernt, 2015). As shown by Haase et al. (2016), housing vacancy is considered to be a "typical" aftermath of shrinkage, nevertheless it might have various explanations and relevance in each context undergoing demographic decline. Considering that the macro-scale dynamics of capitalist development impact on the socio-spatial forms and territorial divisions (Soja, 2000), the examination of shrinkage and growth beyond the dualisms of urban-suburban or beyond urban agglomerations, may reveal different facets of this transformation, and might explain the phenomena as a change in the pace or the socio-spatial organization of the urbanization process.

3.3 BUILT ENVIRONMENT & THE "NEIGHBORHOOD COMPONENT"

Although the units of analysis or the spatial focus of each of the concepts may differ between cases and perspectives, the role of the physical settings in which these transformations occur and the centrality of the "neighborhood" in the analysis have been considerably debated. Analytical frameworks investigating structural social changes or city-wide dynamics, providing a systemic understanding of urban change, pay little attention to the effects that physical environment or neighborhoods' material structures may have on this process, while concepts with stronger links to the sociological perspectives consider that a neighborhood is the meeting point between macro-and micro-scale socio-economic dynamics and is, therefore, the key for understanding urban transformation.

In the case of filtering, albeit the quantitative focus and the non-spatial understanding of housing market mechanisms, some research takes into consideration the spatial aspects and blueprints of filtering processes (Baer, Williamson, 1988). More specifically, spatial aspects of vacancy and urban abandonment are addressed as neighborhood phenomena (Arsen, 1992). Research exploring the nexus between household mobility and neighborhood change, suggest that instead of dwellings' characteristics, demand is affected by the "quality" and structure of neighborhoods (Leven et al. 1976; Grigsby, 1963), while determining probabilities of filtering (Sommerville and Holmes, 2001). In the same vein, housing abandonment is interrelated with neighborhood socio-economic, ethnical composition and the pace of change, with factors such as racial composition, income levels, social status, levels of ethnical segregation being crucial for identifying probability of abandonment and explaining its clustering (Sternlieb et al., 1974). . Most of these contributions, based on urban ecological premises, give importance more to the ways in which the social and physical structure of neighborhoods affect household mobility and vacancy, and to a lesser extent on where filtering occurs and why, tracing, sometimes, questionable assumptions on households behaviors (i.e. the tendency of households to choose neighborhood in the basis of social or ethnical homogeneity).

In tenure residualization and low-demand research there is no agreement on links between physical characteristics and vacancy and the possible neighborhood effects in the process. Certain scholars suggest that poor dwelling conditions are the key for the depopulation of council estates, since they have direct impacts on the popularity of housing (Praak and Priemus, 1983 in van Beckhoven, et al. 2005). Other perspectives though, find no causal links between the two processes (Power and Mumford, 1999; Kennan, et al., 1999; Bramley and Pawson, 2001). The neighborhood component, albeit non-existent in studies of tenure residualization, is considered to be crucial for the explanation of low-demand dynamics, according to which there are explicit and sometimes causal links between housing demand, high vacancy levels and inner-city neighborhood abandonment (see Keenan et al. 1999 and Goodchild et al. 2000). Drawing on sociological traditions, explanations of changing housing demand suggest that housing "unpopularity" and the de-densification of neighborhoods of economic and social activities are interrelated and lead to the disruption of the community. The so called "vicious cycle of decline", manifested in neighborhoods, runs along with the growing households' dissatisfaction leading to neighborhood depopulation (Keenan et al., 1999; Bramley and Pawson, 2001).

In the literature on "shrinking cities", the role of the physical environment in the process of shrinkage is introduced only at the more specific analysis at the local scale. The aim is the examination of the physical manifestations of shrinkage (i.e. housing vacancy), yet no causalities between the process of shrinkage and typological/morphological characteristics of the housing stock, are found. Material aspects are used to explain the reason that in the context of generalized shrinkage, sub-areas of urban agglomeration follow different trajectories in the vacancy process (Hausermann and Glock, 2004). As mentioned, urban shrinkage analysis pays attention to the impacts of global and regional dynamics on urban agglomerations. Nonetheless, the "multi-dimensionality" proposed in theory is not always present in empirical research, since in-depth specific relations between global tendencies and neighborhood dynamics are not demonstrated (Bernt, 2015). The variegated forms of growth-shrinkage relations are examined either in terms of various urban forms (i.e. inner city or suburban locations) or in terms of hierarchies between cities (i.e. capital or second cities), or else in different contexts and rarely between neighborhoods. Empirical investigations, however, use the neighborhood space as an analytical tool in order to understand spatio-temporal juxtapositions of economic, demographic tendencies in situ (Haase et al, 2014). Nevertheless, the centrality of the neighborhood component in the urban shrinkage framework depends more on the context or the scale of analysis the former knowledge and less on disciplinary limitations (see Bentley et al., 2016 or Hackworth, 2015)

3.4 STRUCTURAL OR ACTOR-CENTERED DRIVERS OF CHANGE.

Collective and individual actors' roles identified in three conceptual frameworks, depend primarily on the approach adopted. Although both structure and actor-centered approaches can be found in each conceptual framework, the over-representation of the one or the other approach relates to the disciplinary scope and the way in which the "problem" is defined.

The role of individual behaviors and choices are considered important for the explanation of housing vacancy in neighborhood studies with this perspective being adopted, albeit in different ways, by filtering

and low-demand hypothesis. Filtering models, echoing premises of rational choice theory, assume that aggregate social behavior results from the behavior of individual consumers seeking to maximize their utility or profit. In many filtering and vacancy chain models, individual household decisions to move in order to improve living standards, change "lifestyles" or to seek for "newness" and neighborhood "homogeneity" (Galster, 2001), are considered the driving force of the whole process, therefore the ones shaping residential mobility patterns. Distortions in the process of housing allocation, which may result in long-term vacancy and abandonment are usually explained by research as a result of (aggregated) landlords' decision to disinvest (Sternlieb et al., 1974), while in other cases the result of state intervention in the housing market (i.e. taxation, see White, 1971). Furthermore, collective private actors such as real estate agents or developers involved in housing supply are conceptualized as passive followers of housing demand (White, 1971), which in fact has been contested by studies about real estate speculation (Smith, 1979; Aalbers, 2006).

According to the changing demand hypothesis, housing vacancy is the result of rising "unpopularity" of specific areas or types of housing schemes. The debate focuses mostly on community responses to changes and on individual preferences, assuming that choices constitute the driver of neighborhood change. Individual actors' "aspirations", tastes, perceptions of specific "unpopular" areas are not embedded in a social/class/ethnic structures' or discourse analysis, which could provide more insights on the manner in which "positions", "behaviors" and symbolic meanings are shaped beyond consumer preferences. Similar and rather undermined simplifications can be found considering the links drawn between spatial concentration of actors with similar "situations" and problems, the rise of anti-social behavior and disruption of community bonds that foster "flight". Although the term "popularity" is strongly interconnected with individual "tastes" and preferences, some research attempt to explain relationships between individual and collective actors' practices, while combining aspects borrowed from institutional and sub-cultural approaches to explain neighborhood change (i.e. Power and Mumford, 1999). Nonetheless, both filtering and low demand hypothesis frame residential mobility in terms of "choice", thus failing to recognize that the spatial concentration of "poverty" and spatial "entrapment", as well as households' "exclusion", might be linked to the limited accessibility or feasible housing options and highlight structural forms of discrimination.

Although considerations regarding the changing institutional and policy roles have been relevant for the analysis of low-demand housing, stronger influences of political-economic perspectives can be found in "residualization" and to a certain extent in the literature on "urban shrinkage". A considerable amount of contributions on "tenure residualization" analyze links between changing social configurations and the housing system. More specifically, they investigate impacts of social, political-economic processes in labor relations, class formation, state policies, housing provision or consumption patterns. Tenure-class interdependencies have been widely debated, yet their mutual or causal relationships have not been proved (i.e. see Saunders, 1984). Some research suggest that tenure residualization reflects the impact economic restructuring policies had on working class fragmentation and political disempowerment (Forrest and Murie, 1984). Others suggest that the declining "successful" class-based housing struggles might highlight the "political decline of the working class" (Savage, 2000 as cited in Somerville, 2005 p.113). From a housing system-welfare state transformation perspective, scholars suggest that tenure residualization constitutes a result of state value-laden responses to the process of "maturation", and involves a set of specific policy decisions (i.e. state-controlled non-profit sector, minimization of state subsidies, promotion of homeownership) (Kemeny, 1995). Not-profit housing, limited to low-income households' needs, is isolated from competition with commercial housing sectors, thus the formation of two polarized and disconnected tenure systems limits the possibilities for dumping rents in both sectors (Kemeny, 1995; Lennarz, 2013). Yet other, more determining views consider housing a "capitalist commodity" and suggest that shifts from residualist to mass housing models and vice versa, correspond to "normal" and "abnormal" phases of capitalist development (Harloe, 1995), disregarding the role of individual actors in the process.

Theories supporting the "urban shrinkage" concept are also influenced by political-economic theorizations. In this perspective, shrinkage is seen as part of the structural change of capitalist development with specific socio-spatial configurations in built environment. Despite the analysis of the drivers of change in a global context, the path through which shrinkage is analyzed at the local scale remains unclear and rather general, since pre-existing local or regional asymmetries, institutional and legal changes, specific private interests in situ as well as the ideological framework in which policies leading to shrinkage have been justified, are in certain cases not extensively explained. Thus, a specific pattern of global tendencies (i.e.

industrial restructuring, suburbanization etc.) seem to be translated in the same way in each case (i.e. see Weichmann and Pallagst, 2012). These simplifications and argumentation gaps might be rather symptomatic of the attempt to fit all "urban shrinkage" specificities under a unitary framework that explains a "global phenomenon" (Pallagst et al., 2014).

4 CONCLUSIONS AND DISCUSSION

The comparative analysis of the concepts reveals that housing vacancy might originate from rather different urban processes and be explored by various disciplinary perspectives. Some of the concepts analyzed share common points and influences, while having important differences. The critical review of certain important aspects such as spatial, scalar and actors' considerations revealed the over-sighted factors, the assumptions and the contradictions between the concepts. In this sense, it demonstrated that disciplinary lenses might limit the scope of explanations of rather complex phenomena, while highlighting on the other hand that similar overall tendencies might not impact in the same way each context.

The issue of vacancy seen as a spatial manifestation of economic, demographic and social change, is a measurable indicator of change in "taste" and "preference", a result of institutional failure, a natural market process, a societal necessity or even a driver of further "decline". Understood as problematic or as natural, housing vacancy is seen as the result of a dynamic and sometimes contradictory relation between fixity and motion (Harvey, 2014), places and flows (Castells, 1996), indivisibility of supply and heterogeneity of demand (Arnott, 1989), place-bounded meanings and individual aspirations. In this regard, it is considered to be framed through the interaction between social practices and material settings. However, the review revealed that when social or spatial components or their interrelations are missing, explanations seem to be shaped in a "void" (Madanipour, 2013). This is quite obvious for instance in the ways in which residential preferences is conceptualized in some of the theories. Choice seen solely as driver of residential and neighborhood change without reflections on the its relation to existing resources or on the contextual or societal conditions under which these preferences emerged, explanations tend to be incomplete.

Regarding the scalar interrelations, apart from filtering models, all concepts explore the causes and consequences of vacancy in different spatial scales without clear links between spatial, economic and political scales at all times. Considering the way in which research on urban shrinkage, and to a lesser extent on residualization, have analyzed the impact of globalization on local physical "decline", it could be argued that observations at a global scale might indicate tendencies, yet cannot explain in itself the conditions and processes under which capital and people fled from a specific urban context. At the same time, global restructuring cannot be translated in the same way in Detroit and Liverpool, although both cities have been affected by deindustrialization processes. Instead, the examination of these global dynamics at a local scale can only be meaningful when contextual specificities and historical developments are embedded in the analysis.

With regard to the methodological aspects of scale selection, each research prioritizes one spatial unit and timeframe, in which the phenomena are observed, measured and explained. A number of empirical studies, irrespective of the different disciplinary focus, examine housing vacancy at the scale of neighborhood. Neighborhood as a socio-spatial entity, albeit the ambivalence and diversity of definitions (see. Galster, 2012), and its changing meanings still comprises some of its "traditional functions" and constitutes a site in which social interaction, routines, everyday life practices and experiences can be studied (Forrest, 2004). However, the scale of the investigation depends not only on where the phenomena occur, but on the type of interrelations researched each time, as well. Therefore, even if we consider housing vacancy a neighborhood phenomenon, a multi-scale testing might be necessary in order to understand whether observations and conclusions are consistent when examined at different scales (Andersson and Musterd, 2010, p. 25).

Explanations of housing vacancy mechanisms prioritize economic over other kind of drivers of urban transformation. Either as the output of flawless markets' and consumers' logic or as an aftermath of capitalism inner logic, vacancy is often explained on the basis of economic rationality of the markets, state or individuals. This perspective is not problematic per se, but it might be misleading especially when individual and collective actors' roles and agency is seen as a minor aspect of the urban transformation process. Vacancy seen as part of filtering is explained as a "natural" housing market process and as

process detached from the agents and structures producing it. In this respect, vacancy is considered problematic only when it leads to extensive property devaluation with impacts for owners and markets. Similarly, when vacancy is explained as low-demand, it is more likely associated with "supply-demand" schemes in housing economics, than with the complex relations between poverty, space and place, which it actually refers to. In this perspective, vacancy takes a neutral meaning and housing is perceived as a consumption-driven process. Vacancy seen as part of tenure residualization process, is explained in wider economic terms with the difference that its implications are considered to be problematic. The "problem" is confined to a specific tenure and a segment of the working class and therefore the housing process is explained as the struggle between capitalist abstract logics and aggregated and predetermined social categories. Shrinkage, although potentially referring to a structural urban change in the context of global capitalism, is a relatively "neutral" term (Oswald, 2005). However, when shrinkage is rather explained as a (new) normality of urbanization under global capitalism, growth-shrinkage relations seen as "natural" and in this sense they are depoliticized.

The critical analysis of three commonly used concepts is an attempt to demonstrate the great variety of approaches that can contribute to the understanding of the drivers and the possible reasons behind housing vacancy phenomena. Deciphering the disciplinary origins of each concept is important in order to understand whether an issue, appearing similar at first glance, is actually referring to similar processes and whether it has similar meanings. Furthermore, looking at the concepts' disciplinary premises, in a dialectic manner the conceptual gaps, their similarities as well as limitations are better revealed. This might need be faced when trying to work on disciplinary boundaries, and to combine in a sophisticated way ideas and methodologies. Lastly, the various meanings and terminologies might be relevant for conceptualizing the overall patterns in each case, while potentially having several implications on the way the specific phenomenon is problematized, whom does it affect and in what way it is going to be addressed by policies.

ID 1432 | THE REUSE OF ABANDONED PUBLIC BUILDINGS: AN ANSWER TO HOUSING CRISES? AN INVESTIGATION ON THE CITY OF ROME

Anna Maiello¹; Antonella Maiello²

¹Independent Researcher; ²Federal University of Rio de Janeiro
maiello.anna@gmail.com ; antonellam@ippur.ufrrj.br

ABSTRACT: The recent financial crisis had a strong impact on housing affordability. To the European Observatory on Homelessness the number of homeless has increased in all countries along the last ten years (Housing Europe, 2015). The current Europe refugee crisis is feeding this population, making proper policies more complex and urgent. Regrettably, the public support for housing in EU has decreased along the last ten years. In metropolitan areas’ peripheries, where there is a default in infrastructures and services, new residential buildings have been built. The Italian capital city well epitomizes this national framework. Between 2012 and 2015 Rome has consumed 160 ha. In this context, squatting has been often the only one solution for people who is waiting for a public house. Along these years, the movements for the housing right supported many people to have a quality dwelling. The research explored the re-use of public abandoned buildings as a possible solution for housing crisis investigating the case of the so called “Casilino 900” camp and of Roma people living there. Can the self-help housing for abandoned public buildings respond to the increasing housing demand? Employing municipal data on state-owned buildings, the paper proposes in its results a housing capacity map. The map shows the empty public properties in the city of Rome and identifies for each building its housing capacity. In the conclusions, considerations from the case study are drawn considering the broader national situation on re-use for housing of abandoned public space.

KEYWORD: housing crisis, public building, re-use, Roma population

1. BACKGROUND

1.1 HOUSING POLICY AND HOUSING DEMAND IN ITALY: FOCUS ON THE CAPITAL CITY

In Italy 650.000 families are waiting for public housing (Federcasa, 2015). According to governmental data, eviction notices increased 48% between 2008 and 2015. The public housing stock (ex IACP) was partially sold or need to be refurbished. A critical lack of affordable houses does exist. Yet, due to the financial crisis, they are generally empty. Regrettably, the public support for housing in EU has decreased along the last ten years, from 1.1% of GDP in 2003 to 0.8% in 2012 (Pittini, Ghekière, Dijol, & Kiss, 2015). In Italy,

the public fund for social housing (GESCAL) was abolished and a lack in policies followed during the 1990s. To face the housing demand and the shortage in the investments, private funds have been introduced and a part of public stock have been sold.

Today housing policies in Italy are regulated by the "Housing Plan" (art. 11 D.L. 112/2008) and the management passed from the state to the municipal level. Social housing is considered today as a system of solutions for the welfare, so, differently from the traditional ERP (Edilizia Residenziale Pubblica) it is part of economic strategies and, thus, urban transformation programs. The National Plan for Housing Policies (Presidenza- Consiglio-dei-Ministri, 2009) expects to increment the public stock and to refurbish the existing one, and supports housing cooperatives formed by final residents of the public houses.

In the city of Rome, where is registered the highest housing demand in Italy, the "Housing Plan", approved in 2010, expects to build 6.000 public housing (traditional ERP with public investments) and 20.000 social housing (public-private funds). The program is based on a demand for the weak segment of city population of 52.800 housing in 2009 (CRESME, 2009) and, considering city administration contributions, can afford 25.700 of the actual demand.

According to Legambiente, one of the most active environmentalist association in Italy, the Housing Plan will increase the current land-use surface in Rome with 40 million cubic meters, producing a land consumption equal to 9700 hectares (Bianchi & Zanchini, 2011). The construction of social housing on the outskirts aggravates the expulsion process of a large population that is unable to support rents in the gentrified city that has about 245.142 empty apartments (Ibid.).

In this framework of new buildings and empty rooms, the indebted Municipality has implemented a twofold policy strategy. On the one hand, it sold the vast public assets, including ERP properties, and, on the other, purchased or leased areas for public services. In addition to the purchase of areas for social housing, the Municipality rents apartments in residences whose rent value range from 2140 to 4200 euros/month to host family in housing emergency (21 Luglio, 2011). Beyond these costs, which are part of municipal public spending, there is the expense for the rent and the management of nomad camps (around 16 million euros / year according to data in 2011 by the association "21 Luglio").

Meanwhile, in Rome, due to the ban on lists for public housing, the movements for the right to home and the citizens with difficulties in finding a dwelling moved on their own occupying empty buildings. According to interviewees listened in this research and as confirmed in municipality official website¹ (Comune-di-Roma, 2011), municipal administration acknowledges that occupations in some cases really helped housing emergency and so had to regulate these processes. According to a specific regional policy, based on self-help housing regional law (Lazio, 1998), eleven abandoned buildings in the city of Rome have already been refurbished and occupied. This law states that, if the Municipality supports the most of refurbishment costs (i.e. facade and structure), low-income people waiting for housing can take part to the public announcement for the rehabilitation of empty buildings, joining a housing cooperative.

1.2 ABANDONED PUBLIC SPACE AND THE GOVERNMENTAL INTERVENTION

The deindustrialization processes, began in the second half of the last century, have left abandoned and nonfunctional pieces of city. With the recent economic crisis, the need to regenerate and reactivate existing assets "in a medium to long-term perspective, safeguarding the environment, landscape and limiting agricultural land consumption as a key to sustainable development has become evident" (Arcidiacono, Bruzzese, Gaeta, & Pogiani, 2015).

That of urban voids (open spaces and unused buildings) is a phenomenon that has different origins and shapes. On the one hand, the great abandonment of industrial buildings that began at the end of the last century, linked to the decline of the Fordist production system, affirms the end of the urban growth of some contexts (shrinking cities) in parallel to the growing phenomenon of the megalopolis (Oswalt, 2006). On the other hand, the disposal of large urban infrastructures become obsolete, as some railways stations⁴. Another issue is that of unused large public structures such as barracks, convents, ex mental hospitals

¹ Interview with the representative of movement BPM. See Section 2 for details.

(abolished by a national law in Italy). Finally, there are all those abandoned private spaces that, due to the economic crisis, have lost their function.

To valorize public properties, the Italian government introduced a federalism program for public properties, and it is known as *Federalismo Demaniale*. It refers to barracks, villas, historic buildings that, the government transfer to local public administration to sold and cover the public debt (Presidente-della-Repubblica, 2010). Many of these spaces have been transferred from the state to the municipalities, worsening the economic and management constraints of local administrations. This valorization policy was carried out based on the housing offer, and on the belief that the real estate is coming into crisis and has been no longer able to adequately respond to demand as in the past, mainly due to the shortage of economic resources. As a result of such a policy orientation and as a prove of such a real estate crisis, there is a large amount of unsold assets and stalled real estate transactions (Mangialardo & Micelli, 2017).

If, on the one hand, there is an immobile real estate market, on the other hand, the crisis has produced innovative and different bottom-up experiences of re-use of abandoned spaces.

An example is the temporary re-use of spaces by the so-called creative class that has occupied abandoned buildings to organize artistic, cultural or social activity for a short period of time. Such experiences, which have been implemented in several European cities in the end of last century, have revealed new political instruments of negotiation between administration and active citizens (Inti & Ingaggiato, 2011).

Other contributions to the recovery of abandoned property are related to housing occupations, as the experiences in Rome that occurred in the last decade through the work of the three main groups for the housing right (BPM, Action, Coordinamento cittadino di lotta per la casa). If squatting until the 1970s and 1980s had a political aim, those of the last thirty years have been driven, above all, by the need to find an alternative housing solution and to fill in the lack in housing policies. In the capital city, many of these occupations have been approved by the Municipality because they contribute to solve housing emergencies¹. From the point of view of public intervention in the process of recovering abandoned buildings, beyond the urban regeneration policies there are different experiences of relationships between administrations and active citizenship. In Milan, the Municipality generally acts with public-private funding partnership to elaborate projects for the re-activation and re-use of vacant buildings (i.e. BASE)², for the third sector and the creative class, to support innovation experiences³.

The city of Turin, that for its industrial productive vocation has been interested, more than other Italian cities, by the industrial decline of the 1990s, historically moved towards urban recovery and programs for citizen participation and social interest (for instance, AxTO, Case del Quartiere)⁴.

In Naples, the current municipal administration has shown an ideal engagement with 'commons' issue by establishing a public campaign on this issue and a proper municipal secretary (Secretary on right to the city, urban policies, landscape and commons). Within this space of public debate, the Municipal administration conveyed in a resolution that last year recognized seven 'free' municipal buildings (as the promoters of those initiatives use to define the processes), previously occupied, as strategic commons for citizenship and 'civic development environments' (Comune-di-Napoli, 2016). Being formally acknowledged as space of public and cultural relevance within a municipal administration legal act (a resolution of municipal council⁵), they will be ideally protected from future eviction.

¹ In an interview for this research a member of BPM group explains that the recent occupations in Rome have no more a temporary character as in the past. It is supposed to be that the inhabitants will stay longer, thus, the recovery operations have more quality, and care about energy saving too.

² BASE is a cultural innovation project in Milan. It is a 6.000 sq. mt. space based that host co-working, workshops, shows and artistic performances.

³ Public lesson by Carlo Calvaresi, 2017, *Innovazione e rigenerazione urbana a Milano*. Da BASE a molto altro, University of Naples.

⁴ "AxTO" is a public program by Turin Municipality for the regeneration of peripheries according to public spaces, housing, school, job and community. "Case del Quartiere" is a network of neighborhood places where different activities for the community take place.

⁵ The resolution is DGC 27/05/2016 n.446

In Italy, where soil consumption is still very high, i.e. 8 m² / second in the last 50 years (ISPRA, 2016), urban regeneration is today the most pursued policy to save economic and environmental resources. Moreover, cities can count on a more active and conscious population about urban issues.

2. THE CASE STUDY

2.1 HOUSING POLICIES FOR ROMA POPULATION IN ITALY AND IN THE CITY OF ROME

The present research focused on the Roma population that never had easy access to a stable housing. In Italy, in fact, the gypsy host request has always been solved through the 'camp policies', i.e., urban areas, commonly located in the city fringes or peripheries, formally delimited and conceded or abusively occupied, where Roma people are precariously settled, living in caravans or shacks. This kind of response arises from the incorrect assumption that all Roma are nomads and they base their living culture in the camps.

These ideas are based in a mentality developed during the second half of the 1980s, when the first Regional Law (R.L.), N.82 of 24-5-1985 (Norm in favor of Roma people) was enacted (Lazio, 1985). The R.L. 82/1985 recognizes and protects the practice of nomadism associating it, though, to the whole Roma population. These measures have been efficient for the most part of Sinti and Roma population, mainly composed of nomad people living in Italy with difficulty in parking (since they were moving by caravans) and staying legally for a period in a public area. Today, however, at least 2/3 of the Roma population is sedentary and lives in houses. Some Italian Regions, as Tuscany and Emilia Romagna, established a local legislation which adopt and broaden the principles of the R.L. 82/1985 already in the 1990s (Lazio, 1985). As a matter of fact, since the 90s, a large Roma migratory wave occurred, due to refugees from the wars in Ex-Yugoslavia countries.

The temporary camps hosted refugees and the minimum living standards established by laws were no more applied due to the emergency to accommodate migrants.

In 2008 after the further migration from Romania (which joined the European Union in 2007), the Italian Government conferred to the Prefects of Rome, Milan and Naples (cities that host the largest number of Roma people), and then, Turin and Venice, extraordinary powers to solve the housing problem of Roma, and the situation of "Emergency" was acknowledged and declared.

Once again, the identified policy solution was the camp: a temporary answer before the housing inclusion, according to the declarations of municipal administration, which became permanent¹. Anyhow, beyond the limits of political commitment with the issue of integration, the myopia of adopted policies and the economic barriers to access the Rome formal housing market, the issues of affordable housing for Roma people still confronts a major problem of social acceptability. Without a decisive political intervention to abolishing discriminations and to promoting the cultural integration of Roma people, this community, commonly labelled as a social problem and associated with micro-crimes and high urban violence, have poor chance to rent a house outside the camp. There are, in fact, many different hindering factors that get Roma housing inclusion, harder than that of other citizens. First, the common preconception, that prevents, in most cases, the simple request to rent a house. Second, the difficult to progress in the rankings to access to a public house for which, one of the requirements, is to have suffered an eviction, a condition in which most of Roma has never been, as they always lived in camps in Italy (and not in a formal house). Another hindering factor is that the political decision related to the location of a camp follows the real estate market and the profitability criteria linked to the rent of the area. It is necessary to free that area from a camp to raise its value. Conversely, if a land is not attractive for the real estate, it is more interesting to start an urbanization process building a new camp. There is, finally, a business barrier that involves the so-called nomad "equipped" camps², linked to the land and infrastructures costs, as well

¹ This view has clearly emerged from the surveys of ethnographic work, both in communal documents and in articles produced by various field research.

² Equipped camps represent the answer of Rome Municipal Government to Roma people informal settlement. As alternative to the informal camps, the Municipality provides regular "equipped" camps that consist in private area where Roma families live in small modular containers. Conversely to the informal settlements, all the equipped camps are located outside the ring road which bypass city-center around Rome (Grande Raccordo Anulare - GRA)

as to the public funds for the associations involved. This factor is also related to another issue: the low claims of Italian government to the European funds for Roma Emergency (Italy had requested 1 million euro of EU funds in 2011 whereas Spain, which requested 62 million euro). In the city of Rome, when the “Nomads Plan”, the main tool of municipal policy on Rom issue, was presented in 2008, there were at least one hundred camps: “equipped” camps (so-called “solidarity villages”) with video surveillance and managed by non-Roma organizations; ancient partially-equipped camps, where often some services were provided; and, finally, informal settlements frequently evacuated and reformed in more invisible areas of the city (Romito, 2008).

The aim of the “Nomads Plan” was to host a maximum of 6000 Roma within 13 camps equipped in the capital territory (outside the ring of the so-called Gran Raccordo Anulare, whose acronym is GRA, the ring road which bypass city-center around Rome), for a total cost of 32 million euros, from the Roma emergency fund. The plan was based on the data collected by a census carried out by the Italian Red Cross in 2008, which reports: 2700 people in the fourteen “tolerated” camps, 2200 in over eighty abusive settlements and 2241 in the seven authorized villages. About 100 settlements for 7200 people.

2.2 THE CASILINO 900 : FROM THE INFORMAL SETTLEMENT TO THE EQUIPPED CAMP

The study focused on the real experience of a Kosovo community currently living in a last generation camp in the Rome suburb. The research has been structured as a story of transition from the slum, “Casilino 900”, where the community lived up to the settlement demolition, to the “equipped camp”. The failure of both housing solutions, one informal, the other regular, has prompted the community to organize themselves and move out of the camp to claim the right to housing.

“Casilino 900” was one of the most ancient informal settlement in the city of Rome. From the 1960s to the 1980s it hosted Italian southern migrants that arrived in the capital for job. Around the end of the 1960s the first Roma groups occupied the camp. Then, as an effect of wars in the Balkans, many refugees arrived. In 2000, around 703 people from Bosnia, Kosovo, Montenegro, Serbia, Macedonia, Poland, other regions of ex- Yugoslavia, Italy, Morocco and Czechoslovakia lived there in 150 barracks (21Luglio, 2011).

In 2008 the camp experienced several initiatives aimed at participation and integration of the inhabitants, as “Savorengo Ker” (translated from romani “the everyone home”): a self-built home realized by a group of inhabitants with the support of Università di Roma Tre and Stalker|ON. “Savorengo Ker” was built to symbolize the will of a part of Roma population to live in a house, not in containers, as housing policies always provided for them. Despite the initiatives to counteract the eviction, in February 2010 the “Casilino 900” was evacuated, according to the municipal “Nomads Plan”. In around a month was completed the demolition of the barracks and the transfer of residents (618 people including 273 minors) into four new generation equipped camps outside the GRA.

The group from Kosovo was transferred to “Camping River”, 30km far away from the “Casilino 900”, living in containers in an area rent by the Municipality (7€/person a day). The equipped camp had one hundred height containers (14, 21, 23 sq.mt.), height bungalow and twenty-two rooms for four hundred seventeen people (107 from “Casilino 900”) (Figure 1). The area is very close to the riverbank and it is reached getting a train from the city center plus a shuttle, running every hour, from the “Prima Porta” station (1€ each journey) localized 3km far away from the camp.

The regeneration of the area where the “Casilino 900” was, has never proceeded and the area has been recently illegally occupied again.

Figure 1. The container house at Camping River. First author field-work photo

2.3 RESEARCH METHOD AND MATERIALS: THE FIELD-RESEARCH

The research was shaped by an ethnographic approach at the methodological level, accordingly, different techniques were employed to address the field research (Beaud & Weber, 2007; Gold, 1997; Olivier de Sardan, 1995). The field research last nine months and combined the following main tools for data collection: participant observation in the public assemblies organized by the Kosovo community; interviews to the actors involved, informal conversation with key informants and documental analysis/secondary source consultation (web-sites, public reports and municipal administration data). While triangulating all these different sources, a final map of the abandoned public properties in Rome was elaborated.

The assemblies were organized by the Kosovo community transferred in “Camping River” one year before in collaboration with different associations of non-Roma people (named *gagé* in Roma language). Meetings occurred weekly for the first four months. The group had two directions and aims: report the violation of human rights of Roma population in the capital and find a better housing solution in one of the abandoned building of the city. Through a key informant from the Kosovo Community, we could access to the “Camping River” and map it, also getting interviews with inhabitants¹.

We collected five interviews with camp inhabitants, based on a life history interview approach: three with residents from the Kosovo community that have been transferred from “Casilino 900”; one with a young guy from Romania living there and finally one with the shuttle driver who has been working for Roma equipped camps services for a long period².

Moreover, three interviews were realized with members of associations involved in project for alternative solutions for housing crisis and best practices in Italy: a member of “BPM” (Blocchi Precari Metropolitani), a group for the right to home in the capital; a member of “Popica Onlus”, an association helping Roma population in the city of Rome; a representative from “Casa della Carità” a charity association from Milan.

Follows a section on best practices of self-help housing experiences in the city of Rome according to the Regional Law on self-help housing (L.R. 11 Dec. 1998, n.55), to explain how does it work and to carry on this as possible solution for housing crisis (Lazio, 1998).

Employing municipal data on state-owned buildings, the research proposes in its results a housing capacity map. After data collection, inspections to abandoned public properties in the city were conducted and documented by a photo archive and field-notes. This register was used to produce a housing capacity map that shows the empty public properties in the city of Rome. For each one of the considered group of buildings its housing capacity is estimated. Other properties were selected for social and public services, or appointed to be sold to finance municipal housing policy.

¹ Every equipped new generation camp is monitored. To enter it is necessary to show an ID and to inform the reason and the name of the resident visiting.

² The cohabitation between the Romans and Kosovars that arrived in the “Camping River” later was not pacific. The Romans did not want to be interviewed.

Finally, the map allowed to select, together with Roma community representatives, a building sample for future self-help housing activities, providing a related cost assessment. The building chosen to develop a housing project was a unused depot of the Local Transport Agency in Rome claimed by different realities in the capital.

3. FINDINGS

3.1 CONTENTS FROM THE FIELD-WORK

The ethnographic experience – visits at the camp, participation at assemblies, interviews with housing activist at national level, secondary data and document analysis -, allowed to produce information at three level: 1) housing and human condition of roman community in Rome; 2) possible political path and operative answers to housing crisis (especially in term of reuse); 3) elements for an operative solution for Roma housing problem in Rome.

As for the first point, contents came from life history interviews made with Camp dwellers as well as from the personal researcher experience of the Camp life. As a matter of fact, the visits to the Camp showed the difficulties to access it from the city-center. Starting from Flaminio metro station in Piazza del Popolo, Camping River dwellers must take a train to Prima Porta, then a bus or private Shuttle which connects directly this point to the Camp, but passes once per hour. Therefore, Village River dwellers take at least 1 hour and a half to reach the city center. Life history interviews showed all housing diseases related with the container solution and the different approach from different communitarian group. Two different communities were joined in the Camping River, the Kosovars, mainly dislocated from Casilino 900 and the Roma people, mainly arrived there after the '90 Balkans wars. Roma people just provided one short interview. In general, this community showed fear to speak about their condition, also due to the relation with local cooperative which manages their housing in the camp. Moreover, the unique interview coming from this group showed the cultural relevance of communitarian dimension for Roma people, where being close to family and its own community is a priority which lead dwellers to accept housing diseases.

We Romans Roma could not live alone. We are just fine when we are all together. So even when one day I get married I ought to stay in a place where my whole family is [...]. It's not because we do not have the money that we remain here, but because we need so much space to live close to our families (Dimitri, Romania).

On the contrary, Kosovar Roma community members interviewed, showed a firm will to claim for a real house. This community arrived earlier in the city and suffered previously the eviction from "Casilino 900" to "Village River". They are not nomads and suffer the camp housing condition based on 14/21 or maximum 32 sq.mt. containers.

We want to create a negotiation platform [with public institutions because we only want homes, not to live with two or three thousand people in a fence (Bajram, Kosovo).

As for the second level of contents the interviews with the representatives of Blocchi Precari Metropolitani (BPM), a coordinated network of housing struggle movement, and Popica Onlus showed an increasing reality of Italian housing policy: the replacement of public government by social movements, active citizenship and so called third sector in the provision of welfare. BPM reported a long experience in urban occupation, even testifying the recent changes of the movement action responding to the changes of housing crisis and related social demand. The interviewee told how the occupation strategy changed along the last twenty years. Until the nineties housing struggle movement pointed at empty large building, such as school, emptied by the demographic downturn. Nowadays, the BPM promote a new kind of occupation aimed not only at large spaces but also at empty apartments. Moreover, while 1970s e 1980s housing movements were born to support mostly national community (e.g., meridional immigration), the current housing struggle has a larger responsibility and need to learn to deal with a multicultural, multiethnic and even multigenerational (from the student to the old people) demand. The interviewee referred of a proper structured administration based on desks open to the public, collecting private demands on the base of a pattern form. No more public houses are going to be built, and list to popular housing are stopped since many years. This, together with new immigration waves, leads to a crisis proved in the BPM interview by the existence of lists also for occupations.

There are counters that address the issue of the right to housing, for example, to protect against evictions, unsecured loans. These counters come both through propaganda and word-of-mouth. One tries to understand the problem of the applicant person. You compile a chart that lets you understand the issues in terms of housing, economics or for example regarding documents in the case of immigrants. Once the problem has been identified, we explain what our goal is: to put into motion the Municipality Housing Plan of six thousand popular houses, which has never taken off, and therefore participate in the demonstrations that push this plan. Those who live in a very delicate situation are assisted in occupations that have already begun, they decide through assemblies or ask for other movements. Occupations are decided based on a project at times they are to carry out a protest, (those of those days at the former San Paolo), sometimes to stay.

BPM interviewee emphasized in his tale the new relief acquired from the activity of reuse of occupied space. This activity has turned fundamental especially in the case of large dismissed space occupation, i.e., the occupation of those space born for a use different from housing, such as ex-industry. From this perspective, a paradigmatic experience was that of Metropoliz LAB, where BPM member and Popica Onlus¹ cooperated.

The Metropoliz experience concerned the occupation and reuse of an ancient bakery factory, dismissed and abandoned for twenty years. Interviewees reported how Metropoliz was a succeeded experience both on the side of cultural integration and reuse for social housing. Different cultural communities, from Latin America, eastern Europe, Northern Africa and even Italian and Roma People live there. They formed a larger community with co-habitation rules. They use local materials, still from the ancient building to build their own houses. The integration process was not an easy one, especially for Roma people who arrived later. Nonetheless, it testifies the viability of reuse and self-recovery of abandoned building as an alternative path for housing emergency. Housing emergency concerns with people in social, economic and, in some cases, political marginalized conditions. The process of occupation and reuse, guided by a partnership among different social actors, opened to member of this community a door to social inclusion. Maria di Maggio, of Popica Onlus stated:

The community [a specific Roma Community of the neighborhood Centocelle in Rome periphery] did not rely on the third sector, and continues to be independent. Considering the need to start a residential path, they turned to BPM, as a struggle for the home. Meetings were held and the community participated in the struggles for housing rights together with the movements

This kind of bottom-up experiences, which occurs in the informality, with no official government recognition and legitimation, and even in the struggle, reflects a logic of integration totally absent in housing solutions such as those of equipped camp.

Finally, the third kind of contents collected during the ethnographic research concerned data about abandoned/empty public building in Rome. This information based on municipal government documents, were discussed together with Roma Kosovar communities, within assemblies in the aim to identify the ideal space for re-use and housing among those listed. Results of this part of the research are presented in the following Section.

3.2 CONTENT ANALYSIS: THE HOUSING CAPACITY MAP

Between 2008 and 2011 the city of Rome experienced three different occurrences which, somehow, provided different opportunities to rethink the re-use of public buildings: 1) the National government measure establishing the federalism of the public properties (federalismo demaniale) according to the d.lgs. 28 May 2010 n.85 (Presidente-della-Repubblica, 2010); 2) sale of National Ministry of Defense barracks; and 3) the Local Transport Agency (ATAC) financial crack.

¹ Popica Onlus is the other association interviewed which is concerned with Roma children and in general with Roma integration issue.

Lastly, a self-help housing model is proposed on one of the selected complexes, occupied by the movements for the right to home: a dismiss depot of local public transport agency. The depot is in a central area of Rome, just steps from the metro and the Basilica of Saint Paul. The context is mainly residential and it is included in a urban regeneration program.

4. CONCLUSIONS

Italy has a vast abandoned real estate portfolio and a relevant number of people waiting for a house also because housing policies have been slow and myopic over the last decades and part of the public properties have been sold. This research provides evidences that the self-help housing to re-use abandoned public buildings can be a technical viable path for housing crisis and against land take. The case presented shows, above all, that main barriers are of political and administrative nature. Temporary solutions (i.e. containers and residences) for housing emergency (refugees, Roma population, people in the lists for housing) are no longer desirable, as they contributed to reducing public funds.

The experience of self-help housing in the Italian region of Lazio is an example of sustainable, (at the same time economic, environmental and social) recovering of public buildings. The regional administration covers the expenses to recover common and external parts. The occupants gather in co-operative and restructure the interior of their future homes. As a return to the society, common spaces inside the buildings are provided for social services or to host associations. In addition to building spaces, this practice builds communities through the recovery work and the common home need. As a result of the creative work of building his own home, a bond between the good and the inhabitant, and, thus, a sense of responsibility and care for that space is produced. In Rome many of these occupations have produced new centralities for the city: multiethnic places where social integration and environmental sustainability is experimented.

The theme of integration is more and more current in Europe, especially in Italy, increasingly affected by refugees migrations.

The assistance approaches to the Roma population have shown many limitations, as the “Casilino 900” case showed. Regarding the Roma issue, it has been pointed out that it should not be treated in the specificity of ethnicity, but within policies that concern any citizen. The limit to a specific approach to the Roma population, as a specific cultural community, which has been the most popular until today, has produced marginalization and social exclusion with inevitable negative effects on the non-Roma population as well. The camps, as the experts maintain, as complainants who live there and as evidenced by the continuing news stories, are ghettos of illicit. Nando Sigona using a Foucault expression defines them as “total spaces [...] places where the life events [...] of an individual appear to implant in a fully encoded existence” (Sigona, 2015).

The camps provided by the “Nomads Plan” are in isolated contexts, are structures designed for five hundred people, with administrative costs for the municipality comparable to rent a house for each family. Just an integration approach, driven by forward-looking policy and long-term cultural (and not only economical or technical) programs can solve situation of ordinary emergency.

If nomadism in Italy can be said to be disappeared, then speaking of nomadic camps is a non-sense¹. The goal is to facilitate access to the home. Housing solutions should be considered for individual realities (families, individuals, extended families, etc.), as is the case for non-Roma families. For those who live in Italy for many years and are in the lists for social housing, it is necessary to rethink the requirements for the access.

Parks can be used as temporary structures for nomads (about 1/3 of Roma population in Italy) or for those who want to start a residential settlement. However, management should be rethought because it is subject to high costs and reconsidered location because it does not favor integration. Valuable alternatives for extended families who want to continue living together are micro-villages.

¹ According to data by association helping Roma population (“Comunità di Sant’Egidio” in Rome, “Casa della Carità” in Milan, “Caritas Diocesana” in Naples) 1/3 of Roma living in 2011 in the main Italian cities stayed in camps, while 2/3 lived in houses.

Based on these conclusions, we argue that an integration approach for housing problem needs to be settled at level of national governmental policy. Thus, it is necessary to include “Roma emergency” in the more general housing issue in Italy, which is especially urgent in the capital city, where Roma population, citizens and immigrants joined to claim the right to home.

Finally, as the presented active citizenships initiatives in the capital city show, the self-help housing for abandoned buildings, can convey the civic creativity and provide an effective driver of social mobilization and political pressure, against the government inaction.

It is necessary to return to invest in housing policies. The regional law of Lazio on self-help housing is useful to rethink the social housing building programs.

1 INTRODUCTION

This paper critically analyses the legal and institutional framework set up by the Portuguese government in 2004 to boost ‘urban requalification’ – the Urban Rehabilitation Societies (SRUs) – and its implementation in the city of Porto. Firstly, we present a diachronic analysis that identifies phases of continuity and change in models of urban requalification in Portugal. Secondly, we present the background for the SRU model and discuss the context in which it was implemented in Porto. Thirdly, based upon a qualitative methodology, which uses literature reviews, analysis of political documents, and six semi-structured face-to-face interviews conducted with local and government officials, we analyse practices of urban requalification³ within a specific urban requalification operation, in the Cardosas quarter, which is an example of a large-scale requalification operation promoted by the Porto Vivo SRU in a context of public-private partnership.

Discussion of the results of this operation contributes to the debate on the criteria for evaluating the success of urban requalification projects from both processual and substantive perspectives vis-à-vis their effects on families and neighbourhoods. A set of research questions was formulated with this purpose in mind:

- How have urban requalification strategies and goals been defined in the context of a neoliberal model which was implemented in a time of crisis and what role did partnerships with private actors play in that definition?
- What groups were targeted by the requalification projects and, regarding housing, were there affordability concerns that protected less affluent populations from increasingly hostile conditions for middle class families in the historic centre of Porto?
- Were the local population’s interests and local heritage considered in strategies and implementation, especially in large systematic operations such as the Cardosas?
- To what extent did the Cardosas operation contribute to gentrification dynamics and to the explosive growth of tourism-related activities in the historic centre of Porto?

2 THEORY

Several studies have shown that the impact of rent regulation in the private rental sector varies greatly between countries and regions (see, for example, Moore & Dumming, 2017; Andersen, 2012, and Oxley, et al. 2011). They also have shown that reform of the first generation of rent control has followed different paths in different countries. In countries with strong state-led social welfare traditions, such as Germany, first-generation rent control has been replaced by softer rent controls complemented by incentives, such as tax concessions and direct subsidies to private landlords to provide housing at sub-market levels and means-tested housing subsidies to families. Meanwhile, in countries dominated by neoliberal ideas reform of first-generation rent regulation, which is associated with security of tenure (including protection from eviction), but also low rents and problems of maintenance, has led to deregulation and urban requalification subsidies which are not tied to conditions (e.g. the definition of lower prices or lower rents), leading to cycles of boom and bust (see Ball, 2016).

Scrutinizing the relation between urban requalification and systems of rent control and tenancy law, Altes (2016) notes that, whilst rules that protect tenants from rising rents may result in under-investment and the misallocation of housing, deregulation of rent control and tenant protection (against forced relocation) can lead to over-investment in real estate, make it more difficult for new households to enter the housing market as rents generally rise faster than incomes.

National and local housing policies are important to stimulate housing requalification but also to shape the effects of requalification on housing costs, the control of rent increases for sitting tenants, and to counteract speculation so that median and low-income groups are not denied housing opportunities in areas of high demand. These groups are increasingly affected due to the contemporary pressure on real estate markets brought about by financialization, which produces urban (re)development where real estate is treated as a 'financial asset' and investment locations are chosen according to its perceived return rate (Loon & Aalbers, 2017).

Local governance is a key intermediary in such processes, as public actors are playing the role of facilitators in the creation of financial assets (see Loon & Aalbers, 2017, pp. 222). The analysis of objectives that guide national and local policies, specifically political instruments that used to stimulate urban requalification and the way they filter external factors such as globalized finance or tourism, affecting the characteristics of national and local housing markets, is therefore crucial for those concerned with the transformation of cities.

3 GENERAL BACKGROUND 3.1. URBAN DECLINE OF PRIVATE RENTAL SECTOR AND INNER CENTRES IN PORTUGAL

Degradation, loss of resident population, and a growing number of vacant buildings have been severe problems in Portuguese city centres for the last decades. According to the 2011 Census, about a million buildings throughout Portugal are in need of repair and of these about 400,000 require significant works, with a greater concentration in city centres. In the case of the historic centre of Porto, where there is a total of 1800 buildings, about 34% were in poor or very poor condition, requiring deep interventions, and another 51% required small and medium-scale repair (Census 2011). Regarding the occupation of buildings, it is estimated that 19% of all buildings were vacant in the municipality of Porto in 2011. Accordingly, between 1991 and 2011, the population of the historic centre fell from 20,342 to 9,334 individuals, a loss of about half of the total resident population (Census, 2011).

The private rental sector decreased abruptly in Portugal between 1981 and 2011, from 40% to 20%, a reduction from 1,074,590 to 545,710 dwellings (Census, 2011). In the municipality of Porto, between 1981 and 2011, the private rental sector decreased from 67,373 to 43,302 dwellings.

In 2011, in Portugal 19% of total rent contracts were established before 1975, 34% between 1975 and 2005, and 47% between 2006 and 2011. Evidence shows that pre-1990 contracts are characterized by low rents. Moreover, about 15% of all rented accommodation in Portugal in 2011 still carried rents equal, or less than, 35 euros per month, where often senior tenants live with poor housing conditions¹. In Porto half of a total of 43,302 private rental dwellings, equivalent to 21,084 have rents below 100 euros. Contrarily, the segment of contracts signed after 1990 is increasingly dominated by higher rents, due to a high demand from tourism activities, which has raised issues of affordability and tenant security from middle and low incomes families. In the historical Porto, after a period of stagnation that followed the 2008 global economic crisis, when the availability of credit was problematic, between 2010 and 2014, real estate sale prices increased 50% and by the end of 2014 rehabilitated dwellings had an average value of 2,370€/m² (Porto Vivo SRU, 2014: 86).

3.2 URBAN REQUALIFICATION IN PORTUGAL AND IN PORTO

Legal changes in rent regulation (Law 31/2012) have been implemented with the aim of reversing the effects of decades of rent freeze. The 2012 new Urban Lease Act Law, aiming to implement the full

¹ It is worth noting that rent controls were first introduced in Portugal in 1910, but the freezing of all private sector rents was not implemented in Lisbon and Porto until 1948. With the revolution of 1974, in a context of economic recession and housing shortages, the freezing of rents was extended throughout Portugal. These rules allowed sitting tenants to remain in their houses without incurring increased housing costs and, owing to inflation, rents become almost symbolic, namely, designed for tenants of middle incomes who had hitherto paid very low rents. Because property owners have not traditionally made enough money for maintenance or renovation and tenants could not be evicted, the vast proportion of older housing stock has suffered dilapidation.

liberalisation of the rental market, set a five-year period of transition from the old (prior to 1990) lease contracts to a new regime of rents (free of rent control mechanisms), with the exception for low-income tenants or those with disabilities, where the rent increases should be compensated by housing allowances paid by the state. It was expected that full liberalisation accompanied by a new rent subsidy scheme, would come into effect in 2017, but the left-wing government increased the transition period by another five years.

Over time, several programmes have attempted to boost the renovation of the private rental sector building stock, being possible to identify different phases, in terms of strategies, instruments, and implementation. Two main phases of national policy for urban requalification can be identified: i) from 1986 until 2000, an approach that targeted private rented dwellings with old contracts and poor housing standards, and gradually adopted an integrated approach that aimed to combine small-scale housing interventions with social equipment, patrimony and cultural valorisation,; ii) from 2000 onwards, a neoliberal approach focused on public-private partnership to leverage private investment and generate trickle-down effects. The latter involved the creation of public-private partnerships to allow economic revitalization and operations of housing requalification, the Urban Requalification Societies (SRU, in the Portuguese acronym).

The first national framework for urban requalification was created when Portugal entered the European Union in 1986, the access to funds of the Community Support Framework enabled an important expansion of national investment in urban requalification, in matters of public space, slum clearance and the conservation of historic monuments and sites, but not of housing requalification, which was then considered a responsibility of national member states (Alves, 2017a).

The 'Programme of Urban Requalification' launched at this time by the central government in partnership with local authorities, aimed at the requalification of private rented buildings and involved two main instruments, one technical/ institutional and the other financial.

The first provided funding for the creation of Gabinetes Técnicos Locais (GTL) Local Technical that hired architects, engineers, sociologists, social workers, etc. in an attempt to support local municipalities in efforts of urban requalification, namely of historic centres Costa (2010: 398). When government financing ceased, many of the GTLs, whose activity was structured around social objectives and bottom-up approaches, became local municipal offices.

The second enabled the creation of a list of programmes of housing requalification that targeted private rented dwellings with old contracts and poor housing standards. In particular, the RECRIA (acronym for Special Reimbursement Scheme for the Recovery of Leased Property), and more recently the REHABITA (acronym for Regime to Support Housing Recovery in Ancient Urban Areas provided funding for landlords - to support the upgrading and maintenance of buildings and sitting tenants – and for tenants - housing allowances to cover the rent increases following housing requalification. In some municipalities, municipal housing services provided housing for the temporary relocation of sitting tenants during the periods of housing requalification, which was considered a great incentive for landlords to rehabilitate their properties. In the case of RECRIA, access to funding was conditional on the existence of at least one tenant in the building with a pre-1980 contract (i.e. with frozen rent values). However, the execution rate of this programme was lower than anticipated, since it demanded about 40% matching funds from the municipalities' own budget. Except for programme REHABITA, which targeted areas mainly coinciding with historic centres, the national programmes of requalification were not tailored for city centre needs. They were simply targeted to individual owners interested in carrying out maintenance/requalification in occupied buildings associated with old contracts and low rents.

Whilst national policy for urban requalification in the 1990s focused upon critical areas and gradually adopted an integrated approach that aimed to combine small-scale housing interventions with social equipment, modest public projects, patrimony and cultural valorisation, the 2000s saw a significant policy shift. There was greater focus upon public spaces, cultural facilities, streetscaping, pedestrianization schemes, and urban refurbishment. Large events such as the 2001 Porto European Capital of Culture (Alves, 2017b) and POLIS (Baptista, 2013), created after the Lisbon World Exhibition of 1998, are clear examples of this.

More recently, the European Bank of Investment (EIB) has become one of the most relevant funding sources for urban requalification. In 2008, the Portuguese authorities and the EIB signed a Memorandum of Understanding

for the application of the Joint European Support for Sustainable Investment in City Areas (JESSICA), which was deployed for country's structural funding programme (ERDF) from 2007-2013. This instrument funded municipalities, SRU, banks, investment funds or private entities involved in urban regeneration projects. The national program 'Partnerships for Urban Regeneration', operationalized this strategy during the period 2009-2013, through initiatives that were supported the requalification of historic centres, critical neighbourhoods, and waterfronts. In the historical centre of Porto supported 2 interventions (see next section)

In 2013, a new financial instrument using funds from the EIB was launched by IHRU for the requalification of buildings that are totally or partially occupied by sitting tenants with old contracts associated to low rents. It has a budget of around 50 million euros and is expected to induce both housing requalification and affordable rents. This was expected to capitalize on the effects of the new Urban Lease Act Law, which paved the way for greater flexibility in the renegotiation of open-ended residential leases between private landlords and tenants, by phasing out rent control mechanisms for old leases and imposing stricter limits on the possibility of transmitting the contract to first degree relatives.

Porto urban requalification policy followed closely the national phases mentioned above.

After the 25th April Revolution, in 1974, the state created a government agency, CRUARB¹ to promote the requalification of the riverside front of Porto. Its mission was ensuring that the "working class population that inhabited that area for a long time, in the worst conditions of housing and exploitation" could remain in the area (Alfredo, 1997: 78). The goal was to avoid evicting the poor as a result of rising property values deriving from the requalification works.

3.3 THE URBAN REQUALIFICATION SOCIETIES MODEL

Over 30 years, with public funding only, first from the Housing Development Fund and from 1985 onward as a GTL, when government financing ceased and CRUARB became a municipality project, municipal funding and national or European competitive bids, the CRUARB agency developed a model that was based upon buying degraded properties, through negotiation or expropriation, and developing projects of engineering architecture to rehabilitate derelict buildings. The rehabilitated buildings were either sold or entered the social housing rent market, meaning they had rents below market values. In 1992 access to Poverty III funding created the Foundation for the Development of the Porto Historic Area (FDZHP) that with CRUARB promoted an integrated programme of actions that combined urban requalification with more immaterial dimensions of intervention, such as of training for unemployed, support for children, etc. (Alves, 2017b). In 2001, the preparation of the Porto European Capital of Culture event led to investments that were mostly focused upon "public spaces, streets, cultural facilities, streetscaping, pedestrianization schemes, and new urban furniture" (Balsas, 2007: 232).

In 2004 the approval of new legislation concerning rent regulation and urban requalification led to the creation of the Urban Requalification Society (SRU) model. This institutional arrangement was based on the premise that, in order to tackle city centre requalification, local authorities need a lighter structure of governance and partnerships with national authorities and private actors. This model, that operates under a regime of exception providing the SRU with more entrepreneurial and discretionary processes of decision and delivery outside existing state bureaucracies, included the possibility of property restructuring and forced intervention through expropriation.

The Urban Requalification Law (legal decree no. 103/2004) created two institutional models for these societies, one in which the municipalities hold all the capital, and another in which societies enjoy capital from the municipality and the central state. The second model was implemented only in Porto, Coimbra, and Viseu, all of which remain active to date.

¹ Portuguese acronym for Committee for the Urban Renovation of the Ribeira/Barredo Area.

The SRU model puts great emphasis on strategic planning. First of all, municipalities and SRUs enjoy substantial freedom to define their strategy of action and priority areas of intervention (called Urban Requalification Areas – ARU). In these areas, special benefits apply automatically regarding national taxes (Value Added Tax for requalification works), and local taxes (namely, property taxation). In addition, specific action programmes may be approved – Urban Requalification Operations, ORU – with concrete goals and requalification programmes to be executed by SRU directly or in partnership¹.

It is a competence of municipalities in coordination with SRUs to rank and coordinate the various goals of urban requalification from the strategic to the operational stages, which means that, for the first time, there is policy decentralization in behalf of municipalities.

SRUs have the legal power to expropriate or force the sale of buildings that are in a poor state of repair with the aim of promoting their requalification, when all other options are excluded, considering that requalification is, in the first place, a duty of the owners, and the role of the SRU is primarily to enforce the duty. On the other hand, the legal status of the SRU model makes it easier to employ staff and contract commercial loans, and to implement faster licencing procedures, allegedly improving the cost-effectiveness of urban requalification.

Owing to austerity measures from 2009 onwards, tight debt controls were implemented in the municipalities and a rule enforcing financial sustainability for municipal companies was put into practice, leading to many SRU in small and medium cities being shut down and to strong pressure for financial sustainability. At the same time, changes in urban requalification laws in 2009 and 2012 introduced significant amendments to the SRU's instruments of action. Funding schemes for housing requalification to be used by private owners were drastically reduced and replaced by tax reductions and tax benefits. These changes increased the need for municipalities and the SRU to engage in partnerships that would enable higher investment.

4 PORTO VIVO SRU AND THE CASE OF THE CARDOSAS INTERVENTION

This paper scrutinizes the SRU model, by looking at the city of Porto, where historic centre degradation were very severe by national standards and SRU implementation represented a drastic change in both governance and policy goals. The paper focuses on a particular Porto Vivo SRU intervention, designated Cardosas Operation, which is an interesting example of SRU strategies for two reasons. Firstly, it was identified in Porto Vivo SRU strategic documents as a priority intervention area or pilot intervention quarter, meaning that it qualified for flagship projects aimed at inducing requalification in neighboring buildings and surrounding quarters. Secondly, an innovative implementation mode was used, intending to test partnership models and inspire future actions. In effect, requalification was not led by private owners but by real-estate promoters with whom Porto Vivo SRU established partnership contracts. Porto Vivo assumed important investments in this operation, such as the acquisition of buildings (expropriated or negotiated purchases from private owners), demolitions and constructions, namely a square inside the quarter and an underground parking space.

This project has generated strong controversy over the amount of public spending and goals of the intervention (supporting a luxury hotel and a high-end housing development), but also for the real-estate speculation that it generated, a result which is recognized by supporters as a sign of success and by critics as a negative effect. There was strong opposition also from academics and practitioners in the areas of architecture and conservation due to disregard of local heritage and the option to demolish many buildings and completely alter the quarter's urban design.

The research presented here is informed by two main sources of information. Firstly, upon qualitative documentary analysis, namely legislation, strategic documents, SRU execution reports, and a literature review on the topic. And secondly upon qualitative, semi-structured, face-to-face interviews with

¹ ORUs are approved by the executive and deliberative organs of the municipality and can be either simple ORUs (an integrated operation of urban requalification aimed main mostly at buildings) or systematic ORUs (which require a strategic programme and are aimed at both building requalification and qualification of infrastructures and public spaces and equipment).

staff/officials working in SRU (5), local authorities (2), and in the central institution responsible for housing policy (2). Interviews were conducted in Porto in 2015 and were later transcribed.

Bearing in mind that, depending upon the goals of the evaluation, its research object, and methodology, different results and knowledge can derive from the evaluation process, we framed an evaluation matrix based on two main fields of analysis fields and several associated indicators to be studied and documented, where possible, with quantitative data. Essentially, the focus of the research is upon underlying strategic principles and assumptions behind governance and operational choices, modes of implementation and, finally, their direct effects in in the housing and residents' socio-economic profile (see Table 1).

<i>Analysis fields</i>	<i>Elements of study/ indicators</i>
Strategies and governance	Goals and principles embedded in the Cardosas operation, and their relationship with the broader strategy for the historic centre. The purpose of partnerships between Porto Vivo SRU and private investors, and how it was defined in terms of roles, costs, and the benefits for each partner. Perceptions of success/failure associated with the operation.
Physical and social impacts of requalification (the before and the after)	Changes in housing stock and structure (tenures, rent values, etc.). Changes in the state of conservation of the buildings. Changes in the residents' socio-economic profile (social status of the incoming population, evidence of displacement). Changes in economic activities (effects on the local economy in terms of new/old uses, etc.).

Table 1 – Analysis matrix

4.1 THE IMPLEMENTATION OF URBAN REQUALIFICATION SOCIETIES IN PORTO

Porto Vivo SRU was set up as a public capital company, where the central state (through the Institute for Housing and Urban Requalification, IHRU in the Portuguese acronym) owns 60% of the capital and the Porto municipality the remaining 40%. The creation of this company led to transference of competencies and resources from the municipality to the SRU. In terms of governance, this decision was preceded by a strategic study – the Porto Vivo SRU Masterplan - which delimited the historical centre as the main area of intervention by the SRU. By using statistical data and multivariate analysis techniques, the choice of the city centre was justified on two grounds: the high level of housing degradation and concentration of poverty and social exclusion in the historical neighbourhoods, and the existing economic opportunities related to tourism, heritage, and creativity.

The Porto Vivo SRU Masterplan defined a strategy of requalification based upon two main strategic guidelines (Porto Vivo SRU, 2005): Re-population, through attracting new residents, and economic revitalization, through the promotion of activities related to commerce, culture, and leisure that benefit from the tourism dynamics, which in turn derive from Porto historic centre's status as a UNESCO World Heritage site.

In strategic terms, the historic centre of Porto was defined as an ARU (the so-called Urban Requalification Areas – ARU) in 2012, and within this area several blocks were identified as priority areas of intervention or pilot areas to guide future interventions. It was also expected that the concentration of public investment in these priority areas would generate trickle-down effects that would attract private investment to neighbouring areas, stimulating a wave of private investment that allowed for the requalification of the whole city centre.

For each quarter targeted for priority intervention, strategic documents were drafted. In terms of strategies, instruments, and implementation, after more than 10 years of SRU intervention in the historic centre of Porto, we can identify three main types of intervention:

1. Direct requalification of derelict buildings owned by the SRU and designated for housing. The rehabilitated dwellings have been either sold or placed on the rental market. It is interesting to note that those that have been rehabilitated for renting are located in a deprived area, the Morro da Sé neighbourhood, benefitting chiefly from a €7,5m loan granted by the European Investment Bank, which has enabled the requalification of 32 buildings. It is also interesting to note that, of all housing stock in Morro da Sé, 47% needed deep interventions, 23% medium interventions, while

- only 4% were in suitable for use. Furthermore, due to expropriation processes throughout the 1990s, 40% of all buildings was public property (SRU/municipality) and of these many were vacant or in poor condition. Of the total, before interventions by SRU, 80% of the buildings were already occupied by tenants and the remaining 20% by owners.
2. Urban Requalification contracts with private partners (e.g. the Carlos Alberto intervention) or real estate funds (e.g. Cardosas and D. João II operations), where Porto Vivo SRU participated with the expropriation of buildings, rehousing of sitting tenants, demolition, cleaning etc. These were, by and large, ambitious and expensive real estate projects aimed at selling for profit (on average, 1.900 euros/m²). The tenants who lived in the blocks where these operations took place were relocated to social housing districts or to Morro da Sé
 3. Direct physical requalification of public space aimed at inducing requalification by private owners. This is the case of the operation in Mouzinho-Flores, contiguous to the Cardosas operation, which was funded by a national programme paid for using structural funds and Partnerships for Urban Regeneration.

4.2 THE CARDOSAS INTERVENTION

The Cardosas quarter occupies 7,485 square metres and is located in a transition area between Praça da Liberdade/Alíados boulevard (where Porto town hall is located) and the historic Centre (Figure 1). The requalification strategy for the Cardosas quarter was detailed in a document approved in June 2007, but the decision to intervene and the general strategy was undertaken in 2005. The minutes of a meeting of the Administration Board of the Porto Vivo SRU date from 2005 and already describe the decision to develop an ambitious and systematic requalification operation that would involve the social, economic, and urban revitalization of the quarter. The goal of mixed-use occupation (housing, commerce, and services), with car parking to support future residents and activities, is clearly stated in that document.

Figure 1 – Location of the Cardosas quarter in the Historic Centre of Porto

4.2.1 STRATEGIES AND GOVERNANCE

Drafted by a private consulting firm on behalf of Porto Vivo SRU, the Cardosas strategic document is structured in two parts. One describes the conditions before intervention, seeking to justify the need for a systematic intervention that targets a segment of the population with high purchasing power. The second details the strategy that must be followed to achieve this goal. Regarding the former, it states that prior intervention in the quarter there were 42 buildings with 92 owners. The document is, however, vague regarding characterization of the resident population. It states that six buildings were for housing purposes, but does not elucidate the number of residents, the number of families living there, or their specific needs. It also states that, 35% of the built area was used for commerce and services, and 15% was allocated to commercial storage.

The document defines a systematic strategy of requalification that aims to produce quality housing for a high- end market segment. Affordable housing at controlled costs and for rent is not envisaged for the quarter. With this purpose in mind, strategy has been drafted based on the following:

- The demolition of the buildings inside the quarter (11 buildings) to create a public plaza and (see below) underground car parking;
- The requalification of a historic palace overlooking Praça da Liberdade and a few minutes' walk from São Bento station, that became a luxury hotel¹;
- The restructuring of uses, promoting mixed use of qualified commerce and services on the ground floors and housing on the higher floors for new, and affluent segments of the population;
- The alteration of the existing built structure to increase space available for housing and other activities (merging two or more buildings to create more spacious housing). While the general façade was maintained, the back (interior of the quarter) had been totally demolished and reconstructed.

In a different section of the document, it is stated that the resident population will be relocated in other areas, without stating which, or the conditions thereof. It is clear, however, that the decision to displace and rehouse this population elsewhere relates to the understanding that they can afford the “higher standard” quality housing that will be provided there (SRU strategic document, 2007: 21). It is even stated that, as only a small proportion of the population live there, this will facilitate displacement and the success of the operation:

“Another aspect to be considered [...] relates to the fact that, currently, the quarter has virtually no resident population, therefore the introduction of a ‘new’ population will, in theory, introduce no significant social conflict factors.” (our translation) (Porto Vivo SRU, 2007: 24).

The document also states that it is likely and desirable that the renovated dwellings will be sold as second houses or to private investors interested in tourism-related business, such as short-term rentals:

“Excellent access to public transport, such as train, underground (qualified transports), and buses, may be an added factor of differentiation for this quarter, namely, for the segment which choses to have a second home in the city of Porto.” (our translation) (Porto Vivo SRU, 2007: 24).

Whilst the strategic document recognizes the excellent access to public transport (metro and train station, bus), and the fact that alternative parks are available within 150m (Sequeira, 2011), the strategic document claims that a car park “is indispensable to make housing viable in the quarter”, due to the current demands of the affluent population that is expected to occupy the area, both as residents and hotel guests, which are typically car users. (Porto Vivo SRU, 2007: 25).

Analysis of the strategic document reveals that it mainly proposes the need for deep intervention in the quarter based on evidence that it was underused² and in a poor state of conservation³. The SRU proceeded to expropriate some block-front buildings and invested €13M in expropriation of the core of the block to gain possession of 22 buildings. In the case of other buildings with requalification needs that were not subject to “forced sale”, contracts were drawn up between owners and the SRU for requalification promoted by the owners themselves. An equal percentage of buildings remained in good repair. It should be noted that the SRU’s Statement of Accounts for 2012 explains €7M of deficit by the high cost of expropriation, arrived at not by agreement with owners but by court decisions: “Judicial decisions in expropriation proceedings were above the amounts allocated in the framework of expert opinions requested by the SRU for this purpose.” (Porto Vivo SRU, 2012).

In the case of the Cardosas operation, Porto Vivo SRU, as the project leader, assumed the costs of expropriation and demolition for park construction and public spaces, establishing a partnership with two private partners - Lúcio da Silva Azevedo e Filhos, S.A. (LUCIUS) and the InterContinental Hotels Group - for the requalification of Palácio das Cardosas. While LUCIUS was responsible for the construction, real estate development, and marketing of the housing, Intercontinental was responsible for the construction

¹ See <https://www.ihg.com/intercontinental/hotels/gb/en/porto/prtha/hoteldetail>

² technical inspections report that 24% of the buildings were empty and only 28% were totally occupied

³ 57% of the inspected buildings were in poor condition, 17% were average and 26% had a good conservation state

and hotel management (see Table 2 for details of the partnership roles). For the hotel project, a real estate investment fund - designated First Oporto Urban Regeneration Fund (4F) - was involved as a financial instrument to support the operation.

The business plan of the Cardosas project, as submitted to JESSICA program for funding¹, defined that i) all of the project's construction and commercialization expenses are assumed by the private partner, and ii) the revenue obtained from the sale of commercial areas and houses is equally divided between the SRU and the private partner, while the amount received from the sale of the car park is almost all the private partner's: "Porto Vivo SRU and Lúcio will each receive 50% sales of residential and commercial areas (about €7.9M). In addition, Lúcio will receive the amount relating to be car parking sale (€6.5M)." (Deloitte and Parque Expo, 2009: 46).

The 4F began activity in June 2011, with an initial capital of €5M and acquired all the 40 buildings in the Quarteirão das Cardosas that were owned by LUCIUS, that is, buildings expropriated by Porto Vivo and transmitted to Lúcios, new buildings, however erected or under construction, inside the block intended for trade/services/equipment, parking, and possibly other real estate acquired by way of negotiations. (See Gaspar, 2014: 61-63).

	Porto Vivo SRU	LUCIUS	Intercontinental
Role	Project leader Expropriation, when necessary Mediator between Intercontinental Group and property owner regarding the hotel	Real-estate promoter Construction Sale of housing units Use a real-estate fund to support the operation: First Oporto Urban Regeneration Fund (4F) Lúcio was the sole subscriber of the 4F capital	Promotion and management of a hotel used a real-estate fund to support the operation
Cash inflows:	Expropriation, demolition, and underground car parking costs	Construction and commercial costs	Investment and management costs (hotel)

4.2.2 CRITICAL ANALYSIS OF CARDOSAS OPERATION IN THE CONTEXT OF THE SRU INTERVENTION

Based upon nine semi-structured face-to-face interviews conducted in Lisbon and Porto at the beginning of 2015, we now aim to shed light upon how the SRU, local authorities, and the Institute of Housing and Urban Renewal (IHRU), that is, the government-run body responsible for supporting and implementing government housing policy in Portugal, assessed the Cardosas operation from the point of view of their impacts upon i) practices of urban governance (formal and informal relations between stakeholders within the municipality, across government levels, and in the context of public-private partnerships), and ii) on housing market dynamics (e.g. changes of tenure, rents etc.). The link between strategies of housing and urban requalification and issues of housing affordability for low- and middle-income families were broached when, for example, we asked about the impact of the operation on the provision of affordable rental housing (below market rates). Whilst some interviewees did not know in detail about the Cardosas operation, they were, however, familiar with the contents, methodologies, and purposes of the SRU model in one or more cities, which introduced new perspectives to the analysis.

Of those interviewees who were familiar with the Cardosas intervention they all recognize that this generated a high deficit for the public partners (values mentioned vary from seven to nine million euros). This was due to a wrongful evaluation of the costs involved in the Porto Vivo SRU tasks. However, the interviewees presented different explanations of the reason for such high deficits. In one interview (PS3), the construction of the square was decided during the project and exceeded initial costs. Another interviewee (CG2), mentioned that expropriation costs were above the expected and Porto Vivo SRU

¹ The goal of JESSICA (Joint European Support for Sustainable Investment in City Areas) is to support institutional investors, namely, municipalities and Urban Requalification Societies, to invest in requalification funded by Real Estate Investment Funds. It is important, however, to note that projects to be eligible for funding, which have to be framed by "integrated sustainable urban development plans".

argued that this caused the deficit. Another criticism regarding financial management involved the sale of the park to a private company for a very low price (100 thousand €) (CG1).

Because central government manages the majority of Porto Vivo SRU's capital, it was expected that this deficit would be financed with additional public funding. This led to major conflicts between stock-holders and closer scrutiny of the conditions of partnerships in future projects (PS3). IHRU interviewees stated that this deficit was not expected, as financial studies of the project estimated that it would generate profit from the sale of apartments: "The model defined for that operation was expected to be profitable [...] the State decided to go forward, I am convinced, because it was not a waste of money. It was, in a certain way, a loan." (CG1).

When looking at the operation globally, besides housing, the major project was a luxury hotel, interviewees alleged that "1 € of public spending generated 16 € of private investment" (PS1), and that housing sales were highly successful, indicating that private partners achieved their goals.

In terms of the physical and social impacts of requalification, the Cardosas operation had several impacts regarding the transformation of the housing stock (e.g. tenures and typology structure, rent values), the state of conservation of the buildings, in some cases more renovation than requalification, economic revitalization of the area (with the creation of 19 commercial spaces), and changes in the residents' socio-economic profile, with the displacement of existing tenants (how many was not stated), and the attraction of 50 new luxury apartments (e.g. most one- or two- bedroom units). The sale of all new apartments at high prices indicates a transfer of tenure towards ownership but not necessarily for permanent use or permanent residents, but most for short rental. A high share of apartments is for short rental, as the transaction prices are not attractive for most families that showed an interest in the historical centre. (CG2) Interviewees who claimed the success of the Cardosas operation (PS1, PS2, PS3) argue that, from a commercial point of view, the operation as a whole was a success (PS1), showing that it targeted a type of demand that needed to be accommodated. When asked about the need for a more diverse social composition of the quarter, one interviewee argued that the inclusion of other social groups (low-income groups) is a fact in nearby quarters: "50m from the Cardosas we have the Morro da Sé" (PS3), a typical medieval district with narrow streets, difficult access and a concentration of derelict buildings, favouring traffic and drug use in some public plazas, associated with a bad reputation (Alves, 2017c). In the historical centre of Porto, rehabilitated housing for rental purposes provided by SRU for temporary or definitive relocations is concentrated in Morro da Sé, while some families are rehoused in social housing neighbourhoods.

The transformation of the physical built environment was also the object of strong criticism, for several reasons: LG1 mentioned the rearrangement of parcels (fusions of small buildings to create larger housing units); the lack of respect for architectural heritage; the car-friendly strategy, and the privatization of open space in the quarter which was initially designed for public use. In the words of one interviewee: "In the end, all that was left was a scenario, a square that is not a square, a hotel solution that gives me the chills, so from my point of view it is something that cannot happen again." (LG1).

Porto Vivo SRU representatives justify the need for the closing of the inner square after 9pm to avoid security problems such as vandalism and the presence of marginal populations (PS1, PS2). There is an underlying concern to create a safe environment for new residents. Whilst it was mentioned that this situation may be reviewed after the opening of commercial spaces on the ground floors (PS1), this has not happened and the central plaza remains closed at night.

5 DISCUSSION AND CONCLUSIONS

Housing dilapidation, poor housing conditions, and the decline of the private rented sector remain key challenges to historic Portuguese cities as the result of obsolete forms of rent control and housing policies focusing upon purchase rather than rental.

The model of "Urban Rehabilitation Societies" was created in a context of neoliberal framing of the role of the state and it became fully operational in the early days of austerity enforcement. The discourse and rhetoric of this policy model is framed by cutbacks in instruments of direct public intervention and employs the view (both ideological and practical) that intervention must rely upon private investment. This is

apparent in the two main strategies set up by the central state to boost urban requalification, that is, the liberalization of rent markets, and the setting up of governance models that encourage public-private partnerships vis-à-vis quarter-based operations of urban/housing requalification, chiefly SRUs.

Local authorities, which in the context of SRUs became key actors in the definition of strategies of urban and housing renewal, both in terms of the selection of priority areas for intervention, that is, the definition of goals that should guide intervention, and policy implementation, have been 'steered' towards policies designed to increase real-estate prices (Van Loon & Aalbers 2017).

The Cardosas operation is an interesting case to illustrate the many pitfalls of this model of urban rehabilitation (e.g. governance, forced displacements, social-spatial income polarization), as it was promoted by Porto Vivo SRU, which is owned by the central state and Porto municipality, and diverged from the fundamental principles and goals of previous models (e.g. CRUARB) that aimed to promote housing rehabilitation for social purposes and promote a rental market accessible to the more vulnerable living in the city centre (Alves, 2017a).

By funding deep restructuring of the Cardosas quarter, both in terms of urban design and the social composition of the area, [SRU] acted as intermediaries in the financialization of the real-estate market in Porto, reinforcing the income gaps between the poorest and the wealthiest neighbourhoods of this historical centre.

The process is widely documented. The urban renewal operation of Cardosas transformed the mixed structure of the area, both in terms of population and economic activities, on which its historical identity is based, to offer the provision of new services and luxury housing affordable only for a few. Associated with architectural and infrastructural improvements and to territorial marketing, the urban renewal operation meant real estate prices rose and led to the expansion of property ownership. This was accompanied by forced displacements and a non-intervention policy regarding the use of rehabilitated housing for temporary accommodation (e.g. short rental destined for tourism), so as to attract further investment and expansion of activities in the area, in accordance with a global market perspective (chiefly tourism and real-estate).

It should be noted that SRU strategy in large-scale partnership projects found strong opposition and the Cardosas project became the focus of counter-action, as the interviews demonstrate. Firstly, due to the high financial deficit of the SRU, it legitimated criticism of the society's governance model, justifying the central state position of backing away from requalification policy implementation. This deficit also made apparent the appropriation of public investment by private interests, accompanied by widespread public criticism of the use of public money to fund high-end real-estate developments. Secondly, contestation of the planning and design of the project by academic and practitioner movements raised awareness of heritage protection. Thirdly, due to pressure from a boom in tourism activities, housing affordability has become a major issue for local populations hence a topic of political debate.

What new elements does this case bring to our knowledge of gentrification processes?

1. The effect of globalization and financialization was enhanced because local capital was low and a very profitable investment opportunity was available;
2. Governance restructuring under a neoliberal model provided favourable conditions to the entry of market-led interests (such as a partnership model, lack of public scrutiny, and no coordination of goals between central and local authorities);
3. The state made no effort to counterbalance these trends and actively supported them as a result of austerity.

As emphasized by Pugalís, based on other neoliberal experiences (Pugalís, 2016), the SRU model provides a resignification of the concept that is inherent in requalification policy. Requalification that once focused upon the provision of decent housing for city centre populations, and in the 1990s to the provision of infrastructure and public amenities, paved the way in the 2000s for a more systematic market-led approach which in Portugal has been reinforced by neoliberal and austerity policies. The SRU model provided the governance instruments that made possible its implementation in the case of Porto, leading us to question whether, with good governance, the outcomes would have been different (Clark, 2014).

In this regard, we claim that measures could have been undertaken for the production and preservation of affordable housing, so that increases of rent would be limited and adapted to middle-class housing needs and demands. To do so, models of urban governance should be reviewed to ensure accountability regarding respect for policy guidelines across all stages of action (from strategy to project implementation), while the funding of public institutions, such as SRUs, should be designed to relieve dependence upon private investors and ensure that no public funding is used to increase profit in speculative operations, but to limit such profit.

ID 1485 | SOCIAL HOUSING AND REHABILITATION OF CENTRAL AREAS: THE EXPERIENCE OF ZEIS 3 IMPLEMENTATION IN SÃO PAULO, BRAZIL

Eduardo A. C. Nobre¹; Simone Ferreira Gatti¹

¹Faculdade de Arquitetura e Urbanismo da Universidade de São Paulo

eacnobre@usp.br ; sifgatti@gmail.com

ABSTRACT: The debate on urban interventions in central areas is probably one of the most controversial issues among architects and planners. Depending on how state and market act on the production of space, the development of certain urban areas occurs or their decay. In response to the decline process, the governments of several cities of the world have been developing urban policies of intervention in these central areas, basically in two ways: through their eradication, or through their rehabilitation. Recently the implementation of social housing policies has been defended as a strategy to cope with city centre decline. The aim of this paper is to analyse the case of São Paulo, Brazil. Over the last hundred and fifty years it has grown very quickly, presenting both rise and decline processes. Since the 1970s the municipality has been implementing several plans in order to revert the decline, and recently with the aim to provide social housing. The paper is divided into this abstract and four more sections. First a little historic appraisal of the public responses to the decline process, followed by a view on the rise and decline of São Paulo city centre. The next section will analyse the policies proposed and implemented by the municipality for the centre and then analyse the implementation of ZEIS 3, a type of inclusionary zoning, searching to understand it results in a rehabilitation process. This paper is partially result of a post-doctoral research project financed by FAPESP (São Paulo State Research Support Foundation), Process # 2015/26447-7.

1 URBAN POLICIES FOR CENTRAL AREAS

The debate on urban interventions in central areas is probably one of the most controversial issues among architects and planners. Since cities are socially constructed, they are constantly changing, growing or declining in response to changes in the societies in which they are embedded. Depending on how the state and the market interact on the production of space, the development of certain urban areas occurs, with the appearance of new economic activities and social classes, or their decay, with the end of these activities, economic decline and migration (Couch, 1990).

In response to this process, the local authorities of several cities have been developing urban policies for intervention in these central areas basically in two ways (Nobre, 1994): the first would be its eradication, caused by the renovation of its built environment; the second would be its rehabilitation, through improvement projects.

After World War II, the consolidation of Modern Urbanism and Architecture, following the modernist precepts of the CIAMs and the Athens Charter, led to the adoption of reconstruction policies based on the renewal of the urban fabric (OECD, 1983). The need to affirm the birth of a new period and the break with the painful recent past, technological development and capital inflow from the Marshall Plan allowed the reconstruction of several European cities, much influenced by Le Corbusier's ideas.

The United States, despite not having suffered from the destruction of the war, also adopted the process of urban renewal in order to combat the process of "degradation" of the central areas (Rapkin, 1980). In order to eradicate the slums in these areas, generally residence of the poor afro-descendant population, the Federal Government established the Federal Housing Act in 1949, which provided federal resources for

the expropriation and remodelling of these areas and the construction of peripheral housing complexes. The harmful physical effects and social impacts on these excluded groups made this law to be known as the Federal Bulldozer (Anderson, 1962).

A questioning of this process started in the 1960s. The destruction of pre-existing urban form and the removal of settled communities, usually low-income, ended up causing strong popular reactions, causing urban riots in many cities. Urban and sociological studies were made, criticizing the effects and consequences of this process due to the problems arising from social ties disruption and the expulsion of areas with a concentration of jobs and services (Jones, 1979; Knox, 1982). At the same time, the awareness of the environmental burden related to the destruction of a sound built environment and the historical importance of the urban fabric also questioned these interventions (Couch, op. cit.).

From the 1970s on, new urban studies began to work with the concepts of building rehabilitation and community development in various European cities, such as Amsterdam, Bologna, Madrid, Rotterdam and Venice. In the United States, the Federal Government, under pressure of the booming of the Civil Rights Movement, launched the Model Cities program, which provided assistance to cities and community groups to rehabilitate deteriorated areas occupied by low-income population. (Rapkin, op. cit.)

Recently the studies for central area rehabilitation have been working with the concept of compact mixed use cities. One of the main aspects of this concept is the construction of social housing as an important element in this process. In addition to central area repopulation, social housing construction has a social justice aspect, as it allows low-income class access to the city, jobs and services.

2 SÃO PAULO CENTRAL AREA RISE AND DECLINE

The São Paulo Metropolitan Region (SPMR) is located in the Southeast region of Brazil, standing out as the largest Brazilian urban agglomeration with 19 million inhabitants, of which 11 million in the city of São Paulo (MSP) in 2010 (IBGE, 2010). Besides the MSP, it is formed by other 38 municipalities, extending by eight thousand and five hundred square kilometres, equal to 10% of the national territory. Its Gross Domestic Product (GDP) was € 256 billion in 2010, accounting for 19% of the Brazilian GDP (74% in services and 26% in industry). Despite all this wealth, the metropolis has presented an uneven development, whereas 63% of the residents earn less than five MW – minimum wages (less than € 1,144) and only 6% earn more than twenty (more than € 4,576).

The Metropolis developed due to the concentration of economic activities related to great cycles: coffee trade with Europe from late 19th century on; import substitution industrialization from the 1930s on; deindustrialization with tertiary sector growth since the 1980s. Historically, middle and high income populations have settled in the most central areas of the metropolis, where commercial activities, jobs, services, public equipment and the best infrastructure are concentrated (Villaza, 1997). On the other hand, the low-income sectors were “expelled” to less privileged areas in relation to these factors, living in a high level of precariousness in slums, favelas and peripheral illegal settlements.

As seen in the previous section, the rise and decline of urban areas change according to how the State and the market intervene on the city. In the case of São Paulo, the central area rise and decline occurred over the last century, following the metropolis rapid and recent development. During the first three centuries, the city remained in the adjacencies of the historical hill, site of its foundation. Coffee plantation and export from São Paulo State and European immigration in the middle of 19th century resulted in an intense economic development with impact on the urbanization process.

The accumulation of capital was drained to the real estate sector, resulting in urban sprawl over the adjacent farms along the railroad. The economic development brought a greater division of labour and social stratification resulting in spatial segregation. The city expanded in all directions, but selectively. To the west, the terrains of slightly wavy topography and rising altitude were appropriated by the elite. The lowlands, to the east segregated by the Tamanduateí floodplain and the railroad, were left to the low-income class.

The Santos-Jundiaí railroad construction caused the valorisation of the Northwest sector, as the the Luz Rail Station made the region the main gateway to the city. During this period, urban planning in Brazil was

influenced by European experiences, resulting in central area improvement plans for the main cities of the country (Leme, 1999). Following these concepts, the main public works of the time valued the Central Area, through the construction of new avenues and expansion of the existing ones, construction of parks, gardens, squares and public buildings, such as the remodelling of Anhangabaú Valley, the construction of the Patriarca Square and the Municipal Theatre, as in figure 1.

The urban legislation of this period reinforced the valorisation of the central area. The Code of Postures, which was the main existing legislation, prohibited the installation of so-called “nuisance” practices, such as tenements and slaughterhouses, in the “city perimeter”, in an attempt to keep this area exclusive to the São Paulo elite (Rolnik, 1997). At the end of the nineteenth century, the expansion of the upper classes rose toward South, developing Vila Buarque and Higienópolis neighbourhoods, reaching Paulista Avenue, moving away from the working-class districts. From the early twentieth century, this expansion went south towards the Pinheiros river floodplain, in an Ebenezer Howard “garden city” model development.

Figure 1 – Anhangabaú Valley in 1920s.

Source: http://smul.prefeitura.sp.gov.br/historico_demografico/img/1920/teatro-sao-jose-grande.jpg

From the 1920s on, São Paulo has consolidated its position as the industrial centre of Brazil. High rise development and commercial specialization caused the centre loss of residential function. The 1930 Avenues Plan resulted in the construction of a series of radial roads, reinforcing the city centre valorisation and low-income peripheral sprawl. From the 1950s to 1960s, Paulista Avenue became the new elite centre, while the Central Area became the popular centre, being progressively abandoned by the bourgeoisie.

Between the 1980s and 2000s, the centre decline was intensified as large public and private investments developed a “new metropolitan centre” in the Southwest Zone of the city, along Pinheiros River embankment (Nobre, 2000). These investments resulted in a large increase of vacant commercial buildings in the Central Area, which old buildings could not compete with the new development in those regions. Between 1990 and 1998, while the city's vacant commercial stock grew by 32%, the Centre vacant commercial stock increased by 55%, reaching almost 600 thousand square meters, 60% of the city commercial vacant buildings, though the Centre concentrates only 40% of the built stock (Nobre, op. cit.).

The City Centre decline was accompanied by the continuing low-income peripheral sprawl. Between 1991 and 2000, peripheral districts and municipalities, located in environmental protected areas (mountain ranges and watershed areas), gained 360 thousand inhabitants, with a growth rate of 6.3% per year, well above the metropolis average of 1.6% (Nobre, 2004).

Paradoxically, during this period the central districts were the ones with the highest population decline in spite all the existing infrastructure (São Paulo, 2006). From 1980 to 2000 the ten central districts lost almost 200 thousand residents. This led to an increase in vacant residential properties, growing 55.6%, from 270 thousand to 420 thousand, specially the residential vacancy that went from 10.6 to 14.5% of the building stock. Around 40 thousand residential vacant units were located in the central area districts (9.2%

of total residential vacancy). According to IBGE data, the ten central districts were among those with the highest residential vacancy rate, with an average of 18.4% of vacant properties, as seen in table 1.

	Population		Growth	Households	Vacant	Vacancy Rate
	1980	2000				
Metropolitan São Paulo	12,588,725	17,878,703	1.8%	6,531,119	728,171	13.1%
City of São Paulo	8,493,226	10,434,252	1.0%	3,554,820	420,327	14.5%
Bela Vista	85,416	63,143	-1.5%	33,848	5,479	21.9%

3 PLANS AND PROJECTS FOR SÃO PAULO CITY CENTRE

The first responses of the Municipal Government to the City Centre decline date from to the 1970s. At that time, the plans had a strong emphasis on issues of historical heritage and traffic control, based on the idea of urban rehabilitation, proposing the expropriation and restoration of historical interest buildings and the creation of a pedestrian sidewalk circulation system approximately seven kilometers long (Emurb, 1979).

In the 1980s, despite various proposals nothing was implemented. The diagnoses elaborated by such studies already identified a centrifugal growth/peripheral expansion and proposed the population densification in the central area, through zoning revision. At that time, the only actions implemented were the construction of tunnels that deviated through-traffic from the central area, recreating the Anhangabaú Valley Park and the restoration of the Municipal Theatre.

Luiza Erundina's Office (1989/1992) proposed a "Return to the City Centre". In addition to finalizing Anhangabaú Valley works, it promoted several urban projects public competitions for the neighbourhoods around in the Central Area, implemented a program of slum tenements improvement of and brought the City Hall from the middle class area to the City Centre, seeking to move the axis of municipal power to the popular city.

It dates from this office the Anhangabaú Urban Operation, a project that aimed at City Centre improvement, making better use of vacant and underutilized properties, encouraging the preservation of historical heritage and residential use in the area. It provided exceptions to the land use legislation and the building code, allowing higher FAR (floor area ratios) and the transfer of development rights for listed buildings.

Although all the benefits proposed, there was few interest of the real estate market, since until the end of the project in 1994, only seven proposals had occurred, consuming only 13% of the additional building stock (Nobre, 2009). The higher densities allowed in the new of FARs did not constitute sufficient incentive to attract new investors to the City Centre.

The following two offices, Paulo Maluf (1993/1996) and Celso Pitta (1997/2000), despite continuing the discussions about the central area, changed their focus favouring the development of large real estate projects in the city's Southwest Zone, where the highest income population lives, concentrating heavy public investments in several road works and removal of favelas, valuing even more urban development in this area.

Despite this, it was during this period that the PROCENTRO – City Centre Urban Requalification Program was created. The diagnosis presented in its creation document defined as the main problems of the Centre deterioration the difficulty of traffic access, circulation and parking; obsolescence and insufficiency of the real estate stock and deficiency of personal and patrimonial security (São Paulo, 1993). The proposals were a result of the discussions of the municipal government with central area businessmen who wanted to reverse the process of Centre decline, bringing back the elites. Despite all the incentive to urban renewal contained in the PROCENTRO projects, it also caused little interest from real estate market.

The Martha Suplicy administration (2001/2004), instead of just stimulating real estate development as an urban renewal strategy, decided to propose a new plan for the Centre, based on functional and social diversity, seeking to emphasize housing, employment, culture, leisure and education activities in this region. Social housing implementation became one of the main strategies of this plan.

For that reason, this office changed the composition of the PROCENTRO council, now coordinated by the Secretary of Housing and Urban Development (SEHAB) with a more diversified representation of the society than the previous one, adding representatives of professional institutions (lawyers, architects and engineers) and also from the housing movement. In 2003, after signing a € 145 million loan with the Inter-American Development Bank (IDB), the Central Area Rehabilitation Program – Ações Centro was launched coordinated by the Municipal Urbanisation Company (EMURB) responsible for City Hall major works.

The Ações Centro Program contained five lines of action:

1. Reversal of the real estate devaluation and recovery of the residential function;
2. Transformation of the economic and social profile;
3. Rehabilitation of the urban environment;
4. Improvement of transport and mobility;
5. Institutional strengthening of the Municipality.

The reversal of the real estate devaluation and recovery of the residential function would be obtained through the revision of the legislation, implementing the Social Interest Special Zone – Type 3 (ZEIS-3). The ZEIS-3 is a type of inclusionary zoning where at least 40% of new development area must be social housing units. The type 3 were enacted in areas with vacant land or underutilized buildings in the City Centre.

In order to reduce vacancy, the 2002 Strategic Master Plan defined that any building with more than 80% of its area unoccupied for more than five years in the central area could be expropriated by the municipality if it remained vacant. This was in accordance to the 1988 Federal Constitution that defined the conditions of urban property social function.

The “Living in the Centre” Program (Programa Morar no Centro) was also implemented, promoting social housing in the central area, handing by the end of 2004 many social housing developments¹ and favela upgrading financed by the Federal Saving Bank (CEF – Caixa Econômica Federal).

Complementing these actions, the Law of Selective Incentives was enacted providing tax exemptions for new companies and development in the central area, and both the Municipal and the State Government brought 11,500 public servants from various municipal and state departments to work in the City Centre, resulting in the recovery of local commerce, specifically bars, restaurants and small services.

The next office, Serra/Kassab (2005/2012) revised the Ações Centro program, causing a reversal in the ongoing process. The Nova Luz Project proposed the expropriation of several blocks near the Luz Rail Station, known as “Crackland”, to promote an urban renewal process based on an information technology pole development, many poor families were evicted from vacant buildings, and the City Hall pardoned millionaire debts in property municipal taxes of several vacant buildings.

4 SOCIAL HOUSING PRODUCTION IN THE CITY CENTRE AND THE REVISION OF THE ZEIS 3

Despite the changes in the “Living in the Centre” program, some social housing production occurred, often by the initiative of the residents themselves and not so much of the government. According to the Instituto Polis (2013), since the 1990s there have been 44 occupations of vacant buildings, accommodating almost 10 thousand families in the central area. However, the response from the government was three times smaller than the problem, since 2001 only 2,833 housing units were produced, of which 709 were financed by CEF, 858 by CDHU (State of São Paulo Housing and Urban Development Company) and 1,266 by the Municipality.

Some old buildings were renovated for the low-income population and the works were carried out by small contractors (Gatti, 2015). In their research on the implementation of the ZEIS 3, Samora & Hirata (2013) state that between 2001 and 2010 10,317 units were launched with 70 square meters of floor space and maximum price of € 1,800/m². Of this total, 3,567 units were located in ZEIS, or 35% of the total. The highest concentration of construction permits in ZEIS 3 occurred between 2006 and 2010, when 2,673 units were launched, 56% of the total period. According to them, new private development followed middle-class models because as 90% of the buildings constructed are in tower blocks of more than 10 floors and 44% of buildings have underground parking areas. By these parameters it can be affirmed that the population of low income was not met as predicted before. On the other hand, public developments followed the traditional patterns of social housing, as 44% of them are five floor high buildings to avoid lift costs.

The 2002 Master Plan earmarked one million square meters as ZEIS 3. By 2013, 51% of this area had already been consumed for real estate projects. Of this total, only 23.8% was built for public social housing; 22.1% was lower middle-class private dwelling; 22.2% was high-income development and 31.9% social facilities. This process of rehabilitation of the centre resulted in an increase of 63,800 new residents and the construction of 40,700 new homes in apartment buildings (Kara-José, 2013). The 2002 São Paulo Strategic Master Plan (Law 13,430/2002) was scheduled to be revised in 2006, but the proposal for revision was not completed in the last two municipal administrations. The review was started in the first year of Fernando Haddad office (2013/2016) through a broad discussion process and it was approved on July 31, 2014.

The master plan revision would be an opportunity to review the implementation of the urban planning instruments detailed in the 2002 Plan. Many of them did not achieve their goals in the way they were designed because they were not properly applied by the administration that followed its approval. In the case of ZEIS one can identify multiple aspects of conceptual misunderstanding, the inapplicability of its fundamental principles and the need for revisions considering the urban transformations over the last decade.

The new 2016 Master Plan brought significant advances in the viability of housing for low-income families: it increased from 964 to 2,542 the total number of ZEIS perimeters and from 145 to 478 the perimeters of ZEIS 3, destined almost exclusively for families earning less than three MW (€ 729). The most important change was the enactment of mechanisms to create land banking for the production of social housing, through the ‘Solidarity Quota’, resources derived from the large scale urban development projects (called Urban Operations) and the allocation of resources from the Urban Development Fund (FUNDURB). With the ‘Solidarity Quota’, any enterprise with a computable area above 20 thousand square meters must donate 10% of its built area for social housing, on site or on other land, or donate land equivalent to 10% of the total area project or donate an amount in cash equivalent to it to the FUNDURB (Gatti, 2015).

The creation of a land inventory for housing production is one of the major advances of the New Master Plan proposal, since it allows the municipality to face one of the greatest difficulties of housing management, which is to acquire land that is well located and therefore highly valued for social housing production. The areas earmarked as ZEIS are intended to guarantee the permanence of the low income population in their places of origin and to reserve parcels of land throughout the urban perimeter for the production of social housing, especially in the central areas, where the price of land makes it quite impossible the access to housing for the poorest population.

However, during the ten years ZEIS implementation after the 2002 Master Plan, the production of social housing in well-located areas only benefited families earning less than three times the minimum wage when was associated with public housing programs, produced on a small scale. On the other hand, the private market, which was responsible for the production of social housing and lower middle-income housing in combined enterprises in ZEIS, limited the service to families with incomes between 5 and 6 MW, since there was no obligatory percentage to attend lower income families.

With the new Master Plan, two social interest income brackets were created: Social Housing 1 (HIS 1) from 0 to 3 MW; and Social Housing 2 (HIS 2), from 3 to 6 MW. Priority was given to housing production for HIS 1: at least 60% in ZEIS 1, 2, 3 And 4; in order to guarantee the housing service for the poorest, who are majority of those who inhabit the perimeters of ZEIS and the highest percentage of the housing deficit. Even so, the most vulnerable section of the population, with incomes less than one MW, may not be included in the housing program if the local authority does not assume this commitment, since there is no minimum percentage allocated to it in the perimeters of ZEIS. This was a current debate during the review of the Master Plan, which was left out of the proposal because of the difficulty in measuring this demand. It is a population that lives in slums, favelas or even in the streets, and is at the limit of informality. This demand requires a specific housing policy other than that of housing finance with transfer of ownership, in order to reverse its condition of abandonment.

Considering that social housing production in ZEIS for lower income brackets has not happened over the last ten years and that the revision of the Master Plan has sought to join efforts to this, focusing on the role the government should play in this process, the question is whether the implementation of the resources as proposed by the new Master Plan will respond to this new expectation. If a major effort has been made to earmark new perimeters of ZEIS 3 in underutilized areas occupied by precarious housing with potential for housing production, should not resources be provided for the acquisition of this land and their production? The resources of the Solidarity Quota and Urban Operations are not prioritized to be applied in areas of ZEIS. The resources of FUNDURB are destined to acquire land 'preferentially in ZEIS 3', but not necessarily. According to the Master Plan rapporteur in the City Council, councilman Nabil Bonduki, making land available outside ZEIS would further expand the stock of land, since land already earmarked as cheaper ZEIS would be more easily acquired by other instruments. However, if there is no public initiative in housing production in ZEIS, these recorded lands may be frozen and idle, which would not necessarily be a bad thing, considering that these areas would still be 'saved' for future social housing production. The aggravating factor is that these areas are constituted predominantly by a population living in slums and in a precarious housing situation and that will continue without any prospect of improvements in their housing conditions so soon. Considering these aspects, the municipality should move towards the acquisition of these areas inside the ZEIS.

Nevertheless, for the viability of acquiring land, even if not exclusively in ZEIS, there are many sources: the solidarity quota, urban operations, FUNDURB and the instruments of property social use induction (PEUC – parcelling, construction and compulsory use of land), progressive property tax for unused land and buildings, real estate consortium, municipality right of preemption and abandoned buildings and land reclamation. But there is no reserve of resources specifically for the production of new units or renovation, especially in the area of ZEIS, whether for purchase or lease.

Although public resources can be earmarked for housing production, its priority allocation in the new Master Plan is for the acquisition of land. The main rationale for this was the priority to solve the land issue, since land prices are the biggest obstacle to the production of housing and the construction can be financed by other sources, such as the My House, My Life Program (PMCMV – Programa Minha Casa, Minha Vida), a Federal Program that finances housing acquisition and construction. With a land banking this difficulty would then be overcome for the production of well-located housing for the poor.

However, public policies must seek not only for financing the acquisition of housing through transfer of ownership, as it will continue to be inaccessible for the most vulnerable sections of the population, that cannot meet the requirements of formal financing, nor afford condominium expenses and new costs of formal housing, nor those whose work dynamics require residential mobility. The long-term instability of this model must also be considered, since changes in the economic or political conditions may compromise the granting of subsidies, not securing the tenure of the residents.

4.1 CHALLENGES OF PUBLIC POLICIES IN ZEIS 3 AFTER THE MASTER PLAN REVIEW

Considering the challenges for the ZEIS 3 to become viable as an instrument for access to housing and permanence of the poorest population in the central areas, a research was initiated under the current FAUUSP-FAPESP post-doctoral program to verify the performance of the municipal public policies on the areas earmarked as ZEIS after the revision of the Master Plan. Among the policies underway, three active policies on the areas of ZEIS are being verified: the application of instruments that induce the social function of property, whose notification of the PEUC will be dealt with here, the application of Municipal Fund (FUNDURB) resources and the housing policy guidelines of the new Municipal Housing Plan. The survey will still have the data updated with the end of the current municipal management and will also present the survey on the approval of enterprises in ZEIS 3 that used the rules of the new Master Plan approved in 2014, in order to verify who are the developers in ZEIS, what type of development is being produced and which demand is being met.

Regarding the application of the instruments that induce the social function of property, they were regulated by the Master Plan and implemented by the DCFSP – Department of Control of the Social Function of Property, inside the SMDU – Urban Development Municipal Department. The three instruments that induce the social function of the property will be given successively, in the following order: Parceling, Building and Compulsory Use (PEUC), Progressive Urban Territorial Property Tax (IPTU Progressive in Time) and Expropriation through Payment in Securities Public Debt, to be initiated by notification of the owner of the urban land not built (property with an area above 500 square meters with FAR equal to zero); underutilized (property with an area of more than 500 square meters whose FAR is lower than an specified value); and where there is at least 60% of the area not built for more than one year. From the notification by the PEUC, the owners will have up to one year to present a project, two years to start the works and five years to complete them. After a period of five years, the progression of the IPTU rates can be initiated, and after five more years the expropriation can be done.

ZEIS 2, 3 and 5 are considered priority areas for the application of the instruments that induce the social function of the property, among others, which also include the City Centre, amongst other areas. The PEUC notification was initiated within the ZEIS inside Urban Operations from the fiscal registry of the Finance Department. This department crosses the data from plot areas with the built-up areas, providing the data for the identification of underutilized and non-built properties. For unused real estate, there is no database, only a study on vacant buildings. The identification of the unused ones is the great challenge for the City Hall, since it is done through surveys, by a reduced team, and from the reception of information from municipal councils and social organizations, as well as more recently the implemented Collaborative Map by the City Hall to identify the social function of property ownership. From the crossing of ZEIS perimeter data with PEUC notifications made available until August 2016, it was possible to identify the notification of 116 properties reported in ZEIS 3 (of the 749 existing perimeters), compared to the 258 mobile units reported in ZEIS 5 and 544 Buildings reported outside of ZEIS, according to the following map, where it is possible to visualize the low incidence of areas of ZEIS 3 reported by PEUC.

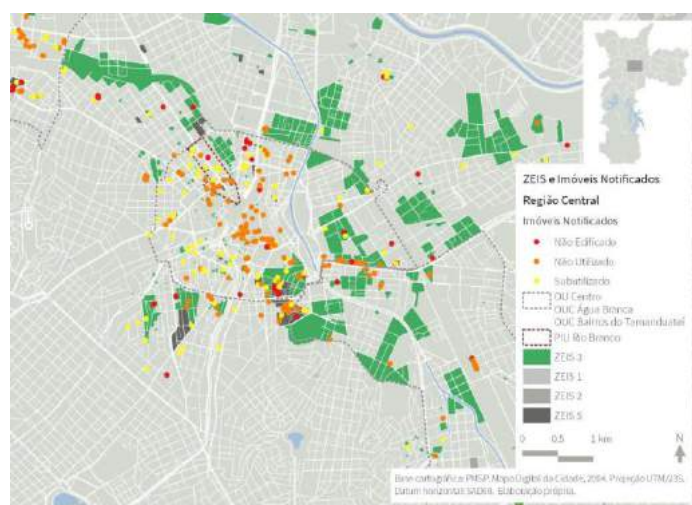

Figure 2 – ZEIS and Buildings notified by PEUC in the central area.
Source: elaboration by the authors

The municipality justification for the low incidence of notifications is mainly due to the characteristic of ZEIS 3, where there is a high incidence of buildings built, but not used, or of irregular use and occupied by precarious housing, such as tenements, which in practice are in use. And it is precisely these properties that do not have a database for notification, depending on surveys and cross-checks of data from sources other than the official databases.

Buildings occupied by housing movements, for example, or illegally occupied, are not notified, so that the City Hall does not legitimize repossession processes, thus constituting against the right to housing of the occupants. However, of the 544 properties reported outside ZEIS, 349 correspond to the unused category within the perimeter of the City Centre Urban Operation, which may be justified by the notification of buildings identified in the surveys.

5 FINAL CONSIDERATIONS

The Ação Centro Program proposed an integrated rehabilitation of the central area with a plural vision, based on: the recovery of urban space and public buildings; the promotion of new commercial activities; the definition of a strategy of occupying vacant land with social housing; the promotion of public policies for vulnerable groups. So, the program aimed to promote both the functional and the social diversity of the area. Change of the municipal administration has considerably modified the program, focusing on urban renewal of an elitist character in the Luz region.

The attempts to fix the low income population as a resident in this region ended up encountering resistance from the owners, who did not want to lose the expectation of their land valuation. The part of the Program that was implemented managed at least to reduce physical decay and housing vacancy. The arrival of thousands of civil servants and the recovery of urban space and public buildings, despite not reversing the production dynamics of the metropolis, managed to attract private investments in the occupation and recovery of several properties, without causing a large expulsion of the low-income population. However, the current political forces seem to direct the current public policies for the Central Area to a process of renovation of its urban and social fabric.

There was an omission of the municipality that resulted in the non-implementation of the social housing units sufficient enough to meet the demand. The ZEIS 3 tool, designed specifically to meet the lowest income strata (up to 3 minimum wages), was not working and social housing in the city center continues to face many threats. The Federal My Home, My Life program implementation resumed to credit and housing financing, with a paradoxical effect, as it ended up causing a rise in land prices throughout the city and in the country (property values doubled in only five years).

Finally, a new proposal for the implementation of housing developments in the center was launched by the State and the Municipality, in the model of a PPP in which only 16% of the 20,221 units envisaged are destined to the lower income strata. So far, it seems that the occupation of empty buildings promoted by housing movements is the only way to ensure the right to stay and fight for decent housing in the central area for the lower income most vulnerable groups.

The cross-referencing and knowledge of the motivations for which there is little incidence of PEUC notifications in ZEIS 3 show us how existing instruments to guarantee the social function of property need to be articulated with a specific housing policy for precariousness existing in areas of ZEIS 3, in order to achieve the objectives inherent to the demarcation of central areas destined to the production of housing of social interest. The lack of an action policy focused on the perimeters of ZEIS can contribute to the maintenance of existing housing precariousness and to the idleness of these areas, since with the review of the Master Plan, prioritizing the perimeters of ZEIS for HIS 1 make difficult to the private market to undertake land in areas earmarked as ZEIS 3.

Considering the impossibility of the private market to produce housing for the lower income brackets in well-located areas, the new Master Plan reinforces the role of public power as a promoter of social housing in the ZEIS perimeters in order to reverse the 2002 Master Plan logic, which focused the responsibility for this production on the private market. We still have to understand how and with what housing programs the ZEIS will fulfill their role as a tool for democratizing access to land. Municipal Management will need to be committed to the acquisition of land in areas earmarked as ZEIS and in the application of resources for

a social housing production that is not only linked to housing financing, but also to the creation of a public park that promotes access to housing without transfer of ownership and guarantee the permanence of the poorest in real estate valued areas.

ID 1520 | COLLABORATIVE HOUSING SHAPING NEW FORMS OF URBAN REGENERATION: AN ITALIAN APPROACH, THE CITY OF TURIN

Nadia Caruso¹

¹Politecnico di Torino

nadia.caruso@polito.it

1 INTRODUCTION

The concept of "collaborative housing" encompasses various perspectives on the housing issue: from the scale of single architectural project to the broad neighbourhood dimension, involving different actors and networks and with a specific attention towards social capital and the role of the community. The main research question of this paper is whether a collaborative housing development has an effect on the larger neighbourhood. The aim is addressing the topic focusing on the urban regeneration/revitalisation effect, in order to understand if collaborative housing can be an aid against social exclusion and marginalisation related to housing distress. Therefore, the author intends to investigate whether the development of collaborative housing can be a mean to increase social cohesion and strengthen community involvement.

The Italian case study can contribute to an international comparison: Italy constitutes a particular territorial context in Europe due to the scarce investment on public housing and the irregular attention of national governments and national policies on the social housing sector. This case allows to discuss the definition of collaborative housing in a historical and place-specific perspective.

The practices developed in Turin, a metropolitan city in the North-West of Italy, show a comprehensive approach to the housing issue. In Turin public and private local stakeholders promoted a general frame of actions to deal with social exclusion and marginalisation related to housing distress. The city's approach indicates that collaborative housing can promote new forms of intervention in the urban contexts.

The city of Turin is also a national well-known pilot case for urban regeneration practices, strategic planning and integrated approach to urban problems. In the past decades the local government has fostered the debate and the development of innovative practices to tackle social and economic challenges: the city had to deal with the post-industrial phase, re-inventing its identity, image and vision for the future and managing socio-economic inequalities. Therefore, the theoretical framework implies the reflection on the national housing policies and the path-dependent dynamics taking place in the country and in the local case study.

The variety of housing practices established in Turin shapes a broad scenario of different tools and mechanisms to reach various forms of housing distress and social inequalities. The analysis of these practices contributes to both the definition of "collaborative housing" and the focus on typologies, actors and residents involvement, values and tenures. The reflections on these forms of collaborative housing are linked to their future challenges: financial and temporal sustainability in the long term, the relation with the other welfare sectors, and the role of private actors.

2 COLLABORATIVE HOUSING

Since the 1990s many European countries have seen the development of a wide range of selforganised forms of collective housing provision. These take a variety of shapes, including Community Land Trusts (CLTs), co-housing, residents' cooperatives, self-help and self-build initiatives, experimental work-life communities, ecological housing communities, new settlements based on (local) community asset ownership, etc. While not entirely new, this recent wave of collective self-organised housing feature some new aspects and approaches, including concerns for wider social inclusion and cohesion as well as affordability and higher environmental sustainability standards.

"Collaborative housing" has been adopted by many researchers and practitioners as an umbrella term to encompass the wide variety that these forms of housing can take. The term suggests that collaboration among residents in housing provision represents one core aspect of all different models (Fromm, 2012; Vestbro, 2010). The international literature refers to a broad variety of experiences with the characteristics of co-housing (see the special issues of the journals: *Built Environment* 38/3, 2012; *Urban Research & Practice* 8/1, 2015). Therefore the focus of research on collaborative housing is mainly on its ability to ease residents' daily living tasks and improve residential social contact within a self-created community (Fromm, 1991; McCamant & Durrett, 1988; Vestbro, 2010); less so on their effects on the larger neighbourhood as a stabilizing and instigating force, in the provision of services, or as an aid to the needs of specific groups of residents.

In this paper the meaning of "collaborative housing" will be stretched encompassing not only cohousing, but also other forms of housing sharing services, promoted by public and private actors, involving not-for-profit associations and supporting the daily lives of residents.

3 ITALY: IRREGULAR ATTENTION FROM THE STATE AND HIGH HOUSING DEMAND

The strength of traditional social housing policies has ended with the neo-liberal turn and the withdrawal of the State from housing as a welfare sector. In some European countries important strategies are still developed by the national state but the Italian situation is different. Italian housing policy is traditionally residual and oriented towards home ownership. After the strong investment in housing after the Second World War, during the 70s and 80s housing sector registered the withdrawal of the State from this policy. Then, from 2000s national Italian governments enforced various contrasting policies. Every government has promoted different mechanisms to address housing need, focusing on specific categories of people and implementing specific tools. This turnover has created a variable picture of Italian housing policies. Different laws and plans have started targeting the institutional and legislative framework in order to reform the sector and promote rental housing, but public-private partnerships (especially triggered by the system of real estate funds introduced lately), cannot be considered as the solution for the pressing and urgent housing need. Today, a structured response designed strategically for the long-term housing system would be the most important achievement for the country, surpassing the fragmented and short-term initiatives of the past decades. Neo-liberal turn and welfare cuts are pushing to enhance the importance of private actors and self-made solutions. This tendency, which is common to all Europe, implies a certain degree of spatial imbalance, since not all territories can afford wise self-initiatives, ethical private investors and local authorities that promote empowerment of their communities.

Families and social structure have changed in the last decades, so the housing demand have become highly fragmented. The number of family members has decreased and been transformed, the population has grown older and the number of families has increased (formed by only one or two people) compared to the past¹. The family structure has also changed with the new forms of couples, since divorces, unions, separations have created single-parent families or families with different parents. Spatial variability has diminished. Moreover, internal mobility has undergone a reduction, and the process of migration towards the biggest cities is not so strong anymore. Home ownership is strong and has kept increasing (Indovina, 2005).

¹ Birth rate has decreased since the 1960s, while the life span has improved (longevity can be calculated as around 80 years nowadays).

Families, as in other Southern European countries (Allen, Barlow, Leal, Maloutas, & Padovani, 2004), play a main role in solving housing issues. Family networks substitute the State providing help to find accommodation and/or economic resources. If the national housing policy can be considered weak and never able to cope with the demand, solidarity has played an important role in compensating for the welfare state's weaknesses. Despite these attempts, the whole problem was not solved and the housing market has proved to be the foundation for many social and economic problems, especially considering the imbalance between housing demand and supply (Governa & Saccomani, 2009).

Housing deprivation no longer concerns only traditional low-income families but new, numerous and heterogeneous population segments, which were not previously affected by this problem (Tosi, 2007). Moreover, the changes in post-Fordist societies and the impact of the globalisation process, mainly related to labour market flexibility and to the widely feared risk of unemployment (Clapham, 2006) has given rise to new forms of social fragility and poverty, which has strong consequences for housing needs.

Real estate agencies have developed and are now ruling the sales market. The cooperative sector has been strengthened, while real estate developers keep polarising (Boeri, Lanzani, Marini, & Associazione Interessi Metropolitani, 1993). A real estate boom could be observed from 1997 to 2005, housing prices increased by 51%, in big cities property sales rose by 65% and rent prices grew by 85% (Anci-Cresme, 2005). Public-private partnerships and negotiation practices have become more common, and so has the use of different financial resources.

A clear picture of the housing demand is hard to get in Italy. In terms of quantity, demand-related data are partly measurable with no clear details about how many people have temporary housing needs or who has affordability problems in the private housing market. Both the number of people in the lists for social housing and the total amount of public dwellings are registered, so the public housing situation is better defined. For instance, in Turin there are around 18,000 subsidised dwellings¹ with around 10,000-13,000 applicants each call (13,000 in 2014). Every year only few hundreds of dwellings are freed and change their tenants. Adding the number of families with emergency housing conditions (e.g. eviction) and the ones at housing risk to the waiting lists would strongly increase the demand's numbers.

The high degree of differentiation among local contexts, regions, provinces, municipalities, North and South of Italy shapes the Italian scenario. The housing need is pressing throughout the country, shaped by different local characters (changes in the housing demand, number of empty dwellings, percentage of illegal housing or squatting in public housing, etc.). Urban dimension, extent of housing needs and local actors influence the outcome of practices. Despite these local differences, the subsidised housing sector responds to a small share of housing hardship and is unable to offer a solution for all applicants. Therefore, considering the current data about the impact of the financial crisis and the growing socio-economic inequalities in Italian cities, housing can be acknowledged as one of the main pillars of welfare to be addressed in order to improve social cohesion and social inclusion at a national scale.

Despite the controversial national scenario (various governments' turnover), in the local contexts the concept of social housing has been expanded and various types of interventions are now part of public housing policies (Caruso, 2016). Public authorities (Municipality, Regional Administration and territorial housing agency) are making an effort to take care not only of the most vulnerable classes of the population, but also of different categories of people with housing needs. In fact, the cities' public entities and their private not-for profit actors acknowledge the growing diversity of the housing demand. The measures adopted focus on the differentiated demand, namely young people, the elderly, temporary residents and immigrants. The intention is to adapt housing policies to social groups that are experiencing housing hardship or which are at risk of housing deprivation.

¹ Instead, the main metropolis in the North-West of Italy, Milan, has about 60,000 dwellings and 1.3 million citizens. The size of subsidised housing also influences its management in terms of financial resources to maintain it, managerial capabilities, social services to support the inhabitants and avoid social polarisation and social exclusion.

4 TURIN: FROM URBAN REGENERATION TO HOUSING PRACTICES

Turin, the regional capital of Piedmont, counts about 900,000 inhabitants and is located in the North-West of Italy. It has always been an industrial city, the hometown of the car factory FIAT. Nevertheless, the city has been looking for a new identity since the 1990s, and new cultural and economic sectors have been promoted to surpass the Fordist image. The city has a past of one-company-town linked to the automotive sector and FIAT industry, then in the post-Fordist phase it became an experimental field for several spatial planning strategies (strategic plans, urban regeneration processes, urban development projects changing its urban structure). Housing policies in Turin were developed in the last decade without any form of advertising: there was a temporal agreement in favour of housing as priority among public authorities (Region and City Council), local bank foundations (ethical investors), and tertiary sector.

During the past 25 years, changes in social, economic and physical domains marked a huge transformation for the city of Turin. From 1993 a change in the national electoral law allowed the direct election of the Mayor and Turin is a good example of the “turn” of Italian politics at a local level. Various forms of urban development were implemented following the Masterplan (1995). The urban structure was transformed by substituting industrial areas (especially those located along the railway system, which is now mainly underground) with public and private housing and public buildings. This axis is called the backbone, *spina*¹. The local government’s priorities, defined since the mid-90s, have enabled Turin to implement many innovations in terms of urban policies, above all in the field of urban regeneration (Regione Piemonte, 2004) and strategic planning. Progetto Speciale Periferie (PSP, Special Project for the Peripheries) was an integrated programme of urban regeneration initiatives organised in various neighbourhoods by applying the area-based integrated approach. A Pilot Project of Urban EU initiative (called “The Gate”) and an Urban 2 initiative took place in Turin, (in the area of Porta Palazzo and Mirafiori, respectively). Furthermore, Turin was the first city in Italy to promote a voluntary strategic plan, which involved the city’s actors. The city experimented with this tool twice in the 2000s. A third strategic plan was developed in 2015.

In 2006, the city hosted the Winter Olympic Games. And since then it has made every effort to attract and organise a large variety of cultural events (Rossi & Vanolo, 2013). The old industrial spaces have been transformed and a new season of real estate expansion has taken place. Numerous cultural and sports buildings were built to host the Games and other events. The Olympic buildings have generated issues about the re-utilisation of cultural and sports buildings and the sale of several new residential constructions in the free market. Nevertheless, it is also important to highlight the presence of subsidised and assisted housing in Olympic housing projects². Meanwhile, focusing on the infrastructural field, the first metro line was built, the second one is currently being designed and various car sharing and bike sharing have been launched. The scenario of projects, initiatives, strategies and urban development show a city with multiple paces and interests; precisely, the political élite demand and promote competitiveness (economic transition, Olympic Games, international events); hence, innovative approaches and tools (urban regeneration, strategic planning, place-based approach) are applied to overcome social polarisation and reinforce social cohesion.

For instance, different public authorities at the city level (i.e. planning, social services, police forces) have cooperated to target neighbourhoods presenting complex problems with an integrated approach (Saccomani, 2004). If this was a time to experiment with urban policies and develop the capacity of “discussing and deciding” to govern the change (Bagnasco, 2008), the physical developments promoted by the Masterplan were implemented without particular concern for the social dimension. In the wake of other European cities, Turin exploited its urban development to reinforce the real estate sector and the so-called neo-liberal policies (Moulaert, Martinelli, Swyngedouw, & Gonzalez, 2009; Moulaert, Rodríguez, & Swyngedouw, 2003), paying scarce attention to architectural quality and the integrated approach.

During the past decade, public and private actors have developed several housing initiatives in the territorial framework of Turin. Coming from different perspectives and points of view, various stakeholders have implemented housing solutions to meet a broad range of needs. Despite the scarce financial

¹ The current Masterplan, approved in 1995, supported the revitalisation of the real estate sector. Building production has been accelerated following the idea of transforming the areas close to the railways and dismissed industries. The sector has fallen from 2008.

² For instance, 342 units of one of the Media Villages built for the Olympic Games were transformed into social housing. In the Athletes Village, 204 units were converted into social housing.

resources, virtuous actions have dealt with the housing issue and were unable to solve it but can be considered as “pillows” slowing down the impact of public housing residualisation and the financial crisis.

Public actors (Piedmont Regional Administration and the City of Turin) triggered the launch of local housing policies through a programming phase and specific attention towards the differentiated housing demand. The work of public authorities has been combined with the initiatives of bank foundations¹ and the services sector (associations and not-for-profit organisations) in order to shorten the gap between demand and supply, dealing with structural issues of the Italian housing system.

The city of Turin has three documents (norms and plan), which must be taken into account when describing its housing policy in the last years:

- change in the city's Masterplan by providing 10% of agreed housing in a new housing development (over 4,000 m²) (Variante 37/02, art. 6, section 10bis Norme di Piano) in order to increase social housing and promote the social mix in new urban developments;
- guidelines promoting the social mix in the neighbourhoods where urban regeneration programmes are in force (Municipal Council Decree no. 06990/012 of 31/08/2004);
- municipal Housing Plan 2009-2010 (Piano Casa, D.C.C. 205/2008) that describes the actual situation and defines the strategies and initiatives for the next years.

The first two tools represent the intent to improve the social mix in both the new urban development and the older subsidised neighbourhoods. The financial character of these measures is important, precisely the city is not investing big amounts, but alternative procedures (low-budget) are established in order to encourage social polarisation in the city. Following the first norm, the Municipality has the pre-emptive right to purchase flats within 12 months or else the flats will be rented out as agreed housing. Imposing this norm to private housing developers can be considered a burden for the private housing development sector, while new social housing flats are increasing the supply without a real public investment.

The guidelines promoting different forms of action are, instead, meant to improve the social mix in social housing neighbourhoods. For instance, guidelines promote the creation of “special lists” of people who can access social housing. If normal waiting lists are defined according to economical, social and health criteria, “special lists” can include elderly people, young couples, migrant workers waiting to go back to their countries, disabled people and police officers. Using “special lists” allows to mix the traditional most vulnerable people with these categories of population, thus re-balancing the community.

Turin's Housing Plan frames the housing situation in the city in 2008, but it also promotes several initiatives that were already implemented in the previous years:

- a public agency of intermediation for the private rental market called Lo.C.A.Re. established in 2001 and extended to the metropolitan area from 2010; it provides economic incentives and guarantees owners an economic contribution for the tenants; since 2001 this initiative has supported around 4,000 tenancy agreements;
- new temporary residences for various categories of people (temporary city users, elderly, single parents, etc.) in housing need (called: Social Hotel “Sharing”, Social Collective Residences, Supportive Condo); the beneficiaries are individuals or families needing a dwelling for a limited amount of time (18 months maximum) for economic, occupational or family problems; in some cases, specific categories of people are added to these projects in order to complete a path towards housing independence with social services; public or private services are present in the buildings in order to assist both inhabitants and the neighbourhood's citizens, thus maintaining relations with the rest of the urban area; some of these residences can be considered part of urban regeneration initiatives due to their transformational power to change dismissed buildings and areas;

¹ In Italy bank foundations play the specific role of ethical investors and complementary promoters of social policies. The general goal of these bank entities is to provide services and activities of general interest, which have a value for the community. These are not-for-profit entities and, according to Italian law (Legislative Decree 153/1999), they can operate in specific sectors, such as education, health, charities, religion, social housing and local development, civil rights, care of the elderly, sports, scientific research, environmental protection, art and cultural activities. In the housing and social housing sectors, they can invest in urban regeneration projects, in public-private partnerships, and they can provide public services.

- promotion of forms of co-housing, called Supportive Co-housing (Coabitazioni Solidali): since 2007 the city has experienced young people settled in subsidised neighbourhoods in order to support integration and cohesion in the multi-problematic social housing settlements, but also promoting young people's independence from their original families; the young residents offer the community 10 h/week of voluntary work, and the municipality gives them a 90% discount on the rent; the positive outcomes of this project have led to its application in other areas of the city;
- support of the private rental market and of evicted families; a specific form of local subsidy ("Safe from Eviction Fund", Fondo Salvasfratti) was created through a partnership between the municipality and the local bank foundations (Compagnia di San Paolo and Fondazione CRT¹); the fund is used to find an agreement between families evicted from private rental dwellings and the owners in order to keep the families in the dwellings or to find other suitable accommodation; another subsidy ("Rent Supporting Fund", Fondo per il sostegno alla locazione) supports vulnerable families paying a private market rent, and is provided throughout Italy; such a tool allows to financially support the vulnerable families, which could not access subsidised housing due to the lack of dwellings;
- organisation of the public real estate assets of the city of Turin, including the sale of public dwellings owned by the city outside its boundaries, purchase of new dwellings, specific forms of agreements between private developers and the municipality, and the implementation of the Masterplan's norms (Variante 37/02, explained previously) to obtain new dwellings; the goal of the municipality is to recover financial resources and invest them in new dwellings, thus increasing its assets;
- support young citizens in order to promote their housing independence; several measures are guaranteeing loans and subsidies to younger generations to promote their access to the rental market or to home ownership, but also the availability of public dwellings or other forms of temporary housing.

The city intends to provide differentiated solutions to meet the various housing demands by targeting the various market niches (subsidised housing, housing subsidies, rental market, etc.). The different measures show the public interest for specific categories of people like the elderly, migrants, temporary users of the city, young people with precarious jobs, evicted families, etc. The city's officers working on these issues are those who were previously involved in urban regeneration projects. They can be considered genuine institutional capital. They promote the integrated approach and cooperation with other public sectors (social services, health, police, etc.).

The city of Turin tackles different challenges with these initiatives, namely social mix, housing affordability, low rental market percentage, provision of services in some neighbourhoods, etc. The whole scenario shows the general goal of improving living conditions in the city.

As stated above, the two local bank foundations are also investing in housing to meet the housing need. In particular, Compagnia di San Paolo's housing programme (Programma Housing) promotes experimentation of new housing models and practices, financing of housing initiatives (basically partnerships between the services sector and public authorities), and housing funding. The bank foundation has established a real estate agency called Stesso Piano, similar to the municipal one, to support young people in the private rental market; and two temporary residences hosting vulnerable families and people experiencing housing distress, entrusting the residence to actors of the tertiary sector. Associations and NGOs are financed by this entity in order to address the housing need of specific categories of people (women, elderly, migrants, etc.) with pilot projects. The initiatives of Compagnia di San Paolo seem similar to those proposed by the city; in fact, they constitute a complementary actor providing housing solutions and funds for social experiments.

¹ In Turin there are two bank foundations that provide several local services and activities, either as sponsors or promoters. Compagnia di San Paolo and Fondazione CRT are active and important actors in the city and many cultural and artistic initiatives, educational and health programmes are financed by them. In particular, Compagnia di San Paolo is the sponsor of various initiatives and projects in the housing sector and has a specific programme called Housing Programme (Programma Housing).

5 CONCLUSIONS

Turin's practices are acknowledged as new service arrangements (in terms of organisational structures, processes and types of service offers) in the local welfare system concerning the economic and political frameworks (funding, decision-making procedures and participation). They draw on the city's urban regeneration and integrated approach (as streams of values), including both bottom-up and top-down elements, and various local stakeholders (public and private at different scales) implement a variety of practices.

The path-dependency character is based on the traditional integrated approach of the city's urban policies but also on the urban regeneration phase that strongly affected social housing neighbourhoods.

These characters can be clearly noticed in housing initiatives with focus on a multiple goal policy (social, physical and environmental) promoted by public-private partnerships, the use of inclusive tools, concern for the most problematic social housing neighbourhoods and vulnerable citizens.

On the other hand, the territorial specificity is related not only to municipal public authority and its institutional capacity (institutional milieu or capital). The team of civil servants employed in the public housing sector is the one that was previously in charge of urban regeneration projects with an integrated approach (URBAN initiative projects and other programs)¹. Their skill can be recognised not only in the way they cooperate with different public authority departments and deal with multiple dimensions of a social and urban challenge but also in the joint action with other local stakeholders (bank foundations, regional public authority, services sector). This cooperation allows experiments and improves the definition of new strategies.

Despite the absence of strong actors in the social housing sector (such as housing associations present in Northern and Central Europe), the partnerships among public and private actors shows a coherent picture of Turin housing policies towards differentiation and interest in new flexible and temporary forms of response. Management of the existing stock is an expensive duty in Italy, especially for the conditions of the old social housing buildings. In the case of Turin, the city takes care of some housing pilot projects with a guiding role (temporary housing residences, social/supportive ones) and makes an effort to maintain a sort of social support in older social housing neighbourhoods (i.e. initiatives about social mix and insertion of young people) that are well-known for their social issues focused on by former urban regeneration practices.

1 INTRODUCTION

Urban regeneration and cultural urban regeneration are familiar terms in the western planning field, because of the long-term practices and researches. According to academics, cultural urban regeneration is an urban revitalization approach revolving around culture. For instance, the North Quarters in Manchester reconstructed and transformed from cotton manufacturing into a cultural quarter, providing job opportunities, forming galleries and workshops clusters, fostering multi-culture inclusion and beautifying the environment. The cultural quarter which gathers cultural activities, production and consumption in previous dilapidated place has been practiced rather successfully in western cities. Factually, homogeneity, over-commercialization, gentrification, disparity of society and short-term effects are also appeared in cultural quarters in the late development stage. For many developing countries where urbanization and urban regeneration are underway at same time; the “cultural urban regeneration” is an advanced term which requires explanation, analysis and discussion. As the world’s fastest urbanized developing country, China faces emerging urban problems such as economic structure transformation, environment pollution and heritage conservation. In recent 10 years, more cultural events and cultural projects are held or constructed in Beijing and attract attentions from international planning field. It should be admitted that the political, economic and social contexts in Beijing are distinct with western cities; thus, whether the concepts of cultural urban regeneration and cultural quarter practice in Beijing should be proved

Generally, there are three steps in this research; literature review, data collection and finally analysis and discussion. The concept of cultural urban regeneration and cultural quarter, impacts of cultural urban regeneration in both sides are reviewed in the second section. To face international readers, Beijing and Chinese planning system is briefly introduced. After data collection, results are discussed, revolving around

798 Art District, in terms of the development process, current situations, physical, economic, social and political impacts. To summarize the research, the key findings are finally discussed for further studies.

2 LITERATURE REVIEW

2.1 CULTURE URBAN REGENERATION

Cultural urban regeneration is a specific approach in the whole range of urban regeneration; thus, descriptions and definitions start from urban regeneration. In the west European context, Couch claimed (2003) that Arab-Israeli war in 1973 is the turning point of economic growth followed by social segregation, physical deprivation and environmental problems. Generally, urban regeneration is defined as a response involving strategies, policies and projects to survive run-down cities in physical, economic, social and environmental aspects (John and Evans, 2008). Urban regeneration covers the problems about urban areas, urban processes and urban people without fixed principles, and the contents are also flexible due to diverse characteristics of cities (Tallon, 2013). The development of urban regeneration is supposed to adapt to the pace of the urban change (Tallon, 2013), and because of this, there are different features of urban regeneration in different periods. In the early stage, the urban regeneration emphasized the physical transformation, for example, the slum clearance was proceeding in Europe (Hausmann's refurbishing in Paris) and America (Couch, 2003). During 1980s, social inclusion and economic initiatives were integrated in urban regeneration process with physical revitalization in west European countries (Couch, 2003; Vickery, 2007). Following that, the increasing urban population and environmental pollution raise the attention of the environment in urban regeneration process (Tallon, 2013).

In the late 20th century when the economic and social situations have been changed from manufacturing economy to knowledge economy, the cities in most western countries and several cities in south world have been influenced, entering the post-industrial era (Bell and Jayne, 2004). Culture which refers to production and consumption of art rather than only "high art", as the core point of city economic development was considered by UNCHS (Habitat) in the globalizing transition process (Wansborough and Mageean, 2000). This economic structure change also manifests the increasing of people capitals and the demand of cultural consumption. People trace the post-modern culture (clothes, music and films) to show their lifestyle; in the meantime, governments set place-marketing strategies to create distinguish identities and enhances competitiveness through culture (Wansborough and Mageean, 2000). In order to cope with demand of cultural consumption and keep prosperous economic growing, culture was recognized as an engine, contributing to holistic urban regeneration and solves multifaceted urban problems (Tallon, 2013).

The way of urban regeneration revolves around culture is classified into three models by DCMS (2004): culture-led urban regeneration, cultural regeneration and culture and regeneration.

Culture-led urban regeneration: This regeneration mainly sets cultural activities as driver and catalyst followed by economic, social and physical performances, resulting in impacts on different dimensions (DCMS, 2004, pp5).

Cultural regeneration: It is an integrated process that cultural activities connect with other economic, social and environmental activities in implementing an area strategy (DCMS, 2004, pp5).

Cultural and regeneration: Regeneration process just uses the feature of cultural activities which are not integrated with area strategies and projects (DCMS, 2004, pp5; Vickery, 2007).

Although there are separate meanings of each ideal model, actual practices may intersect between these models. In the case of Albert Dock, cultural activities should conform to the intention of Mersey River environmental conservation. Therefore, three models can be roughly named as cultural urban regeneration.

2.2 CULTURAL QUARTERS

There are several methods of cultural urban regeneration which consists of culture quarters, carnivals and festivals, sport-led regeneration and other developments without precise names. Cultural quarters is one of

them mainly concerned and practiced in cultural regeneration process (Tallon, 2013). The role of people in regeneration has been underlined by Turok; correspondingly, creative class is a key element of cultural quarters. Additionally, Florida (2005) regarded artists, designers, actors and elite in creative thinking as core members and their related activities should be gathered into a cluster to improve competitiveness.

Culture quarters can be thought into symbolic and physical perspectives. In symbolic perspective, cultural quarters should compass diverse activities dominated by cultural production activities and entertainment consumption behaviors (Tallon, 2013; Roodhouse, 2010). Apart from creative class, other people from different social backgrounds, different scales of enterprises and even government departments are responsible for these activities (Montgomery, 2003). On the other perspective, the cultural quarters are normally located at precious historic areas in run-down areas covering at least a round area with 400-meter radius (Tallon, 2013; Montgomery, 2003). Moreover, cultural quarters highly focus on the public realm where activities are held, such as friendly footpaths. Beyond that, the lasting time of activities is suggested to extent until night (Montgomery, 2003). There is a gap between the ideal image and real performances; therefore, whether culture quarter bring long-term and effective benefits to cultural regeneration is vital to be measured.

The process of emerging and managing a cultural quarter which is briefly classified into two modes is complex and various attributed to local circumstances. Participants including creative class, diverse types of enterprises, organizations and governments all engage in at different phrases to procure their interests. Several focused cultural quarters; Soho in London, New York's Lower East Side, and the Left Bank in Paris emerged because of fertile cultural capitals and potential cultural facilities connecting with abutting learning and innovation zones through a bottom-up method which means cultural quarters are formed spontaneously (Montgomery, 2003; Roodhouse, 2010). Cultural quarters will also be deliberately established as a regeneration policy, which refers to another top-down method (Montgomery, 2004). The primary step of cultural quarter is to beautify the physical environment to attract and sustain the cultural-related production and consumption, regardless of whether establishing mode is adopted (Roodhouse, 2010). Importantly regardless of whether establishing mode is adopted (Roodhouse, 2010). Importantly

2.3 THE IMPACTS OF CULTURAL URBAN REGENERATION

Cultural urban regenerations are popularly adopted by cities in the global scale, because positive impacts of cultural urban regenerations extent to physical, economic, social and cultural aspects. The refurbishment of dilapidated buildings protects valuable heritages and upgrades physical appearance in surrounding areas (Tallon, 2013). Not only cultural industries and employments are inspired, but also other related industries such as tourism integrated with cultural urban regeneration are thrived (Tallon, 2013; Yang, 2012; Roodhouse, 2010). Through active participation, the senses of identity are created and different stakeholders achieve their targets in these creative, inclusive, and vitality venues (Tallon, 2013). To the culture itself, it is diversified and strengthened, which enhances the cultural power in local, regional even national scales (Yang, 2012).

On the other hand, cultural urban regeneration projects may suffer from troubles and cause negative consequences. Homogenization of cultural regeneration shows in physical landscape, cultural images and economic activities (Tallon, 2013). Over-commercialization is always connected with gentrification and social exclusion that impoverished residents are firstly forced out; gradually previous artists or small and medium-size enterprises in these areas leave owing to high rents (Tallon, 2013). Additionally, elderly people and children are always excluded by unsafe environment with high commitment rate and improper night activities (Tallon, 2013). For example, the participants are biased toward young adults, creating drinking culture and young-dominated culture with several unhealthy even illegal behaviors, which differs with the purpose of inclusion and multicultural interaction (Jayne, Holloway and Valentine, 2006). Therefore, the impacts and the efficiency of government interventions are significant to be evaluated in short-term and long-term.

2.4 WHETHER THERE IS CULTURAL URBAN REGENERATION IN BEIJING

There may be a wondering whether there is cultural urban regeneration in China which is only a developing country; after all, cultural regeneration is dominated in developed western countries. Compared with other developed countries, China experienced the urbanization, industrialization and tertiarization at the same time under particular Chinese political and economic system transformation (Yang, 2012). Cities with different urbanization contexts facing different issues, triggering Chinese urban regeneration in physical dimension (Zhai and Wu, 2009). During that time, the urban regeneration was limited in housing; similar with European countries, the property-lead urban regeneration became a trend in late 1990s, but the over-commercialized implementation in this method aroused consideration of balanced development (Zhai and Wu, 2009). Central government published the “Scientific Outlook on Development” and “Harmonious Socialist Society” in series and both of them define the innovative role of “culture” in urban regeneration (Zhai and Wu, 2009). Due to that, the objectives of Chinese urban regeneration are filled with the meaning of cultural and social inclusion and community harmony (Zhang, 2004). Following international and domestic development tendencies, cultural urban regeneration attracts more attentions and becomes a fashion in China.

3 THE BRIEF INTRODUCTION OF BEIJING AND CHINESE PLANNING SYSTEM

3.1 THE BRIEF INTRODUCTION OF BEIJING

“Beijing is the capital of People Republic of China, a national political and cultural centre and an international modern city”, defined as the nature of Beijing (Beijing Municipal People’s Government, 2004). Beijing covers 16410.54 km² located in the north of Huabei Plain. It consists of 14 districts and 2 counties with 21.148 million permanent residents up to 2013 (Beijing Municipal People’s Government, 2016). In term of political aspect, China adopts the system of people’s congress which means that the all power of state belongs to people who will exercise state power through the people’s congress at different levels (The National People’s Congress of People’s Republic of China, 2016). Beijing as the capital of China, it holds a large number of political conferences and events; additionally, the national political and administrative institutions and departments are situated in Beijing and the 172 foreign countries having diplomatic relations with China set their embassies in Beijing (Ministry of Foreign Affairs of the People’s Republic of China, 2016). Through political associations and contacts, Beijing is a significant node in the world. After 21st century, Beijing gains opportunities to hold cultural events, festivals and exhibitions to achieve cultural communication.

3.2 THE EVOLUTION OF PLANNING SYSTEM IN CHINA

The evolution of planning in China is corresponding with the development of Chinese society. After establishing the People’s Republic of China, the government had the first sense of urban planning and city development in 1950s when the industrial projects were funded and supported by former Soviet Union (Wu, 2015). Moreover, the first five year economic plan was published in 1953 to guide the economic development in physical aspect, which implies that the urban planning is an instrument of ideology transformation and political control (Wu, 2015; Yeh and Wu, 1999). Because of the political failure in the late 1950s and 1960s, the sprouting urban planning was abandoned. However, the national government was still powerful to decide city population, land use, economic structure and development (Yeh and Wu, 1999). At local level, governments had less power to organize the city developments, caused by the centralization of national power (Wu, 2015). Experiencing economic reform and opening-up in 1980s, the national government recognized the importance of planning; thus, the City Planning Act was proposed in 1990, when was the first time to identify the statutory state of planning and strengthen the power of local governments to decide developments and land use (Wu, 2015).

Since 1990, the statutory planning system with two-tier has been set. Specifically, urban mast plan belongs to the upper tier. It should decide the development objectives in different periods usually from 5 years to 20 years, the nature of city, population size and urban structure (Wu, 2015; Zhang & Tao, 2010). Moreover, it is also supported by other supplementary plans such as district plans (fenquguihua) and specific plans (zhuanxiangguihua) (Wu, 2015). The legal requirements are fixed, but the new concepts of

urban planning; cultural heritage conservation and sustainable development are adopted in master plan (Zhang & Tao, 2010). The lower tier is the detailed development control plan to regulate the urban land use, building height, building density, road hierarchy, green space, distribution of infrastructure and even the underground space to guide the developments sustainably. Similar with urban master plan, the detailed development control plan is supplied by detailed construction plan (Wu, 2015; Xia & Tang, 2010). By the evolution of planning system in China, stakeholders, international consultancy companies and residents who previously were not involved in the planning system engage in this planning process. However, the functions of their contributions are limited in real practices because planning process still tightly connects with centralized political power and economic development goals (Wu, 2015).

Figure 1 - Two-tier Structure of Statutory Planning System in China

4 THE DEVELOPMENT AND IMPACTS OF 798 ART DISTRICT

4.1 THE DEVELOPMENT OF 798 ART DISTRICT

Without the initial intention by municipal and district governments, the embryonic form of 798 Art District was set up spontaneously and occasionally. The Chief of General Affairs and Coordination Office in Beijing Administrative Committee of 798 Art Zone, Wang Li described this self-development process in a Chinese Proverb, “favorable climate and geographical position and support of the people”. Specifically, the China Central Academy of Fine Art moved from Wangfujing to Wangjing where it is close to the current 798 Art District in late 1990s. At that time, the Sculpture Department in this academy searched a suitable workplace for a large sculpture work; Lugouqiao Anti-Japanese Portrait (Huang ed., 2008). Because of industry re-adjustment and suspended proposal of “Beijing Electronics Town” built upon current factories, the factories planned to rent vacant factory warehouses temporarily to receive rents for compensating laid-off workers. Taking an account of warehouses in Bauhaus style with high ceiling and comfortable natural lighting, the first renting contract was signed. After that, artist; Sui Jianguo, publisher; Hong Huang, etc, who study abroad or have advanced art concepts set up their work studios in 2000. Gradually, dozens of individual artists, art organizations such as Beijing Tokyo Art Projects, and art clubs moved into this area, gathering diverse forms of art and culture (Huang ed., 2008).

However, the Seven Star Group which consists of 797, 718, 798, 707, 700 and 701 factories and 11 institutes forced the artists out and prohibited Dashanzi International Art Festival (Current Name: 798 Art Festival) to achieve revitalization of old factories in schedule, even though the motion of preserving 798 Art District was approval by Beijing National People’s Congress in 2004. Under the coordination by the Jiuxianqiao Local Committee Office, the Art Festival preceded as usual. Since 2004, 798 Art District has been prevailing. Chen Xingdong Space for Contemporary Art and Galleria Continua Italian Gallery were both launched; the Germany and Austrian prime minister visited 798 Art District in 2004 and 2005 separately. The chairman of European Commission even delivered his wish that the 798 Art District should be maintained to Prime Minister of China Wen Jiabao in 2005 (Huang ed., 2008). After experiencing the conflict between artists and Seven Star Group, Beijing municipal and Chaoyang district government considered that the 798 Art District should be regulated to lead a safety and well-operated creative district. Therefore, the 798 Art District was authorized as the “First Batch of Beijing Creative Cultural Industry

District" in 2005, and then Beijing 798 Art Zone Administration & Development Office was established by the Chaoyang district government and Seven Star Group (Ye, 2010). Although Beijing 798 Art Zone Administration & Development Office offered services and regulated, coordinated and handled issues in the district, it did not have administrative power to regulate public affairs because it was only a company. In order to effectively organize the 798 Art District, the Beijing Administrative Committee of 798 Art Zone with administrative power directly lead by Chaoyang district government was set in 2010 (Beijing Administrative Committee of 798 Art Zone, 2014). In recent years, Beijing municipal government offered the supports officially and powerfully. Following the objective of booming culture industry in Beijing Master Plan 2004-2020, to diversify artwork exhibitions and platforms, perfect art work trade market, create innovative brands, enhance creative education and integrate with other industries (Beijing Municipal People's Government, 2004). 798 Art District is one of them to be built as an international contemporary art communication and creation center and consist of art studios, art educational institutions and art incubators to inspire artwork creation and trade (Beijing Municipal People's Government, 2014).

Depending on the bottom-up method contributed by individual artists and art organizations in the early stage (late 1990s-2006), and the top-down method cooperated by governments, artists and art organizations from 2006 to present, 798 Art District as typical cultural quarter is established.

Figure 2-The Timelind of 798 Art District Development

4.2 THE PRESENT SITUATIONS OF 798 ART DISTRICT

Figure 3 – The Administrative Participants of 798 Art District Figure 4- Structure of Committee

798 Art District is located in the northeast of Beijing along the Airport Expressway and Jingshun Road. The core area of 798 Art District is 300,000 m² roughly bounded by Jiuxianqiao North Road, Jiuxianqiao Road and Wanhong Road. Up to 2014, there were over 500 institutions ranging from galleries, artists' studios to various cultural organization specialized in animation, media, publishing and design consultation, clustering with fashion shops, bars and restaurants. They totally cover 230,000 m² building area (Beijing Administrative Committee of 798 Art Zone, 2014). Entering a relatively mature development phrase, the participants in the management are various including representative artists or institutions, Seven Star Group and Beijing Administrative Committee of 798 Art Zone. Generally, they undertake different parts; Seven Star Group as property owner reaches renting agreements with every renter and advertises the 798 Art District to be welcomed; artists and institutions primarily operate their own art creations successfully and then cooperate with Seven Star Group and Beijing Administrative Committee of 798 Art Zone to hold cultural events. The Beijing Administrative Committee of 798 Art Zone plays a significant role in district management through guiding the cultural development in a rather uncontrolled environment, creating communication opportunities and the art work trade market, guaranteeing the safety of cultural activities and building construction and supervising illegal behaviors.

4.3 THE PHYSICAL IMPACTS OF 798 ART DISTRICT

The most apparent impact of 798 Art District is shown in physical aspect, which can be described in two phrases; from 1960s to 1990s and from 2000 to present. In 1957, the previous joint factory in 798 Art District is a rather urbanized area comparing with vast agricultural land. As the national announcement of building wireless component joint factory in currently 798 Art District was published in 1951, the joint factory was guided by German Democratic Republic because of weak economic power and construction experiences in China (Huang ed., 2008). The booming industrial phenomenon depressed in 1990s when the industry structure transferred and factories waited for constructing “Beijing Electronics Town”.

The positive physical impacts produced started in 2000 when large number of art workers and cultural institutions firstly refurbished the warehouses and workshops. Figure 5 indicates that the Bauhaus style warehouse is kept in original structure with physical refurbishment. After transformation, the interior decoration represents the features of every artist and cultural institution, blending into particular industrial housing. At that time, different forms of street artworks such as sculptures and graffiti have already appeared to creating creative atmosphere, but the necessary infrastructure is still lacked.

Visitors were frequently lost without correct guide and the streets were congested and messy with visitors, vendors and rubbish. Caused by clearance of partial factories and studio refurbishment, 798 Art District seldom has having green spaces and public spaces with proper street furniture. After intervention by the government and Seven Star Group through 180 million and 10 million Yuan investments in 2006 and 2014 separately, 7 public toilets, lighting system, 207 uniform transport signs in five levels and supervision and security system were all installed and improved (Sohu Culture, 2008). The roads in 798 Art district is renamed as 798 Road, 798 West Road, etc. Furthermore, broad roads, refurbished sewerage system, water-proofing system and multi-story parking building, create pleasing environment for art workers and visitors.

Figure 5 - The previous Bauhaus style warehouse is transferred into Pace Beijing art Gallery

Although the physical conditions have been progressed after investments and managements, several tough original problems are still left and new conflicts and problems emerge constantly. The personal salvage stations along the 718 Street with big trucks and tricycles, which caused a smelled and dangerous street environment. Even though Administrative Committee bans the informal trading on the street, the street vendors are still rampant especially on the weekend. Additionally, the periphery areas of 798 Art District is vacant with rubbish dumps and vagrant dogs and cats. Superficially, the green spaces beautify the environment and attract people, but several artists against that and said 798 was an art district rather than a garden; thus the green spaces should be created in suitable places (Ye, 2010). Actually, the use rates of these public spaces are various depending on weather and air quality. In the winter and summer with low or extremely high temperature and poor air quality, there is almost no person; on the contrary, visitors always enjoy public spaces in a sunny day with good air quality and pleasant temperature. Although infrastructure is updated, the original physical appearance is negatively influenced by dismantling valuable constructions. The cars still park along the street, resulting from the shortage of parking guides; nonetheless, there are 11,799 m² parking spaces (Sohu Culture, 2008). The accessibility of 798 Art District is problematic; there is no subway station provided in the 500 m walking area. Visitors could only get access to 798 by buses or private cars. Even they close to Jiuxianqiao Road, the 798 Art District is hard to be found because it is hid by high-rise buildings without artistic features.

4.4 THE ECONOMIC IMPACTS OF 798 ART DISTRICT

Since the economic structure adjustment in 798 Art District is stepwise, the economic contributions of 798 Art District is also gradual. In terms of industry structure, the previous industrial dominated structure is replaced by service dominated structure, gathering over 500 cultural institutions increased from 64 in 2004 and 354 in 2007; among of that, 25 are overseas institutions (Beijing Administrative Committee of 798 Art Zone, 2014). Being mixed, not only cultural institutions, but also restaurants, bars and shops formulate the current economic structure. Significantly, the economic influences radiate from cultural urban regeneration in 798 to over 10 surrounding art districts such as 751 Art district and Caochangdi Art District (Sohu Culture, 2008). In the process of structure transition, the employment number is over 10 thousand and gross income surges 300 million every year (Xu & Li, 2012).

Because of artistic reputations and curiosity of people, the number of visitors reaches eightfold growth from 500,000 to 4,000,000 during 10 years (Sohu Culture, 2008). However, similar with other cultural quarters, 798 Art District faces commercialization, which is the most controversy problem in the cultural urban regeneration. There is a distinctive approach relying on the particular administrative power in China. In order to keep the nature of art district, the administrative committee requires the property management company belong to Seven Star Group to formulate a preferential rent policy for cultural institutions. In detail, they will not renew the contract with other recreation stores such as Karaoke and public bath center. Determining by the type of tenants, two or three-year rent contracts are designed for cultural institutions; the rent will be low than the average rent: 3.5RMB/square metres per day (approximately equal to £0.37), but for restaurants or bars, the rent contract only lasts one year with 7~8 RMB/square metres per day rent (approximately equal to £0.75~0.86). Therefore, the tenants are dominated by cultural institutions, in accordance with the character of art district. To be honest, the result of this method is controversial that individual artists are still unable to afford rents and are forced out without financial support, after all, the rent in 2004 was only 0.6 RMB/square metres per day (approximately equal to £0.06) (Xu & Li, 2012). Aimed at this result, Wang stated that the transformation was led by the market spontaneously and it was unpractical to recall the artists back in 798 Art District where the bustling environment was unsuitable for art creation. The planners, Chen and Li also expressed that art creation existed in a freedom and peaceful environment which only appeared in the early stage of 798 Art District development. Besides, Li pointed out that the real art creation did not emphasis the industry agglomeration; it was a personal creation behavior.

The prosperous economic development contains defects. In spite of over 10000 people getting employment opportunities, the number of laid-off workers for previous factories is more than new jobs. 798 Art District just provides jobs for another group of people. On the other hand, the art work commonly trade in Hong Kong or overseas because of high tax rate in the mainland China. Even though the first national cultural bonded centre was launched in 798 Art District in 2012, which was aimed to inspire the artwork trade with the simply trading process, tax depreciation policy and fast networked transaction, the galleries in 798 Art District are only used as displaying platforms, (China Economic Net, 2012). Consequently, the tax and employment contributions of artwork trade are less than expected amounts.

4.5 THE SOCIAL IMPACTS OF 798 ART DISTRICT

As an art district, the social impacts are direct and profound in 798; besides, the former history of 798 Art District and location contexts produces political impacts. Initially, 798 Art District keeps group of buildings in Bauhaus style with artistic value, reflecting the history of 718 joint factories. Chinese contemporary art which expresses issues of Chinese society in a critical views publicly displayed in 798. Relying on the affluent cultural resources, the administrate committee and cultural institutions organize and hold diverse forms of activities to encourage people with different backgrounds to be involved. 798 Art Festival, 798 International Children Week and fashion shows attract different aged participants. For reasons of these attractive points, over 4 million domestic and international visitors have a tour in 798 Art District every year. Almost 30~40% of these visitors are from overseas; thus, the multi-culture intercourse and collide are frequently occurred in 798. Because of high artistic quality, 798 Art District gradually forms an art signal and wins domestic and international reputations. For example, 798 Art District was awarded as one of the 22 municipal art center in the world by Time in 2003 (Sohu Culture, 2008). Without being fear of visiting 798 at night, safety condition is well performed and managed in 798 Art District by administrate committee through the necessary supervision system, strict night visiting regulation and less proportion of bars.

The popularity is considerably produced among foreigners compared other sightseeing spots in Beijing. Diplomatic relations and cultural interactions with other countries and organizations have been enhanced since 2004 through dozens of celebrities visiting 798 Art District, including previous French President Nicolas Sarkozy (Sohu Culture, 2008). Wang also gave an example that a 100-200 m² art gallery with a small exhibition might be visited by 10 even 20 embassies, reflecting the essential role of 798 Art District as a media for unofficial political communication. It also has domestic political influences through government interventions and management to achieve patriotism education and ideology propaganda.

Figure 6 - The paintings in So Kun Solo Exhibition Figure 7 - The sculpture made by Song Dong

Although the social influences of 798 Art District have constantly expanded since 2004, the negative impacts are obvious. Most laid-off workers leave their previous working and living places caused by dismantled dwelling and low incomes. Only small part of them undertake less-skilled and low-paid jobs such as security men or cleansers in 798 Art District where they are not actually interested in. They thought their memories were gone with the disappearance of daily life in factories (Zhang and Chen, 2012). Not only they are excluded, 798 are less welcomed by elderly people and low-income people. According to the survey which researched 605 visitors randomly in 2005, young visitors (aged 20-30) take 57.4% of total visitors and the average age of visitors is only 29; in addition, 44% of foreign visitors receive over \$ 2000 (approximately equal to £1387) every month, while domestic visitors earn over ¥ 5000 (approximately equal to £537), who are from middle or high class in their countries. Besides, 91% of visitors are well educated and receive undergraduate degree (Wang, 2007). There is a tendency that more low income people visit 798 art district, but the general structure of the income and age of visitors do not change. From that, the periphery and exclusion issue are evident and severe. For the political influence, Li stated in another side that the artistic atmosphere was less freedom compared to previous environment without government intervention; thus, the creative productivity decreased.

5 SUMMARY

798 Art District is a mode of cultural urban regeneration in Beijing. This research clarifies the establishing process and the role of different participants. In the physical and symbolic perspectives, 798 Art District clusters diverse cultural production and consumption activities in a former run-down factory area, covering 300,000 m². Relying on deteriorated factory conditions, geographical position and supports of the creative class 798 Art District was spontaneously established. Similar with other cultural quarter, 798 Art District is remained after struggling with property owner and local governments in the second development phrase in top-down method. The Beijing Administrative Committee of 798 Art Zone represents local government engages in the regular operation and management with Seven Star Group and creative class in the district. Importantly, the Beijing Administrative Committee of 798 Art Zone takes more responsibilities compared with other property owners and organizations in western culture quarters, supervising the illegal behaviors, establishing trade market, etc.

In terms of physical impact, Bauhaus style warehouses in 798 Art District have been conserved; upgrading green infrastructure and transport system also contribute to physical transformation. Generally, the goals of creating and enhancing cultural industry and integrating cultural industry with other industries have been achieved, which is demonstrated by the increasing number of visitors and cultural interactions in 798 Art District. Since the government takes more responsibilities than western countries in cultural regeneration projects such as 798 Art District, political power should not be ignored.

However, 798 Art District still has several negative impacts described in Literature Review. Over-commercialization is illustrated by similar physical environment, economic behaviors and social activities before official interventions. With diverse strategies: variable rents for different tenants, the art activities and commercial behaviors are relatively balanced. The problem, gentrification is not prevented, which experiences two phrases. Initially, the original residents or workers in factories move out, and then the local stores or individual art studios are forced out. Additionally, 798 Art District is more exclusive for young, high-skilled and high-income groups. The political constraints for art creation and cultural activities which is irregularly occurred in western countries exist in 798 Art District, hindering its development in a certain degree.

1 INTRODUCTION – HOUSING PROBLEMS IN EUROPE

The EU development strategy for the next decade (Walsh, 2012) has as a strategic priority the identification of mechanisms for enriching quality of life and reducing social-spatial inequalities. For that, rather than focusing exclusively on economic growth, regions should enhance place resilience and reduce their vulnerability at various scales (Murphy and Scott, 2014). One fundamental scale is that of housing and related services. Indeed, for the past two decades a large array of factors have contributed to increase the housing problems and vulnerabilities of European countries, such as the decline of public investments, the restructuring of social services' systems, the reduction of the consumption capacity, and also the internal disparities and domestic policy decisions that eventually led to the most recent economic crisis (Carballo-Cruz, 2011, Dellepiane Avellaneda and Hardiman, 2010, Eichengreen et al., 2014).

In the countries of Southern Europe in particular (Portugal, Ireland, Italy, Greece and Spain), housing bubbles have burst (notably in Ireland and Spain, see Dellepiane Avellaneda and Hardiman, 2010, Whelan, 2014, Carballo-Cruz, 2011), youth unemployment, dissatisfaction and emigration have dramatically increased (Cairns et al., 2014), and severe austerity measures have been implemented (Murphy and Scott, 2014). These and other factors have led to decreases in levels of happiness, life satisfaction and quality of life (Anderson et al., 2012, Bell and Blanchflower, 2011), have affected employee job satisfaction, commitment, and self-regulation (Markovits et al., 2014), and have had increasing social risks, for vulnerable groups as immigrants, low waged workers or youths (Cairns et al., 2014) and in terms of poverty and social exclusion (Frazer and Marlier, 2011).

The housing market itself, often used as proxy for cost of living and life satisfaction (Garrido-Yserte et al., 2012, Murphy and Scott, 2014), has been more than often associated to financial volatility and social vulnerability (e.g. Loutskina and Strahan, 2015, Martin, 2011, Whitehead et al., 2014, Donald et al., 2014, Priemus and Whitehead, 2014, Whitehead and Williams, 2011). Indeed, the urban economy is very sensitive to housing, and the effect is larger in localities more financially integrated (Loutskina and Strahan, 2015). Thus, falling housing prices and transactions since 2010, mortgage debts and overdue loans, limited credit from banking institution, unemployment in the construction industry and the simple fact that supply far exceeds demand, have all, to a greater or lesser extent, contributed to increase the state of housing problems.

Even so, this is not just a question of economics. More and more, housing is perceived as a freedom right (King, 2003) rather than a socio-economic claim. Housing, and access to housing, is, undoubtedly, the most visible side of the social conditions of populations, and decent housing is essential for maintaining an acceptable standard of living, by providing warmth, security, safety and privacy (Nepal et al., 2010). The recent impact of elements such as the crisis have only exacerbated housing problems that were already long standing, related to social exclusion and social cohesion. Certain groups in deprived areas, for example, like low-income households and young families, face daily the struggle to meet housing expenses in an unaffordable housing market (Somerville, 1998, Frazer and Marlier, 2011, Healy and Hillman, 2008). As well, prolonged home staying of youths at the parents' house has also become a relevant problem (e.g. Cairns et al., 2014), producing a negative impact upon their capacity to enact housing transitions. Non-coincidentally, these examples relate exactly to the two main conclusions of the European Report 'The State of Housing in the EU 2015' (Pittini et al., 2015): (i) there are more people without a proper home today in Europe than in 2009 (the high point of the crisis); and (ii) there are not enough affordable homes available in most European countries to meet the increasing demand.

On one hand, the EU regards housing as a major cause of economic and social instability (Whitehead et al., 2014). On the other, decent and affordable housing is regarded as an important tool in addressing social exclusion and maintaining social cohesion (Frazer, 2005, Nepal et al., 2010). Thus, the problems related to housing, and particularly to the socio-economic inclusion of low-income households and other vulnerable social groups, are considered a priority in new European directives, in a sense that stronger policies and regulations need to be established (Matos, 2012, Donald et al., 2014). However, this is still, recognizably, a major challenge (Pittini et al., 2015). Many social housing traditional systems in European countries are declining due to budget cuts and political change (Boelhouwer and Priemus, 2014, CECODHAS, 2012) and there seems to be a lack of a common housing policy in Europe, particularly in terms of a long-term stable framework for the affordable housing sector (Pittini et al., 2015).

First, European housing markets are very heterogeneous (for example Northern and Southern markets are recognizably different, see Balchin, 2013, Elsinga and Hoekstra, 2005, Allen, 2006, Holdsworth and Irazoqui Solda, 2002, Priemus and Dieleman, 2002) making it very difficult to propose one-size-fits-all policies (Pittini et al., 2015). Second, the economic crisis is still ongoing and essential empirical data of recent years is thus unavailable, or at least incomplete. Consequently, former models that can properly measure and regulate housing problems at the European scale; explain the effects of the socio-economic crisis on the housing sector and housing conditions; interpret the differences in resilience between national housing systems in Europe; and predict the impact of recently adopted measures, are still to be properly developed (CECODHAS, 2012, Priemus and Whitehead, 2014).

This being so, at this stage, authors address the importance of continuing to monitor change, for example by developing indicators that help understand cause-and-consequence effects (Méndez et al., 2015), and formulate hypothesis based on the comparison between different experiences (Priemus and Whitehead, 2014, Méndez et al., 2015). According to Guerra (2011) an essential step may involve taking an holistic approach to address the deteriorated housing conditions that still persist today (derelict buildings, overcrowded dwellings, lack of basic living conditions), as well as the inherent social consequences (debt, eviction, homelessness, growth in waiting lists for social housing). More precisely, models and policies should adapt to the profound changes of the past decades, including (but not limited to) the economic crisis, the austerity measures, the new models of housing intervention and the increasingly complex social realities and lifestyles, which are, more than often, unfairly distributed (Guerra, 2011, Frazer and Marlier, 2011, Méndez et al., 2015).

Consequently, the most recent studies on housing problems and housing vulnerability have developed indicators that are multi-criteria and consider both objective/economic indicators and subjective/social indicators, such as Murphy and Scott's (2014) housing vulnerability index, which established a link between household vulnerability and localities that contained oversupply of houses and younger population in rural areas in Ireland; Nuuter et al's (2015) housing sustainability index for ranking European countries; Carmo et al's (2015) logistic regression model for assessing vulnerabilities and inequalities in the access to housing in Lisbon; or Pendall et al's (2012) multivariate regression model to analyse the relationship between potential personal or household vulnerability and potentially precarious housing conditions in metropolitan areas in the United States. As well, other studies have dwelled on how housing conditions cope with climate change, extreme weather conditions or natural disasters (Barbosa et al., 2015, Vincent and Cull, 2010, Van Zandt et al., 2012) or even on how housing itself can be the instrument to reduce the vulnerability to these conditions (Tippel, 2006).

2 PURPOSE AND METHODOLOGY – SCALE MATTERS?

Regardless of how housing and social problems and vulnerabilities are measured and interpreted in recent years in the literature (the debate regarding it is vast and thus out of the range of this paper), it would be unrealistic to assume that they are evenly distributed across social and territorial levels. Consequently, to achieve more cohesive communities, many research projects and policy programs have addressed spatial unevenness, spatial segregation and social mix through the evaluation of housing conditions and housing policies (Cassiers and Kesteloot, 2012). But if on one hand these policies have been criticized for being based on little tested assumptions and showing only limited results (Cassiers and Kesteloot, 2012, Musterd and Andersson, 2005), on the other hand they have, recognizably, been structured only around the problems of specific territorial areas. According to Battaglini and Annunziata (2014) policies seek elements of temporal and territorial stability in everyday life, but this stability has many times been achieved at the expense of disregarding matters of scale.

Since the turn of the millennium, the debate around how 'scale matters' has been continuous in the literature across a wide range of thematic areas, notably, for example, in climate change (see Wilbanks and Kates, 1999, Neil Adger et al., 2005). However, the same degree of attention has not been given when addressing problems related to housing conditions and social vulnerabilities. Precisely for that reason, very recently authors like Cassiers and Kesteloot (2012) or Donald et al (2014) have reinforced the need to address social-spatial inequalities across a wide range of spatial scales, mainly at the subnational and urban levels. 'The State of Housing in the EU 2015' Report also supports this idea, by stating that, because European housing markets are so heterogeneous, "the best way, indeed, to observe the markets is at national and even regional level, since the needs of the metropolitan areas, which become increasingly dense, differ a lot from the ones of the rural areas." (Pittini et al., 2015).

However, there is still a somewhat stiffness of scale in responding to these directives and analysing housing conditions, as studies either regard solely local scales (e.g. Carmo et al., 2015, Murphy and Scott, 2014, Pendall et al., 2012) or national scales (e.g. Nuuter et al., 2015), but not both. In Portugal, for example, João Ferrão (2014) has discussed how public policies only take into account the national level, evaluating various phenomena as if the country were a point. The author states, quite rightly, that although somewhat small when compared to other European countries, Portugal has enormous geographical, housing and social diversity. Thus policies, particularly cohesion and sectorial policies, should not be a-territorial nor should they oversimplify the segmentation between coast and inland; urban and rural; and metropolitan areas and the remaining country. By doing so, they take the risk of concealing the actual magnitude of problems and the location of many problematic areas.

Consequently, stemming from this debate and considering Portugal as a test case, the purpose of this research is to test and evaluate whether scale-of-analysis matters when addressing the issue of housing problems and vulnerabilities. A straightforward methodology is used where four territorial levels are analysed in turn through housing data; the national, the regional, the municipal and the borough levels. The analysis was conducted at two different time frames (2001 and 2011) corresponding to the last two population and housing Census in Portugal, which supplied the data for this research. Based on the most problematic issues identified at national level, three indicators of housing problems and vulnerabilities were selected: (i) the state of decay of buildings (derelict or requiring medium to large repairs); (ii) dwelling overcrowding; and (iii) dwellings lacking basic amenities. These indicators were analysed on the remaining

territorial levels, thus enabling direct comparison, the pinpointing of problematic hotspots and the highlighting of territorial disparities. Then, hypothesis testing, namely t-test for dependent samples (in the comparison of any two scales) and repeated measures ANOVA (in the comparison between the four scales), was applied to look for significant differences between spatial readings at different levels. In the final section, the research question is taken up and debated, in order to understand whether the territory should play a more important role in the integration of public policies for housing.

3 A PORTRAIT OF PORTUGAL'S HOUSING STOCK – NATIONAL AND REGIONAL LEVEL

In the last 30 years, the housing offer in Portugal has significantly increased and comfort levels of dwellings have also considerably improved. Nonetheless relevant housing problems, mostly associated to socially vulnerable groups, have persisted over the decades. Towards the end of the 20th Century, housing problems in Portugal were largely associated to the rapid growth of the Lisbon and Porto metropolitan areas. Several authors identified the causes for these problems (Ferreira, 1987, Ferreira, 1993, Serra, 2002, Guerra, 2011), namely the return of residents from former Portuguese colonies after the 1974 revolution; the intensive rural exodus from the interior to the coastal cities around the same period; the lengthy freeze of rent values (which contributed to the deterioration of the housing stock and overcrowding); the lack of social housing and its poor construction quality (leading to the rapid deterioration of buildings); the concentration of disadvantaged social groups in social housing neighbourhoods (and respective social consequences); and the outbreak of illegal construction and of precarious, run-down dwellings, recently exacerbated by the arrival of many economic immigrants from Africa and Eastern Europe.

Today, Portugal is living in a well-known scenario of economic and social crisis (succinctly described in Cairns et al., 2014). Unemployment has risen from below 7% of the working population in the early 2000s to 14% in 2014 (PORDATA, 2015) with obvious consequences to the investment in housing. Portugal was a country with high transaction rates at the beginning of the century (Whitehead et al., 2014), a consequence of the increasing demand and social relevance of owning individual private housing with specific characteristics (location, materials, architectural design), fuelled by bank mortgages (Guerra, 2011, Matos, 2012). However, there was a massive and consistent fall both of housing transactions and housing prices since 2010 (Whitehead et al., 2014, Matos, 2012), at the same time that average credit valuation for home loans has had a negative variation, representing a greater stiffness in conceding credit, a reduction of housing loans and a drop in housing demand, not accompanied by a decrease in supply. If in the early 2000s companies needed an average time of 7-8 months to sell a house placed on the market, in 2013 that time had increase to 17 months (PORDATA, 2015). This caused huge problems for the mortgage and housing markets and the bankruptcy of many construction companies (Whitehead et al., 2014, Matos, 2012). But it also contributed to worsen living conditions and increase social inequalities, as there has been a significant increase in overdue rent/mortgage payments, in cries for counselling on mortgage and debt management, in the number of houses repossessed by the banks, in the waiting lists and types of profiles applying for social housing, and in the number of families filing for insolvency (PORDATA, 2015). As in Portugal there was (and is) a deep culture of home ownership, many families were forced to relinquish the main destination of most of their savings, and as the budget available for social housing is decreasing, the most vulnerable groups are having no choice but to seek overcrowded poor quality accommodation, and the risk of homelessness increases.

The analysis of the data from the last two population and housing Census in Portugal, 2001 and 2011 (INE, 2001, 2011, see Table 1) helps to trace this evolution in Portugal's housing stock. The increase in the number of dwellings in the country after 1974, by decade, was always greater than 20% (Matos, 2012) representing the massive investment in new housing. And even though the rates eased over time, this increase was never really accompanied by the total number of inhabitants. As Table 1 shows, the housing stock continued to grow significantly between 2001 and 2011 (an increase in 12.2% of buildings intended for housing and in 16.2% of dwellings), whereas the Portuguese population in that period only increased 1.0%. Moreover, 91% of these new inhabitants have come, not from births, but from migration, and the elderly population has increased in almost 20% since 2001 (INE, 2011). Overall, the country only increased in about 200.000 inhabitants, but gained 800.000 more dwellings, i.e. there were four new dwellings for each person.

The housing boom was able to replace older construction thus, theoretically, increasing the quality of dwellings. The number of buildings in the country constructed before 1960 has reduced by a third, and about 30% of the housing stock was built in the last two decades (Table 1). Of the Portuguese regions, the Algarve (at the South of Portugal) and the Madeira Island showed the greatest increases in housing stock from 2001 to 2011 (24% and 23% respectively – see Table 2), a growth that can mainly be attributed to the considerable rise in tourism. These are, naturally, the regions also possessing the youngest housing stocks. The lowest increases were observed at the North of Portugal and in the Alentejo region (around 10%). The inland regions as well as the greater metropolitan areas of Lisbon and Porto contain older housing stocks. Yet it is to be noted that the regions around Greater Lisbon and Greater Porto contain younger housing stocks – intense suburban construction in the last decade and good conditions of access to housing credit are the cause.

	2001	%	2011	%	Variation (%) 2001-11
Population	10356117	100.0	10562178	100.0	1.0

Table 2 – Housing stock data, by regions, for 2001 and 2011
Source: INE, 2001, 2011

The number of dwellings per building has also increased from 1.6 in 2001 to 1.7 in 2011. This indicator is larger in the greatest metropolitan areas in the country, Lisbon (3.3), Setúbal (just South of Lisbon; 2.5) and Porto (2.3), whilst the remaining regions have primarily single family homes (averages ranging from 1.1 to 1.3 dwellings per building) (INE, 2011). The Azores display the lowest figures (around 1.1).

With the renewal of the housing stock, the comfort and the state of conservation of buildings/dwellings has also improved, both at a national and a regional scale. The percentage of derelict buildings having medium

to large repair needs has decreased in the order of -30% nationwide from 2001 to 2011 (Table 1). Over two thirds of buildings in the country were deemed in good state of conservation and hence do not need repairs. Madeira Island has the highest percentage of derelict buildings with medium to large repair needs (12.5%) and the Azores the lowest (7.4%) (Table 2). The most significant improvement was witnessed precisely in the Azores, with the percentage decreasing from 16.7% in 2001 to 7.4% in 2011, and in the North region, with values decreasing from 21.1% to 12.1% in the same ten year period. The percentages related to dwelling problems have also decreased from 2001 to 2011. The number of overcrowded dwellings has decreased to 11% nationwide (Table 1), with the archipelagos of Madeira and Azores displaying the highest percentages (23% and 16% respectively – see Table 2). This value has also decreased to below 10% in 2011 for the Center and Alentejo regions. The fact that the size of households is dropping dramatically in Portugal may also contribute to reduce the problem of overcrowded dwellings.

Non-conventional family dwellings, namely tents, rudimentary wooden homes, mobile homes, improvised buildings or others also decreased considerably (-76%) since 2001. This success is partly attributed to the Special Rehousing Program, introduced in 1993 (Decree-law 163/93, of 7th May, amended by Decree-law 271/2003, of 28th October). This decree's major goal was to eradicate non-conventional housing mainly from the two largest metropolitan areas of Lisbon and Porto. It allowed local authorities and other agents to use government funds for building social housing in order to rehouse those families that were living in precarious accommodations. Significant reductions were also achieved in the number of dwellings without basic amenities as piped water supply or shower facilities (reductions of around 60% - Table 1). As of 2011, no region in Portugal displayed a number of dwellings without bathtub or shower above 3% (see Table 2). However, the number of dwellings of usual residence without any amenity constitutes the only national indicator which has increased between 2001 and 2011. This may signify that derelict dwellings that were previously unoccupied/abandoned have become occupied in the last ten years, causing further social and health problems. Further strain is also caused by the fact that 60% of the elderly population is living either alone or in exclusive company of other elderly people (an increase of 28% since 2001), often in unsuitable conditions.

4 SPATIAL DIMENSION OF HOUSING PROBLEMS – MUNICIPAL LEVEL

When looking at national statistics, there is no question that housing conditions have, overall, significantly improved in the last decade, both as a result of public and private initiatives. If this has been heralded as a significant achievement, it stems nonetheless, as Ferrão (2014) points out, from an a-territorial perspective of analysis that can be concealing the actual magnitude of existing problems and the location of many specific problematic areas. Actually, as discussed in the previous section, several authors (Guerra, 2011, Matos, 2012, Whitehead et al., 2014) have shown evidence of smaller scale housing problems in Portugal that elude, to some extent, the national/regional overview. At this scale, it can be established that some regions are obviously more problematic than others, but even regions which overall have displayed positive improvements from 2001 to 2011 may still contain areas at risk. Therefore, such a wide and vague glance may not suffice at a time when the debate and proposal of place-specific territorial policies is on the political agenda, not only of Portugal, but of the European Union.

Consequently, two additional levels have been added to this analysis: the municipal and the borough level (next section). Through the analysis of the national and the regional level (previous section), a decision was made to select three main representative indicators of housing problems in Portugal; (i) the state of decay of buildings (derelict or requiring medium to large repairs), that represent over one tenth of the total housing stock in the country; (ii) dwelling overcrowding, occurring in one in every ten dwellings; and (iii) dwellings lacking bathtub or shower, whose number dropped by more than half from 2001 to 2011 but still represents one of the most problematic issues concerning housing salubrity conditions (see Table 1). Each of these problems was mapped at the municipal level for the years of 2001 and 2011 (Figures 1 to 3). The percentage values obtained consider each municipality as a separate entity; for example, the percentage of derelict buildings is obtained by dividing the number of derelict buildings in a given municipality by the total number of buildings in that municipality. The figures illustrate first the overall major improvements in housing conditions that Portugal witnessed from 2001 to 2011, but second they confirm how misleading a national/regional analysis can be, as many problems still persist in vulnerable localities.

Figure 1 represents the number of derelict buildings, by municipality, in 2001 and 2011. The images illustrate well how the national average has significantly decreased in the ten year period, with the dilution

of many hotspot areas, but also point out to how this phenomenon is clearly territorialized, thus constituting an important source of information for national public policies concerning the rehabilitation of the built environment. Derelict buildings are still a problem especially in urban areas of the Center and Northern regions of Portugal that, with the exception of Madeira, also appeared as the most problematic areas in the national/regional analysis (Tables 1 and 2). The southern region of Alentejo, on the other hand, has had a significant improvement at municipal level from 2001 to 2011, although such improvement is less perceptible at regional level. As it can be seen on Figure 1, the Alentejo municipalities closer to Spain have had a decrease of 10 percentage points, or more, in the ten year period, whereas those closer to the Atlantic Ocean have had a much smaller decrease of the problem.

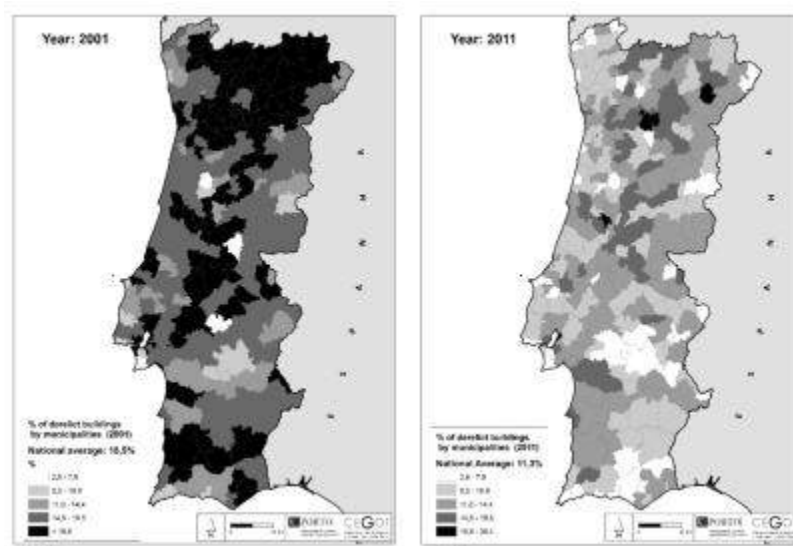

Figure 1 -Derelict buildings by municipality, in 2001 and 2011 (data source: INE, 2001, 2011)

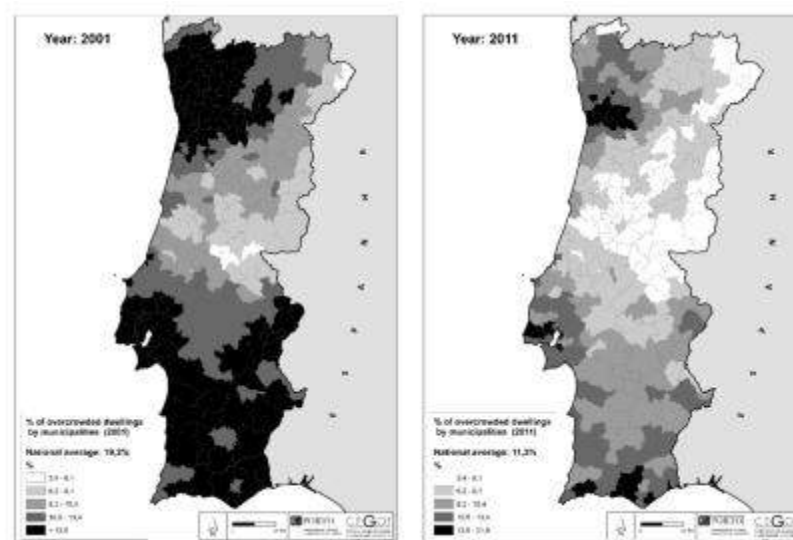

Figure 2 -Overcrowded dwellings by municipality, in 2001 and 2011 (data source: INE, 2001, 2011)

Dwelling overcrowding (Figure 2) is another problem that has seen a relevant reduction at municipal level from 2001 to 2011. In 2001 (Figure 2, left) problematic areas are unequivocally identified as being the northwest region of Portugal, the metropolitan area of Lisbon, and the greater extent of the south of the country. In 2011, this problem has been significantly reduced to specific areas, notably the extended outer rim of the metropolitan areas of Lisbon (municipalities of Sintra, Amadora, Odivelas and Loures) and East of Porto (Cinfães, Marco de Canavezes), as well as some municipalities in the southern Algarve and Alentejo regions (Figure 2, right). Identified problems in the areas around Porto, Lisbon and the Algarve somewhat coincide with those found in the regional analysis, albeit with less definition, but again, the evidence of problematic hotspots in the Alentejo region is exclusive of the municipal analysis.

Comparatively, the municipalities of the interior and the centre of the country have very few overcrowded dwellings, particularly in 2011.

Finally, Figure 3 displays the number of dwellings lacking bath or shower, by municipality, in 2001 and 2011. If in 2001 most of the country, with the exception of the Lisbon metropolitan area and other by-the-sea municipalities, had comparatively medium to high problems of this nature, in 2011 they have mainly remained inland. Whereas most municipalities of the West of the country have practically solved this problem, hotspots still remain in some municipalities in the north (Baião, Cinfães, Resende) and in municipalities closer to the Spanish border, something which was not really perceived through the regional analysis. However, both the municipal and the regional analysis coincide in revealing that the borderline between the Algarve and Alentejo is the most problematic area in the country regarding dwellings lacking bath or shower.

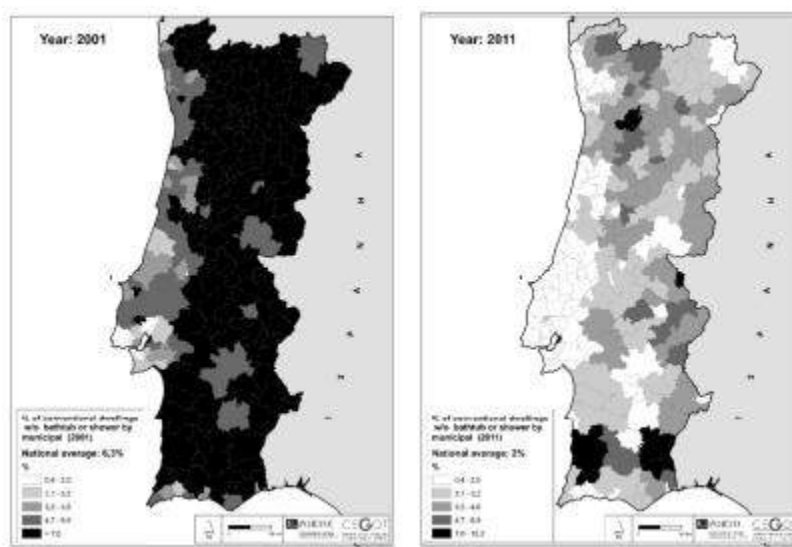

Figure 3 – Dwellings lacking bath or shower by municipality, in 2001 and 2011 (data source: INE, 2001, 2011)

5 ZOOMING IN ON HOUSING PROBLEMS – BOROUGH LEVEL

The fourth, and last, scale of analysis selected in this research was the borough level. As in the previous section, color maps were produced representing the geographical distribution, at this scale, of the same three variables: derelict buildings, dwelling overcrowding, and dwellings lacking bathtub or shower, both for 2001 and 2011 (Figures 4 to 6).

As seen above, new housing stock does not necessarily mean that the problem of building deterioration is solved, because of the poor construction quality of the last thirty years and the lack of funds from public and private quarters to carry out maintenance. Even so, obviously, physical deterioration affects older buildings the most and, therefore, the most problematic areas identified were those in traditional areas of older construction, i.e. historical centers, particularly of Lisbon and Porto, and many other urban centers in the country both in the Center and interior northern regions (Figure 4). In this case, this is, overall, very similar to the outcomes of both the regional and municipal analysis.

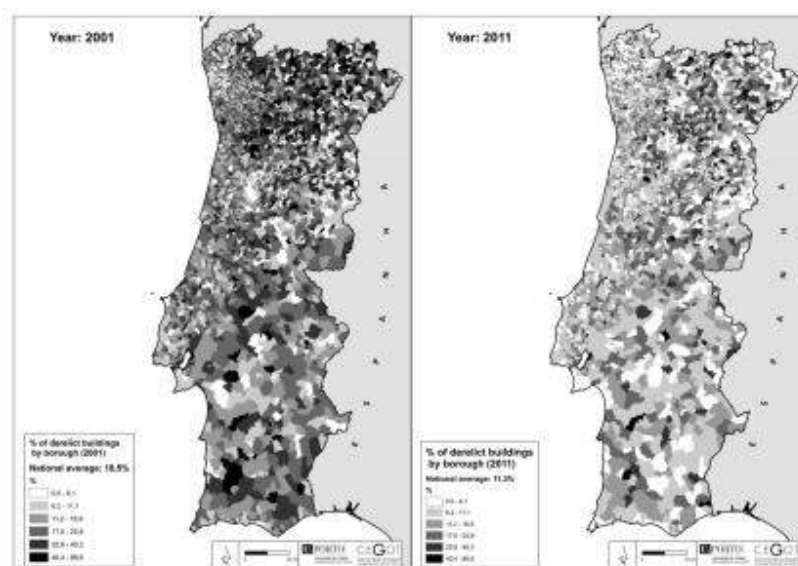

Figure 4 – Derelict buildings by borough, in 2001 and 2011 (data source: INE, 2001, 2011)

Overcrowded dwellings (Figure 5) have seen considerable reductions since 2001 in the littoral north, Lisbon and southern regions of Portugal. Nonetheless, there are still some severe hotspots, primarily located in densely populated areas, where inhabitants possess low school qualifications and scarce economic resources, namely in the north and in the Archipelagos of Madeira and Azores. Although the identified problems in the areas around Porto, Lisbon and the Algarve coincide, generally, with those found in the municipal and regional analysis, a closer attention should be given to the northern region. In the regional analysis, this region displays a percentage of overcrowded dwellings inferior to that of Lisbon and the Algarve, and the municipal analysis (Figure 2) shows three concentrated hotspots corresponding to each of these regions. Only in the borough analysis (Figure 5) it can be seen that the extent of the problems covers a much larger geographical area in the north.

Lastly, Figure 6 shows how the number of dwellings lacking bath or shower has had a significant improvement at the borough level from 2001 to 2011, particularly in the interior and the north of the country. At this level the worse situations are still found in the rural areas in the north, the inland centre and especially in the mountainous regions of Algarve, at the south of the country. This is in line with the regional and the municipal analysis that, overall, revealed the most problematic area to be between Alentejo and Algarve.

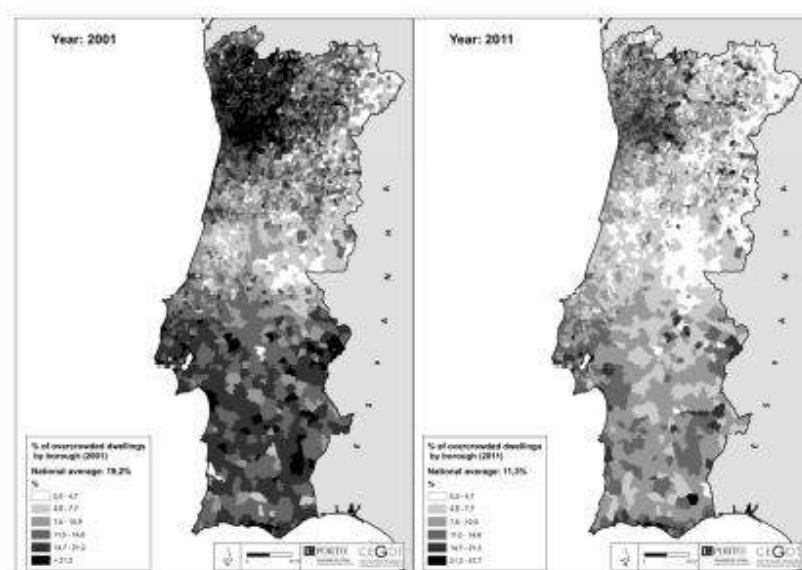

Figure 5 – Overcrowded dwellings by borough, in 2001 and 2011 (data source: INE, 2001, 2011)

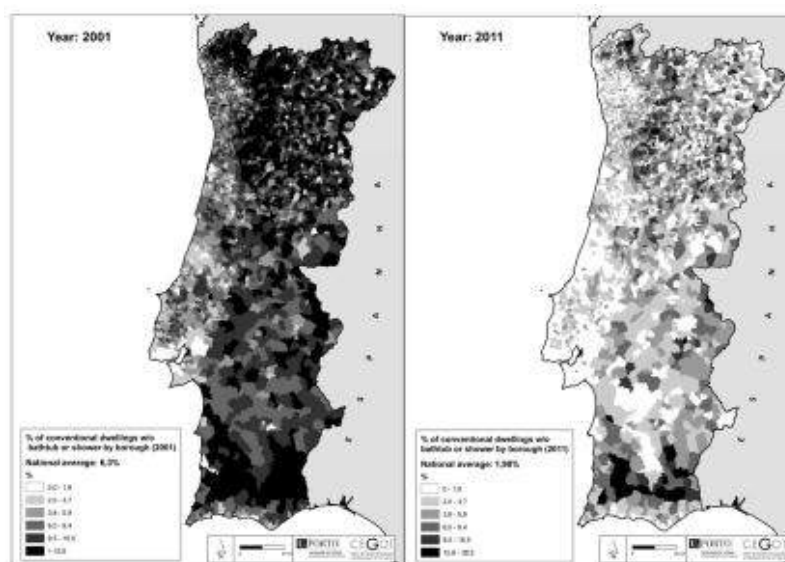

Figure 6 – Dwellings lacking bath or shower by borough, in 2001 and 2011 (data source: INE, 2001, 2011)

6 STATISTICAL COMPARISON OF THE FOUR SCALES OF ANALYSIS

In the previous sections it has been discussed that there are some perceptible differences between the problematic areas identified at different territorial scales. To further understand if these differences between scales are, statistically speaking, significant, parametric hypothesis tests were applied to the universe of the

4.241 (in 2001) and 4.260 (in 2011) boroughs of Portugal. Considering the three variables that have been analyzed in greater detail in the previous sections (% of derelict buildings; % of overcrowded dwellings; % of homes lacking bath or shower), each borough was characterized by four different values; i) the respective value at borough level (Figures 4 to 6); ii) the value of the municipality in which the borough is in (Figures 1 to 3); iii) the value of the region the borough is in (Table 2), and iv) the value for the country (Table 1). This last value is, obviously, the same for all boroughs.

In this way, 24 values were attributed to each borough: four for each scale, for each of the three variables, for each of the two years in analysis (2001 and 2011). Consequently, parametric tests for related samples were used to identify differences of means between scales. T-test for dependent samples were used for the comparison of two scales, and repeated measures ANOVA tests were used for comparisons between more than two scales. The confidence level used was 95%, therefore for p-values above 0.05 we could accept the null hypothesis (H_0), i.e. that there are no significant differences between scales of analysis. The tests were applied at national level and by regions. P-value results are displayed in Table 3.

Looking at the universe of around 4.260 boroughs in Portugal it can be seen that there is indeed a significant difference between the four scales of analysis for each of the three variables and in both years (p -value = 0.000). Looking at every two different scales in turn, the same conclusion can be drawn, and the p -value is always rounded to 0.000 with the exception of the comparison between the municipal and the borough scale for the variable '% of overcrowded dwellings' in 2011 (p -value = 0.038, see Table 3). This means that, considering a higher level of confidence (e.g. 97%) the null hypothesis would be rejected and thus it could be argued that no significant differences between these two scales actually existed when reading this variable. Basically, this would mean that the analysis of hotspots and the definition of specific territorial policies could be addressed, in this case, at municipal level, instead of the borough level.

Because the results for the entire universe of boroughs in the country were more than likely to reveal significant differences between all scales and across all variables, as it was the case, the tests were repeated for each region in turn. In this case, for each borough, the value for the country and for the region is the same and hence no National-Regional analysis can be performed.

The analysis by regions shows perceptible differences across variables and across regions. Comparing the four scales of analysis simultaneously, the archipelagos of Portugal (Madeira and Azores) are the only ones that show no significant differences between scales of analysis, namely when the variable '% of derelict buildings' is considered. In Azores this happened only in 2001 (hence the scales now display, overall, different values), yet in Madeira this happens for both years. This lack of difference between scales for these regions and this variable is completely confirmed by the t-tests for each pair, with a few exceptions (e.g. a rejected test for the National-Municipal comparison in the Azores in 2001).

Table 3 – P-value results of the parametric hypothesis tests for 2001 and 2011

Actually, it is precisely this variable, '% of derelict buildings', that presents less significant differences across territorial scales, particularly in the Islands and in the southern regions of Alentejo and Algarve. In Alentejo the similarities occur between the National-Borough and Regional-Municipal scales, whereas in the other three regions they are mostly transversal between all pair comparisons in both years, with the exception of the National-Municipal comparison. The Lisbon and northern regions always present significant differences between scales for this variable in both years, and the same occurs in the Centre region, for 2011. The variable '% of overcrowded dwellings' follows a similar, yet less perceptible, tendency, displaying less differences between some scale comparisons in the Azores, Alentejo, the Algarve and, notoriously, Lisbon, where no significant differences are found between the regional, the municipal and the borough scale.

On the opposite side, the variable 'Dwellings lacking bath or shower' always reveals that the values are significantly different between any two scales, with the exception, again, of the Islands, yet mostly for 2001. In fact, this is a common tendency of the analysis. With the exception of the Municipal-Borough comparison, where the values for 2001 and 2011 are mostly similar, in the other pair comparisons, in most places where no significant differences were found for 2001, they occurred in 2011. This happens, for example, in the analysis of the '% of derelict building' both for the Center and the Azores, of the '% of overcrowded dwellings' for the Algarve, or of the '% of dwellings lacking bath or shower' for the Azores, at various scales. The opposite hardly occurs in the analysis; e.g. the readings for the National-Municipal

comparison of the ‘% of derelict buildings’ in Alentejo and Madeira. This is a significant find as it reinforces the idea that territorial policies for the Horizon2020 period need to be devised at a more focused scale than before, to take into account the significant differences between spatial readings that have appeared from 2001 to 2011.

This should be particularly more pressing at municipal level. Indeed, it is highly perceptible that the Municipal-Borough scale is the one presenting the less amount of differences, particularly in the variable ‘% of overcrowded dwelling’, whose test was accepted for every region except the North, and ‘% of derelict buildings’ in Algarve, Madeira and Azores. It is noticeable how in Madeira there are no differences between the reading of these two scales for every variable and both years. When planning by regions, the municipal scale should then be considered enough to address the specificities of the territory.

As seen before, National-Borough, National-Municipal and Regional-Municipal similarities are scarcer, occurring mostly for the variable ‘% of derelict buildings’ in Alentejo, Algarve and the Islands. Furthermore, every region except the North and the Center display some particular instance where there are no significant differences between the values measured either at the borough or municipal scale and the regional scale. The North region, however, is the only one which always displays asymmetries between scales, and hence should be the one subject to a more careful regional and local planning agenda concerning housing problems.

7 DISCUSSION AND CONCLUSIONS

This paper intended to answer the question of whether scale-of-analysis mattered when evaluating housing conditions and consequently when designing public policies intent on reducing housing problems and vulnerabilities. According to Battaglini and Annunziata (2014) territorial policies “have to be place-based, site specific and embedded into the territorial complexity that is changeable and evolves over-time”. This is even more pressing in a post-crisis scenario, where profound socio-economic changes have occurred which have affected the housing market and housing conditions (Guerra, 2011), particularly because these changes can be different across spatial scales (Cassiers and Kesteloot, 2012, Donald et al., 2014). As there are evident territorial disparities between countries but also between regions within the same country, many authors have urged for better tailored regulations and policies (Donald et al., 2014, Matos, 2012, Whitehead et al., 2014). However, planning practices have not yet systematically taken into account multi-scalar territorial perspectives, or rather, studies have focused either on wider, national scales (e.g. Nuuter et al., 2015), considering countries as points-on-a-map (Ferrão, 2014) or have been more place specific in evaluating housing conditions, focusing on local scales (e.g. Carmo et al., 2015, Murphy and Scott, 2014, Pendall et al., 2012). By not considering that places may have several geographies at different scales, the ‘scale matters’ debate, so prominent in other fields, has mostly been absent from studies on housing problems, and hence this research presents an original first step towards that debate.

The same three variables (% of derelict buildings; % of overcrowded dwellings and % of homes lacking bath or shower) were calculated at national level, by regions, by municipalities and by boroughs, and the value of the four scales has been associated to each borough for comparison. Geographical disparities in all indicators have been found, and several local hotspots at municipal and borough level have been highlighted that eluded national and regional views. In the last section, through statistical comparison, it was possible to prove that different regions require different territorial approaches to policy design, depending on the problem to address.

The variable ‘% of derelict buildings’, for example, displays little significant differences across territorial scales in several regions of Portugal, implying that it could be well catered at a higher territorial level. On the contrary, the variable ‘% dwellings lacking bath or shower’ displays significant differences across most territorial scales, meaning that the smaller the scale when addressing this problem the better, as its geographical dispersion is very precise. However, the municipal scale may be enough when evaluating these problems, as many similarities, across all variables, were found between the municipal and the borough scale. In the smaller insular regions of Portugal; the Madeira and Azores islands located in the Atlantic Ocean, as well as in the Algarve, this phenomena is always most prominent. The North region, on the other hand, displays the greatest differences between scales. It could be argued that these differences are also dependent on the way regions are structured, but there appears to be a sufficiently identifiable

pattern on this analysis of indicators and scales to support the proposed construct. Further comparative studies, with a greater amount of variables, should be pursued to further prove this point, but the fact remains that the scale of analysis may indeed be a determining factor on the design of effective territorial-based housing policies. This is more relevant when it is determined that from 2001 to 2011 similarities between higher and lower order scales of analysis have dissipated, thus corroborating the urges of Battaglini and Annunziata (2014) and of the 'The State of Housing in the EU 2015 Report' (Pittini et al., 2015) for more local, place specific approaches in the Horizon2020 period.

More than two decades ago Rémy and Voyé (1992) argued that dwellings had increasingly become the space of identification for the family, and the basis for the organization of everyday life. To have proper home is a freedom right (King, 2003), and citizens have transformed their homes into an extension of themselves and their existence, and this is truer in the countries of Southern Europe where a culture of home ownership and a home-for-life exists. In the last decades, with the aid of European Structural Funds and through rehabilitation and social housing programs, Portugal has significantly improved its housing conditions, but the numbers can be deceiving. First because a downturn, spurred by the economic crisis, the shortage of public and private resources and the reduction of credit from banking institutions, has led to a decline of the purchasing power of families, causing indebtedment and insolvency, and to a cut in social housing benefits, something which may force vulnerable groups into poor quality accommodation or even homelessness. And second because the data may be read at the improper scale, concealing the actual magnitude of housing problems by neglecting specific local hotspots.

Therefore, after nearly thirty years of public policies promoting real estate investment, they now need to address issues of building rehabilitation, comfort and overall housing quality to overcome social-spatial inequalities in terms of housing conditions and access to housing, as preconized by European guidelines. To do so, it should be considered that the territory plays a central role in the integration of public policies for housing, and that scale does matter. At the same time, however, it would be a highly unfruitful waste of resources to develop specific strategies for every borough or every municipality and, true enough, in some cases the differences in readings between these scales and higher order ones are inexistent. It thus appears crucial, at this point, first to recognize that multi-scaler territorial approaches are needed to evaluate to what extent policy design should take into account the specificities of countries and regions; but second that policies should be flexible, avoiding unrealistic one-size-fits-all solutions in order to adapt to the size and characteristics, not only of the territorial scales they are focusing on, but of the specific problems themselves. To think policies at different scales and from different perspectives is a complex process, not common in planning practices, but it is one we should build towards, in order to produce a proper territorialized housing policy, responding to the European common goals but at the same time adequate to the different realities of our countries and regions.

ACKNOWLEDGMENTS

The contribution and support of the Centre of Studies on Geography and Spatial Planning (CEGOT) of the University of Porto for facilitating this research is gratefully acknowledged. In addition, this work, as part of CEGOT, was partially supported by the European Regional Development Funds, through the COMPETE 2020 – Operational Programme 'Competitiveness and Internationalization', under Grant POCI-01-0145-FEDER-006891; and by National Funds through the Portuguese Foundation for Science and Technology (FCT) under Grant UID/GEO/04084/2013.

ID 1563 | SUPPORTING INNOVATION IN REHABILITATION INITIATIVES FOR DEPRIVED NEIGHBOURHOODS: A MULTI-LEVEL PERSPECTIVE

Angela Barbanente¹; Laura Grassini¹

¹Politecnico di Bari

angela.barbanente@poliba.it

1 INTRODUCTION

The rehabilitation of deprived urban neighbourhoods through area-based and integrated approach has assumed importance on the European and many national agendas for over thirty years (Berg et al., 1998; Couch et al., 2011). Such approach, rather than focusing on improving the social, economic, housing and urban condition of individuals or households with low incomes and specific needs with no regard where they live, pursues the same objectives by concentrating on specific (deprived) geographic areas.

In some countries the experience of area-based initiatives has been long and weighty in terms of resources allocated, and has anticipated European initiatives, namely the URBAN Community Initiative. In other member states, including Italy, vice versa, when introduced by the European Union's initiatives in a limited number of target cities and towns, this approach was considered an absolute novelty (Parkinson, 1998; Carpenter, 2006; Dühr et al., 2010; Seixas and Albet, 2012).

Area-based and integrated approach to urban rehabilitation assumes wide and variable meaning in different contexts according to different European, national and regional policies. Also the terms used change in relation to the specific problems to be emphasized but also to the political rhetoric aiming at stressing the novelty of urban policy undertaken. Regeneration, for example, is a term used recently at the EU (and Italian) level to indicate urban policies aiming at improving the "quality of life", in the broadest sense, in deprived areas (EU, 2015). But this term implies different approaches: while some consider local communities or neighbourhoods as the very object of regeneration, others use various policy instruments to improve the urban economy to the benefit of the inhabitants' economic well being (Cochrane, 2007). Some approaches are physical, property-led or business driven, some others focus on the urban form and design, on cultural industry or health and well-being, some others emphasize community-based, social economy (Colantonio and Dixon, 2010). In addition, the term urban regeneration in continental Europe appears to be rather indeterminate in its outcomes compared with the Anglo-American context in which this and related terms were originally coined (Rossi and Vanolo, 2013).

This paper will focus on area-based integrated initiatives aiming to rehabilitate deprived urban areas. Typically, these initiatives include 'hard' measures, such as physical restructuring or upgrading programmes in specific areas, and 'soft' measures, such as fostering skills, social capital, and building capacity of people (EU, 2015).

The evaluation of the impacts of these interventions on the areas where they were implemented highlights the difficulty to deal with the complex causes behind deprived areas, which relate to processes of differentiation, segmentation and urban segregation as structural elements of the social-spatial dynamics (Harvey, 2012). In many cases spatially targeted urban policies were unsuccessful to lessen poverty and improve neighbourhoods in the worst areas. Changes often implied that refurbished areas became gentrified; problems and people were shifted to other areas thus not the poorest people got the advantages (Atkinson, 2000; Uitermark and Loopmans, 2013). Property-led approach to urban rehabilitation, on which important urban programmes focused in the UK (Imrie and Thomas, 1994; Colenutt and Cutten, 1994; Turok, 1992) and elsewhere (Porter and Shaw, 2009), was unable to fight social exclusion and contributed to increased inequalities. Moreover, in the face of recession and economic crisis, such approach is likely to trouble mostly economically and financially marginal places, projects, and people (Parkinson, 2009).

However, denouncing distortion and rhetoric of area-based approach is not a request for terminating community capacity-building and local-level initiatives, as even critical literature argues (Swyngedouw et al., 2002). The dismantling of universalist social policies, which paralleled the shift to spatially targeted and place-focused approaches, has overburdened these policies with excessive expectations. The European experience of area-based initiatives suggests that there is a need for an approach that combines aid to

both 'people and places', that is mainstream economic and social protection policies which complement and reinforce more specific urban policies (Atkinson, 2001).

At the end of the first decade of 2000, the economic and financial crisis revived interest in place-based integrated policies for urban regeneration (Urbact, 2015). Increasing inequalities in European cities make it a crucial challenge to continue to experiment such policies in order to improve deprived neighbourhoods. This challenge is supported by the new European cohesion policy (Barca, 2009). Novel urban policies should be founded on area-based integrated policies that are able to link interventions coming from different government levels (supranational, national, regional and local) (Subirats, 2016). After decades of experimentation, there is a consciousness that this approach is still to be considered a very powerful and innovative method of public action, but it is not an easy one. It requires learning from experience and keeping channels open for innovation (Urbact, 2015).

From these findings comes the focus of this paper on how to trigger and support innovation in area-based integrated actions for rehabilitation of deprived neighbourhoods. This is a crucial issue for contexts that lack a long run experience in this field. But it is also important in countries where in the last decades a property-based approach to urban regeneration prevailed. Apart from the perverse results of such approach, the economic recession has significantly changed its feasibility margins.

The paper is divided into the following sections. Section 2 provides a summary of researches on frameworks for the analysis of innovation dynamics in spatial planning and urban governance. Section 3 describes the framework known as Multi-Level Perspective (MLP) for the analysis of innovations in socio-technical systems. The paper then proposes a revised MLP framework to investigate leverages and key resistance to change in the the design and implementation of an extensive integrated initiative promoted in 2006 by the Apulia region in Southern Italy¹ and implemented in deprived neighbourhoods at the local level (Section 4). The research on which the empirical analysis is based draws on systematic regional data on individual integrated programmes, on their implementation monitoring, on interviews with involved actors, and on the direct experience of one of the authors who has been a regional deputy president of Apulia regional government with responsibility for housing policies from 2005 to 2015.

2 FRAMEWORKS FOR THE ANALYSIS OF INNOVATION DYNAMICS IN SPATIAL PLANNING AND URBAN GOVERNANCE

Social innovation scholars (Moulaert et al., 2005, 2007, 2013) have made extensive research on innovation processes in the planning field. Although there is not a single definition of social innovation, that concept is mainly associated with the improvement of the quality of life in neighbourhoods and local territories through renewed social relations at the community level. It has thus three main dimensions: a product dimension, i.e. the satisfaction of human needs as they are perceived by local communities; a process dimension, i.e. changes in social relations linked to governance issues; an empowerment dimension, i.e. an increase in the socio-political capability and access to resources by local people (Moulaert et al., 2005).

Within this literature, "agency" of innovation is usually considered to be at the local level, while the other levels are framed as path dependent flows of actions, with a rather passive role in the dynamics of innovation (Moulaert et al., 2007). This literature shows different possible interplays across levels. Several case studies show the mushrooming of innovations in the interstices of established institutional settings and their radical opposition to them, which often resulted in their incapacity to challenge hegemonic forces (Novy and Hammer, 2007). Other cases show a gradual withdrawal of the grassroots experiences from the initial radical perspective towards formalisation, professionalization and possibly co-optation within the institutional boundaries set by new public management models (Christiaens et al., 2007). Other cases finally show some forms of inclusion of partners from outside the local context, which sustained the operation of socially innovative initiatives in different ways (Moulaert et al., 2010).

¹ Apulia is one of the fifteen ordinary-statute regions that together with five special-statute regions cover all Italy, with a population of 4.1 million people, an area of 19,347 sq. km, 258 municipalities, 8 municipalities with the role of provincial capitals.

In general, social innovation scholars maintain the need for specific innovation episodes to challenge established governance discourses to be able to produce wider alternative social action (Moulaert et al., 2007), and they recognise the need to connect episodes of social innovation to formal institutional systems to sustain them and increase their impact on higher scales (Moulaert et al., 2005; 2010). Nevertheless, a comprehensive framework to analyse evolutionary pathways of innovations is not developed.

An interesting discussion on innovation dynamics in urban governance is made by researchers from sociological institutionalism in planning (Healey, 1997, 1999, 2007; Vigar et al., 2000; Cars et al, 2002; Fainstein, 2000; Gualini, 2001), who have applied a social constructivist frame and a relational view of social action to understand institutional dynamics, thus contributing to connect the phenomenology of micro-practices to wider structuring forces. In this field, an interesting debate on innovation has been developed as a critique of state-centred interventions in promoting changes in the formalized way of “doing government” and of social engineering approaches to institutional design aimed at the creation of more efficient infrastructures for urban performance.

In particular, Healey et al. developed an interesting framework to analyse the institutional relations of governance dynamics (Coaffee and Healey, 2003, Gonzalez and Healey, 2005, Healey, 2006). This was built on a more dynamic conception of Luke’s three levels of power elaborated by Dryberg (1997) and on Giddens’ conception of the interaction of structure and agency (Bryson and Crosby, 1992; Giddens, 1984). The framework expresses the three levels in terms of: the level of specific episodes of interactions, which are characterized by power dynamics of interpersonal relations; the level of governance processes, with power relations embedded in organized institutional practices and deliberately manipulated by strategic actors; the level of governance culture, with a deeper level of taken-for-granted assumptions, culturally embedded habits and routines (Coaffee and Healey, 2003). According to this framework, transformation in urban governance cannot be claimed unless all three levels change significantly (Coaffee and Healey, 2003; Gonzalez and Healey, 2005).

Level	Dimension
Specific episodes	<i>Actors: key players—positions, roles, strategies and interests</i> <i>Arenas: institutional sites</i> <i>Ambiences (interactive practices): communicative repertoires</i>
Governance processes and ‘mobilisation of bias’	<i>Networks and coalitions</i> <i>Stakeholder selection processes</i> <i>Discourses: framing issues, problems, solutions, interests, etc.</i> <i>Practices: routines and repertoires for acting</i>
Governance cultures	<i>Range of accepted modes of governance</i> <i>Range of embedded cultural values</i> <i>Formal and informal structures for policing discourses and practices</i>

Figure 1. Levels and dimensions involved in governance dynamics (source: Coaffee and Healey, 2003).

Transformative effects are thus produced only when governance innovations move from episodes to regulatory practices, i.e. when “the learning experiences, network-building and mobilisation capacity developed in these episodes of governance, and specifically those centred around place qualities, accumulate the power to shift ‘mainstream’ politics and administration” (Coaffee and Healey, 2003, p. 1980). To endure, specific episodes have to become institutionalized in the routines of governance practices and change governance culture (Coaffee and Healey, 2003; Gonzalez and Healey, 2005, Healey, 2006). The core question is thus: “What does it take for innovations in particular episodes to be translated into ‘mainstream’ practices, in ways which transform the mainstream rather than just incorporate new ideas and practices in ways which neutralise threats to established practices and the various power relations embedded in them?” (Coaffee and Healey, 2003, p. 1983). Put it in another way, how can specific innovation episodes have a “destabilizing role, creating challenges and opportunities across the landscape of urban governance through which quite different relations and power dynamics could emerge to shape the future governance culture”? (Coaffee and Healey, 2003, p. 1996).

Despite some cases observed by Healey et al. (see e.g. Coaffee and Healey, 2003) showed how local episodes of institutional changes were prompted jointly by top-down (national agenda aimed to modernize local governance) and bottom-up forces (local political pressures), the framework in its initial version only acknowledged the “agency” of innovation at the local level and disregarded the importance of wider “opportunity structures” in which episodes of innovations are situated and of exogenous forces to generate a pincer movement to force change in embedded urban governance cultures (Gonzalez and Healey,

2005). These are added in subsequent versions of the model, where Healey tried to combine more explicitly the initial conception of the levels of governance with the Giddesian relation between structure and agency by emphasising the reciprocal influence of each level with another through rules, norms, material resources and framing ideas (Healey, 2006). In this model, transformation initiatives are produced by the interplay of rules, resources and ideas coming from different levels and not only located at the local level. Figure 2 represents this refined model of governance dynamics.

Figure 2. Transformation initiatives in governance dynamics. Note: Although laid out as separate levels and structuring dimensions, in any actual instance these all interact

Figure 2. Governance dynamics in transformation initiatives (Source: Healey, 2006).

For the purpose of our study, the interest for this framework comes from its capacity to adopt a multi-level approach to innovation dynamics, although it does not identify specific transition pathways across levels. A limitation of this framework is nevertheless its exclusive focus on institutional dynamics, thus its neglecting of the technical dimension of innovations, which, in the opinion of the authors of this paper, constitutes a core part of innovations in spatial planning and urban governance. The transitions to new approaches to urban rehabilitation include both an institutional and a technical dimension, that are worthy of consideration.

Next section will also show how the framework developed by Healey et al. can be included within a more general framework dealing with socio-technical innovations, which can be used to explain innovation dynamics as well as to identify catalysts and barriers for change.

3 A MULTI-LEVEL PERSPECTIVE ON INNOVATION

This section deals with the description of a framework known as Multi-Level Perspective for the analysis of innovations in socio-technical systems, which the authors maintain can be usefully applied to analyse innovation dynamics in the area of urban rehabilitation.

This framework has been developed in the broad field of innovation studies, on the basis of insights from evolutionary economics – in particular the concepts of regimes, technological trajectories, path dependency and niches (Nelson and Winter, 1977, 1982) – from sociology of technology – in particular the idea that technological innovations are socially constructed through interactions between engineers, firms, policy makers and consumers (Bijker et al., 1987; Hughes, 1987; Bijker, 1997) – and from neo-institutional theory – in particular the idea that actors do not act in a vacuum but are embedded in deep-structural rules, shared beliefs and norms that guide their perceptions and actions (Giddens, 1984). It addresses the study of innovations at the level of socio-technical systems, i.e. a system encompassing not only its technological dimension but also changes in user practices and cultural meanings, institutional structures, policy, markets, scientific knowledge and infrastructures (Kemp et al., 1998; Elzen et al., 2004; Geels, 2004). In these systems transitions are considered as co-evolutionary processes, which involve many actors and social groups and take place through complex dynamics among them.

The field of urban rehabilitation can be considered a socio-technical system; its technical dimension is made of different types of planning instruments at different scales (including strategic plans and programmes, regeneration initiatives, ...). Innovations in the technical tools used to develop rehabilitation

interventions interact with user practices and cultural meanings (how local communities frame rehabilitation interventions, which involvement is required from them in the development of such interventions, ...), institutional structures (which governance frameworks can enable new regeneration plans to be developed and carried out, how they interact with existing government structures, ...), policy (which regulatory, normative and strategic actions are developed to orient territorial transformations), markets (how private firms can be partners of the regeneration initiatives, ...), scientific and technical knowledge (which skills and competencies professionals involved in plan making have and how they can develop new scientific and technical competencies required by innovative rehabilitation interventions) and infrastructures (how changes at neighbourhood level interact with infrastructural networks at the urban scale e.g. in terms of utilities' connection, mobility, etc.).

The MLP specifically elaborates a framework to address transitions in socio-technical systems emphasising a co-evolutionary and non linear approach (Rip and Kemp, 1998; Geels, 2002, 2005). That framework distinguishes three levels at which and across which change dynamics take place during a transition.

The lower level is the level of niches, which act as “incubation rooms” for radical novelties and protect them from normal market selection (Schot, 1998). Niches may be R&D laboratories, small market niches whose users have special demands (e.g. the military) or subsidised demonstration projects (some area-based integrated initiatives mentioned in section 1 fall in this category). The literature on strategic niche management usually identifies three important niche-internal processes (see e.g. Kemp et al. 1998; Hoogma et al., 2002). In the first place, niches provide location for learning processes to happen in relation to various dimensions: technological components, organizational issues, market demand, user behaviour, infrastructure requirements, policy instruments, symbolic and cultural meanings, scientific and technical knowledge. Learning takes place through cycles of actions (experimentations), sensemaking and adjustment of cognitive frames like in the enactment-selection-retention model proposed by Weick (1995). According to this model, actors first do something in the world on the basis of existing cognitive frames, then they interpret outcomes of actions, and finally retain meaningful data within cognitive frames through data accumulation or frame alteration. Learning of this type thus happens during co-construction of niche-innovation experiments and is socially developed among different actors involved (Raven and Geels, 2010). Secondly, niches provide the locus for the articulation of expectations or visions, which give direction to internal innovation activities and to learning processes. Finally, niches are the places where social networks are built and strengthened to expand the social and resource base of niche-innovations and to increase their legitimacy (Kemp et al. 1998; Hoogma et al., 2002).

The meso level in MLP is the so-called “socio-technical regime”. This concept builds on Nelson and Winter's notion of technological regime (Nelson and Winter, 1982), that refers to cognitive routines, beliefs, norms and heuristics shared by engineers and designers in a technical community. It is also similar to the concept of “technological paradigm” used by Dosi (1982) to explain why technological development is mainly channelled along technological trajectories through incremental innovations. In socio-technical regimes, the deep-structural rules that coordinate and guide actors' perceptions and actions in a Giddensian manner (Giddens, 1984) do not belong to engineers only, but they also shape perceptions and actions of other social groups like users, policy makers, civil society, scientists, capital banks, public authorities, etc. In MLP the notion of regime thus introduces a structuralist element in the perspective, which is used to explain several lock-in and path dependence mechanisms of development trajectories (Geels, 2004). Because of the regimes, changes still occur, but they proceed almost predictably in certain directions, giving rise to stable trajectories. This also explains the dynamic stability of socio-technical systems.

The macro-level is then called “socio-technical landscape”. It represents the wider exogenous context, which influences niche and regime dynamics. It refers to several aspects like macro-economic trends, deep cultural patterns, macro-political development, etc., which may include physical aspects influencing the socio-technical system like physical infrastructure or smart grid development (Rip and Kemp, 1998). The socio-technical landscape represents the greatest degree of structuration, which is beyond the control of individual actors.

The core point made by MLP is that innovations in socio-technical systems come about through the interplay between dynamics at multiple levels. Figure 3 provides a description of the dynamics of each level and the way they interact dynamically in the development of socio-technical transitions. Although

each transition pathway is unique, MLP identifies key steps in the dynamic interaction among levels, which can explain transitions.

Figure 3. Dynamics of socio-technical transition according to MLP (source: Geels and Schot, 2007).

After a stage of experimentations of different designs in niches, which may be externally influenced by the meso-or by the macro-level through expectations and size of support networks (Geels and Schot, 2007), niche innovations may at some point build internal momentum, as rules and user preferences become stabilized in a dominant design. At this point, if “windows of opportunity” are opened up at the regime level thanks to pressures put by landscape development, new configurations emerging from niches may break through (Geels, 2002). This may create changes in the socio-technical regime, which may eventually influence landscape development. On the other hand, failures in transitions may occur when niche-innovations fail to build sufficient momentum or suffer setbacks, or when windows of opportunities for niche innovations do not materialise due to insufficient tension in existing regimes.

With this framework, the MLP thus tries to explain transitions in socio-technical systems doing away with simple causality and linear explanations. It employs a co-evolutionary and systemic approach based on the acknowledgement of processes on multiple dimensions, which link up and reinforce each other in a circular causality. Secondly, the MLP emphasises the importance of agency, as experimentations, trajectories and multi-level alignments are all enacted by different actors from different fields (market, industry, science, policy, culture, technology). In this way, the MLP is able to deal with the core analytical puzzle of transitions, namely the oscillation between stability (due to several lock-in and resistance mechanisms) and change. At the same time, it succeeds in identifying links among apparently disjointed dynamics happening at different levels, ranging from the micro-level where radical alternatives are developed and tried by pioneers, social movements and other actors outside the existing regime and landscape levels. One limitation for the application of this model to the field of urban rehabilitation is the under-theorization of the institutional and governance dynamics in the transitions. The six pillars highlighted in the socio-technical regime encompass markets/user preferences, industry, policy, technology, culture, science; thus the institutional and governance dimension of innovation is somehow restricted within the policy dimension. Because of this, the authors of this paper propose to enrich this model by adding a specific institutional/governance pillar, whose dynamics and specificities can be understood on the basis of the literature on innovation in urban governance discussed in section 2. The revised framework is shown in Figure 4.

The MLP framework has so far been applied to several fields, including water supply and sanitation (Geels, 2005), energy (Verbong and Geels, 2007), transportation (Geels, 2012), organic food and sustainable housing (Smith, 2007), urban infrastructures (Maassen, 2012). More recently the MLP has been applied to urban studies (Hodson and Marvin, 2010, 2012; Coenen and Truffer, 2012; Hansen and Coenen, 2015), in the attempt to highlight the influence of spatial dimensions and place specificities in sustainability transitions. These studies thus investigate transitions at the level of the city.

This paper proposes an application of a revised MLP framework to the field of urban studies as well, focusing on innovation in the area of urban rehabilitation.

4 THE TWISTED PATHS OF INNOVATION IN REHABILITATION INITIATIVES FOR DEPRIVED NEIGHBOURHOODS IN APULIA REGION

4.1 A VARIETY OF DISPERSED (AND MISSED) INITIATIVES

In Italy the initiatives for deprived neighbourhoods have developed along with the reduction of welfare and social services, the persistent lack of a national urban policy and even of a national housing policy, after the decentralisation of this responsibility to the regional governments at the end of the 1990s (Padovani, 2011). State investment in housing has been progressively decreasing since the late 1970s, and the limited available public funds were channelled almost entirely towards the so-called “complex programmes”. These are new planning instruments that include a wide variety of area-based initiatives funded by the Ministry of Infrastructures through competitive bids among the cities, adopting different terminology, approaches and methods, which produced an archipelago of isolated, episodic, uncoordinated local experiences¹. The feature that all these programmes share and that differentiates them from other European experiences is that these new planning instruments with strong predominance of the physical aspects on social, economic, and cultural ones.

Thus, only partial convergences can be identified between such national programmes and the initiatives launched by the European Union: Urban Pilot Project (1990-1997) and URBAN programmes (1994-2000). Indeed, the prevalence of physical actions characterizes also the implementation of the URBAN Community Initiative in Italy². The term “integrated action” has been interpreted in very different ways during the experimentation both of the “complex programmes” (Cremaschi, 2001; Padovani, 2002), and the URBAN Community Initiative (Tedesco, 2005). Many regional and local governments still show difficulty to promote integrated actions that move beyond the aims, methods, and achievement of urban renewal, considered as a process of essentially (more or less thorough) physical change (Couch, 1990, 2). The ability to develop new capacities for introducing integrated actions into the ordinary course of events appears limited (Lingua, 2007; Palermo and Ponzini, 2015).

Notwithstanding this, literature shows that URBAN led to significant results in terms of governance experiences and learning processes in the involved Italian cities (Frank et al., 2006), in line with the general trend of a more relevant impact on the Southern European countries lacking of long-standing national urban regeneration policies (Atkinson and Zimmermann, 2016). But the explicit objectives of such initiative, i.e. to promote innovative area-based strategies and reinforce and spread knowledge and experience greater research insight.

Before 2005 the Apulia regional government had never developed neither an urban rehabilitation initiative nor a programme for public housing. Some municipalities had experienced a number of area-based and integrated programmes promoted by the European Commission and the national government.

The Urban Pilot Projects and the two URBAN Community Initiatives involved a limited number of municipalities, mainly provincial capitals³. The national programmes initially involved few municipalities, again mostly provincial capitals. Later, in 2002, the Contratti di Quartiere II (Neighbourhood Contracts) involved 15 medium-small towns and only two provincial capitals (Barletta and Lecce). But this initiative started only in 2008. The implementation of all these programmes, which was entrusted jointly to

1 Programmi integrati di intervento and Programmi di riqualificazione urbana (1992), Programmi di Recupero Urbano (1993), Contratti di quartiere I (1997), Contratti di quartiere II (2002). On the evolution of urban renewal policies in Italy see Governa and Saccomanni (2004).

2 Physical/environmental regeneration accounted for 62 per cent of expenditure in Italy, as opposed to just 10 per cent in Denmark. Expenditure on employment and entrepreneurship ranged from 52 per cent in the Netherlands to just 18 per cent in Italy (Carpenter, 2006).

3 Brindisi was the only municipality that benefitted from the Urban Pilot Programme (Second Phase, 1997). URBAN I (1994-1999) was implemented in Bari, Foggia and Lecce, URBAN II (2000-2006) in Mola di Bari and Taranto. In Bitonto and Brindisi was developed Urban Italia, a special national initiative that funded the twenty municipalities that had been ranked after the ten admitted to the funding of URBAN II.

municipalities, regional government and the Ministry for Infrastructures, is varied. Some never started, others are still under way, and these include also initiatives that were funded in the early 1990s. Moreover, like in most parts of Italy and with the exception of some well-documented local experiences (Palermo, 2001; Governa and Saccomanni, 2004), these programmes were seen as a way to relax the rigidity of the traditional master plans. Thus, the judgment of failure of these programmes in Apulia does not seem to be too severe.

4.2 THE NEW REGIONAL INITIATIVE

The European integrated urban rehabilitation programmes and national “complex programmes” depicted above represent the regional background knowledge for the regional area-based integrated initiative launched in Apulia in 2006.

This initiative, defined as “Integrated programmes for the rehabilitation of peripheral neighbourhoods” (hereinafter referred to as the Italian acronym “PIRP”), aimed at spreading rehabilitation practices in deprived urban neighbourhoods through an area-based and integrated approach. It was an ambitious initiative in a context characterized by modest experience in this field, and a traditional regional housing policy incapable of meeting the needs of the most vulnerable social classes and assuring the right to housing, interpreted as the right to live somewhere in “security, peace and dignity”¹. Funded with 93 million euros, the PIRP was part of a large regional programme for public housing². This was a policy objective of great importance for the left wing government set up in 2005, for the first time (surprisingly) ruling Apulia Region after decades of centre and right governments, and strongly determined to radically change inter alia the spatial planning and urban governance practices that had consolidated for decades in the region. The term “peripheral” does not indicate the neighbourhoods’ topographic position and physical distance from the city centre, but their condition of deprivation and marginalisation. This is represented through significant indicators of disadvantaged socio-economic situation as well as the shortage or degradation of infrastructure and services. Therefore, the historic centres in such conditions were eligible areas.

Municipalities were to base their PIRP proposals on an idea of neighbourhood’s regeneration aimed at creating (or recreating) place attachment and social space. The regional call required that the programmes be developed with the active participation of the inhabitants, in order to meet people needs, desires and expectations, and improve their well-being. Integration was interpreted both in the physical dimension, in order to avoid urban mono-functionality and segregation, and in the socio-economic dimension, to activate effective actions against social exclusion. Finally, the PIRP call for proposals asked for projects that demonstrated to save environmental resources (energy, water and soil), reuse abandoned areas, reclaim polluted sites, restore soil permeability, enlarge and improve pedestrian and green areas in order to create “kid friendly neighbourhoods”.

The PIRP initiative encouraged 122 municipalities to experience 129 area-based integrated initiatives³. This high number of programmes was the result of intense supportive activities. The regional government directed, encouraged and accompanied local initiatives’ design through the promotion of thematic seminars and exchange of experiences on programme’s innovative key issues and an electronic forum aiming not only to provide answers to specific questions but also to foster the exchange of ideas and experiences among the participants. It defined in detail the evaluation criteria for selecting the initiatives in order to avoid the trivialisation and distortion of the innovative features of the programme. Precise points were assigned to each aspect of the programme, stressing those that were supposed to be more innovative in the local contexts (Tedesco, 2009). Notwithstanding this, both the design and implementation of local programmes show relevant differences among the various involved municipalities which deserve examination.

¹ According to the definition of the UN Committee on Economic, Social and Cultural Rights.

² This included also interventions for the rehabilitation of public housing, rehabilitation of vacant dwellings for rental housing, and social housing allowances, for a total of 207 million euros.

³ Provincial capital cities could apply for two programs.

4.3 GRASPING THE MULTI-DIRECTIONAL DYNAMICS OF INNOVATION DIFFUSION

This section uses the modified MLP framework in order to investigate the different performances of design and implementation of PIRPs in the light of the multi-directional dynamics of innovation diffusion linking this programme to the EU and national area-based and integrated initiatives (see figure 4). MLP will help to understand not only whether and to what extent these experiences left trace in the region, but also which kind of innovation has penetrated into the local contexts, if those directly involved in innovative programmes show differences from contexts that were not implicated, and what can be considered the major catalysts for innovation.

Innovation was the key-word for Urban Pilot Projects and an explicit goal included in the launching of URBAN Programme (CEC, 2002). In the intention of the European Commission both these initiatives had a clear demonstrative character. This implies that the URBAN 'core approach' should be 'transferable' from one context to another. These initiatives can thus be considered niche-innovations with respect to the design and implementation of the PIRP programme in Apulia region. They give direction to two flows of learning processes: vertical flows, which involve the different levels of government implicated in the initiative, and horizontal flows, which involve different actors at each level.

On the other hand, national "complex programmes" contributed, together with connected changes in national norms and regulations that had to be directly applied or transposed by the regional legislation, to strengthen the socio-technical regime that shape perceptions and actions of regional and local institutions and social groups. In Apulia, a region characterised by 'sclerotic' urban planning practices and a powerful construction sector, the local actors deeply involved in entrenched modes of urban governance (politicians, public and private planners, architects, engineers, construction companies) had perceived these programmes in an opportunistic way: as an additional source of funds not to be missed and an chance to force urban planning rules to make extra-profits.

The PIRP initiative was entrusted to the regional social housing department. This had managed various phases of the national "complex programmes" implemented in the Apulia municipalities, while had been completely excluded from EU initiatives. Their approach was based on the consideration of the private sector as largely coincident with power groups linked to the construction sector, while ignoring the involvement of local organizations, cultural, social and environmental associations and, above all, the inhabitants of deprived neighbourhoods. In order to remove probable obstacles to innovation due to the one-sided representation of private sector as well as to lock-in and resistance mechanisms typically affecting public organisations, the deputy president responsible for social housing enlarged the decision arena. She involved in the design of the PIRP objectives and call for proposals, the regional tenants' unions, social housing agencies, representatives of the national association of municipalities, and the most important environmental and welfare associations.

As a result, the PIRP was the first initiative in Apulia that involved extensively and consciously in area-based integrated programmes, alongside the municipal officials and the actors traditionally active in urban development, local organizations, cultural, social and environmental associations and, above all, the inhabitants of deprived neighbourhoods.

In the design of PIRP two learning flows triggered by the URBAN niche-innovation influenced the decisions at the regional level: one comes from the EU level and the other from the local level. On the one hand, the URBAN approach inspired an interpretation of area-based and integrated approach emphasising public participation and social-economic dimensions over the physical ones. On the other hand, what had been learned by the URBAN initiative implementation at the local level gave suggestions for improving the PIRP programme. In particular, in order to avoid opportunistic criteria guiding the choice of target areas, i.e. the selection of the most central and visible rather than the most disadvantaged ones, more than 30% of the PIRPs evaluation score (60/170) was assigned to area-based indicators of socio-economic and physical degradation and deprivation.

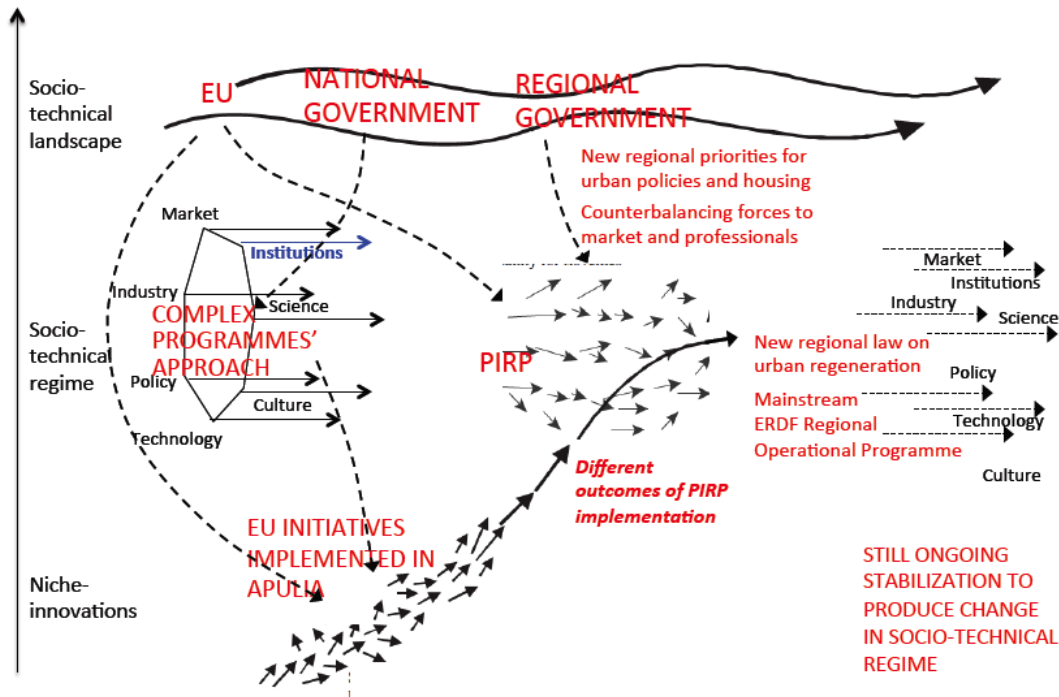

Figure 4. Dynamics of socio-technical transition in the case-study (modified Geels and Schot's MLP framework)

Moreover, a perverse effect of the implementation of the URBAN programme in Apulia historical centres was the rise in real estate values and the consequent eviction of inhabitants (Palermo and Savoldi, 2002). In order to prevent these undesirable processes, the regional programme included a specific financial support in favour of low-income inhabitants of the historical areas to be used to restore their houses or in favour of owners wishing to rent the vacant houses to low-income categories for 8-15 years. Such a focus on the protection of residential functions avoided the economic-functional specialization and consequent morphological segregation that impoverish many historical areas, and that make these areas renewed as neighbourhoods not for daily living but to be visited.

The examination of the PIRP implementation in the capital cities that experimented the URBAN programme highlights the failures in transitions that characterise such niche-innovation. The URBAN initiative was unable to build sufficient momentum to spread innovation within the municipalities that had been involved in the programme⁸. Thus, one could expect some horizontal learning flows coming from the success of these experiences, at least in terms of organizational capacity and process innovation. On the contrary, these cities had great difficulty in starting and implementing the proposed programmes.

A deeper investigation of these PIRPs reveals that the existing socio-technical regimes dominating the major cities were an obstacle for innovation. The huge participation of construction companies, sometime competing for the leadership of the programme, some other assuming the guidance, caused a slowdown and recently even a stop in the implementation. Cognitive routines, beliefs, norms and heuristics shared by technical actors in unity with economic interests, supported or in any case not opposed by the local political power, gave rise to implementation processes that tended to replicate the opportunistic attitude assumed in the "complex programmes" experience. There is more. A landscape level event, namely the economic and financial crisis started in 2008 and still on going in the local housing market, has heavily affected these initiatives, to the point of vanishing some of them.

The systematic inquiry into the implementation of the PIRP programme brings to the fore that small and medium-sized towns were more able to grasp the potential of key innovations activated by the regional government. In most of these contexts we observe product innovation, i.e. the satisfaction of inhabitants needs; a process innovation, i.e. changes in social relations linked to governance issues; an empowerment dimension, i.e. an increase in the socio-political capability and access to resources by neighbourhood communities (Moulaert et al., 2005). The greater 'proximity' and more dense interactions between inhabitants and decision-makers allowed these communities to make their voice heard, to become an active part of the process, and to exercise control over the implementation of the programmes,

up to the technical construction site. This stimulated also engineers and architects to innovate their techniques, get out of their professional routines, and find low cost technical solutions aiming to help inhabitants to manage and maintain facilities and common areas. Contrary to what one might expect, the small towns were much more dynamic also in PIRP implementation. The smaller and simpler organizational structure avoided the problems of lack of coordination and cooperation that occurred in larger cities when the integrated approach made it necessary to combine skills and financial sources from various municipal departments.

The political discourse, which for the first time in Apulia attributed centrality to the rehabilitation of deprived neighbourhoods in connection to the right of the city, found greater spaces for penetration in contexts in small and medium towns. The main reasons for this surprising outcome seem to be the robustness of socio-political ties and the lack of strong economic interests able to direct rules, resources and ideas to their advantage (Healey, 2006) and to oppose resistance to change.

The regional government considered the PIRP programme as an important, extensive and long cycle of experimentations, which triggered learning processes that were not to dissipate, and that had to be exchanged with other experiences and helped to steadily penetrate into everyday practices. To this purpose various initiatives were undertaken: inter alia the approval of a regional law on urban regeneration (No. 21 of 2008), and the adoption of the approach and devices provided by this law in the mainstream ERDF Regional Operational Programme for 2007-2013, and then 2014-2020, as well as in regulations and guidelines that direct ordinary regional and local planning practices.

In developing these instruments, the regional government took into account both the positive and negative impacts of experimentation. Two aspects are worth mentioning for their importance in the Italian debate on area-based initiatives. In major cities, unlike in small towns, the choice of target areas was independent of any strategy to ensure the achievement of the overall objective of combating spatial inequalities and social exclusion in the most disadvantaged areas. Notwithstanding the high rank assigned to area-based degradation and deprivation indicators, interest groups succeeded in influencing the selection of target areas for the regional call for their own benefit. Thus, the regional law No. 21 of 2008 requires the selection of areas to be based on a city-wide "urban regeneration strategy", designed with the active citizens participation and approved by the City Council. The strategy must be based on a detailed examination of the conditions of deprivation and degradation in the different city districts, and must condition the choice of neighbourhoods where regeneration actions are to be developed. The approval of such strategy came to be a prerequisite for applying the priority axis for "urban development" included into Apulia ERDF Operational Programme 2007-2013 (320 million euro), which was entirely devoted to urban regeneration. This did not completely eradicate opportunistic attitudes, but induced municipal officials and local communities to understand that their old land use plans had deeper limitations than rigidity, and opened spaces for civic participation and increased awareness about urban degradation and deprivation problems. This approach is tending to stabilize at the regional level: the approval of the "urban regeneration strategy" according with law No. 21/2008 is an essential prerequisite for applying for funds under the 2014-2020 "urban development" priority axis, according to the call for proposals presented in 2017 by the regional government for partnership agreement. This is a way to obviate the excessive incrementalism characterising the area-based approach not only in Apulia region (Governa and Saccomanni, 2004)

5 CONCLUDING REMARKS

This paper has analysed innovation dynamics in urban rehabilitation of deprived neighbourhoods by combining existing frameworks developed in the field of social innovation and sociological institutionalism with the MLP framework developed in innovation studies, so far applied to several fields including urban infrastructures, food and housing, and sustainability.

The application of a revised MLP framework to the area of urban rehabilitation revealed two main advantages for the analysis of innovations compared to established models. First of all, it allowed to broaden the range of actors and processes involved in the innovation process as well as the levels to which they belong and act in transformative practice. This result was particularly important in the area of urban rehabilitation, where European, national, regional and local levels interact and influence each-others. Secondly, it helped to overcome a perception of innovation as proceeding from bottom-up,

grassroots practices to subvert higher level structures and governance systems. In this respect, the multi-level perspective employed in this paper showed the nested hierarchy of processes and the bi-directional influencing dynamics of change. Furthermore, this paper revealed the influence of place specificities on innovation dynamics and demonstrated the importance of investigating the specific places, where niche practices find barriers for their penetration, and the places where innovation unfolds.

The use of the above-mentioned analytical framework strengthened the investigation of the complex socio-technical processes of design and implementation of area-based and integrated actions for deprived neighbourhoods, and led to a wider conceptualization of drivers and barriers for innovation and change in such initiatives.

1 INTRODUCTION

The central goal of the project is to investigate the living environment of low quality in residential areas in the cities, which mutually need improvement and regeneration in the scope of future sustainable urban development. The most problematic questions are being raised during the last decades about the marginal and post-socialist prefabricated housing estates built during the 1950-80s in EU. However, the inhabitants as core users of these housing areas are not fully participating in the development initiatives for revitalization on one hand, and have not been given due attention by the city to express their needs and expectations on the other hand. The main documents which contextualize the research are EU Urban Agenda and, especially, the New Urban Agenda by United Nations Conference on Housing and Sustainable Urban Development (Habitat III), which give value to the citizens; recognize the importance and prioritize their participation in the city development, urban regeneration. The research is focused on the development of interoperable connections between urban environment of low liveability and the inhabitant through participation strategies, understanding the role of innovation (regenerative and participative) for efficient public participation. It is considered to narrow this focus to Poland as the case study country because Poland is one of the countries in Central Europe, which received post-socialist prefabricated large housing estates built between 1960 and 1990 with population of over 8 million people, flats in large housing estates are estimated as 35% of the overall number of dwellings in Poland.

In the context of the above documents by European Commission and Habitat III the research objectives are summarized in the following layers of the research: (a) prefabricated housing Estates and social housing policies; (b) development of public participation in urban development (regeneration of residential areas) in the framework of European Standards. These correlated layers are directed to achieve the main

research hypothesis: (a) the retrieved matrix of indicators of living environment of prefabricated large housing estates and societal needs of inhabitants sets the core in regeneration program; (b) the interoperability of European Standard CEN/TS 16555-1:2013 (Innovation Management) and participatory strategies in urban sustainable development envisages an innovative linkage element between urban regeneration project management and participatory process. This becomes especially important at the time, when R&D&I European Standards as national standards in Poland have not been adopted yet. The research comprises collaboration with Portugal (CIAUD, FA ULisboa) in the scope of participatory strategies for urban development as one of the countries which also has not implemented these standards by now. In the fall 2016 this research project was submitted to POLONEZ, that is the National Science Centre (Poland) fellowship program, co-funded from the EU H2020 Marie Skłodowska-Curie Actions.

The use of the transdisciplinary approach in correlated urban categories 'city – inhabitant – knowledge&innovation' expects impact on the mechanism for improvement of the level of living environment in the cities and human settlements, their smart sustainable development for the societal benefit, which are among the Europe 2020 targets and priorities.

2 CONTEXTUALIZATION OF THE RESEARCH

The main documents, which contextualize the research, are EU Urban Agenda, the New Urban Agenda by United Nations Conference on Housing and Sustainable Urban Development (Habitat III). These documents envisage the mutual role of the citizen as the participant in the city development and urban regeneration, defining a "participatory" (New Urban Agenda, 2016) city, which "achieve sustainable integrated urban development" (New Urban Agenda, 2016) by leveraging innovation.

The framework of Europe 2020 Strategy (European Commission, 2010) states mutually reinforcing priorities for smart, sustainable and inclusive growth. These three directions envisage developing of knowledge and innovation; resource efficient, greener environment; social and territorial cohesion as drivers for future economies throughout the Union. The mechanism of achieving the goals set by Europe 2020 requires the translation of these goals into national targets and trajectories. Smart growth receives a productivity gap due to a lower level of innovation, insufficient use of information technologies, and reluctance in some parts of our societies to embrace innovation. According to (European Commission, 2010) "smart growth means strengthening knowledge and innovation as drivers of our future growth".

The Europe 2020 targets and priorities are interrelated on the level of living environment in the cities and human settlements, their smart sustainable development for the societal benefit. Almost three quarters (72.4 %) (Eurostat, 2016) of the EU-28's population lives in the urban environment. And the quality of urban life in cities, towns and suburbs demands its improvement.

In this context, the European Commission, expresses its concern for future cities in "Communication from the Commission to the European Parliament, the Council, the European Economic and Social Committee and the Committee of the regions the urban dimension of EU policies – Key features of an EU Urban Agenda" COM/2014/0490 final" (European Commission, 2014) and refers to the principles of the European sustainable urban development model synthesised by Cities of Tomorrow, which describe future cities as: places of advanced social progress; platforms for democracy, cultural dialogue and diversity; places of green, ecological or environmental regeneration.

It is acknowledged in the New Urban Agenda (New Urban Agenda, 2016) that in the sustainable development of cities and human settlements citizens "play an active and unique role in development initiatives". The Agenda underlines as one of the main feature, that it envisages in the cities and human settlements, that they: "are participatory; promote civic engagement; engender a sense of belonging and ownership among all their inhabitants; prioritize safe, inclusive, accessible, green and quality public spaces friendly for families; enhance social and intergenerational interactions; and foster social cohesion, inclusion" (New Urban Agenda, 2016, 13 b).

Among the main interlinked principles and commitments of New Urban Agenda (New Urban Agenda, 2016) are: (a) "leave no one behind <...> by enhancing liveability; by ensuring integration in the urban space; by ensuring public participation providing safe and equal access for all; by providing equal access for all to adequate and affordable housing"; (b) "ensure sustainable and inclusive urban economies, by

<...> leveraging high competitiveness and innovation"; (c) "ensure environmental sustainability, by promoting sustainable use of land and resources in urban development, by building urban resilience.

In the above context, future development of the cities correlates the categories of (a) knowledge and innovation, and (b) social cohesion translated to the goals on national level. EU Urban Agenda COM/2014/0490 final and, especially, the New Urban Agenda by United Nations Conference on Housing and Sustainable Urban Development (Habitat III) (New Urban Agenda, 2016) give value to the citizen; recognizes the importance and prioritize his participation in the city development, urban regeneration.

The above documents are contextualizing the research and are opening further contemporary questions and possibilities of research on participatory processes in urban regeneration: how to understand the innovation in participatory engagement for contemporary sustainable city; what is the nature of correlation between the categories 'city – inhabitant – knowledge&innovation', their interoperability in participation strategies. The definitions of 'participation', which are used during the last decades, consider its meaning as "a varied set of initiatives that are committed worldwide to dealing with scenarios in transformation" (Falanga, 2013). Participatory engagement of the citizens to the development of the settlement faces the challenges during the process: from the involving of the inhabitants until the conclusion stage. How do participants envisage and percept 'What city do they need?' What tools may influence of the effectiveness of public participation?

Therefore, we argue to understand the participatory process also as service and product during urban development and regeneration projects in the sustainable city development. This approach opens the possibility for the development of public participation in urban development in the framework of European Standards as European Standard CEN/TS 16555-1:2013 (Innovation Management). The wide use of this standard is not developed yet among the all countries in the EU, because not all the member states have not adopted it on their National levels. That is why it became important to identify the case countries, which still haven't implemented these R&D&I European Standards as national standards, and have not efficient results in public participation during urban development projects. The special interest is put on participation in urban regeneration of prefabricated housing estates as living environment of low quality in residential areas in the cities.

Concern on better measures of innovation in service sectors, non-technological innovation, innovation linkages and appropriate tools of analysis for policy makers is addressed in Oslo Manual (OECD and Eurostat, 2005). Manual used as a contextual framework for the understanding the role of innovation (regenerative and participative) in the research as innovation in service and non-technological product. Along with the Manual the use of Standards of Innovation Management will give the possibility to approach the conditions in the process of participatory strategies in urban development.

The structure of European Standard CEN/TS 16555-1:2013 Innovation Management foresees the parts: innovation management system (CEN, 2013); strategic intelligence management (CEN, 2014a); innovation thinking (CEN, 2014b); intellectual property management (CEN, 2014c); collaboration management (CEN, 2014d); creativity management (CEN, 2014e); innovation management assessment (CEN, 2015). According to CEN/TS 16555-1:2013 Innovation Management System (IMS) is defined as "set of interrelated or interacting elements of an organisation to establish innovation policies and objectives, and processes to achieve those objectives". The tasks to achieve the effectiveness of processes have been underlined in the Communication, "A strategic vision for European standards: Moving forward to enhance and accelerate the sustainable growth of the European economy to 2020" COM (2011) 311 final European Commission (2011).

The paper looks at the developed justification of the case countries and objectives of the research; defined case studies in the scope of the central goal of the research; the project working framework and methodology design; discusses expected societal impact of the Innovation management technology standards as a tool in participation process in urban regeneration of living environment in the cities.

2.1 JUSTIFICATION OF THE CASE STUDY COUNTRIES AND OBJECTIVES OF THE RESEARCH

The project aims to investigate the living environment of the low quality in the contemporary city with the process of participatory strategy. The large housing estates of prefabricated dwellings are described as the typology of housing with: “negative phenomena leading to the social and physical degradation of these areas, referred to as the large housing estate syndrome” (Szafrńska, 2013); monotonous, often not safe environment (Wrana, 2014); lack of safety feeling of security (Szafrńska, 2015); bad image; need of technical rehabilitation; “the challenge to secure neighbourly relations is <...> increasing” (Droste and Knorr-Siedow, 2005). Thus, the living environment of large housing estates of prefabricated construction is recognised as living environment of low quality. The number of flats built between the 1960–1990s in large housing estates in the socialist countries of Central Europe (Knorr-Siedow, 1996): Bulgaria – 55%, CSFR – 66%, GDR – 48%, Poland – 61%, Romania – 49%, Hungary – 52%. Poland is among the countries with the highest quantity of dwellings (61%) in prefabricated housing estates built during the 1960-90s. The special interest in the project is put on Poland as case study country that received post-socialist prefabricated large housing estates, which challenge in regeneration of these residential areas and involvement of inhabitants to participatory process in urban regeneration of prefabricated housing estates as living environment of low quality in residential areas in the cities.

The participatory process in EU cities receives two main strategies as: participation in the process of projects for urban development; participatory budget. In Poland both of these ways of participation obtained strong and weak sides during the procedures (Feltynowski, 2015). Therefore, the importance of future implementation of interoperable mechanism between knowledge and the city, innovation and consumer, smart city development and participatory engagement, contributes to the harmonization of procedures leading to development of smart sustainable city for the societal benefit.

The structure of the research is set in two main layers, which build the context for the research objectives. These layers are: (a) prefabricated housing Estates and social housing policies; (b) public participation in urban development (regeneration of residential areas) in the framework of European Standards (Innovation Management).

The outlined context of the case study country of Poland according to these interrelated two layers of the research is as follows:

- a. Poland is one of the countries in Central Europe, which received post-socialist large housing estates built between 1960 and 1990 with population of over 8 million people (Węclawowicz, 2007), flats in large housing estates are estimated as 35% of the overall number of dwellings in Poland (Szafrńska, 2013);
- b. participatory strategies of two types are used in Poland: participation in the process of projects for urban development (Law Dz.U. 2003 nr 80 poz. 717 for spatial planning and development) (Ustawa, 2003); participatory budget started in 2011 in Poland. Poland is among the Member States that has not adopted the European Standard CEN/TS 16555-1:2013 (Innovation Management – Part 1: Innovation Management System) on the national level yet. This standard aims knowledge transfer and allows its implementation within the multidisciplinary scope.

The researches of the last decade explore the problematic features in prefabricated large housing estates in the scope of Poland (Szafrńska, 2013; Szpytma, 2014), local cities as Lodz, Lublin (Wrana and Skoczylas, 2014; Ostańska, 2009, 2011; Jarocka-Mikrut and Glen, 2014; Skoczylas, 2016) in particular. It is stated by Szafrńska (2013) that “twenty years of the socio-economic transformation in Poland show that so far no comprehensive strategies of transforming large-scale housing estates have been devised yet, and solving this problem has been postponed until an indefinite future.” The research by Szafrńska (2013) concludes that “modernization (humanization) of large housing estates requires the involvement” of local communities (inhabitants) and central and local authorities, “the correlated and integrated actions of these actors should take into consideration the needs of residents”.

The process of public participation in urban development in Poland is in the scientific debate (Kaczmarek and Wójcicki, 2016; Feltynowski, 2015; Gawroński et al., 2010). In case of Poznań it had been experimented the Internet tool “in the form of a geo-survey in GIS, the first of this kind to be conducted in Poland, successfully eliminated the problem of the insufficient representativeness of traditional consultations” (Kaczmarek and Wójcicki, 2016) and stated that “it is necessary to improve the decision

process in urban spatial planning by augmenting the traditional forms and instruments of public participation with new ones". They should offer the possibility of greater participation and a wider social representation than the traditional consultative meetings.

Justification for tackling specific scientific problems by the project. In Poland regeneration of prefabricated post-socialist housing estates has only recently been acknowledged as well as the suggestions of implementations of new schemes of public participation, while explorations of interoperability of European Standards for Innovation Management Systems in urban regeneration, as a whole and residential areas of low liveability in particular, in the cities and active types of participatory strategies are absent from the academic debate. There is a gap in existing research about public participation in urban regeneration of post-socialist housing estates in regional city of Lublin that verifies the importance of the planned research hypothesis as innovative interdisciplinary approach to the existing problem of quality of prefabricated living estates. Existing process of public participation in urban development receives more problems and questions, then positive results because it lacks an innovative linkage element which has to connect effectively the city inhabitant and administrative authorities, urban regeneration project management. It means that public participation as a tool for public consultation in spatial development of the city is not effective now and not enough to become a interoperation mechanism, thus need to be investigated for innovative changes. Meanwhile, "local governments often fail to tap into the experiences, ideas, and resources of civic actors when identifying and defining problems and challenges that call for innovative solutions" (Sørensen and Torfing, 2016).

The correlated layers of the research are directed to achieve the main research hypothesis: (a) the retrieved matrix of indicators of living environment of prefabricated large housing estates and societal needs of inhabitants sets the core in regeneration program; (b) the interoperability of European Standard CEN/TS 16555-1:2013 (Innovation Management) and participatory strategies in urban sustainable development envisages an innovative linkage element between urban regeneration project management and participatory process. This becomes especially important at the time, when R&D&I European Standards as national standards in Poland have not been adopted yet. The aim of this hypothesis is in innovation and knowledge transfer for efficient practices and results.

Thus the research objectives of the project are summarized in two layers and set as following:

- a. prefabricated housing Estates and social housing policies: (a.1) identifying the representative case studies for complex analysis of the prefabricated housing estates in Poland (Lublin: LSM, Stanislaw Moniuszko quarter; Krakow; Warsaw); (a.2) identifying interconnection between prefabricated large housing estates and challenges in social housing policies in Poland; (a.3) development of matrix of bottom-up and top-down indicators of prefabricated housing estates and societal needs of inhabitants as the core in regeneration program;
- b. development of public participation in urban development (regeneration of residential areas) in the framework of European Standards: (b.1) identifying the initiatives, realised projects and projects in progress on urban regeneration of residential areas with involvement of inhabitants in Poland and abroad; (b.2) analyzing the interconnection of the authorities, construction enterprises, research institutions and participatory process in the context of the European Standards CEN/TS 16555-1:2013 (Innovation Management – Part 1: Innovation Management System) and Parts 2-7 (CEN, 2014a-2015); (b.3) analyzing participatory process (case studies) in the framework of Innovation Management Technology Standards and Oslo Manual as service and product in urban development and regeneration projects in the sustainable city development: challenges and potential; (b.4) determining and providing recommendations on linkage element between urban regeneration project and participatory processes for innovation in urban sustainable regeneration.

In the development of the Strategic Plans for Urban Rehabilitation, which in Portugal focus on territorial units with enormous influence on the life of the citizens, it is possible to verify the weak affluence to the public participation in the contexts of the planning of the city and its development. This weak affluence on the destiny of the city is worrisome when analysed from a qualitative perspective. It is also necessary to analyse the different contexts where these phenomena occur and to frame them in the respective social, administrative or methodological frameworks.

The presence of Portuguese case studies is also related to the need to promote a broad comparative framework that allows the involvement of different administrative, social and methodological matrices, and not only with the absence of the CEN standard, which allows for clarification more sustained from good and bad practices in public participation associated with urban development. It is planned to analyse and verify approach to CEN/TS 16555 (Parts 1-7) in the scope of participatory strategies in Portugal as the case study country. It is observed that the public participation in spatial development in Portugal receives similar to Poland weak sides of the process: low involvement of active citizens; lack of toolkits to improve public participation and its strategies; “contradictions and delays in the evolution of urban policy in public participation” in Portugal case (Tulumello, 2016).

Scientific interest of the cooperation in the project (Research Centre for Architecture, Urbanism and Design (CIAUD), Faculty of Architecture, University of Lisbon Portugal) in the scope of participatory strategies is based on documents New Urban Agenda (New Urban Agenda, 2016) and Communication on strategic vision for European standards (European Commission, 2011) which contextualize the interests around innovation, necessary standardization procedures and importance of future implementation of R&D&I European Standards as national standards in the countries as Poland and Portugal, since none of the listed countries adopted the European Standard CEN/TS 16555-1:2013. This fact establishes cooperation in WP3 and WP5. The cooperation aims also on (a) identification of public participation within Lisbon Metropolitan Area (MA); (b) regulations on public participation in public policies in Portugal; (c) qualitative and quantitative analysis of public participation in Lisbon MA.

2.2 JUSTIFICATION OF THE CASE STUDIES CONTEXT

2.2.1 PREFABRICATED HOUSING ESTATES AND SOCIAL HOUSING POLICIES IN POLAND

Contemporary Poland received more than 70% of prefabricated housing blocks, which include 50% of panel housing built between 1946 and 1992 (Ostańska, 2009). 21% of population lives in post-socialist large housing estates in Poland. Among the Polish cities Lublin with the population of 325049 (BIP, 2015), received accordingly flats in prefabricated post-socialist large housing estates. The attractiveness of the city for the people who would like to live here is the responsibility of the authorities. And Lublin has to develop its advantages to become attractive and health urban place. Lublin-city of Inspiration – this is the brand marking approach of the City Council for smart, sustainable and inclusive growth. But there are still difficulties with the strategic view for the development of the city. Among the actual questions is the quality of living environment of post socialist housing estates in Lublin (Wrana and Skoczylas, 2014; Ostańska, 2009, 2011; Jarocka-Mikrut and Glen, 2014; Skoczylas, 2016):

- processes of strong and multifaceted social, physical, and economic degradation;
- the low quality of technical exploitation of the prefabricated living blocks, for instance: heat losses in the structure of the multi-family housing block;
- limited activation of engagement of inhabitants to bottom-up upgrading processes.

These features remain the perception of the prefabricated large housing estates as the ‘typical housing standard’.

2.2.2 INNOVATION MANAGEMENT TECHNOLOGY STANDARDS: RESIDENTIAL AREAS IN FUTURE CITY

The Innovation Union (IU) states the priority for R&D&I development. The EU flagship initiatives for innovative development, assumes the reinforcement of knowledge and innovation as drivers for future growth, promoting knowledge and innovation transfer throughout the Union. The mechanism of mutual interoperability of innovation in knowledge, research and development sets the crucial goal to achieve output of growth in societal benefits. The transfer process needs to use interoperable standards by the Members of the EU. In this context, the importance of future implementation of Innovation Management European Standards as national standards in Poland and Portugal becomes great priority, since they have not adopted the European Standard CEN/TS 16555-1:2013 Innovation Management - Part 1: Innovation Management System.

European Commission, expresses its concern for the required standards production that enable the effectiveness of processes, in the Communication, "A strategic vision for European standards: Moving forward to enhance and accelerate the sustainable growth of the European economy to 2020" COM(2011) 311 final (European Commission, 2011). This carries out the Regulation (EU) 1025/2012 and the European Council conclusions of March 2014, which recognize the importance of European and International standards. It becomes of mutual importance the understanding of the use of CEN/TS 16555-1:2013 in the scope of urban development of sustainable cities.

2.2.3 PARTICIPATORY STRATEGIES IN URBAN REGENERATION OF RESIDENTIAL AREAS

The value and necessity of participation in the regeneration of prefabricated housing in Poland is stated by Dmítruk (2014): "The way of correct approach by the city authorities to the renovation of panel housing estates, along with the need to involve local residents to social discourse is crucial in the whole process". Nevertheless, the obligatory process of public participation in urban development projects regulated by (Ustawa, 2003) is analysed in the example of project in Lodz by Feltynowski (2015) which raised the next weaknesses as: "Polish law allows participation in urban planning procedures, but not everyone wants to exercise this right"; citizens "do not participate in public discussion; this is the main problem of the Polish regulations"; "only 14% of remarks to the land-use plans are taken into account; some remarks are unfounded" and thus "not included into the land-use plans". The case of Poznań (Kaczmarek and Wójcicki, 2016) underlines problems as: "public activity was found to be low, with poor attendance at consultative meetings". And it was stressed by Kaczmarek and Wójcicki, 2016 "that it is necessary to improve the decision-making process in urban spatial planning by accommodating not only traditional but also new forms and instruments of public participation".

These broader contexts raise the necessity of exploration of: indicators of living environment in prefabricated housing Estates in Poland and challenges in social housing policies; use of the CEN/TS 16555-1:2013 in the field of public participation in regeneration of residential areas towards a future sustainability; development of participatory innovative strategies in urban regeneration of residential areas.

In January 2017, Sintra City Council, a city that integrates the Lisbon Metropolitan Area, presented the Report (Relatório de Discussão Pública: ARU Queluz/Belas, 2017) on the weighting of the public participation it received as part of the presentation of the Queluz / Belas Strategic Urban Rehabilitation Program (Programa Estratégico de Reabilitação Urbana de Queluz-Belas, 2017). This public discussion, as well as the respective publicity of the Urban Rehabilitation Operation project, allows the development of a process of participation, through the involvement of local actors in the definition of land planning policies, in compliance with the provisions of article 17, paragraph 4 of the Legal Regime of Urban Rehabilitation, in conjunction with Article 89 of the legal regime of territorial management instruments (Legal Regime of

Territorial Management Instruments) approved by Decree-Law no. 80/2015 of May 14. Note, therefore, the tax nature (imposition), of a legal and administrative nature, for the development of processes of public participation.

The process of public participation takes place over a period of 20 (twenty) days. The publication of this period of public participation is carried out in the Diário da República, a national newspaper (Correio da Manhã), as well as on the Sintra City Council website and the Collaborative Territorial Management / Procedures In Progress Program (PCGT / PEC) of the General Directorate of the Territory. Additionally, two public clarification sessions were held in the areas of influence of the Urban Rehabilitation Area, as well as versions available for consultation of the documents that comprised the Queluz / Belas Urban Rehabilitation Strategic Program: (a) at the Municipal Department of Environment, Planning And Land Management, D. Afonso Henriques Square, Sintra; and, (b) at the website of the Sintra City Council. From this period of public consultation, and publicity, resulted in 6 participations of different representativities: (a) one belonging to a political party; (b) one belonging to the citizens' movement; (c) a local company; and, (d) three citizens.

The Queluz / Belas Strategic Urban Rehabilitation Program covers a territory with 518 ha, with a total of 59,662 individuals, and a population density estimated at 11,528 inhabitants / km². It is therefore evident, despite efforts to the contrary, the lack of interest of a very significant part of the population (99.99%) in the

procedures associated with the development of the city of Queluz / Belas, making it pertinent to identify the motivations leading to the presented scenarios.

3 PROJECT WORKING FRAMEWORK

3.1 RESEARCH DESIGN AND METHODOLOGY

The paradigm of a New Urban Agenda in the main EU and UN documents, and EU Communication (COM (2011) 311 final) "A strategic vision for European standards" contextualise underlying scientific methodology. The methodology design is built for two layers of the research, and use the next methods accordingly:

- (a.1) data collection for the case studies residential areas analysis includes (projects, urban plans, technical observation, sociological survey of inhabitants);
- (a.2) content analysis of social housing policies documents;
- (a.3) qualitative and quantitative analysis to build a matrix of bottom-up and top-down indicators of prefabricated housing estates and societal needs of inhabitants as the core in urban regeneration program;
- (b.1) qualitative analysis of projects on urban regeneration of residential areas, which include the involvement of inhabitants; SWOT in participatory strategies;
- (b.2) approach to CEN/TS 16555-1:2013 by analysis of structural elements of innovative management in technology standards Parts 1-7 (CEN, 2013-2015) in the scope of urban regeneration and participation process; identification of analysis criteria of participants of urban regeneration project, which are based on CEN/TS 16555-1:2013; analysis of interconnection of the authorities, construction enterprises, research institutions and participatory process in the context of the European Standards CEN/TS 16555-1:2013 (Innovation Management – Part 1: Innovation Management System) and Parts 2-7 (CEN, 2014a-2015);
- (b.3) identification of analysis criteria of public participation in urban regeneration, which are based on CEN/TS 16555-1:2013; analyzing participatory process (case studies) in the framework of Innovation Management Technology Standards and Oslo Manual as service and product in urban development and regeneration project;
- (b.4) determining and providing recommendations on linkage element (autonomous mechanism, independent expertise, efficiency evaluation) between urban regeneration project and participatory processes for innovation in urban sustainable regeneration.

The methodology design comprises the next steps according to the above research layers and methods: data collection for the case studies in Poland of prefabricated residential areas (Lublin: LSM, Stanislaw Moniuszko quarter; Krakow; Warsaw) analysis (projects, urban plans, technical observation, sociological survey of inhabitants); content analysis of social housing policies documents; qualitative and quantitative analysis to build a matrix of bottom-up and top-down indicators of prefabricated housing estates and social needs of inhabitants as a tool to approach urban regeneration program. The results of this layer will identify the data of the quality and challenges of living environment in the case studies of prefabricated housing estates built during the 1960-80s in Poland.

As most of the regeneration of prefabricated housing built in the 1960-80s in Poland in the large housing estates was made providing only complex insulation of the blocks (Wrana, 2014), it becomes important to analyse the realised projects of urban regeneration of residential areas not only in Poland, especially those, which deal with prefabricated post-socialist dwellings and involve inhabitants to public participation. The realised examples of urban regeneration of prefabricated housing estates built in the 1960-80s (Germany, Halle, Leinefelde, etc.) with participatory approach allow analysing the achieved quality of 'new' living environment of the neighbourhoods and the types of all parties of the project. SWOT analysis of public participation in case study countries (Poland, Portugal) will give the qualitative evaluation of their results. Approach to European Standard CEN/TS 16555-1:2013 is the context analysis of the standard with the aim to identify the criteria, structural elements of innovative management from the standard for participatory process in urban regeneration project, as well as for other parties, which are connected in the project. The qualitative analysis of public participation in urban regeneration together with other parties as authorities, construction body, research institution, their interconnections, will give the wider view of the

contemporary challenges of the role of the inhabitant of the city in urban regeneration of their living environment. This step will allow to outline the points of interoperability of the participation process, in particular, and technology standards CEN/TS 16555-1:2013, identify the analysis criteria based on it. The aim of the analysis of participation process as service and product in the framework of Innovation Management Technology Standards and Oslo Manual is to identify and build the structure of linkage element between urban regeneration project and participatory processes. This linkage element will embrace the structural elements of the above Standards (strategic intelligence management; innovation thinking; intellectual property management; collaboration management; innovation management assessment, expertise, efficiency evaluation) for innovation management in urban sustainable regeneration of residential areas.

3.2 WORKING PACKAGES

The main tasks for the research are comprised in the next Working Packages (WP) (Tab.1) and list of actions:

WP	Description	Tasks
WP1	Prefabricated housing Estates	Selection of prefabricated residential areas for the case studies in Poland (Lublin: LSM, Stanislaw Moniuszko quarter; Krakow; Warsaw); Application for the site plans; Analysis of selected case studies (projects, urban plans, technical observation)
WP2	Social housing policies in Poland	Social housing statistics and policies in Poland (stat databases, regulation documents)
WP3	European Standards: CEN/TS 16555	European Standards: CEN/TS 16555 (Parts 1-7); Analysis of urban regeneration projects, which include participation of inhabitants; Approach to CEN/TS 16555 (Parts 1-7) in the scope of participatory strategies and other bodies of urban regeneration projects;
WP4	Case studies	Prefabricated housing estates and regeneration practices: qualitative analysis, SWOT (Poland) Public participation strategies in the urban development projects (Portugal)
WP5	Participatory strategies	Regulations for participation in urban regeneration; Participatory process in EU member state (Portugal) Sociological survey in case studies (program, pilot survey, survey, interpretation of results)
WP6	Public dissemination	Urban Lab (summer school) Workshop: "My city – my dwelling" Exhibition of the results of the workshop (school, community centre) Publications of articles in the general press
WP7	Conclusions	Interoperability of CEN/TS 16555 and participation in urban regeneration; Recommendations on linkage element 'urban regeneration project - participatory process'

Table 1 - Working packages during the research project

4 CONCLUSIONS: EXPECTED SOCIETAL AND INNOVATIVE IMPACT OF THE PROJECT RESULTS

The project explores the actual problems in the development of cities, especially in the urban regeneration of low quality of living environment in panel prefabricated large housing estates on the example of Poland, and underlying to the main EU and UN documents, which state the concern and mutually reinforcing priorities for smart, sustainable and inclusive growth. The exploration of the tool for development of interoperable connections between the urban environment of low liveability and inhabitants' sustainable participation is suggested in the context of technology standard CEN / TS 16555-1: 2013, which is not implemented in Poland on the national level. The use of the transdisciplinary approach in correlated urban categories "city-inhabitant-knowledge and innovation" expects impact on the level of living environment in the cities and human settlements, their smart sustainable development for the societal benefit and effective public participation.

Innovation management technology standards are put to the research to explore their application as a tool for participatory strategies in urban regeneration. This approach is suggested as the one that envisages the use of official documents of CEN / TS 16555-1: 2013, which are on the stage of adoption on members' national levels, as well as Urban Agendas by EU and UN, Oslo Manual and European Communications by EC as: COM(2010) 2020 final; COM/2014/0490 final; 2020 COM(2011) 311 final. Here the importance of the exploration of the opportunities of the applied use of Standards and Manual in the interdisciplinary scope gives the framework for their application in the main goal of the project as regeneration of the living environment for the inhabitant. Thus the project will explore the structural parts of the Standard (Innovative Management) on the example of participatory strategies in urban regeneration project. A new linkage element (entity, organisation, third body, other) between participation process and urban project management, with the aim to receive effective public participation, will embrace explored structural parts as: strategic intelligence management; innovation thinking; intellectual property management; collaboration management; innovation management assessment, together with added expertise and efficiency evaluation.

The implementation of European Standard for Innovation Management requires an transdisciplinary approach and therefore the use of different disciplines and environments: from urban and landscape design and architecture to construction, from SME and R&D Centers to Public stakeholders methodological approaches. The use of CEN / TS 16555-1: 2013, which is applied for R&D&I management in Europe, and European Urban Agenda, are key factors for the development of case studies.

ID 1575 | THE PRODUCTION OF COMMON SPACES IN BUILDINGS OF VILA VIVA AT 'AGLOMERADO DA SERRA', BRAZIL

Débora Andrade Gomes Moura¹
¹Universidade Federal de Minas Gerais
debora.agm@gmail.com

1 THE PRODUCTION OF SPACE IN 'FAVELAS'

The production of space in Brazilian 'favelas' is spontaneous, continuous and self-produced -and often, self-built. There is a diversity of uses of public and private spaces, such as everyday life, work and play. The occupation process is precarious and requires an active procedure in interaction among neighborhood residents to improve common facilities. The existence of the 'favela' comes from the process of exclusion of the working class in Brazilian cities.

Belo Horizonte, capital of one of the most populous states in Brazil, is a planned city that was only established 119 years ago, and yet has multiple illegal occupations. Since the beginning of its construction there was no space in the urban zone for the builders. In the history of the city, the state has tried to change 'favelas', with removals or transformation of the spaces where poor people live.

In 2005, the construction works of the Vila Viva Program for urbanization begins in 'Agglomerado da Serra', one of the biggest 'favelas' in the city. It includes the paving of streets -most of them less out of a necessity for the population and more so as a municipal mandate, in order to remove a large part of dwellers of low socioeconomic status -, creation of parks -that prohibited popular access and were abandoned augmenting water supply, sewage collection and the construction of buildings. The buildings were constructed to resettle a small part of the original dwellers of 'Agglomerado da Serra' that were removed from their houses. The production of spaces is a heteronomous process, as it is with formal city.

The adjustment of people that used to live in 'favelas' to these buildings is difficult and many of them sell the apartments even before the distribution of contracts. They miss the plants and the raising of animals that played a part in their domestic economy. Kids are not allowed to stay in the streets that lead to the buildings, as they used to do in the 'favelas'. There is no place in the houses to have parties or barbecues on the weekends, which was common before. The markets are very far from the buildings, creating everyday life problems, and people are not allowed to conduct any economic activities in the buildings. However, life in the 'Agglomerado da Serra' was transformed with the interventions of Vila Viva, creating new necessities and demands, such as the use of cars.

In spite of the prohibitions of the Program, after the implementation of Vila Viva the dwellers are still producing spaces. New uses, adaptations and even interventions are remodelling the heteronomous space with some everyday interventions. Children use the entrance of the buildings to play and some people have even started to sell products and services at home with plaques to announce their new activity. Some transformations of space have begun to emerge, like accommodation of common spaces for plants, animals and barbecues. People come up with solutions for the creation of seats and barbecue supports with the materials they have at their disposal. Forms of privatization of these common spaces are present too, such as parking spaces and mechanic services.

This action-research discusses with those who use and produce the common spaces in how this can be understood as a form of transgression or as real change in conditions of relevance to everyday life of the dwellers. The method of action-research was developed by Thiollent (1986) and leads to actions and seminars with the participation of dwellers.

The group was formed during the visits to photography, distribution of flyers, photography workshops and for indications of other residents. Working aged, adult men and women, aged 25-60 is its social and economical characteristics of the group. They are part of the working class, or the new middle class, as some authors understand it, like Souza (2012). Some of them work at the Edson Pisani School, especially those in Building 1 (Figure 1). In cultural terms, they are educated, some with technical training, and at least one of them is linked to religious institutions, especially Evangelical Churches. This resident, besides

working, studies at night and takes care of her mother. There are local leaders, such as D. Lourdes, who have already worked on improvements in the village.

With regard to changes in common spaces, most actively participate in interventions, being responsible for obtaining materials, labor and the organization of space in general. Often, they are trustees of the buildings and promote improvements constantly, whether they are approved and supported or not by the other residents.

2 INTERVIEWS

When I first arrived at the building 1 to mark the interviews, the residents were performing daily activities. In this building, Dilson and Marcelo were installing lighting in the outdoor area, where the barbecue grill was. In the other buildings, the dwellers were resting, or watching television. I marked them from the March 8th to the March 13th and I began the interviews with the dynamics, to introduce the subject by a logic of the practice and the manipulation of images, since the logic of the speech is less involving for them. It showed first the satellite view of the buildings, which generally creates a lot of interest in locals in locating in the territory. Along with it, I showed some pictures of the uses and interventions I made in the photographic essays and asked them to indicate where each action occurred, and what they thought about it, whether it was in common use or reflected individual interests. The first dynamic often resulted in comments on the solutions found. Then I quickly drew the plan of the building with the common spaces and asked what uses and actions took place in these spaces. I also asked about existing problems, even if they had no apparent solution. The Fiscal Exercise, which was part of the listening exercises developed by Livingston (2006), inspired the dynamics.

The third dynamic, still about the plant, was analogous to the Project of the dweller exercise, in which residents are asked to imagine new uses (Livingston, 2006). In the case of individual interviews, I asked the residents to put themselves in the place of proposers (even if it were something institutionalized, such as the City Hall or a constructor with the technical knowledge to do so) and point out where the uses could take place. This dynamics was important to broaden the residents' imagination and create a greater interest in the proposal and stimulate the mobilization of the residents, depending on the actual viability of the interventions planned.

Then, the questions began, which I systematized in an open script, for a semi-structured interview (qualitative research). Below there are the questions suggested in the script:

- "How long have you lived here? How did you get here? Was it self-construction? Did you plant or raise animals?"
- "Is there anybody in your neighborhood before the removal living in the same building?"
- "How does the condo work?" Is there a liquidator in the building?
- "Is there a little box or storage room in the condo beyond the beads and water?"
- "Do you think to stay in the building or move?"
- "How do you use common spaces? Are there rules for use?"
- "Is there something in collective space that creates some sort of nuisance?"
- "Have you ever been disturbed by anything in the neighborhood?"
- "What do you like least and what do you like most in common spaces?"
- "Have you ever interfered in the common spaces?"
- "Would you like to intervene in some way in these spaces?"
- "Does anyone in the house have any skills or skills?"
- "Would you sell something or announce any service if that were allowed in the buildings?"
- "Do you think the City Hall would approve the uses and modifications?"
- "Do neighbors come together for improvements?" For example, tinkering with collective space, fixing roof -or even for events and parties.
- "Would you like to plant and to raise animals?"
- "What public spaces (squares, parks) that most attract your attention in the city? What do you think about them?"
- "Who does the maintenance and cleaning of the collective space? Is there relay between neighbors?"

We would usually talk in collective use spaces, or in the access street, sitting on the kerb, or in the apartments of the residents. Often family members accompanied the interviews, as in one case that the family was watching television at the time of the interview.

Informal conversations occurred because when I took the opportunity to ask quicker questions. I interviewed Paulo's wife but the initial intention was to interview Ruth, who lives below the UMEI, in Rua São João. I arrived at her apartment (she had moved since my first contact with her) and talked to her and the two people that lived in her apartment. They told me to talk to Paulo and his wife, who live in apartment 402 in the same building, even if they did not get along very well. The wife of Paulo (the husband was absent at the time of the conversation) explained to me that the disagreements happened because the couple did not adapt to the building, since it had always lived in buildings before but the organization is different. The family is middle class, which I deduce from the decor of their apartment, the speech of the wife and the buildings in which they lived previously (because she told me how it was to live there). The wife said that she and her husband tried to implement improvements to match the way it worked in the other buildings in which they lived. However, the other woman, who told me to talk to her, was an alcoholic and came to vandalize the building itself, ruining the entrance gate and sometimes, especially when under the influence of alcohol, fighting with neighbors. The conflicts in this building seemed interesting to me, especially with regard to Paulo's family, who intends to leave the apartment.

Participants (Residents who were interviewed, sorted by date of interview):

1. Luciana, Rua Nossa Senhora de Fátima, 08/03/17 (building 6).
2. Dilson, Rua São João, 20, 11/03/17 (building 1).
3. Reysla e Gabriela, Rua São João, 20, 12/03/17 (building 1).
4. Thalia, Rua das Pitangas, 12/03/17 (building 3).
5. Dominique, Rua Nossa Senhora de Fátima, 12/03/17 (building 6).
6. Valdimir, Largo da Castanheira, 12/03/17 (building 5).
7. Lourdes, Rua da Mangueira, 12/03/17 (building 2).
8. Marcelo, Rua São João, 20, 13/03/17 (building 1).
9. Cláudia, Rua São João, 179, 13/03/17 (building 4).
10. Neighbour at Rua São João, 20, 13/03/17 (informal conversation -building 1).
11. Paulo's wife, 12/03/17 (informal conversation -building 7).

In the individual interviews, there was some positive and negative questions that were discussed, and there was a lot of different approaches depending in the building in which they live. I discovered some interesting things about people and the use of the space around the buildings, which was reflected in the interventions in the common spaces. The goal of the individual interviews was to identify conflicts and problems in the common spaces of the buildings, the dynamics of production of the space by the residents, uses of common spaces and neighborhood relations.

Building 1 has a trustee, who at the time of the interviews was Reysla and by the end of May became Dilson. Dilson says that they divide the accounts and contribute monthly to a small box (collection of R \$ 20.00 per resident), which is destined for small bills and expenses with maintenance, such as they had for the lighting they installed on the day of the meeting. The building is well organized but, despite that, they do not do many condominium meetings, according to Dilson. A quite different case from of building 1 is that of building 2; the interviewed resident, Lourdes, says that the condominium of her building did not work. At first, only Lourdes and S. João (from apartment 102) paid the bills, but at one point they stopped too. Currently, there is no trustee and no one pays condo, so the light has been cut. However, this case was the only one among the buildings analyzed in which there was no agreement among the neighbours.

In building 3, of Thalia, the condominium works. In building 4, the interviewed was Claudia, who said that there is a trustee, who does the maintenance in the building, and who pays the condominium. In building 5, the trustee is Valdimir's wife, the resident interviewed, since 2007 (that is, since the move to the building). He said that he "always took care" of the building. Valdimir said that as in building 1, besides the accounts they reserve money for the condominium fund. However, despite the coincidence, this happens in a few buildings. In building 6, for example, there are some conflicts. When I arrived at Luciana's house to do the interview, she and her husband were looking at the bills, among them the beads and water bills related to the condominium. Accounts were lagging behind the lack of cooperation from some neighbors, she said.

Regarding the cleaning of the common areas, there are discrepancies regarding the care of the residents with the spaces. In building 6, each neighbor clears only their immediate area, but the largest area, which is from the ground floor, is all for Luciana to clean, as she said. There is no relay or collective discussion about it. In buildings 1 and 5, because they are more organized, cleaning takes place regularly. In building 4, Cláudia said that they are doing maintenance in the building, and that the cleaning of the collective space works with relay, every day who has the time does. In building 7, Paulo's wife told him that she moved in 2016, and soon she and her husband worked on transformations, such as buying a large hose with which to clean common spaces more easily. Paulo's wife and husband tried to take care of the garden and to plant, but there was no adherence of the other residents to the idea, which was left behind. She told me that they always lived in buildings and that they bought the apartment thinking it would work like the other places they lived. However, they had problems with the neighborhood for seeking improvements to the building. By the end of 2016, she and her husband had worked to make changes, but they gave up because of the behavior and reaction of the other residents. She said there was vandalism from the gate they had installed for safety; she said also that people (who were not even residents of the building) would be using the hose she had bought without control, wasting water.

The individual interviews were important to begin the process of investigation and start discussions about the theme of the research. Those discussions were deepened in the collective conversations.

3 COLLECTIVE CONVERSATIONS

The purpose of the collective conversations was to propose a collective discussion on individually raised subjects, to define the topic of approach and to seek notes for the next step, the seminar. They occurred near to March 21st. They were enlightening regarding existing consensus and conflict of interest. In addition, they served as a first collective articulation and introduction of questions of the theoretical lens.

The script used to guide the discussion is summarized below:

- Start by citing the main problems raised in the buildings, ranging from garbage thrown in common areas, high bush, bad land for planting, noise until late, to the lack of organization of the residents.
- Question whether the occupation of common spaces can be related to the change or adaptation to the apartment or to some aspect of it.
- Ask how the coexistence between the residents of the building occurs.
- To raise discussion on the theme of the research, related to spaces of collective use in the buildings of Vila Viva of Vila Nossa Senhora de Fátima. Check relevance of the theme to the residents.
- Ask how the construction work (and design) of the interventions that have already been done. Seek to understand if the interventions already carried out were decided collectively -and with what degree of engagement of the other residents, whether to support the idea, whether to give idea, to build or if was a resident from top to bottom.
- Cite plans for the improvement and spatial qualification of the different buildings: leisure area, coexistence, parking, kiosk, common vegetable garden, vertical garden etc.
- Collectively reach a final outline of the situation, according to criteria of desirability and feasibility.
- Understand if someone has participated in a similar process and what are the expectations of each.
- Discuss which intervention priority is best accepted by the majority.
- Discuss "space of collective use", public and private space and control, access and maintenance of spaces.
- Discuss the concept of "spatial quality": what does it mean for them?

Participants:

1. Valdimir, Cláudia (his wife), Adilson (baiano), Zé Maria (Cláudia's father), Adriana, and Zulmira (building 5).
2. Lourdes, S. João, Dalva, and her daughter (building 2).
3. Luciana, Deividson, and Dominique (building 6).
4. Marcelo, Dilson, Manuel, Gabriela, and Maria Lúcia (building 1).

Those conversations were very relevant to get to know about the collective use of the common spaces, and to observe the conflicts there exist in this use and between people's interests. In the building 1, apparently there are no conflicts and the dwellers are like friends, supporting each other and making this place a good place to live. In building 2, the relations are not as good as in the building 1, and the condominium does not work. In building 5, Valdimir makes interventions and use the common space, but has been transformed in a private space, that was only appropriate to him; other residents criticize the use of water, for example. In building 6, there are some conflicts too, as the use of common spaces, which was to be for the dwellers but was occupied by some workers and merchants of the surrounding.

4 SEMINAR

The preparation of the seminar came from the organization of themes of discussion that was raised on the individual interviews:

- Condominium and rules of use of the common spaces
- Cleaning and maintenance of the common areas
- Neighbourhood relationships
- Problems that neighbours and people create
- Problems and advantages of the construction and the everyday life -Problems of no maintenance of the common spaces
- Uses, actions and interventions that take place in the common spaces
- Transformations that they imagine for the space
- History, how and when they moved to the building
- Public spaces
- Manual abilities, initiative and personal positioning
- Pretension on moving or staying at the apartment

These themes interrelate in many points, and have been deepened in the collective conversations. A game is proposed as interface of discussion. The operation is described below:

One of the dwellers present himself, saying where he lives and the more important questions relate with the common spaces. Then, there are disposed some pink cards with excerpts from individual interviews on the upside down; one dweller is invited to begin the game, selecting one of the cards. He starts a discussion about the theme described and answers the questions that are in the card. The game stops when everybody has already picked a pink card. The intention with this first game was to bring into discussion the relations of the neighbours and discuss with the dwellers that are participating of the research that relations, the possible causes and potential solutions. This step was inspired, not only by the methodology of Thiollent (1986), but also by the culture circles of Freire (1967).

The second step was to show images of my research as graduation student, that presents public spaces as streets being or not used according to the surrounding and the constructions. The third step was to bring in a more systematic way the thought of the authors related with the action research. There is the attempt, throughout the discussions, to bring and introduce thought of Lefebvre (1999), Arendt (2010), and Souza (2006) to a language and logic more accessible and bring discussion on urban society, spheres social, public and private and collective autonomy.

The participants of the seminar were:

1. Dilson, Rua São João, 20 (building ¹).
2. Valdimir, Largo da Castanheira (building 5).
3. Cláudia, Largo da Castanheira (building 5).
4. Zulmira, Largo da Castanheira (building 5).
5. Carlos, Largo da Castanheira (building 5).

¹ then started the next step, the third game, and went explaining the cards in order. I started with card 1, which illustrates a public space of quality and spontaneous use, as opposed to the privatized space of card

4.1 THE INTERACTION WITH THE RESIDENTS DURING THE SEMINAR

The interface was fundamental for the researcher to leave his dominant position in relation with the participating residents. The seminar took place in the common area of the building 5. Initially, each resident introduced himself, saying where he lives and how long he has lived there. Valdimir was the first, speaking that he has lived in the building for almost 11 years and that he works as a doorman. He talked about his animals, dogs and chickens and duck. He said that "he lives in the best building to live in". Dilson introduced himself, saying that he also lives in a good place to live, that there is no mess and that he tries to "organize, leave more or less in order"; said also that he is now the apartment manager, when Valdimir asked, saying that he was also the apartment manager of his building. Valdimir also asked if they charged a cashier month in addition to the bills of water and electricity and Dilson said that it is zeroed, that they charge only when there is something to arrange or some maintenance demand.

Then I started the first game with the locals. I asked everyone to choose pink cards and Valdimir left with number 3, whose first question was, "Do you keep in touch with somebody from your original neighborhood?" He replied "in the specific case, there are (...) many people who lived very close". I asked if they lived in the same house as the family of Claudia, who are neighbors of the couple, but said no.

The next question was: "What were the main issues among neighbors before the removal?", and Valdimir replied that "what exists of the removal is the insecure person, whether it was going to be good or not, about the aspect that lived before." He was referring, possibly, to the high-risk areas where many people lived. He said that "it was not good before", and he added: "I always lived near a lot of ravine, so when it rained, the foot of the wall went up to a height, so it was a little greenish, in the building you do not have it. (...) Rain falls, sun falls, you're dry the same way, you do not have that mud that you had before." He said he thinks differently from general thinking, told the story of a lady (Martha) who died of depression because she moved to one of the buildings. But he "liked it, we like the place, it's a quiet environment, up there is a lot of houses on top of the other". Valdimir continued: "The term 'Agglomerado' itself, has come to speak of agglomeration as? You have made a house here, your house has ended here, the other one already comes and already amends another one here. (...) You do not see an urbanized or organized thing, no matter how much they try... even when you urbanize the 'favela', the alley, everything cemented (...), it is urbanized but did not put in order as it would have to be". "There is no maintenance, so in my way of thinking, for me, the building is too good, quiet."

Valdimir talks about the space where the seminar took place: "You have to see here at night (...). Lighten up here, it's a good thing, you can come sit here if you want to chat, make a fire... Look at the wood there, the wood so low down there".

He read the last question on the card and replied, "Many have changed, see?" Repeats the question, "Where did the original neighbors go?" Claudia said, "They went to worse places; it is not that the place is bad, the person who does not do the place: there is no bad place", while Valdimir continued with the question: "Or did they stay in the place?" and replied: "Look, a lot of people have changed, for example a boy who had here with us on the top floor, he no longer lives here anymore, he moved inland, rented apartment. But I at least think so: most of the people who changed back or want to return. Why? People can live in the mountains, live in the 'favela', but there is one thing: you are inside the capital. To Praça Sete [de Setembro], you will walk. How many health posts do you have here? UMEI [Municipal unit of early childhood education], how many UMEIs do you have?". He quoted the posts and the UMEIS and concluded: "So it's just dumb that shift. Because you find everything here".

He spoke about other cities and said that he finds everything messed up, that there is no movement in the city, "everything is stopped". "I think so: as soon as you leave the capital, you've already lost a lot. The mayor is another, the councilmen are others, and the administration is another". He told of his father, who lives in Ribeirão das Neves (MG) and is very different there, and said that the old residents come back, "every once in a while we meet them out there. They sell the house and live in the 'favelas'". It showed where there were invasions in the immediate landscape, where new residents are occupying green areas.

Then it was Dilson's turn to speak about the number 5 card. The first question on this card was, "What actions are going on in the common area of your building?", and Dilson replied "Every once in a while we gather there, Marcelo and his family make a lot of barbecue. And cleaning, right? That we have to do cleaning in the area, (...) give a general there". Valdimir asked if "they got to put the floor there" and Dilson

replied that "no, the stairs are the same way". And he went on: "So, what happens is, barbecue, every now and then, it's not always, and we always give maintenance and cleaning".

Dilson continued with the questions: "Would you like to take care of animals in your house?" And respond that "in apartment, not at all. For me, no", while Valdimir commented, "I have four ", referring only to the dogs, who live inside the apartment. Dilson continued: [when] "we lived up there, we had a house, there was a lot of land. Then my mother had chicken, duck duck, had everything know? It had mango feet, guava foot, urucum" and Valdimir completes: "It was another experience". Dilson continued: "Then we could have these things, now in the apartment I think it will not work, no".

Valdimir told us about the duck: "they left it for me. Actually it's not mine, what happened: the neighbor moved there from the fourth floor and the paw crashed. So he did not take his paw up, he left the pair of ducks". And about the chickens: "It's because everything was so small, I said 'I'm going to leave it there with the ducks.' He said that 'the duck eats a lot', every morning he has to buy something for him to eat. Dilson read the last question: "Is your building leafy?" And responds "woody, no. Huh? There is only that little tree, that seed, that it is born anywhere" and Valdimir interrupted: "that plague! That is not a plant, it's a pest to me" and Dilson defended: [but] "it breaks the branch! [Helps solve a problem]".

Dilson read the continuation of the last question: "Do you agree that it isolates the sound?" And replied, "Yes, it depends". Valdimir said "No, but this is physics, right? Isolates even...", and Dilson completed: "If you have enough, right?". Valdimir continued: "Whatever noise you enter here, oh, on the side of there, you may know that the tree holds [the sound]." Dilson said, "Sure, you go into the Baleia's forest there, 'everything is happening around you, you're there ... in the country there, you're screaming, yelling at you, you're just going to see them 'So [there] from the moment you [reach] ten, five meters from them... In the case there of ours, it does not isolate" and Valdimir interrupted saying" no, in yours does not have because it is also more leaked right? They are more open. And another thing: the movement is much larger than the size of the trees", referring as 'movement' the automobile traffic on the avenue. "Certainly," Dilson replied.

We passed to Claudia, who had taken the card number 2; the initial question was, "How does the cleanliness of the common spaces in your building work?" Claudia replied, "The cleaning here is weekly, right? So we do what we can. Because everyone here works and there are elderly people who can not help either, right? (...) We even understand, I prefer that I clean myself, my brother cleans too, we give him an 'x' value to him -not according to what he has to receive, but how he lives here too, it also helps in that way. There's Vladimir, too, who helps out there in the garden too, he weeds... so we stay like this, take turns. And as I only stay here at home weekend and not always, I only clean Saturday or Sunday. Then during the week have to keep this, this custom stayed, only clean Saturday or Sunday". She also said that she tries "to convince the residents that it is not to put trash in the door... because there are no people who collect this garbage. The trash is right there, and everyone leaves early in the morning, so it does not cost anything to get there. Or if you're lazy at night, going to sleep, put it in the tank". She said that they already had serious problems with neighbors because of this and that, having four dogs, gives "that lot of thing", if they did not want to put it in the bin would be uncomfortable also for the other neighbors. Cláudia concluded: "Every one has to have the awareness that he does not have to put, right? The trash bin is right there, just take it there. And if everyone does this, it's very good".

The next question was, "Do the neighbors help clean these spaces?", and Cláudia said that she had already answered, but Zulmira added: "Dominga helped, right?" And Claudia said that "she helped, I did the same, help as best you can, right? (...) If he's there, he helps. But I prefer that only one helps me to have no problem, because a lot of people end up is messing up, so two people is enough". She went on to the next question: "Do the neighbors throw garbage in the common areas?" and replied, "No, they do not do. They started throwing a liter of milk out the window, I went there, I 'cut', but it was immediate, they do not do this anymore".

She came up with the last question: "Do you think that the City Hall should help in the maintenance of these areas?" to which she replied: "I think so, not directly inside the building, but around" and Valdimir agreed "around, I also think, like here like this", pointing to the ravine.

I finished the first game, and then started the next one. I gave some illustrations and asked if they would know what space it is. The residents looked at the illustrations and Valdimir was the first to try to find out (illustration 1 -figure 3), saying, "this is Savassi out there" and I told him that, in fact, that space was in the

Prado neighborhood (at Belo Horizonte, MG). So I asked about illustration¹ (figure 4): "I wanted to know if you would like to live in such a place?" And Valdimir replied: "no, no, we like 'it's bush, we're an animal'" and he added: "I do not want, not at all, I step in front of those mansions there, I look at them like that, I say, from that place I just want... the money. Not worth it". I commented: "I also wanted to show [with the illustration] that it is not because there is money that is good".

I proceeded to card 4 (figure 6), based on Arendt (2000), differentiating two historical moments: Ancient Greece and modernity. Valdimir commented on the first, "I think I took this part in school" and I mentioned the existence, in antiquity, of a private and a public sphere (the last, more valued in relation to the first). The private sphere would be related to the maintenance of life and work, while the public sphere has as its central activities action and discourse, that is, the exercise of politics by free men. Valdimir completed: "boasting his feats". I have contrasted this reality with that of modern society, when the private and public spheres cease to make sense, since values that are originally private become public, such as individual wealth and work. Valdimir commented, "Are not [more important] today to have more than to be? Today is more to have than to be (...); you are educated properly, you do not have to be anything if you have money. (...) More than being, they are inverted values" and I agreed, adding: "instead of collective wealth, individual wealth has relevance". Thus, the social sphere would emerge, which values work; the important thing now would be to follow a normalized behavior, to act as expected by society. Valdimir then asked: "[would be like] pretending? Almost this, right?" to which I replied: "you have to look like...", and Valdimir completed "...you are normal, but you can be crazy" and everyone laughed. "For a person to live in society, he has to live politically correct. If you do not accept society, you live there in the bush. If you do not take orders (...), there nobody will give you order, nobody will say anything, nobody will charge you your goods, no one will charge you to bathe, you can stink there in the bush. But within society you will not do it, because that does not fit in society". And I concluded by saying that today, instead of having public spaces, we have social spaces, and Valdimir added: "convivial [spaces]; the squares, the malls". I went on to say that the common spaces of the buildings, however social, could have the potential to become public spaces, even if not accessible by anyone -as I already knew that the access issue is delicate for them -but spaces of discussion and search for collective autonomy. Valdimir commented: "not necessarily here, right? Why does not it work like that, right people? Everyday is not... That's a theory, it's a good theory!" and some people laughed. I then finished the last step of the seminar.

5 CONCLUSION

The actions were relevant to understand the thoughts of the dwellers about the common spaces, the neighbor relationships and the production of space -as developed by Lefebvre (2000), in building constructed in 'favelas'. The individual interviews, the collective conversations and the seminar were important steps that demonstrate these thoughts of the people and the opinions of the neighbors about the themes of the everyday life.

The action-research is in process, and the next steps include the realization of woodworking and metal workshops and the collective interventions in common spaces. The intention is to transform the perception of the production of space as a possibility to make those places more suitable to everyday life.

ABSTRACT: This paper deals with the topic of self-build housing and local facilities in Brazil and Netherlands, as part of the comparative research “Between self-regulation and formal government: the challenges of self-build housing and facilities, BESEFOGO”. Self-build is defined as the practice in which people produce their own house and (collective) neighborhood facilities. This can be with or without the hiring of outside expertise (architect, constructor, workers etc.) or official funding outlets (bank loans, mortgages etc.). Formal institutions and governance systems face increasing difficulties in both countries to satisfy the need for good quality, affordable housing, which is an important condition for socially sustainable urban development. Brazil has a long history of low quality informal self-build housing areas that currently face the challenge to improve regarding tenure security, safety and access to basic needs like sanitation, energy, water and public transport. São Paulo has a long history of innovative policies regarding self-build housing. Initially, the self-help housing occurred mainly on individual lots purchased in peripheral areas, slums and squatter areas. In general, this form of self-help was domestic with possible help of friends and relatives, bringing together groups to a collective building task force. During the last two decades, self-help and collective task forces were steadily incorporated by government housing programs. Programs like São Paulo’s local Self-Management Housing Program (1989-1991), the statewide São Paulo’s Self-help Program (1995) and the federal Solidary Loan Program (PCS, 2004) and My Life My House Entities Program (PMCMV-E, 2009) show the consolidation of a different housing production in Brazilian context. The main research question is: how is the capacity for self-regulation in practices of self-build housing and facilities related to formal governance and regulation domains and how can this relationship be optimized to create more socially sustainable forms of urbanization? This paper analyses as specific case study: Ipiranga Building Project, a retrofit project of an old public empty building in São Paulo central area. This is the first renovation project of an existing building ever approved by federal government program PMCMV-Entities. The building was used as a Justice Court House during the 1970’s and 1980’s. It was left empty after 1992. The housing movement -ULCM – Unificação das Lutas de Cortiços e Moradia (Tenements and Housing Struggle Union) – occupied the building the first time in 1999 and again in 2007. In 2009 the housing movement succeeded to negotiate a donation of the 15-story office building for housing use. In 2012 the donation was reverted into a concession for housing purposes. It is the first time the concession is used within PMCMV-Entities and it also important because it changes the usual Brazilian public housing policy based on private property. The building was transformed completely remodelled and have now 120 apartments with areas ranging from 25.00m² to 58m², a ballroom and support areas for families with incomes up to 3 minimum wages. This paper analyses the opportunity of high quality affordable housing in central areas based on self-help and participative practices in the recent Brazilian experience.

1 HOUSE VERSUS HOME

Dream, shelter, home, place, domestic space, private space, social right, property, status, merchandise, investment, rentier, real estate speculation, freedom, security, problem, crisis, credit guarantee –in Brazilian society there are several meanings and values related to housing. The listed words have an adjective function or come from a direct relation of cause and effect.

Such diversity mirrors the scope and complexity of the theme, with meanings, conflicts, representations, materialization, causes and consequences. The direct confrontation of some of these words shows important relationships: Dream -Merchandise, shelter -property, place -status, social right -crisis, domestic space -rentier, home -credit guarantee, investment -house -speculation, problem -freedom. Such combinations are numerous, each one presents a different issue, focus, or context, with conflicting conceptualizations and approaches, interacting on different aspects -economic, social, environmental, physical -in different areas -architecture, sociology, law, economics, with different expectations -but always disparate looks on the same object (Rossetto Netto 2017).

They are facets of the same issue that exposes their tensions and limits. Housing is necessity, it is product, and it is right that can only be universalized through public policies.

The construction of this narrative that will approach the Brazilian housing scene starts from the primary function of housing, the "dwelling" as the need of every person. To live is to supply the basic needs of man in space, and in this way, more than occupying a place there is a need to exist. In order to exist, the space is occupied and physical and social needs are demanded.

A conflict is placed since housing is primary human need with high added value. And this need, in our extremely unequal capitalist society, has, besides its "use value", a disproportionate "exchange value". These exchange value is much higher than the financial resources of a large part of the Brazilian population.

In the Dictionary of Brazilian Architecture HOUSING is defined as: Place where one lives. It constitutes in architecture, the shelter or shelter that protects the man, favouring its life in the double material and spiritual aspects. Act or effect of dwelling. Home address. Residence (Corona & Lemos, 1972).

2 HOUSING POLICY IN BRAZIL

Historically, the access to housing for the low-income population in Brazil was obtained, in general, in a precarious way and consisted of three basic types of houses: tenements, favelas and land subdivision in the outskirts of the city, including homeownership and self-building. Since the beginning of 20th Century, favelas have been the landmark of the city of Rio de Janeiro. However, since the mid-century, a house in a shanty town has been an important option for the low-income population not only in metropolitan areas, but also in almost all the Brazilian medium-sized and big cities (Pasternak & D'Ottaviano, 2015). The growth of the Brazilian cities throughout the second half of the 20th century was characterized by the configuration of two distinct cities: a legal city, consolidated by the implementation of official land parceling (regularized), usually located in central areas, and designed for housing of middle and upper classes; and an illegal city, designed for housing of low-income class, characterized by the implementation of illegal (or irregular) land subdivision in the peripheral regions of cities, by the consolidation of favelas in diverse areas and by the provision of rooms in tenements in central historical districts.

In 1960, the urbanization rate in Brazil was 44.7%; since then, the concentration of the population in urban zones had gradually grown, changing from 55.9% in 1970 to 67.6% in 1980, and reaching 75.6% in 1991. The 2010 Census indicated that 84.36% of the Brazilian population lived in urban areas.

The demand for housing, urban services and infrastructure has followed the similar process. Brazil, like other countries of the Latin America, has presented an intense process of urbanization, mainly in the second half of the 20th century. In 1940, the urban population represented 26.3% of the total. In 2000, it was 81.2%. Such growth seems to be more impressive if we consider the absolute numbers: in 1940, the population living in cities was 18.8 million of inhabitants, and in 2000 it was approximately 138 million. Therefore, it was verified that in sixty years the urban settlements were increased in order to house more than 120 million people. (...) It is a gigantic movement of building a city, necessary for residential settlement of such population as well as their needs for work, supply, transportation, health, electric power, water, etc. Although the path taken by the urban growth has not responded satisfactorily in this space were established. In any case, offhanded or not, all of the 138 million inhabitants live in cities" (Maricato, 2002:16). The urban growth of the population has concentrated, mainly, in the peripheral regions of the Brazilian cities. In absolute numbers, during the last 40 years the urban areas incorporated virtually 108 million of new dwellers. The final result are cities with extensive peripheral areas, with a big concentration of inadequate housing located in favelas and illegal land subdivisions. Due to the lack of an efficient housing policy for low-income population, the informal housing market has been conclusive in the configuration of our cities (Pasternak and D'Ottaviano, 2015; D'Ottaviano and Quaglia-Silva, 2010).

Until the mid of 1980s, the local government and even the federal government strictly followed the legislation when dealing with such phenomena: according to the regulation, a city should not deal with this use of land. Favelas, for example, were seen as provisional housing and as an illegal solution and, for this reason, were ignored by the government.

According to public policies, innovative experiences, such as the intervention in favela areas of Rio de Janeiro, in the 1950s and, then, in São Paulo, in the 1980s, have paved the way for a new understanding of the ways in which the government could act in the vast irregular areas of the Brazilian cities. Under legal basis, the new Constitution of 1988 advanced by defining the need for an urban policy, as indicated in its articles 182 and 183 – Chapter II – the Urban Policy.

The closing of Banco Nacional de Habitação (National Housing Bank), responsible for the construction of big peripheral housing developments, and the new Federal Constitution marked a period of bigger participation of the cities, including in relation to the housing policy.

The approval of the Statute of the City (Federal Law 10.257), in 2001, defines the right to a city, the right to a respectable house and the social function of property as some of the paradigms of the national urban policy.

João Pinheiro Foundation (2016) estimates that the Brazilian housing deficit in 2014 was 6,068,061 units, 83.9% for families with incomes of up to 3 minimum wages (MW) and 48.2% due to the excessive burden on rent.

The methodologies used to calculate the housing deficit and the Brazilians housing plans show that not every housing problem requires the construction of a new house, and when the new houses are needed it is for families that cannot afford to pay for the unit. The range of housing needs mentioned is eye catching when looking at Brazilian cities. But one must look at the city in a complete and comprehensive way: in some cases the problem is wide open, in others it is spatially separated, but there are also those in which the issue is diffused, scattered or even camouflaged. In each of them the lower income population must find alternative ways to access a house, usually on informal ways (favelas, tenements houses, invasions). It is not by chance that such "solutions" are currently the major housing problems of most cities, especially in large cities.

Methodologically, the João Pinheiro Foundation established a reference for calculating the housing deficit diffused by the country, through the composition of different forms of housing needs: those caused by housing and urban inadequacy, and the demands resulting from demographic growth. In the case of economic attraction poles, such as the Metropolitan Region of São Paulo, the demand stemming from economic dynamics is added.

Recently, in July 2016, the Municipal Department of Housing of São Paulo municipality (Sehab-SP) presented to the population the Notebook for discussion of the Municipal Housing Plan (PMH). This document counts the housing needs from updated numbers of the 2010 IBGE National Census, calculations of the Information System for Social Housing in the City of São Paulo (Habisp) from April 2016, the research of the Foundation Institute of Economic Research (FIPE) for the street population, in addition to the prediction of population growth of the municipality until 2024. Although preliminary, the quantification demonstrates the scope and diversity of the problem. There are different situations of urgency that require different forms of action.

In the composition of the deficit related to housing precariousness, the PMH counts as precarious settlements, in addition to the historically well-known ones -favelas and irregular subdivisions -the irregular housing complexes and the tenements. And in a pioneering way in the country, it adds to this amount the population in situation of street (homeless), understanding this group also as a housing problem. The figures presented for this type of housing demand depict 830,192 households in favelas and irregular subdivisions (445,112 in favelas and 385,080 households in irregular subdivisions), it considers the existence of 20,702 households in irregular housing complexes and indicates the existence of 80,389 households in tenements in the Municipality. The existence of 15,905 homeless in the municipality is added to this universe.

In addition to housing needs related directly to housing and urban precariousness, the PMH discussion notebook counts as housing needs the Family Cohabitation (103,664 households for income brackets of up to 6 SM), Excessive Rental Rent (187,612 households), Excessive Housing Dwellings (47,443 households for income brackets up to 6 MW), in addition to Demographic Growth with additional housing needs of type HIS 1 (up to 3 MW) and HIS 2 (up to 6 MW) by the year 2032 -a portion of the population corresponding to the family income of up to 5 Minimum wages -and premise of 3 inhabitants per housing unit, totalizing 147,151 households (Rossetto Netto 2017).

3 HOUSING IN CENTRAL AREAS

Besides the discussion of the housing deficit we would like to introduce the discussion about what kind of low income public housing we should produce. We note that the best way to meet the rights to housing and the city is through well-located housing what can be understood as have a place where the family nucleus is more appropriately equipped with urban life quality, equipped with public facilities, consolidated urban infrastructure (transportation, health, education, sanitation, culture and leisure), as well as the provision of services and jobs.

Well-located houses are not confined to a single consolidated region of the city. In a large city like São Paulo, with expressive intra-urban dynamics, the places with high quality urban life are occupied by higher-income families, or are empty central spaces that have remained outside the real estate interests, or are subnormal enclaves (favelas or slums). The favelas are precarious housing solutions that break up with the formal urban logic of the environment and allow access to employment for lower income families close to their houses (Nakano 2015).

Therefore, a Housing Policy for the centre can reverse socio-spatial segregation identified in the process of emptying the centre (Villaça, 2001). Guaranteeing access to the well-located housing allows the existence of different social classes sharing a democratic space in the city centre. City centre housing policies are a way of breaking conception that only those who can afford the market prices can have access to well-located housing.

In São Paulo all the social housing city centre housing programs are results of the housing movements demands and political action since the 1970's Urban Reform Movement (Silva, 2000; Tsukumo, 2007), and also through the empty buildings organised occupations that started in the late 1980's (Silva, 2000, 2007, Anitelli and Tramontano, 2016). These actions aim to consolidate the revision of the traditional housing projects based on large housing estates implanted peripheral and unstructured areas and without jobs, demanding daily enormous displacements of masses of workers inside the city.

The historical process of urban growth in São Paulo, begun at the end of the 19th century and intensified in the first half of the following century, was based on the Rich Center-Poor Periphery model, in which the central area, a historical site of excellence valued and in the process of verticalization, expelled the lower income population to peripheral areas.

In the first half of the last century, the elite began to move to a sequence of real estate launches, Campos Eliseos, Higienópolis, Pacaembú, the Paulista avenue and Jardins neighbourhoods, which were well suited to modernity and social homogeneity. Sponsored by the State this displacement of the upper classes generated an emptying process at the central area, followed also by the displacement of large companies to other areas of the city, promoting the "decadence" of the centre, and an important socio-spatial segregation that is now São Paulo must important characteristic (Villaça, 2001).

This emptying process generated abandonment and underutilization situations where many high-rise buildings had only the first floor occupied by commercial activities. In other cases, the entire building had been vacated and sealed, like a box intended for storage. Many of those buildings owners failed to honour their taxes, making their property a speculative liability within the city.

Tsukumo (2007) presents the ideological structuring that reinforced this process, with the formation of the idea of degradation, reflecting the popularization of the centre, and the formation of the idea of emptying, motivated by socio-spatial segregation. Although other neighbourhoods emerged as highly valued segregated spaces, São Paulo city centre has never been completely devalued, with a strong popular dynamic. Ferreira (2012) points that the central area concentrates around 17% of formal jobs in the city.

To this ideological structure is added elements raised by Frugoli Jr (2000), such as the abandonment of the Centre by the Real Estate Market with the change in urban legislation, which reduces the coefficient of use (CA) of the lands of the region, fear of violence by the upper classes and the implantation of new infrastructures in the periphery.

The population loss of the central region persisted until the last decades of the last century, when new urban phenomena were also identified in the city, such as peripheral growth, the proliferation of favelas,

the emergence of new centralities and the dissemination of upper classes peripheral fortified enclaves (D'Ottaviano 2008).

The central area demographic dynamics inversion occurs at the turn of the XXth Century to the XXIst, however Nakano (2015) shows that this inversion does not change the inequality in the forms of housing provision for low income families.

4 MY HOUSE MY LIFE ENTITIES FEDERAL PROGRAM

The federal government's My Home My Life (PCMV) housing program was launched in 2009 (PMCMV-1 – Federal Law 11.977), and featured two more issues, PMCMV-2 in 2011 and PMCMV-3 in 2015. Each stage had a total number of new housing units as a goal to be achieved, with a budget corresponding to the specific percentages of the three different service ranges, Group 1 (0 to 3 MW) -Group 2 (3 to 6 MW)-Group 3 (6 to 10 MW). Each group has different grades of subsidy, which was the most important innovation of the Program.

Group 1 has the biggest subsidy, up to 90 % of the housing units' total value. With this subsidy, the PMCMV made possible for the first time to attend low-income families, and transformed smaller incomes into solvent demand for market production. With a national scope, the diversity of urban realities is met with the establishment of maximum values paid for each unit production according to the size and location of the municipality.

The Program was created based on economic objectives to cope with the 2008 global crisis, ignoring the entire structure of the existing national Housing Policy – SNH (Sistema Nacional de Habitação – National Housing System), PLANHAB (Plano Nacional de Habitação – National Housing Plan), SNHIS-FNHIS (Sistema e Fundo Nacional de Habitação de Interesse Social – Social Housing National System and Funding)-and electing private initiative as a promoter to achieve volume and agility. According to Cardoso (2015), the Program implementation process was fast and intense, based on the existing housing programs structures and also in the operation and management experience from the contractors.

As Group 1 production is heavily subsidized, the Program determinates minimum patterns for the housing units that includes size, materials and typology. With that the Program establishes a market anomaly once the Group 1 units are equal to or even better than those for Groups 2 and 3, since for these bands there are no previous requirements, generating commercial harassment on the production of the Group 1. The market seeks to rebut this issue by providing enterprises with better locations and differentiated products such as club condominiums and condominium-closed houses.

Another important point raised by Rossetto Netto (2015) is that as the Program has a physical goal and a pre-determined budget, it is possible to observe a dispute over resources among the Program's different groups, motivated by the economic agents who helped to format it (shimbo, 2010). Defending the PMCMV as a State Policy, the private formulators defend the permanence of the program to allow the agents involved a safe environment for proper planning and the consolidation of the Social Housing Market segment.

This structure of the Policy and the implementation of the program have other consequences. The various ranges, modalities, prices per unit, norms and ordinances issued are forms and attempt to adapt the PMCMV to a large diversity of needs, including for production in the central area. On this dynamic strategy, Loureiro, Macário and Guerra (2014) emphasize that:

“In PMCMV, as in other public policies, there is no clear separation between formulation and implementation, both in terms of participating actors and in relation to the decisions taken in its course, that is, part of the policy design was redefined at the moment of its execution as The response of the government and the management bureaucracy to the social demands not contemplated, the restrictions imposed by the control bodies and even the criticism of specialists and social movements” (Loureiro; Macário and War, 2014 p.24).

In São Paulo the PMCMV production was mostly concentrated in Groups 2 and 3. The Program enabled very few projects in Group 1 although it should be the Program priority as it concentrates more than 80% of the housing deficit.

The PMCMV -Group 1 has two different modalities: the MCMV-FAR (Housing Leasing Fund) and the MCMV-Entities (MCMV-E), each one with a different a set of rules. Despite this, the target audience and the expected maximum values per unit are the same as the minimum specifications of the product and the source of the resources that are fed by the General Budget of the Union (OGU).

The central difference between the two modalities is in the promoter agent. For MCMV-FAR the promoter is a private economic agent, with direct action in the civil construction sector, who is responsible for all the construction work. For MCMV-E non-profit private entities are responsible for the projects and work. In Brazil these entities are mostly housing cooperatives that are not included in the civil construction production chain but act politically to guarantee the right to housing for their associates.

As reported, the attendance of this income group was only possible given the high amount of subsidy predicted by the Program, thus achieving unprecedented within the Brazilian Housing Policy by attending the lowest income range of the population with volume, scope and certain continuity.

The requirements for the beneficiaries' framework in the program are: they cannot be holders of active real estate financing in the country, nor be owners of residential property in the national territory; cannot have any kind of direct or indirect housing subsidies with Federal Government funds (FGTS, FDS, FAR, FNHIS); cannot been contemplated before in a housing program; have no restrictions in any of the federal system or federal revenue..

The value allocated to the operation, in the case of a construction company, is the maximum value per unit and is not limited to construction costs alone. The same happens in the MCMV-E and in the execution of the work the entity can choose different construction regimes, being possible the Self-management by self-construction, by mutirão or by direct administration, or co-management (shared management) through the global work contract for a company construction company. In this modality, the maximum value per unit provided for the range is only possible for the global works regime, with the direct contracting of a construction company to take over the work of the enterprise. For all options linked to self-management there is a reduction of 8% (eight percent) of the maximum value per unit. For builders, the process requires working capital for the execution, since the remuneration of the program is given by measuring the service performed and for the entities there is the advance for the execution of the next month

In the composition of the Investment, the enterprise can count on a counterpart of the States, Municipalities and, in the case of MCMV-E, on the part of the final beneficiaries.

All costs of the operation -direct costs of land, project, technical advice, work administration, work execution, taxes, fees and related fees, social work, including the administration of the operating bank - must be paid by the project revenue: the amount raised by multiplying the number of units by the value of the operation plus the counterparts.

This format, which adopts as reference the maximum value for the production of a housing unit, was established by the PAR, and should guarantee: minimum square footage for unit, minimum architectural specifications as unit area, measurements of environments, finishes, beyond of specific percentages for budget and operation items, such as a maximum of 15% of the value to purchase the land, 1.5% -3% for the project, 1.5% or 2% for Social Work, among others.

The amount of the financing, which the beneficiary will pay, refers exclusively to the transaction value, the amount released by the MCMV without counterparts. This amount is amortized over a period of 120 months, with families paying instalments corresponding to a maximum of 15% of gross family income. The difference in the value of the financing is assumed by the FAR or FDS in the form of a non-refundable subsidy, divided into 120 benefits.

In the case of the city of São Paulo, the enterprises could also count on the possibility of contributing up to R\$ 20,000.00 (US\$ 6,000.00) per unit through the Casa Paulista -State Government Agency, once the program architectonic and urbanistic specifications are met. And since 2014, an additional contribution from the municipality, of same value, through the Casa Paulistana Program was approved.

In addition to the direct subsidy to the beneficiary, the program also has production subsidy through the Special Taxation Regime (RET), in which there is the unification of federal and state taxes levied on housing production, with the definition of a value of 1% on the total cost of work for collection. The Municipal Service Tax (ISS) is exempt for PMCMV-Group 1. The RET is also available for the others Program groups, but with incorporations values differentiated by 4%.

Within the market segment, the format established for the PMCMV -Group 1 is understood as construction at cost price (Rocha Lima Jr, 2009). This range is not attractive to real estate developers, since the operation to be carried out is cost-effective, respecting the minimum specifications of the Program, without profit margins within the values practiced. And Gregorio (2013) demonstrates that even when working at cost, the result margins are negative with variations of more than 5% in deviations in the behaviour of key variables, such as construction costs, requiring a strict monitoring and control system.

Marques and Rodrigues (2013) point out the low production of MCMV-Group 1 in the São Paulo Metropolitan Region (RMSP) -about 35% of the total -almost half of the national average, and accounting for only 7% of the deficit of this specific band. If the representativeness of RMSP is already low, production in the city of São Paulo is also small, as it is verified that up to the middle of 2015, the largest municipality in population of the country had about 1% of the total produced in Group 1. In the central region, the projects are practically non-existent, reinforcing the peripheral pattern of low-income housing production. In this region, the authors only identify PMCMV-Group 2 and Group 3 production. (Rossetto Netto 2017).

The values of the land and the valuation of the central region, as well as the increase of a new middle class with capacity for payment, also potentiated by the Program itself, weigh on this competition. And so, housing in the Centre contradicts the foundations of MCMV: the primacy of private initiative involved in choosing which products to offer, where to deploy them and who to destine them, freely exploiting land rents. (Anitelli and Tramontano, 2016 p.86)

5 THE IPIRANGA BUILDING

The Ipiranga Avenue project is paradigmatic as a case study as it is an existing building reformation project for the PMCMV-Group 1 using the Entities modality. The project was possible after a partnership between Integra (Technical Assistance Studio) and Unificação das Lutas de Cortiços e Moradia – ULCM (Housing and Tenements Struggle Unification) – an old partnership between architecture and engineering technicians and one of the São Paulo housing movements.

The Ipiranga project is a reform with change of use. The building located at Avenida Ipiranga, 1225/1235 - Santa Ifigênia, approved in 1965, was purchased by the Federal Government on April 1, 1970, to be used by the 2nd Region Regional Labor Court. Until the beginning of 2000's the building was hosted 23 Conciliation and Trial Boards of the capital.

The first approach to the property was made in 2007, with negotiations initiated by the at the São Paulo State Department of Patrimony in São Paulo (SPU-SP). The feasibility process began in 2009, with the donation of the property to ULCM, and its contracting took place in August 2014. The works began in the end of 2014.

Despite the approach and prospection of ULC, the real destination of the property for housing production was only possible in 2006, under the government of then President Luiz Inácio Lula da Silva, in which Provisional Measure 335 was issued, transformed in the following year into Law n No. 11,481 (May 31, 2007), providing for the allocation of properties belonging to the Union Patrimony for social housing purposes.

In the survey conducted by the housing movement, which resulted in the construction of the Ipiranga Avenue building, the movement attempted to occupy SPU's property located at Avenida Cásper Líbero, 88, during the Scream of Excluded in September 2007. At the time of entry of the building there was an approach of soldiers of the Army present there, since the property had already been destined to the Brazilian Army. This apparent failure opened the possibility of identification of the building of Ipiranga, its occupation and following negotiation together to Secretaria de Patrimônio da União – SPU (Secretariat of the Union Patrimony).

At the first moment ULCM start a direct negotiation with the SPU. As the negotiation did not work, the movement occupied the building for a short time during 2009.

With the progress of the housing movement negotiations with SPU-SP, through the Working Group, considering the guideline for better utilization of the own nationals with potential of use for housing purposes of social interest, and with the deepening of understandings on the issue, in September 9th, 2009 the SPU issued Ordinance No. 179 in which declared a list of 33 properties in the State of São Paulo of Public Interest, with the building of Avenida Ipiranga in the list of these properties.

Implanted in plot with 520.00 m², the building has 7,123.00m², 18 floors -underground, ground floor, mezzanine, 15 Floors with 3 Types, and penthouse. The project enabled 120 UH with footages varying from 24.47m² to 46.21m², through the MCMV-Entities. The inauguration scheduled for March 2017 had to be postponed because of the federal financing bank rules.

The contract established the following resources:

- PMCMV – R\$ 76,000/unit (US\$ 23,000)
- São Paulo State Government / Casa Paulista – around R\$ 20,000/unit (US\$ 6,000)
- São Paulo Municipality / Casa Paulistana – around R\$ 3,900/unit (US\$ 1,200)
- São Paulo municipality budget was need due to the reduction of the federal transfer and consequent extension of the schedule. (Rossetto Netto 2017).

6 CONCLUSIONS

We understand that the only way to achieve the desired right to housing is through the understanding that housing are both need and product. Housing in a central area, as proposed by the Ipiranga building project, presented in this article, aims to ensure in the context of the city of São Paulo full housing with access to all urban attributes of the city -infrastructure, services and public equipment, economic dynamics and employment opportunities, culture and leisure democratic supply, easily accessible and connected by the abundant public transport network. São Paulo city centre is a extremely qualified space, that was historically abandoned by the richer families.

Proposing housing in the Centre for the lower income families is, therefore, to attack spatial segregation and social disparity through the same action. It is a guarantee of rights possible only through political action, with a public policy that enables trough housing a new redistributive access to the city, that provides a more democratic city in which inequality is not abyssal. Guarantee the right to housing and to the city for the lower income families is also to provide dignity and life meaning instead of mere survival (Rossetto Netto 2017).

A democratic Housing Policy needs a change in its productive base by altering its traditional patrimonialist logic, since the need is to live and not possess goods, besides understanding the reality of the city Centre, the specificities of the urban fabric, requiring change in the size of the interventions and incorporating the requalification of existing buildings as a premise, recycling the built heritage and the way to build the city at the same time. They are essential attentions related to the productive costs, including ensuring urban quality, meeting the specific demand profile and understanding the environmental appeal for the area, as well as for the growth of the city (Rossetto Netto 2017).

The analysis of the dynamics in the central area of São Paulo and its housing aspects since the end of XXth century, as well as the actions from the real estate market, the housing movements and public agents and public programs reinforce the importance to encounter the priority demand to guarantee democratic space, reuse of existing buildings, guaranteeing the public offer of housing.

For the feasibility of central areas social housing the first challenge to be faced is the land issue. The value of land and of real estate in central areas almost always makes social housing projects unfeasible.

The Brazilian legislation (City Statute) indicates that all property must fulfil its social function. However, in the legal sphere, the social function of property is always overlaid by the right to property.

In this sense, the Ipiranga Building project is paradigmatic because, despite all the restrictions and difficulties, it shows how it is possible to provide a housing project for the very low income population with a high standard architectural project in a central area, with the participation of the housing movements and not based on private property.

ID 1603 | PROGRESSIVE CONVERGENCE BETWEEN PRIVATE AND PUBLIC INITIATIVES IN CITY PLANNING AND URBAN POLICY: THE CASE STUDY OF KERAMEIKOS

Gripsiou Argyro¹

¹Laboratory of Demographic and Social Analysis-University of Thessaly

yrwgrips@hotmail.com

1 INTRODUCTION

Urban rehabilitation is defined as a process of improving deprived urban environments through enhancing the physical structure and varying the density established within urban areas. Major initiatives have been introduced to attract residential, transport, economic and leisure uses and activities, resulting in mutations of the spatial, social and economic structure of urban spaces (Nobre, 2002).

During the last decades a great amount of urban and social studies has started to acknowledge the significant role and useful experience of these processes in cities on specific case-studies across the world. The de-industrialization and the loss of manufacturing employment in many urban areas have led to the prevalence of consumption-based, arts-led forms of economic regeneration intended to tackle urban problems (Raco, 2002). Extending this discussion to the Athenian context, this paper examines the strategies of urban rehabilitation-regeneration and gentrification in relation to arts-led regeneration, as well as the effects of the progressive co-ordination between private and public urban development initiatives in Kerameikos. This case study serves towards an optimum understanding of the phenomenon, analyzing the practices followed by local authorities and private investors in the regeneration scheme alongside their spatial, social and economic implications. More specifically, the study approaches urban governance policies, focusing on urban enhancement practices and particular policing measures which aim at the extraction of "social pollutants" from certain city neighbourhoods (Urry, 1995).

International competition among cities has led to the implementation of policies favoring investors and private capital to the detriment of the local population (Harvey, 2000). Further to a brief assessment of the evolution of urban policies in the Athenian context over the last thirty years, the paper interrogates the social and spatial landscape of Kerameikos, taking into account the obstacles posed by the financial crisis in implementing and evolving the gentrification agenda and, consequently, in developing the real estate market. Urban enhancement interventions regarding both the physical environment and the social composition had been made in the pre-crisis period, however the outburst of the economic crisis put an end to an era of soaring land prices and to the "intrusion" of higher income groups. It is worth noting that the population composition has been partially dominated by distinct cultural groups of middle-low social strata.

This paper consists of three parts. An analysis of gentrification and urban regeneration practices is provided in the first part, followed by a description of the urban policies and tactics exercised in Athens, and particularly in Kerameikos. The concluding section provides insights into the prospects of participatory planning to encompass and express the voices of all the social groups living in Kerameikos.

2 URBAN REHABILITATION AND GENTRIFICATION

Since the 1980s, emphasis has been laid upon the potential of cultural policy to function as a tool for achieving urban economic regeneration objectives. The policy framework regarding urban governance has undergone significant changes. The convergence between culture and economics in urban policies since 1990 has been characterised by an expansion of city marketing techniques and city branding strategies (Garcia, 2004). Nowadays, the urban policies are re-directed by emphasizing on cultural forms and symbols as dominant elements of the productive strategy, whereby culture is increasingly commercialized. Due to the developments and needs of the economy, and to the rapid cultural penetration in many fields of production, policy focus is shifting from production to consumption and from material to culture (Scott, 1997, Harvey, 1989). Kong highlights an impressive surge in private-public partnerships (PPP), whereby developers, banks and companies of national and international significance join forces to administer urban issues of cultural economic policy (Kong, 2000:387).

Consequently, cities adopt cultural policies as a means to transform the physical and aesthetic aspects of space – along with their meaning, aiming at its sanitising in the interests of capital accumulation. Additionally, policy discourse now targets the urban historical fabric and the rearrangement of buildings and roads (Uzun, 2002). Along with the ongoing urban regeneration, residential transformation processes have been an important issue in the political agenda. This process leads to the spatial exclusion of impoverished groups, as places are gentrified in the interests of property-led regeneration. Urban policy aims to encompass the new middle-class preferences boosting public-private partnerships in housing regeneration. The underlying principle of these policies is to reduce the abandoned and dilapidated aspects of the inner-city neighbourhoods, attracting the middle classes instead of involving a wider social base (Atkinson, 2010).

Therefore, urban rehabilitation practices in many urban areas go along with the gentrification process. The gentrification phenomenon concerns the physical change in tandem with the socio-cultural capital in living spaces (Holcomb and Beauregard, 1981). Furthermore, gentrification involves the displacement of lower social strata, leaving room for the upper social groups to take over the inner-city areas. Many theorizations of regeneration highlighted the role of culture and capital as the main drivers of gentrification trends. This paper emphasizes the role of public-private partnerships on the implementation of gentrification, as an engine of urban regeneration. This incorporates the use of cultural facilities and practices sponsored by local authorities and private agents as promoters of regeneration projects and associated gentrification phenomena. Stressing the cultural factor, Ley describes artists – whose habits and practices constitute the immense expression of the 'post-industrial civilization' – as the 'stalking horse' of gentrification and revalorization of the city neighborhoods (Zukin, 1988:5, Ley, 1996).

3 URBAN POLICY IN THE ATHENIAN CONTEXT

Being the Greek capital, the metropolitan area of Athens concentrates half of the national population, accounting for the multiplicity and the differentiated tensions within its urban fabric. Similarly to most European metropolises, especially in Southern Europe, the inner city centre of Athens is socially mixed: the particularity of its socio-spatial morphology is linked to the vertical form of social segregation due to the multi-storey buildings of the antiparohi system¹.

Since the 1990s, urban policies in Greece have activated mechanisms and promoted regeneration projects for the enhancement of derelict historical heritage sites through land use conversion. The declining center of Athens has undergone a significant transformation, being subject to urban regeneration

¹ "Antiparohi system is related to the system where promotion is co-exercised by small owners and small construction firms in ad hoc joint ventures to produce small condominiums "(Alexandri, 2012:18)

The residents used to be immigrants Muslims of Thrace, who resided in derelict buildings whose former residents were immigrants from Bulgaria, Poland, Russia, Egypt and Albania settled in the area in the 1970s. Another proportion of the immigrants settled in the area came from Asia – mainly China. The former residents of the neighbourhood are mostly retired (Taxiarchi, 2007).

The morphology of Kerameikos is a result of its historical urban evolution, pre-war buildings, antiparohi buildings, vacant lots, brothels, Chinese community shops, derelict houses, restored buildings, neoclassical and post-modern architecture. Many former warehouses, workshops and craft industrial buildings have been converted into postmodern leisure, art and cultural sites. Attracted by its multiculturalism and its history, many old and new residents and tourists wander in the streets, visiting the alternative cafes, wine bars and artistic spaces. At the same time, undocumented immigrants, drug addicts and other vulnerable social groups have settled in abandoned buildings of the district. During the 2000s, the neighbourhood was characterised as a centre of illicit drug and sex trade activities accommodating people under miserable and de-grading conditions.

After mid-2000s new spatial and socio-economic patterns are being shaped in the district, changing its identity and character. The study area is in state of transition, subject to public and private initiatives as well as to the economic crisis effects. Nonetheless, many researchers, media, politicians and residents refer to the social mutation of the neighbourhood through gentrification as a mean to boosting the image of a European metropolis.

3.2 PUBLIC AND PRIVATE INITIATIVES IN KERAMEIKOS

In terms of planning policies and strategies, the interventions of state and local authorities have determined the evolution of the area of Kerameikos and accompanied the process of socio-spatial transformation. The gentrification took place in Kerameikos mainly via private practices, forced by the partnership between public and private sector. The study area is affected by the practices of public institutions – Municipality of Athens, Unification of Archaeological Sites of Athens S.A, the Ministry of Culture, the Ministry of Environment and Energy, and the Ministry of Citizen Protection – that have developed programs of re-imaging and regenerating the city of Athens through cultural activity and special events.

The neighbourhood of Kerameikos constitutes a part of Athens historic centre as defined by the Presidential Decree –Government Gazette bulletin nr. 567D/13.10.1979-which provides for development management policies to avoid the substitution of the housing stock from the antiparohi system. Furthermore, during the 1980s the Ministry of the Environment and Energy listed thirty buildings. As a result, the study area was abandoned, due to the inability of many households to cope with the

improvements and conversion of listed buildings. Thus, many buildings are abandoned and demolished by their owners due money scarcity, in fear of any compulsory maintenance of their house as listed. In the 1980s, many fires had broken out probably because many owners wished to exploit their property through the construction of new, more profitable buildings. The Presidential Decree of 1984 -Government Gazette bulletin nr. 33/A/84-prohibited the disturbing uses, the renewal of their operating licenses, the increase of horsepower and the establishment of new industries. Most of the traditional industries of Kerameikos were forced to leave. The expulsion of disturbing uses such as garages and engineering workshops resulted in the desertification of the building stock and the progressive change of the productive base of Kerameiko (Taxiarchi, 2007)..

The Local Plan -approved by Government Gazette, bulletin nr. 80/D/1988-describes the district as degraded and anticipates the reduction of construction factors and the restoration of interesting buildings facades and housing stock. That is, the study area is included in the districts intended for "purification". This policy aimed to stimulate residential uses and to improve quality of life. It also included interventions in shaping the historical physiognomy of the centre, the improvement of its image and its functionality through imposing stricter traffic regulations, implementing building renovations and retrofitting and pedestrianisation. Furthermore, the local plan proposed to include the district to the gridded archaeological sites of Athens. It was also proposed to revitalize the archaeological site of Public Sign – the ancient graveyard of Athens, and to turn it into a park (Alexandri,2014).

In the begging of 1990s, many planning proposals and public intervention acts suggested the urban regeneration of Kerameikos. The Council commissioned planning consultants to undertake a number of urban environmental improvement plans. Between 1990 and 1995, the Environmental Study Corporation undertook the upgrading survey of the area. The first plan of urban environmental improvement described the district of Kerameikos as "the most deprived district of the city centre where its extensive habitation is still conserved.

This district is very interesting due to its traditional and historical elements as part of the Athenian history" (Municipality of Athens,1993:10). It was also proposed to transform Kerameikos into a residential center and an area of trade and history. In other words, "it was suggesting its transformation into a cultural hub" (Alexandri, 2014: 5). In addition, the enhancement of the urban environment launched the reduction of roads' lanes, the establishment of parking spaces and selective pedestrianisation, as well as the installation of two metro stations, a tram line and bus lines to serve particularly the inner of the district (Municipality of Athens,1993: 122).

The social infrastructures are not estimated with regard to the current population but with the prospect of a social recomposition that will emerge through the rehabilitation programs (Municipality of Athens, 1993:91). That is, the current societal context of the neighbourhood isn't taken under serious consideration. This highlights the role of regeneration schemes as to the displacement of old residents and underprivileged social groups by the influx of middle-class newcomers. The future population is expected to be more stable and homogenous than the current one, since upgrading programmes lead gradually to the removal of a significant number of the impoverished population, specifically the undocumented immigrants. On the other hand, it was believed that immigrants who would remain as permanent residents would ultimately be integrated into the local population. (Municipality of Athens, 1993:90-91).

Public Sign, Iera Odos and the Silk factory were designated as special urban regeneration schemes related to the improvement of neoclassical houses, the demolition of abandoned houses and the amelioration of local public spaces through pedestrianisation, unification with other archaeological sites and through the creation of a square. The Silk factory, as the neighbourhood's landmark of architectural heritage was turned into the municipal gallery of Athens in 2010, after five years of renovation and in reference to the area's history.

The plan of urban regeneration-rehabilitation placed particular emphasis on the protection of historical and traditional elements of the neighbourhood, aiming to revitalize the traditional neighbourhood in tandem with the "back to the city" movement. Thus, the central and local state enacted the plan of urban regeneration by a presidential decree of 1998 -Government Gazette, bulletin nr. 616/D/98. The latter established the use of the area as "general residence" (Taxiarchi,2007). Therefore, it led to the creation of surplus value in many central areas, satisfying the speculative interests of investors (Alexandri, 2014).

At this point, it is worth noting the systematic trend towards delaying, regarding the adoption and implementation of decrees and local plans in Greece. In the case of Kerameikos, the local plan was elaborated in the 1980s, the survey of urban regeneration and the presidential decree in the 1990s, while throughout this period the characteristics of the neighbourhood had been changing. The regeneration projects are either implemented partly or not implemented at all. However, some projects already announced have been implemented gradually and only with the support of private sector initiatives, namely of Oliaros company. The pedestrianisation of Iasonos street has been implemented by Oliaros after the pressures for further regeneration actions.

Since the 2000s, various programs and actions of urban policies were designated to encourage the improvement and upgrading of historically interesting neighbourhoods, and to provide suitable conditions for the attraction of private capital and for the rehabilitation of Kerameikos. Public and private partnerships were formed to attract private capital and to get involved in the urban rehabilitation process. Gentrification was the consequence of public urban regeneration policies and incentives to private investments, leading to the replacement of working-class and underprivileged social groups by the "new middle class" in Kerameikos. The increase of the rent gap brought about a rise in exchange land values (Smith, 1996) that caused the spatial "ostracization" of lower income groups and, overall, of the "marginal" population (Alexandri, 2014). Entrepreneurial urban politics towards investors and developers have been implemented in Kerameikos, as in many European cities (Harvey, 1989). As an outcome of the urban upgrading process of the last decades, the interest of the entrepreneurs and realtors in Kerameikos housing stock increased. Thus, housing investment was redirected to Kerameikos neighbourhood, thereby entailing a rent gap. The investors have taken advantage of surplus value created in Kerameikos due to the beautification projects. Mostly, the private investments in the neighbourhood were closely related to a vision of middle-scale projects.

In 2001, the state's interest was focused again in Kerameikos by the "Survey of recognition and proposals for interventions for the district of Metaksourgeio" undertaken by the company of A. Karydi. This survey was a part of regeneration proposals and beautification practices of the historic center of Athens and the preparation of the city for the Olympic Games of 2004.

Since 2001, the state took a step back and let the private capital, cultural NGOs and artists to form and gentrify the study area. The AthensX4 was an initiative of Unification of Archaeological Sites SA in line with the Ministry of Environment and Energy that had been approved for the neighbourhood of Kerameikos in 2010 in the context of an architectural competition. AthensX4 competition aimed to promote a city block and the elimination of the intermediate streets by increasing the green spaces.

Nowadays, the "Great Walk" is implemented in parts. The last part was added in 2007 at Pireaus Avenue, opposite to the study area. In addition, the Unification of Archaeological Sites SA was abolished in 2014. It is worth noticing the rise of exchange land values in the adjacent neighbourhoods of "Great Walk." The AthensX4 project, as an urban regeneration action for the promotion of Athens, testifies the cooperation of the state (Ministry of Environment and Energy and the City Council) with banking institutions (National Bank) and the European Union, whilst promoting private and public partnerships (Ministry of Environment and Energy, site).

The Oliaros S.A, a property development company, has shown interest in the potential of gentrification in Kerameikos. The Oliaros S.A is the owner of 4,5% of building stock in the area, namely 65 estates. "OLIAROS believes that with the right approach and collaboration with both private and public sectors KM can become a leading socially inclusive model neighbourhood" (Oliaros Blog)^o. Its vision is to re-energize Kerameikos by introducing a new urban cultural identity. Oliaros proposed a partnership with local state and relative "stakeholders to adopt a common vision, and create the right conditions to attract occupants and investors back to the City Center" (Oliaros Blog). A part of newcomers, gentrifiers and Oliaros co-founded a non-profit organization in 2006, called KM (Kerameikos-Metaxourgeio) Model Neighbourhood, seeking to change the identity of Kerameikos and to create a model neighbourhood.

KM Model Neighbourhood has taken a series of initiatives to transform Kerameikos into a socially inclusive model neighbourhood, putting pressure in Municipality of Athens to achieve its objectives. One of their actions was a 'guerilla gardening' demanding more public and green space as well as better quality of everyday life in the city centre. They transformed many plots into green spaces and allotments. They also participated to the revitalization of Public Sign supported by the municipality of Athens (Oliaros Blog).

In 2007, the company GEK TERNA S.A built a block of expensive apartments similar to "lofts" that attracted the new residents and the upper middle-class gentrifiers. As the company claims "the construction of this complex was intended to give a special and refreshing character in the area and to be an attractive alternative to creative people who are looking for creativity and quality in the centre of Athens" (GEK TERNA Site). The apartment prices in the GEK complex are high, compared to the average selling prices in the rest of the study area. The design of the block is considered to be out of keeping with its surroundings. The prices target the middle and upper social classes, attracting new residents. Thus, GEK implemented this project in order to invest in the area and to create a new real estate market.

Additionally, Oliaros and artists co-founded a not-for-profit organisation ReMapKM and launched for the first time Remap in 2007. ReMap is a biannual art exhibition in abandoned and derelict buildings in Kerameikos, hosting projects of artists and galleries from all over the world. ReMap provides maps of the installations to the visitors who can freely access buildings in Kerameikos. "ReMap has collaborated with the Athens Biennale, Kunsthalle Athena, Deste Foundation, the Museum of Cycladic Art, as well as with smaller institutions and initiatives, altogether introducing a higher and broader level of engagement with contemporary art in Greece" (ReMAP Blog). Nevertheless, the economic crisis and the generalised social uncertainty has prevented the organisation of this art international platform in Athens since 2013.

Immigrants and gypsies who used to live in the abandoned housing stock were evicted by the buildings of ReMap, as the landowners wanted to sell them or conceded them to Oliaros. The impoverished population has been evicted and displaced directly by this art exhibition. It is obvious that the neighbourhood cleansing from underprivileged groups was provoked by the artists and non-profit organisations (Tzirtzilaki, 2009). KM Model Neighbourhood implemented the street regeneration of Iasonos streets by pedestrianisation which was presented to the Municipality Council.

Oliaros was invited to present the main aspects of KM projects in a meeting hosted by the Deputy Minister of Development Mr. Notis Mitarakis and Invest in Greece, and attended by several government officials and administrative executives. (Oliaros Blog). The Athens Mayor Kaminis and the Deputy Minister of Development Mr. Mitarakis expressed their commitment to cooperate closely and proposed the integration of three urban development plans of Oliaros to Urban Development Fund for Attica under the JESSICA Initiative for the Region of Attica (Joint European Support for Sustainable Investment in City Area) – a separate block of European Investment Bank (EIB). In the region of Attica, the investments of integrated plans for sustainable urban development are delivered to urban projects via the National Bank of Greece in its capacity as the Urban Development Fund for the Attica Region. The proposals of Oliaros are the construction of '18+ Student Housing', a specialized market of Greek and international creative products (Street Market), and the creation of creative entrepreneurship (Oliaros Blog).

The implementation of these projects will create suitable conditions for attracting "creative" people of the middle and high class, and the interest of investors and other realtors, resulting to the rise of land values and the change of land uses (Smith, 1996). Therefore, the socio-spatial change of relations and characteristics consist the future vision of the private initiatives over the study area. In this context, the gentrification process in Kerameikos is the outcome of private and public partnerships. The company Oliaros did not implement any of the previous projects, expecting the right investment opportunity in terms of the potential of gentrification. In addition, these projects have been put on hold because of the current financial and political status of Greece. Oliaros promised to commence activities "as soon as tax circumstances become more favorable and the State takes action towards the reversion of the continuous depreciation of the City's center" (Oliaros Blog).

In 2011, the Ministry of Environment adopted an urban regeneration program and the neighbourhood of Kerameikos was characterized as a 'zone of special regeneration' providing tax incentives related to the restoration and reuse of buildings in the historical center. The guiding principle of this decision was therefore to encourage building rehabilitation and to establish favourable conditions for the attraction of private promoters interested in upgrading the area of Kerameikos. In particular, a tax exemption related to the costs of building restorations was provided to the owners or to the tenants of buildings who wanted to proceed to the restoration of residences, listed buildings, building facades, shops and offices. These incentives concerned the owners and investors who had the financial resources and the capital to rehabilitate or purchase the estates and enabled them to better establish themselves in the area. This philosophy of tax benefits has played a strategic role in getting the realtors, private promoters and middle class to invest and settle in Kerameikos.

The Ministry of Citizen Protection had a significant role to play, drawing middle-class people back to the city centre on the expense of lower social, ethnic and racial groups. In the mid-1990s, the police station of the study neighbourhood was merged with one of the Omonoia area. The delinquent behaviours were increasing due to the absence of state in terms of policing the area, resulting to the stigmatisation of the area. The police surveillance project "Xenios Zeus" – in the context of rehabilitation of Kerameikos – proceeded to massive arrests of migrants who had settled in Kerameikos by "cleansing" the urban space from unconventional people or behaviors. This strategy has excluded marginalized population, projecting them as a problem of the city centre (Pain and Smith, 2008). The new waves of immigration of the past years, mostly undocumented, added to the context of the economic crisis and threatened the safety of the new middle class.

In fact, the private initiatives approached the issues of the neighbourhood in the vision of a "model neighbourhood" based on investors' interests by promoting social exclusion practices and creating specific local conditions to the inflow of investment capital. The collaboration between private and public sector engage strategies seeking to create an artistic and "creative" environment, encouraging the potential of gentrification while ignoring the socio-spatial inequalities.

The absence of the state in terms of social policies leads to the progressive sovereignty of gentrification by allowing the urban transformation and the mutation of social structure for the sake of economic benefit. In other words the artists were the "stalking horse" for the needs of promoters, investors and local authorities to revalorize Kerameikos.

4 CONCLUSION – DISCUSSING THE NOTION OF PARTICIPATIVE PLANNING IN KERAMEIKOS

Nowadays, two kinds of gentrifiers co-exist in Kerameikos. Members of upper-middle class and the marginal gentrifiers – artists who created urban NGOs, immigrants, homosexuals, students. The upper class gentrifiers – through their initiatives and their participation in the aforementioned urban projects – put pressure on the authorities to regenerate the neighbourhood. However, the actions mentioned above did not embrace the participation of all the social groups that settle in Kerameikos (Alexandri, 2014). It seems that the gentrifiers participated formally or informally to the elaboration of the regeneration projects. On the other hand, the marginal gentrifiers experience similar realities. They organize a street carnival on spring seeking to project themselves as the alternative voice of Kerameikos (Alexandri, 2012). Hence, it seems that the participation of the citizens in the urban planning may slow down the eviction of the marginalized groups, thus creating a more sustainable and successfully mixed community.

In this sense, participatory planning-participative politics-is a notion-paradigm included in urban planning that aims to harmonize the different points of views among all the participants-citizens, as well as the marginalized groups of society (McTague, C. and Jakubowski, 2013). In addition, it involves the participation of the entire community in the strategy and management of urban planning processes (Lefevre et al, 2000). Participatory planning aspires to fill to the gap between all levels of governance and the local communities. The idea is that the government and the local programs such as urban regeneration move towards a reticular model using the bottom-up approaches (Smith, 1973). Consequently, the planners combine a diversity of interest groups in the process of decision-making by measuring the public opinion.

In Athens, the tools of 'urban governance' concerned mainly the public-private partnerships and quangos were implemented in the Athenian urban policies. These partnerships used extensively in large scale projects decreasing the civil society's participation in the decision-making process of urban policies (Maloutas et al, 2014).

Additionally, participatory procedures take place exclusively at the local level, as:

- " The legal process, which derives from the right of citizens (or institutions) to object before the Municipality regarding planning regulations imposed on their properties.
- The public participation process, with the so-called Neighbourhood Planning Committee (NPC), which is designated and elected by the inhabitants of the area. -The internet (e-government forums etc)" (CEMAT, 2014:70).

In 2010, the local administration reform introduced more independent sub-national decision-making processes (Chorianopoulos, 2012; Souliotis, 2013) providing the Metropolitan Government of Athens with multiple responsibilities of developmental and planning nature. It was an initiative to adapt the Greek local government system to the EU's 'multi-level governance system' in order to benefit from the EU's funding (Maloutas et al, 2014).

However, the sovereignty of the economic crisis 'cancelled' these strategies due to the reduction of the financial resources and led to a declining number of privatization programs controlled by Hellenic Republic Asset Development Fund. The Greek urban policies are fully aligned with EU policies as the EU funds presented the only source for public investment. Additionally, the participation of the citizens organisations in municipal policies took place through a consulting body, rupturing the relations of political authorities and citizens. The result of these processes is the development of local movements and NGOs which try to cope with the consequences of the economic crisis (Arampatzi and Nicholls, 2012). Nevertheless, these social movements have limited access to formal processes of decision-making and urban planning (Maloutas et al, 2014).

Eventually, the challenge of this case study is to stress that the different needs and preferences of different groups can be identified, and that all the groups of the area can proportionally fulfill their needs; further, to cope with the lacks of economic resources to actually implement the plans.

In conclusion, the participatory aspect in this case necessitates the use of a workshop format to ensure that all citizens (Levevre et al, 2000) – mainly the most disadvantaged – should be able to assess their current situation and to engage the participation of individual knowledge in the urban problems while keeping the representation of all involved groups well balanced. This model could engage the participation of the groups or individuals in planning of participative activities and interventions corresponding to the objectives and criteria defined by the planners and the citizens' groups.

ID 1604 | KNOWLEDGE AND VISIBILITY OF COHOUSING. ACCEPTANCE OF COHOUSING IN MADRID SOCIETY

Anais Garcia Perez¹
¹ETSAM
anaisgpe@gmail.com

1 INTRODUCTION

The issue of housing and urban regeneration is not left out of the social context of globalization in which the society is immersed. It produces an alienation of the individual who is forced to live in spaces that do not always respond to the needs that his/her lifestyle demands.

This paper presents cohousing as a more social and egalitarian habitat movement in the urban context. It is a type of collective housing that mixes numerous common spaces with private spaces that guarantee the privacy of the individual. One of the fundamental features of this type of collectivity is the management of all common spaces by its residents, generating an integrated social coexistence of all the inhabitants.

The concept of cohousing generates different images in people, from ideological approaches to points of view related to sustainability or associations with the concept of commune. Other people see it as a different way of organizing their daily tasks in community, or as a cooperative. There is also the vision of cohousing as a more economical way of life. The different interpretations that it causes can be a sign of the increasing interest in this lifestyle.

This article is structured as follows. First, it tells what cohousing is and where it's come from. Second, it analyzes the knowledge of cohousing in Madrid society. Finally it gives some concrete examples of cases of cohousing in Madrid.

2 WHAT IS COHOUSING?

The term "cohousing" is a registered trademark of McCamant and Durrett. In their research McCamant and Durrett defines cohousing like a form of collective housing that vary in size, location, type of ownership, design and priorities but has four common characteristics, (McCamant and Durrett, 1988): 1.- Participatory process: residents organize and participate in the design and planning process for the housing development, and are responsible as a group for all final decisions 2.- Intentional Neighborhood Design; The physical design encourages a strong sense of community. 3.- Extensive common facilities; an integral part of the community, common areas are designed for daily use, to supplement private living areas. 4- Complete resident management; residents manage the development, making decisions of common concern at community meetings.

In Denmark around 1960, people frustrated by the available housing options have developed a new housing type that redefines the concept of neighbourhood to fit contemporary lifestyles. They have built housing that combines the autonomy of private dwellings with the advantages of community living. Each household has a private residence, but also shared extensive common facilities with larger group, such as kitchen and dining hall, children's playrooms, and laundry facilities. Although individual dwellings are designed to be self sufficient and each has its own kitchen.

They wanted a place where children would live near playmates, where individuals would have a feeling of belonging, where they would know people of all ages, and where they would be able to grow old and continue to contribute productively.

Cohousing provides the community support that they missed in their previous homes. Cohousing is a grass-roots movement that grew directly out of people's dissatisfaction with existing housing choices. Cohousing developments are not targeted for any specific age or family type; residents represent a cross section of old and young families and singles.

Cohousing also differs from most of the international communities and communes which are often organized around strong ideological beliefs and may depend on a charismatic leader to establish the direction of the community and hold the group together. Most intentional communities function as educational or spiritual centers. Cohousing, on the other hand, offers a new approach to housing rather than a new way of life. Based on democratic principles, cohousing developments espouse no ideology other than the desire for a more practical and social home environment. (McCamant and Durrett, 1988).

Cohousing communities are unique in their extensive common facilities, and more importantly in that they are organized, planned and managed by the residents themselves. The great variety in their size, ownership structure, and design illustrates the many diverse applications of this concept.

In many respects, cohousing is not a new concept. In the past, most people lived in villages or tightly knit urban neighborhoods. Members of such communities know each others families and histories, talents and weaknesses. This kind of relationship demands accountability, but return provides security and a sense of belonging. Cohousing offers a contemporary model for re-creating this sense of place and neighborhood, while responding to today's needs for a less constraining environment.

Vestbro (2000) defines five types of collective housing in which there are three types of cohousing. The classification is the next.

First group is the collective housing with a central kitchen. In this group there are three types, the classical with employed staff, the cohousing communal work and the cohousing for the elderly people. Second group is another type of cohousing, Danish cohousing. The different between Danish and Swedish cohousing is that Danish is focus on sense of community and Swedish cohousing was born to reduce the burden of house work. Nevertheless, two models are similar. The third group is for service block, or integrated service center, in order to facilitate housework and communal participation. The fourth group of collective housing is for special categories like elderly people, students or residents with any dysfunction. And the last group is the commune, more than four person live and eat together usually in a large one-family unit.

Whit this classification we can say that for Vestbro cohousing is a type of collective housing that share common areas, specially the kitchen and the dining room, and that intensifies the sense of community and help whit the housework. We can annotate that elderly cohousing is defines like a different type of cohousing.

For Martin Field cohousing is a particular style of neighbourhood development, based upon a creative combination of private and communal facilities (Field, 2004). Field picks up the definitions of cohousing from McCamant & Durrett (1988), Fromm (1991), Zahlle and Mortensen (1992) and Hanson (1996) and establish four principles of cohousing: 1.→ Designing for intentional neibourhoods: Design features to maximize intentional and incidental social contact between the people living there. 2.→ The minimum provision of private and common facilities; all residents have private and self→ contained accommodation that is supplemented by other common facilities. 3.- Size and scale to support community dynamics; is important to achieve between creating common identity in a neighbourhood's residents alongside sustaining a sufficient level of privacy for each household in that neighbourhood. 4.→ Residents' control and management, the residents are the collectively responsible for managing the neighbourhood and its facilities.

He defines the four distinctive of cohousing neighbourhoods; cohousing combination of private and communal space, cohousing approach to designing for social interaction, cohousing focus upon sustainable dynamics and cohousing emphasis on collective decision-making.

Like Meltzer remembered, the concept of cohousing is not new, it has roots in utopian, feminist, preindustrial western societies, where small communities used to live and sustain themselves by sharing resources, property and aspirations (Meltzer 2005).

Williams (2007) remember McCamant and Durrett to define cohousing, and resumes the four principles: 1.→ Social contact design: the physical design encourages a strong sense of community. 2.→ Extensive common facilities: as an integral part of the community common areas are designed for daily use, to supplement private living areas. 3.→ Resident involvement in the recruitment, production and operational

processes. 4.→ Collaborative lifestyles offering inter-dependence, support networks, sociability and security.

Communities comprise private units (in which households reside) and communal facilities.

They are planned based on social contact design principles that reportedly encourage more social interaction, helping to build more cohesive communities (Williams 2005)

The international cohousing association define cohousing as a type of collaborative housing in which residents actively participate in the design and operation of their own neighbourhoods. Cohousing residents are consciously committed to living as community. The physical design encourages both social contact and individual. (Cohousing.org)

Matthieu Lietaert (Lietaert, 2009) in her research defines cohousing as a model that is developed in an urban or semi urban context, but not in rural context. Cohousing communities have shown a constructive alternative to the growing atomization and loneliness of individuals in large cities. Lietaert defines six characteristics of cohousing; 1.→ Participatory process. Cohousers manage the whole process from scratch, they can be helped by exporters but they are in the driver's seat. 2.→ Intentional neighbourhood design. 3.→ Extensive common facilities, common facilities and activities must be given vital attention. 4.→ Cohousing community must have complete resident management. It is fundamental that cohousers meet on a regular basis to take decisions. 5.→ Absence of hierarchy; clear mechanisms are created to ensure that everyone gets a fair opportunity to express their ideas during the meetings. 6.→ Incomes are separated. Cohousing community is not a commune.

Francesco Chiodelli & Valeria Baglione (2014) defines cohousing with five characteristics that are necessary and sufficient to define a settlement as cohousing. 1.→ Communitarian multi-functionality: Cohousing communities are always characterized by the coexistence of both residential functions and communal spaces and facilities. These are intended for the community members, and are directly managed by them. Common spaces and facilities do not usually replace private ones, but do lead to the reduction of private housing areas. 2.→ Constitutional and operational rules of a private nature, Cohousing communities are characterized by rules of a private nature introduced by residents to guarantee and defend the specificity and working of the community. 3.→ Residents' participation and self-organization, An essential characteristic of cohousing is the high degree of participation of the residents in the cohousing community's life. Generally speaking, this is true both in the community's constitution phase and in the daily management phase. 4.→ Residents' self-selection The creation of a cohousing community is achieved through the self-selection of future residents, generally, before the physical realization of the settlement. The recruitment of aspirant cohousers is carried out according to informal processes, of almost an empathic nature. 5.→ Value characterization. The cohousing community is created and developed on the basis of certain values, more or less powerful or explicit according to the situation. This value characterization is essential to reach the aim, typical of all cohousing, to create 'a strong and vibrant community

After reviewing the definitions of cohousing since the beginning of the study and taking into account the evolution of both the history and the historical model, we will try to give a definition that serves not only to understand the concept, which is quite clear after the research but also to analyze the case of study that we face.

Cohousing is a type of collective housing that combines enough private space (houses) with a lot of common areas. The idea is to live in community and share the life in the common areas. We think that cohousing has several characteristics (Figure 1);

- a. Voluntary and participatory process. The residents are involved in the process since the first step, it means that they are the ones who look for a group of people that are interesting in this kind of lifestyle. And then, the residents will participate in the rest of the steps like to choose the site, design the project (private and common areas) and manage the community.
- b. Design an intentional neighborhood and a kind of lifestyle. The design of the project must be intentional to maximize the social contact between the residents, it means that life in cohousing is a kind of lifestyle, is not only to share spaces, is to share activities and part of the lifetime, is to spend time in the management of the community and in the common life.

- c. Size, scale and function of the spaces. It is important to say that cohousing provides enough private space to have a good privacy to the cohousers. The relation between the size of the private and common spaces will be proportionate. The function of the private space is the privacy and the independence of every resident. And the common areas are for the life in the community, it means doing things in commons with the other residents, this space are not an extension of the private area. The extensive common areas are not residual, on the contrary, are the heart of the cohousing.
- d. Residence management and absence of hierarchy. The residents are who takes the decisions of the community. For this process is important to have some rules, to the vote or to how make the decision. But is also very significant that there is not a boss or a leader in the community, in this sense each resident must have the same power of decisions.
- e. Urban or semi urban location. Cohousing as an alternative to the growing atomization and loneliness of individuals in large cities must have an urban or a semi urban location. We think that cases like eco-villages don't respond to this characteristic, because tend to be more rural.
- f. Non-speculative, affordable housing. Cohousing was born like another kind of housing in a social context.

Cohousing is an expression of contemporary citizenship, citizens actively taking housing and environment situation in their own hand.

Figure 1 – cohousing definition

3 SURVEY ANALYSIS

For this purpose, a survey was carried out (through an e-mail campaign resulting in a sample of 110 people), which consists of two distinct parts, one related to the social group and type of household to which the interviewed person belongs, and another one related to the knowledge that society has of cohousing; both at an intuitive level (what does it suggest?) and at a rational level (once the concept is explained). (Appendix 1).

The results of the survey give us the little knowledge that Madrid society has about cohousing. Only one third of the sample claim to know that it is cohousing and once their cohousing definitions have been analyzed, we could say that only a quarter of them are close to the concept. The knowledge about the part of coexistence or sharing of spaces is appreciated, however nobody mentions the part of management, maintenance and participation of the same. There is, therefore, a more traditional cooperative vision, in which the involvement and participation of the residents is not a fundamental part of the way of life.

After knowing the definition of cohousing the majority of the sample (90%), thinks that it is an interesting idea, however only 56% of them would live this way.

Once known the movement of cohousing the main negative points pointed out by the respondents are the possible lack of privacy, community functioning and problems with residents. The main positive points are the common spaces, the economy of access to housing, participation in design and community and recovery of neighborhood life.

It is significant that half of the sample (50.90%) miss the common spaces in their home compared to only 20.90% who stated that they did not miss them. It should be noted that 28% of the respondents had not considered the possibility of having common spaces.

The most popular common spaces are in this order: parking for bikes (17), workspace (16), library (15), sports space (11), nursery (9), meeting rooms or common room (8), swimming pool (8), laundry (7).

Only 12.62% of the sample believed that common spaces would not generate problems in the community. A large majority believe that problems with common spaces would be abundant due to lack of agreements, lack of maintenance or misuse of them, as well as lack of involvement on the part of residents.,

At the end of the survey , when the concept of cohousing has been defined, people must to describe cohousing whit three words. The most recurrent words are; community (28/225), sharing (18/225), coexistence (9/225), saving (6/225), collaboration (6/225), socialism (6/225), sustainability (5/225), management (3/225), respect (4/225), commitment (3/225) and cooperation, (3/225).

The results obtained indicate that there is not enough knowledge of cohousing in Madrid society. The concept generates different ideas in people but not is the right concept in many times. This made people are not sure about the concept, it is not clear so is an unknown concept that generates respect.

In the other hand, when people know something about it, generally are interested in there and many times look like an attractive concept. It may mean that whit a greater and better diffusion of this movement, will be more people interested in it.

It is also important to re- mark that the idea of shared spaces frequently generates afraid, it could be because the culture, and because the wrong use of the shared spaces that people are used to do.

4 STUDY OF CASES

During the last years, several movements related to cohousing have appeared in Madrid. In this article, and as part of the visibility of the movement in Madrid society, we have analyzed three cases of associations or groups that are created around the idea of cohousing: Trabensol, Entrepatis and Jubilares.

All the cases of study work in the same property regime, a regime not very widespread in Madrid society and that seems to be suitable for this type of movements. This is the right of use regime and works as follows (Figure 2).

The main thing is that the property of the lot and the building is of the cooperative, and each resident is a partner of the same. This means that the property does not fall on the resident. To be part of the cooperative you have to be a member through a monthly fee.

In order to be part of the project as a future resident, an initial monetary contribution must be made, which will be returned in the event of abandonment of the project, it means, when the person ceases to be a resident. In addition to this initial fee, the resident contributes a monthly fee that covers the different expenses that have the maintenance of the cohousing project to which he belongs.

The characteristics of this property regime allow the resident to have the security of permanence in the accommodation, flexibility of abandonment of the same, saving and liquidity. As for society, it is a model that is not speculative, promotes social relations and values sustainability and architectural quality. The right of use is not hereditary, but yes the initial fee is provided.

The project consists of 54 identical housing units, in size, distribution and orientation; And with many common areas; Classrooms for workshops, library, gym, geriatric bath, socio-sanitary space, kitchen, dining room, laundry, large garden, orchard and greenhouse (Table 1).

Trabensol							
Stars	Number of cohousing	First cohousing	State	Number of units	Type of cohousing	Type of property	Location
2000	1	2013	Active	54	Senior	Right of use	Semi- Urban

Table 1. Resume table Trabensol

Now the admission of new residents in Trabensol are managed by a waiting list, when a resident leaves the accommodation or dies, the updated initial fee is returned to him or his heirs, and the next resident is accessed according to the waiting list. The requirements to be part of Trabensol are to be between 50 and 70 years old, to have good health at the time of their adhesion; Have the financial resources that make it possible to acquire the participation in the property of the cooperative group and to be able to face the monthly quota.

Trabensol project is currently active and has a long waiting list. In addition, it has been perfectly integrated in the municipality, offering to the neighbors a new center with activities, since it is not a project enclosed in itself, but participates in the life of the municipality.

4.2 CASE 2: ENTREPATIOS

Entrepatis is in its origin a collective formed by a group of friends who are interested in cohousing because they are looking for different housing options. Entrepatis is born like an idea in 2007. This idea contains a component of claim; build houses that fight against speculation, with a social model, and more community.

Ten years ago take place the first movements, however, the most decisive steps start in 2012 when they already have a statutes and are a registered cooperative. Approximately 80% of the people who started with the collective are still in he. The intention is not to be a single group but to be several groups or several projects, although each resident only belongs to a cohousing project. (Bensadón, L, personal communication, February 1, 2017). The three pillars that guide Entrepatis are; Social, economic (ethical banking) and ecological.

During their career they have been close to getting two lots previously, but nevertheless finally it was not possible, either by the bureaucratic subjects, or by the financial ones. In this time has been interested enough people for the movement. It is important to say that there are many people who are interested in the moment in which there is a concrete plot of study, although it is not still bought, but that falls of the project if it does not leave that plot in particular. The stakeholders that remain are those who come attracted by the idea of cohousing and not by the location of the lot.

It is at the beginning of 2017 when they get a lot to carry out the project. Today they are developing the participatory workshops of project design. (Figure 4)

The main difficulty that have been found has been to find a lot and be able to access it. Their search has been in the private as well as the public area. Negotiations with public entities have been not fruitful, although they do indicate that there is some movement in favor of valuing cohousing as a model of housing facilitated by the public administration.

Entrepatis has a management adviser, Cohousing Verde, to facilitate the bureaucracy of the cooperative and a team of architects, for the design of the project.

Figure 4 -Entrepatrios organization scheme

The current site where Entrepatrios is doing its first cohousing is located in Usera, in "Las Carolinas" area, near the Almendrales metro. The property is managed by cooperative under the right of use. And the financing of the project has been made through ethical banking.

Entrepatrios consists of 17 housing units. It is an intergenerational cohousing. Future residents range from 30 to 60 years. Couples with a child between 37 and 45 are predominant. (Table 2) (entrepatrios.org)

Currently they are in the design phase, they have started with the common workshops, proposing what spaces they want to have and how they want to distribute them. Future residents have been divided into work groups in which each one advances aspects of the project and then put them in common, in meetings with all the participants. Decisions are taken in assembly and by consensus despite several rounds of voting are required. The homes that have been raised for this case are between 60 and 90 m2. The initial deadline for the design is 2 to 3 months.

The future community is self-managed where residents are the ones who make the decisions through processes of consensus, both the aspects relating to the management of common areas and relative to the acceptance of new residents. This does not mean that they do not continue to have some sort of management advice like the one they currently have.

Entrepatrios

2004	1	2017	Planning	17	Intergenerational	Right of use	Urban

Table 2: Resume table Entrepatrios Entrepatrios

4.3 CASE 2: JUBILARES

Following a previous research work by its founders carried out since 2010, Jubilares made up in August 2012. Jubilares is an association and its objectives are the research, dissemination and promotion of knowledge about cohousing, as well as, cultural and social activities geared towards senior cohousing and support for the model of self-managed elderly communities.

The architectural studio Milla, Mira and Navarro investigated since 2010 the housing possibilities for older people, the current standards and the needs of this social group. During their research process, they find different initiatives that are being developed by the Spanish geography without specialized advice. These groups are usually made up of older people who do not want to use existing residential alternatives to age, and who have the idea of doing it together. It is this movement that drives the formation of Jubilares that finally takes shape in 2012. (Del Monte, J, personal communication, March 3, 2017)

Jubilaes association was born with the intention of forming a network of social support that can help each of its partners in the theme of seniors housing. They are oriented towards the senior cohousing and its fundamental principle is the personal autonomy. Each resident must own their life and their decisions. The assistance needed by each resident is raised through the integral care centered on each person, this type of care requires planning the actions adapting them to the idiosyncrasies of each environment and that the care plans are carried out in a participatory manner by the different agents and actors who cooperate.

In addition to meeting the needs of each person, the person is encouraged and supported to participate actively in the care process

The procedure to carry out the projects has 6 steps (Figure 5). The first step is a workshop in which needs are explained, resources and participants are adhered to. The second step would be viable, where the objective is to close the needs diagnosis and Resources as well as conduct a financial study. The third step would be workshop 1 of expansion and cohesion, with a duration of 3 to 6 months, in which the project is explained to interested people who are not yet part of the group. Subsequently workshop 2, design, where the cooperative is constituted with its statutes, formalized the purchase of land or real estate and is carried out the design of the project, has a duration of approximately 6 months. The fifth step is the construction of the building and edit the regulation of the cooperative. The last step is to live in the Jubilar, the Jubilar Cooperative, begins life in common with the active support of the association. (jubilaes.es)

Figure 5~Jubilaes Methodology

During the time of the existence of the association Jubilaes its main activity has been the dissemination. So far they have had several groups interested in the idea of living in cohousing but not all of them have continued. At the moment they have 9 active groups, one of them quite advanced already in phase three of the procedure, its location is in Torrelodones.

The profile of the people who are interested in the Jubilaes association is a medium high socio-cultural and socioeconomic profile. Most of them own one or more homes. The professions that more abound are the liberal ones and the professions. It should be noted that 70% of the persons concerned are women.

In the subject of the search of land or real estate have tried both the public and private roads. In this case they comment that it is easier to accede to the city councils if the collective goes of the hand of the association and not of individual way. They also mention that as time goes by the public administration sees with better eyes this type of accommodation. In the case of Jubilar propose to the public organisms that this type of house is similar to a project or even a social equipment for which they request the transfer of public land destined to equipment.

Although they have not yet come to buy any land, the financing method with which they propose to work is ethical banking. Likewise the model of property that they propose is the one of cooperative in the regime of cession of use. (Table 3)

Jubilaes

5 CONCLUSIONS

Cohousing is still a very marginal phenomenon. In Denmark, the country where was born cohousing, and considered the most advanced country in this movement, cohousing represent only one percent of all housing. In Spain the percentage is smaller.

Cohousing can be characterized as a pragmatic response to demographic change and new lifestyles; reduce the cost of housing, including energy-bills, combat loneliness after professional life and organized the tight schedule of young middle class families.

This movement can be interpreted as a concrete response to many cities in the objective of urban policy: social cohesion, care for an aging population, local identities under globalization, healthy and child- friendly environments, locally based responsible economy, energy transition and participation in urban inclusion rather than of homogeneity and exclusion. (Tummers 2015)

Cohousing is not a new concept, but it has recently arrived in Madrid society, therefore the difficulties to carry it out are manifest.

The real situation in Madrid is that few people know what cohousing really is but there is a growing interest in this movement in the Madrid society, especially in the elderly. The concept is not clear now, but there are intention to make it known. Culture plays a fundamental role in the acceptance of cohousing. In the survey is verified the fear of people to share spaces, because they identify those common areas with problems, and not whit living in community.

The concept of cohousing generates different images in people, the more abundant are those ; community, sharing, and collaboration. There is a tendency to relate the movement to socialist ideology. There is also the vision of cohousing as a more economical way of life.

We can appreciate that senior cohousing is a more demanded model in Madrid society as an option for active aging and that it is more likely to be carried out due to the current economic situation of the interested parties.

In the analysis of cases we can observe several similarities (Table 4); 1.- All cases arise because the type of housing offered does not respond to the needs or expectations of the interested parties. 2.- In all cases it is observed the difficulty to carry out the process, since the time of the accomplishment of the same one is elevated (average of 13 years). This long time makes many people lose the illusion along the way, also makes many people have to opt for another housing option in that time interval. 3.- All have difficulties to find a plot. 4.- All Have an initial number of stakeholders that is decreasing along the way and that usually grow when seeing the project implemented and in operation. 5.- In all cases the same property regime has been chosen.

	Entrepacios	Jubilaes	Trabensol
Type of movement	Collective- cooperative	Association	Cooperative
Intentions	Other life style Life in community	Network of advice and support to cohousing	Solidarity and cooperation
Start	2004	2012	2000
Origin reasons	Homes against speculation	Divulgaion Residential options	Search in common a satisfactory way to spend the last years of life.
Main difficulties	Find a plot	Continuity of stakeholders	Find a plot

Type of property	Right of use	Right of use	Right of use

Table 4. Comparative table

Two of the cases of study, constructed (Trabensol) or under construction (Entrepacios), are residential complexes that meet the definition of Cohousing as we can see in the table 5.

Case/ characteristic	Voluntary and participatory process	Design an intentional neighborhood and a kind of lifestyle	Size, scale and function of the spaces	Residence management and absence of hierarchy	Urban or semi urban location	Non- speculative, affordable housing
Trabensol	Yes	Yes	Yes	Yes	Yes	Yes
Jubilaes	Yes	Yes	Yes	Yes	Yes	Yes

Table 5. Observance characteristic of cohousing in the cases of study

For the development of more residential units type cohousing in Madrid it is necessary a support from the public administrations. Without public support it is difficult for a movement of these characteristics and, given the difficulties to find land, can progress satisfactorily. Cases, Entrepatis and Jubilaes, have met with a public administration somewhat reluctant to this movement, but that seems to change their opinion little by little.

At the moment, the process to obtain a plot where carry out the development is very tedious and too extended in the time. This causes many of the interested parties to desist and are forced to opt for one of the existing residential options in the Market.

Without question the cases that we have studied here are pioneers in Madrid, and as such will be an example for others. Thus, they allow to advance in the diffusion, knowledge and experience of these movements. Their developments will carry with them more possibilities of new similar developments.

Time is an important factor in the process of implementing a new movement or concept in a society. As we have already pointed out, the Spanish culture is not the same as the Danish culture, and, what now generates doubts or fears, can become habitual and therefore, assimilated by society.

APPENDIX 1: SURVEY

1.→ Where do you live? 2.→ Do you live for rent or in your own home? 3.→ How do you live? Alone/sharing/with my family/ separated/with my couple 4.→ How old are you?

5. Do you know what cohousing is? if not 6.→ No, I do not know what Cohousing is. (Here we define cohousing and then continue the survey) if yes 6.→ How would you define cohousing?

7. Do you think cohousing an interesting idea? Yes/ no 8.→ Would you like to live this way, being part of a cohousing project? Yes/ no 9.→ What do not you like about cohousing? 10.→ What do you like or do you find interesting about cohousing?

11. Do you miss any common space in your home? (Laundry, bicycle parking, nursery, library, center of attention, workspaces ...) Yes/ no 12.→ What common spaces would you like to have? 13.→ Do you think that the management of common spaces by residents would be a problem? Yes/ no 14.→ Why do you think that the management of common spaces can be a problem? 15.→ Once the survey is done write three words that suggest cohousing.

ID 1635 | PROGRESSIVE CONVERGENCE BETWEEN PRIVATE AND PUBLIC INITIATIVES IN PLANNING AND URBAN POLICY: THE CASE STUDY OF KERAMEIKOS

Gripsiou Argyro¹

¹Laboratory of Demographic and Social Analysis-University of Thessaly
yrwgrips@hotmail.com

ABSTRACT: Public policy has been identified as the main driver of transformation of urban residential spaces including the processes of urban rehabilitation and gentrification. More recently, the partnerships between private and public sector can be recognized as a key driver of urban rehabilitation of declining inner urban areas. This article aspires to explore the uses of urban development strategies and tactics as tools of urban economic rehabilitation and gentrification of an old working-class neighborhood of Athens, “Kerameikos”. This will be examined in relation to the arts-led regeneration adopted in inner-city rehabilitation initiatives. The area of Kerameikos is chosen to focus because of the transformative stage of redefinition both of its land’s uses and social network. Following a brief review of the evolution of Athenian urban policies over the past decades, the paper analyzes the origins of urban rehabilitation and gentrification projects and explores the experience of private and public partnerships in Kerameikos. It discusses the tactics of rehabilitation that have developed in the neighborhood and the ways in which spatial and social structure of Kerameikos have been transformed. The socio-spatial context of Kerameikos permits a new regard in social and spatial mutations showing its particularities-accentuating the role of the economical crisis in the specific context of Athenian city center. The paper also underline the significance importance of cultural policy, the role of artists and of urban NGOs as catalysts for urban rehabilitation. The paper ends with a reflection on the notion of participative planning and its potential as an integrated alternative to city governance and offers recommendations for further development within the Greek context.

1 INTRODUCTION

Urban rehabilitation is defined as a process of improving deprived urban environments through enhancing the physical structure and varying the density established within urban areas. Major initiatives have been introduced to attract residential, transport, economic and leisure uses and activities, resulting in mutations of the spatial, social and economic structure of urban spaces (Nobre, 2002).

During the last decades a great amount of urban and social studies has started to acknowledge the significant role and useful experience of these processes in cities on specific case-studies across the world. The de-industrialization and the loss of manufacturing employment in many urban areas have led to the prevalence of consumption-based, arts-led forms of economic regeneration intended to tackle urban problems (Raco, 2002). Extending this discussion to the Athenian context, this paper examines the strategies of urban rehabilitation-regeneration and gentrification in relation to arts-led regeneration, as well as the effects of the progressive co-ordination between private and public urban development initiatives in Kerameikos. This case study serves towards an optimum understanding of the phenomenon, analyzing the practices followed by local authorities and private investors in the regeneration scheme alongside their spatial, social and economic implications. More specifically, the study approaches urban governance policies, focusing on urban enhancement practices and particular policing measures which aim at the extraction of "social pollutants" from certain city neighbourhoods (Urry, 1995).

International competition among cities has led to the implementation of policies favoring investors and private capital to the detriment of the local population (Harvey, 2000). Further to a brief assessment of the evolution of urban policies in the Athenian context over the last thirty years, the paper interrogates the social and spatial landscape of Kerameikos, taking into account the obstacles posed by the financial crisis in implementing and evolving the gentrification agenda and, consequently, in developing the real estate market. Urban enhancement interventions regarding both the physical environment and the social composition had been made in the pre-crisis period, however the outburst of the economic crisis put an end to an era of soaring land prices and to the "intrusion" of higher income groups. It is worth noting that the population composition has been partially dominated by distinct cultural groups of middle-low social strata.

This paper consists of three parts. An analysis of gentrification and urban regeneration practices is provided in the first part, followed by a description of the urban policies and tactics exercised in Athens, and particularly in Kerameikos. The concluding section provides insights into the prospects of participatory planning to encompass and express the voices of all the social groups living in Kerameikos.

2 URBAN REHABILITATION AND GENTRIFICATION

Since the 1980s, emphasis has been laid upon the potential of cultural policy to function as a tool for achieving urban economic regeneration objectives. The policy framework regarding urban governance has undergone significant changes. The convergence between culture and economics in urban policies since 1990 has been characterised by an expansion of city marketing techniques and city branding strategies (Garcia, 2004). Nowadays, the urban policies are re-directed by emphasizing on cultural forms and symbols as dominant elements of the productive strategy, whereby culture is increasingly commercialized. Due to the developments and needs of the economy, and to the rapid cultural penetration in many fields of production, policy focus is shifting from production to consumption and from material to culture (Scott, 1997, Harvey, 1989). Kong highlights an impressive surge in private-public partnerships (PPP), whereby developers, banks and companies of national and international significance join forces to administer urban issues of cultural economic policy (Kong, 2000:387).

Consequently, cities adopt cultural policies as a means to transform the physical and aesthetic aspects of space – along with their meaning, aiming at its sanitising in the interests of capital accumulation. Additionally, policy discourse now targets the urban historical fabric and the rearrangement of buildings and roads (Uzun, 2002). Along with the ongoing urban regeneration, residential transformation processes have been an important issue in the political agenda. This process leads to the spatial exclusion of impoverished groups, as places are gentrified in the interests of property-led regeneration. Urban policy aims to encompass the new middle-class preferences boosting public-private partnerships in housing regeneration. The underlying principle of these policies is to reduce the abandoned and dilapidated aspects of the inner-city neighbourhoods, attracting the middle classes instead of involving a wider social base (Atkinson, 2010).

Therefore, urban rehabilitation practices in many urban areas go along with the gentrification process. The gentrification phenomenon concerns the physical change in tandem with the socio-cultural capital in living spaces (Holcomb and Beauregard, 1981). Furthermore, gentrification involves the displacement of lower social strata, leaving room for the upper social groups to take over the inner-city areas. Many theorizations

of regeneration highlighted the role of culture and capital as the main drivers of gentrification trends. This paper emphasizes the role of public-private partnerships on the implementation of gentrification, as an engine of urban regeneration. This incorporates the use of cultural facilities and practices sponsored by local authorities and private agents as promoters of regeneration projects and associated gentrification phenomena. Stressing the cultural factor, Ley describes artists – whose habits and practices constitute the immense expression of the ‘post-industrial civilization’ – as the ‘stalking horse’ of gentrification and revalorization of the city neighborhoods (Zukin, 1988:5, Ley, 1996).

3 URBAN POLICY IN THE ATHENIAN CONTEXT

Being the Greek capital, the metropolitan area of Athens concentrates half of the national population, accounting for the multiplicity and the differentiated tensions within its urban fabric. Similarly to most European metropolises, especially in Southern Europe, the inner city centre of Athens is socially mixed: the particularity of its socio-spatial morphology is linked to the vertical form of social segregation due to the multi-storey buildings of the antiparohi system¹.

Since the 1990s, urban policies in Greece have activated mechanisms and promoted regeneration projects for the enhancement of derelict historical heritage sites through land use conversion. The declining center of Athens has undergone a significant transformation, being subject to urban regeneration initiatives. Like many cities of rich historic background, Athens has been the epicenter of urban regeneration mechanisms for reviving the declining inner urban areas. Over the past thirty years, Athens has attempted to foreground its history and culture as the key-driver in urban policies, in order to stimulate regeneration interest. A rising awareness of historical and cultural importance forced public administrators to proceed with the implementation of projects that aimed to promote its international role. History and culture were identified as key to Athens regeneration. Although the state and the local authorities put forward proactive planning, putting Athens to the ‘European cities’ map, they often disregarded the social and cultural needs of the local community.

The 1985 Regulatory Plan of Athens defined the boundaries of its Historic Centre. Historic buildings, which preserved their original attributes and presented an architectural interest, were listed. Historic and ancient monuments were protected with regeneration schemes, also reinforcing the cultural aspects of Athens. The Regulatory Plan of Athens has changed by virtue of the law 1515/1985, in order to promote projects for reshaping Athens in the vision of the 2004 Olympic Games, and to boost the city image that required its spatial, social and economic mutation.

The Municipality of Athens and the Unification of Archaeological Sites S.A – a private company owned by the Ministry of Culture – proposed the creation of pedestrianisation “Great Walk”, linking Acropolis to other important archaeological sites in the city centre. This regeneration action aimed to highlight the history of the city by intervening on the public spaces, archaeological monuments and sites, buildings of neoclassical architecture, green spaces and traditional neighbourhoods. Simultaneously, urban policies were carried out to improve and maximize infrastructure use in the urban core. The construction of a series of subways and tram lines minimised distances and had a significant impact on the spatial structure of land uses, as well as the trajectory of adjacent neighbourhoods. In addition, the museum of Acropolis, launched in 2009, is a flagship project aimed to boost the city image and to attract tourism, having a “Guggenheim effect”. The museum of Acropolis represented the potentially exclusionary and polarizing nature of gentrification effects (Moukoulis, 2008:50). As an outcome of the urban rehabilitation of past decades, the interest in the historic centre housing stock has been increasing since the mid-2000s. The urban regeneration strategy promoted by the municipality and the state has had severe impact on land uses and values. In particular, the “Great Walk” conducted to the rise of land values in areas of immediate proximity, and to the creation of cultural uses – especially in old industrial districts – improving the prospects of gentrification.

According to Maloutas (2011:38), “there is no evidence of significant gentrification in Athens central neighbourhoods”, given the structure of the housing stock and small-scale ownerships, as well as the absence of large-scale urban interventions. However, the affluent population never abandoned the city

¹ “Antiparohi system is related to the system where promotion is co-exercised by small owners and small construction firms in ad hoc joint ventures to produce small condominiums” (Alexandri, 2012:18)

centre due to its historic value: the impact of this choice can be largely observed on smaller-scale infrastructure regeneration through locally induced social upgrading of certain traditional working-class neighbourhoods (Maloutas, 2004; 2011). It is indeed the case that "inner city enclaves are experiencing gentrification processes: Artists, higher income

groups of affluent suburbs, young households "have established themselves in the Historic Center (Alexandri, 2011:9). In the more recent years the rhythms of gentrification have decelerated and land prices have diminished to the pre-crisis levels.

3.1 KERAMEIKOS

Although Kerameikos falls under the jurisdiction of Municipality of Athens, its geographical confines are defined differently by the institutions and urban studies. In this paper, it is considered the area which is bounded by Avenue Piraeus, Iera Odos, Konstantinoupoleos, Achilleos and Deligiorgi streets. These axes are chosen to include a district with uniform socio-spatial characteristics, several areas of which were subject to interventions made by public and private initiatives. It is worth mentioning that many residents and urban studies of the area called it Metaxourgeio. We adopt the name of Kerameikos due to the archaeological site of Kerameikos, one of the largest local authorities of ancient Athens. According to the General Urban Plan of Athens (Government Gazette bulletin 80D/4.2.1988), the case study constitutes the district of Rouf. Additionally, the neighbourhood is in close proximity to the central squares Omonoia and Syntagma, and to important archaeological sites such as Acropolis (Taxiarchi, 2007).

The residents used to be immigrants Muslims of Thrace, who resided in derelict buildings whose former residents were immigrants from Bulgaria, Poland, Russia, Egypt and Albania settled in the area in the 1970s. Another proportion of the immigrants settled in the area came from Asia – mainly China. The former residents of the neighbourhood are mostly retired (Taxiarchi, 2007).

The morphology of Kerameikos is a result of its historical urban evolution, pre-war buildings, antiparohi buildings, vacant lots, brothels, Chinese community shops, derelict houses, restored buildings, neoclassical and post-modern architecture. Many former warehouses, workshops and craft industrial buildings have been converted into postmodern leisure, art and cultural sites. Attracted by its multiculturalism and its history, many old and new residents and tourists wander in the streets, visiting the alternative cafes, wine bars and artistic spaces. At the same time, undocumented immigrants, drug addicts and other vulnerable social groups have settled in abandoned buildings of the district. During the 2000s, the neighbourhood was characterised as a centre of illicit drug and sex trade activities accommodating people under miserable and de-grading conditions.

After mid-2000s new spatial and socio-economic patterns are being shaped in the district, changing its identity and character. The study area is in state of transition, subject to public and private initiatives as well as to the economic crisis effects. Nonetheless, many researchers, media, politicians and residents refer to the social mutation of the neighbourhood through gentrification as a mean to boosting the image of a European metropolis.

Figure 3.1: The neighbourhood of Kerameikos Source : National Technical University of Athens, Own Elaboration

3.2 PUBLIC AND PRIVATE INITIATIVES IN KERAMEIKOS

In terms of planning policies and strategies, the interventions of state and local authorities have determined the evolution of the area of Kerameikos and accompanied the process of socio-spatial transformation. The gentrification took place in Kerameikos mainly via private practices, forced by the partnership between public and private sector. The study area is affected by the practices of public institutions – Municipality of Athens, Unification of Archaeological Sites of Athens S.A, the Ministry of Culture, the Ministry of Environment and Energy, and the Ministry of Citizen Protection – that have developed programs of re-imaging and regenerating the city of Athens through cultural activity and special events.

The neighbourhood of Kerameikos constitutes a part of Athens historic centre as defined by the Presidential Decree –Government Gazette bulletin nr. 567D/13.10.1979-which provides for development management policies to avoid the substitution of the housing stock from the antiparohi system. Furthermore, during the 1980s the Ministry of the Environment and Energy listed thirty buildings. As a result, the study area was abandoned, due to the inability of many households to cope with the improvements and conversion of listed buildings. Thus, many buildings are abandoned and demolished by their owners due money scarcity, in fear of any compulsory maintenance of their house as listed. In the 1980s, many fires had broken out probably because many owners wished to exploit their property through the construction of new, more profitable buildings. The Presidential Decree of 1984 -Government Gazette bulletin nr. 33/A/84-prohibited the disturbing uses, the renewal of their operating licenses, the increase of horsepower and the establishment of new industries. Most of the traditional industries of Kerameikos were forced to leave. The expulsion of disturbing uses such as garages and engineering workshops resulted in the desertification of the building stock and the progressive change of the productive base of Kerameiko (Taxiarchi, 2007)..

The Local Plan -approved by Government Gazette, bulletin nr. 80/D/1988-describes the district as degraded and anticipates the reduction of construction factors and the restoration of interesting buildings facades and housing stock. That is, the study area is included in the districts intended for "purification". This policy aimed to stimulate residential uses and to improve quality of life. It also included interventions in shaping the historical physiognomy of the centre, the improvement of its image and its functionality through imposing stricter traffic regulations, implementing building renovations and retrofitting and pedestrianisation. Furthermore, the local plan proposed to include the district to the gridded archaeological sites of Athens. It was also proposed to revitalize the archaeological site of Public Sign – the ancient graveyard of Athens, and to turn it into a park (Alexandri,2014).

In the beginning of 1990s, many planning proposals and public intervention acts suggested the urban regeneration of Kerameikos. The Council commissioned planning consultants to undertake a number of urban environmental improvement plans. Between 1990 and 1995, the Environmental Study Corporation undertook the upgrading survey of the area. The first plan of urban environmental improvement described the district of Kerameikos as "the most deprived district of the city centre where its extensive habitation is still conserved. This district is very interesting due to its traditional and historical elements as part of the Athenian history" (Municipality of Athens, 1993:10). It was also proposed to transform Kerameikos into a residential center and an area of trade and history. In other words, "it was suggesting its transformation into a cultural hub" (Alexandri, 2014: 5). In addition, the enhancement of the urban environment launched the reduction of roads' lanes, the establishment of parking spaces and selective pedestrianisation, as well as the installation of two metro stations, a tram line and bus lines to serve particularly the inner of the district (Municipality of Athens, 1993: 122).

The social infrastructures are not estimated with regard to the current population but with the prospect of a social recomposition that will emerge through the rehabilitation programs (Municipality of Athens, 1993:91). That is, the current societal context of the neighbourhood isn't taken under serious consideration. This highlights the role of regeneration schemes as to the displacement of old residents and underprivileged social groups by the influx of middle-class newcomers. The future population is expected to be more stable and homogenous than the current one, since upgrading programmes lead gradually to the removal of a significant number of the impoverished population, specifically the undocumented immigrants. On the other hand, it was believed that immigrants who would remain as permanent residents would ultimately be integrated into the local population. (Municipality of Athens, 1993:90-91).

Public Sign, Iera Odos and the Silk factory were designated as special urban regeneration schemes related to the improvement of neoclassical houses, the demolition of abandoned houses and the amelioration of local public spaces through pedestrianisation, unification with other archaeological sites and through the creation of a square. The Silk factory, as the neighbourhood's landmark of architectural heritage was turned into the municipal gallery of Athens in 2010, after five years of renovation and in reference to the area's history.

The plan of urban regeneration-rehabilitation placed particular emphasis on the protection of historical and traditional elements of the neighbourhood, aiming to revitalize the traditional neighbourhood in tandem with the "back to the city" movement. Thus, the central and local state enacted the plan of urban regeneration by a presidential decree of 1998 -Government Gazette, bulletin nr. 616/D/98. The latter established the use of the area as "general residence" (Taxiarchi, 2007). Therefore, it led to the creation of surplus value in many central areas, satisfying the speculative interests of investors (Alexandri, 2014).

At this point, it is worth noting the systematic trend towards delaying, regarding the adoption and implementation of decrees and local plans in Greece. In the case of Kerameikos, the local plan was elaborated in the 1980s, the survey of urban regeneration and the presidential decree in the 1990s, while throughout this period the characteristics of the neighbourhood had been changing. The regeneration projects are either implemented partly or not implemented at all. However, some projects already announced have been implemented gradually and only with the support of private sector initiatives, namely of Oliaros company. The pedestrianisation of Iasonos street has been implemented by Oliaros after the pressures for further regeneration actions.

Since the 2000s, various programs and actions of urban policies were designated to encourage the improvement and upgrading of historically interesting neighbourhoods, and to provide suitable conditions for the attraction of private capital and for the rehabilitation of Kerameikos. Public and private partnerships were formed to attract private capital and to get involved in the urban rehabilitation process. Gentrification was the consequence of public urban regeneration policies and incentives to private investments, leading to the replacement of working-class and underprivileged social groups by the "new middle class" in Kerameikos. The increase of the rent gap brought about a rise in exchange land values (Smith, 1996) that caused the spatial "ostracization" of lower income groups and, overall, of the "marginal" population (Alexandri, 2014). Entrepreneurial urban politics towards investors and developers have been implemented in Kerameikos, as in many European cities (Harvey, 1989). As an outcome of the urban upgrading process of the last decades, the interest of the entrepreneurs and realtors in Kerameikos housing stock increased. Thus, housing investment was redirected to Kerameikos neighbourhood, thereby entailing a rent gap. The investors have taken advantage of surplus value created in Kerameikos due to

the beautification projects. Mostly, the private investments in the neighbourhood were closely related to a vision of middle-scale projects.

In 2001, the state's interest was focused again in Kerameikos by the "Survey of recognition and proposals for interventions for the district of Metaksourgeio" undertaken by the company of A. Karydi. This survey was a part of regeneration proposals and beautification practices of the historic center of Athens and the preparation of the city for the Olympic Games of 2004.

Since 2001, the state took a step back and let the private capital, cultural ONGs and artists to form and gentrify the study area. The AthensX4 was an initiative of Unification of Archaeological Sites SA in line with the Ministry of Environment and Energy that had been approved for the neighbourhood of Kerameikos in 2010 in the context of an architectural competition. AthensX4 competition aimed to promote a city block and the elimination of the intermediate streets by increasing the green spaces.

Nowadays, the "Great Walk" is implemented in parts. The last part was added in 2007 at Pireaus Avenue, opposite to the study area. In addition, the Unification of Archaeological Sites SA was abolished in 2014. It is worth noticing the rise of exchange land values in the adjacent neighbourhoods of "Great Walk." The AthensX4 project, as an urban regeneration action for the promotion of Athens, testifies the cooperation of the state (Ministry of Environment and Energy and the City Council) with banking institutions (National Bank) and the European Union, whilst promoting private and public partnerships (Ministry of Environment and Energy, site).

The Oliaros S.A, a property development company, has shown interest in the potential of gentrification in Kerameikos. The Oliaros S.A is the owner of 4,5% of building stock in the area, namely 65 estates. "OLIAROS believes that with the right approach and collaboration with both private and public sectors KM can become a leading socially inclusive model neighbourhood" (Oliaros Blog)⁹. Its vision is to re-energize Kerameikos by introducing a new urban cultural identity. Oliaros proposed a partnership with local state and relative "stakeholders to adopt a common vision, and create the right conditions to attract occupants and investors back to the City Center" (Oliaros Blog). A part of newcomers, gentrifiers and Oliaros co-founded a non-profit organization in 2006, called KM (Kerameikos-Metaxourgeio) Model Neighbourhood, seeking to change the identity of Kerameikos and to create a model neighbourhood.

KM Model Neighbourhood has taken a series of initiatives to transform Kerameikos into a socially inclusive model neighbourhood, putting pressure in Municipality of Athens to achieve its objectives. One of their actions was a 'guerilla gardening' demanding more public and green space as well as better quality of everyday life in the city centre. They transformed many plots into green spaces and allotments. They also participated to the revitalization of Public Sign supported by the municipality of Athens (Oliaros Blog).

In 2007, the company GEK TERNA S.A built a block of expensive apartments similar to "lofts" that attracted the new residents and the upper middle-class gentrifiers. As the company claims "the construction of this complex was intended to give a special and refreshing character in the area and to be an attractive alternative to creative people who are looking for creativity and quality in the centre of Athens" (GEK TERNA Site). The apartment prices in the GEK complex are high, compared to the average selling prices in the rest of the study area. The design of the block is considered to be out of keeping with its surroundings. The prices target the middle and upper social classes, attracting new residents. Thus, GEK implemented this project in order to invest in the area and to create a new real estate market.

Additionally, Oliaros and artists co-founded a not-for-profit organisation ReMapKM and launched for the first time Remap in 2007. ReMap is a biannual art exhibition in abandoned and derelict buildings in Kerameikos, hosting projects of artists and galleries from all over the world. ReMap provides maps of the installations to the visitors who can freely access buildings in Kerameikos. "ReMap has collaborated with the Athens Biennale, Kunsthalle Athena, Deste Foundation, the Museum of Cycladic Art, as well as with smaller institutions and initiatives, altogether introducing a higher and broader level of engagement with contemporary art in Greece" (ReMAP Blog). Nevertheless, the economic crisis and the generalised social uncertainty has prevented the organisation of this art international platform in Athens since 2013.

Immigrants and gypsies who used to live in the abandoned housing stock were evicted by the buildings of ReMap, as the landowners wanted to sell them or conceded them to Oliaros. The impoverished population has been evicted and displaced directly by this art exhibition. It is obvious that the neighbourhood cleansing from underprivileged groups was provoked by the artists and non-profit organisations (Tzirtzilaki,

2009). KM Model Neighbourhood implemented the street regeneration of Iasonos streets by pedestrianisation which was presented to the Municipality Council.

Oliaros was invited to present the main aspects of KM projects in a meeting hosted by the Deputy Minister of Development Mr. Notis Mitarakis and Invest in Greece, and attended by several government officials and administrative executives. (Oliaros Blog). The Athens Mayor Kaminis and the Deputy Minister of Development Mr. Mitarakis expressed their commitment to cooperate closely and proposed the integration of three urban development plans of Oliaros to Urban Development Fund for Attica under the JESSICA Initiative for the Region of Attica (Joint European Support for Sustainable Investment in City Area) – a separate block of European Investment Bank (EIB). In the region of Attica, the investments of integrated plans for sustainable urban development are delivered to urban projects via the National Bank of Greece in its capacity as the Urban Development Fund for the Attica Region. The proposals of Oliaros are the construction of '18+ Student Housing', a specialized market of Greek and international creative products (Street Market), and the creation of creative entrepreneurship (Oliaros Blog).

The implementation of these projects will create suitable conditions for attracting "creative" people of the middle and high class, and the interest of investors and other realtors, resulting to the rise of land values and the change of land uses (Smith, 1996). Therefore, the socio-spatial change of relations and characteristics consist the future vision of the private initiatives over the study area. In this context, the gentrification process in Kerameikos is the outcome of private and public partnerships. The company Oliaros did not implement any of the previous projects, expecting the right investment opportunity in terms of the potential of gentrification. In addition, these projects have been put on hold because of the current financial and political status of Greece. Oliaros promised to commence activities "as soon as tax circumstances become more favorable and the State takes action towards the reversion of the continuous depreciation of the City's center" (Oliaros Blog).

In 2011, the Ministry of Environment adopted an urban regeneration program and the neighbourhood of Kerameikos was characterized as a 'zone of special regeneration' providing tax incentives related to the restoration and reuse of buildings in the historical center. The guiding principle of this decision was therefore to encourage building rehabilitation and to establish favourable conditions for the attraction of private promoters interested in upgrading the area of Kerameikos. In particular, a tax exemption related to the costs of building restorations was provided to the owners or to the tenants of buildings who wanted to proceed to the restoration of residences, listed buildings, building facades, shops and offices. These incentives concerned the owners and investors who had the financial resources and the capital to rehabilitate or purchase the estates and enabled them to better establish themselves in the area. This philosophy of tax benefits has played a strategic role in getting the realtors, private promoters and middle class to invest and settle in Kerameikos.

The Ministry of Citizen Protection had a significant role to play, drawing middle-class people back to the city centre on the expense of lower social, ethnic and racial groups. In the mid-1990s, the police station of the study neighbourhood was merged with one of the Omonoia area. The delinquent behaviours were increasing due to the absence of state in terms of policing the area, resulting to the stigmatisation of the area. The police surveillance project "Xenios Zeus" – in the context of rehabilitation of Kerameikos – proceeded to massive arrests of migrants who had settled in Kerameikos by "cleansing" the urban space from unconventional people or behaviors. This strategy has excluded marginalized population, projecting them as a problem of the city centre (Pain and Smith, 2008). The new waves of immigration of the past years, mostly undocumented, added to the context of the economic crisis and threatened the safety of the new middle class.

In fact, the private initiatives approached the issues of the neighbourhood in the vision of a "model neighbourhood" based on investors' interests by promoting social exclusion practices and creating specific local conditions to the inflow of investment capital. The collaboration between private and public sector engage strategies seeking to create an artistic and "creative" environment, encouraging the potential of gentrification while ignoring the socio-spatial inequalities.

The absence of the state in terms of social policies leads to the progressive sovereignty of gentrification by allowing the urban transformation and the mutation of social structure for the sake of economic benefit. In other words the artists were the "stalking horse" for the needs of promoters, investors and local authorities to revalorize Kerameikos.

4 CONCLUSION – DISCUSSING THE NOTION OF PARTICIPATIVE PLANNING IN KERAMEIKOS

Nowadays, two kinds of gentrifiers co-exist in Kerameikos. Members of upper-middle class and the marginal gentrifiers – artists who created urban NGOs, immigrants, homosexuals, students. The upper class gentrifiers – through their initiatives and their participation in the aforementioned urban projects – put pressure on the authorities to regenerate the neighbourhood. However, the actions mentioned above did not embrace the participation of all the social groups that settle in Kerameikos (Alexandri, 2014). It seems that the gentrifiers participated formally or informally to the elaboration of the regeneration projects. On the other hand, the marginal gentrifiers experience similar realities. They organize a street carnival on spring seeking to project themselves as the alternative voice of Kerameikos (Alexandri, 2012). Hence, it seems that the participation of the citizens in the urban planning may slow down the eviction of the marginalized groups, thus creating a more sustainable and successfully mixed community.

In this sense, participatory planning-participative politics-is a notion-paradigm included in urban planning that aims to harmonize the different points of views among all the participants-citizens, as well as the marginalized groups of society (McTague, C. and Jakubowski, 2013). In addition, it involves the participation of the entire community in the strategy and management of urban planning processes (Lefevre et al, 2000). Participatory planning aspires to fill to the gap between all levels of governance and the local communities. The idea is that the government and the local programs such as urban regeneration move towards a reticular model using the bottom-up approaches (Smith, 1973). Consequently, the planners combine a diversity of interest groups in the process of decision-making by measuring the public opinion.

In Athens, the tools of 'urban governance' concerned mainly the public-private partnerships and quangos were implemented in the Athenian urban policies. These partnerships used extensively in large scale projects decreasing the civil society's participation in the decision-making process of urban policies (Maloutas et al, 2014).

Additionally, participatory procedures take place exclusively at the local level, as:

- " The legal process, which derives from the right of citizens (or institutions) to object before the Municipality regarding planning regulations imposed on their properties.
- The public participation process, with the so-called Neighbourhood Planning Committee (NPC), which is designated and elected by the inhabitants of the area. -The internet (e-government forums etc)" (CEMAT, 2014:70).

In 2010, the local administration reform introduced more independent sub-national decision-making processes (Chorianopoulos, 2012; Souliotis, 2013) providing the Metropolitan Government of Athens with multiple responsibilities of developmental and planning nature. It was an initiative to adapt the Greek local government system to the EU's 'multi-level governance system' in order to benefit from the EU's funding (Maloutas et al, 2014).

However, the sovereignty of the economic crisis 'cancelled' these strategies due to the reduction of the financial resources and led to a declining number of privatization programs controlled by Hellenic Republic Asset Development Fund. The greek urban policies are fully aligned with EU policies as the EU funds presented the only source for public investment. Additionally, the participation of the citizens organisations in municipal policies took place through a consulting body, rupturing the relations of political authorities and citizens. The result of these processes is the development of local movements and NGOs which try to cope with the consequences of the economic crisis (Arampatzi and Nicholls, 2012). Nevertheless, these social movements have limited access to formal processes of decision-making and urban planning (Maloutas et al, 2014).

Eventually, the challenge of this case study is to stress that the different needs and preferences of different groups can be identified, and that all the groups of the area can proportionally fulfill their needs; further, to cope with the lacks of economic resources to actually implement the plans.

In conclusion, the participatory aspect in this case necessitates the use of a workshop format to ensure that all citizens (Lefevre et al, 2000) – mainly the most disadvantaged – should be able to assess their current situation and to engage the participation of individual knowledge in the urban problems while

keeping the representation of all involved groups well balanced. This model could engage the participation of the groups or individuals in planning of participative activities and interventions corresponding to the objectives and criteria defined by the planners and the citizens' groups.

ID 1674 | STATE-LED GENTRIFICATION AND DISPLACEMENT IN TARLABASI: AN END TO RESISTANCE?

Özge Yenigün¹

¹Middle East Technical University
versenozge@gmail.com

1 INTRODUCTION

Starting from the 1980s, central and local governments have been actively involved in neoliberal urban restructuring which is characterized by large-scale urban development projects as well as major urban renewal and redevelopment processes. There is an extensive literature discussing and evaluating the spatial and social impacts of urban renewal and urban redevelopment processes that intensely result in gentrification and displacement of existent residents. In most cases, the form of gentrification is state induced, and urban renewal and transformation projects lead to ‘state-led gentrification’, which eventually results in major displacement of the residents, creating adverse impacts especially for the vulnerable parts of the communities.

Against the negative impacts of these processes, resistance movements emerge. As Newman and Wylie (2006) indicate, residents develop strategies at individual and/or collective level to handle and overcome the adverse impacts of gentrification and displacement. In most cases, residents respond collectively to the risk of displacement. Collective mobilization through community organizations, neighborhood associations or grassroots initiatives may affect the processes of gentrification and displacement, although do not halt the large-scale urban renewal/transformation projects in many cases, but challenge the central and local authorities when the residents come together and endeavor to negotiate the conditions of these projects.

Istanbul has been subjected to a major restructuring process in the post-1980s, with neoliberal policies and an urban transformation agenda put into practice. As part of this wider restructuring project, Tarlabası renewal process was initiated in the 2000s, from then signifying mass demolition of cultural and historical urban tissue, and following gentrification and displacement processes. With Tarlabası Urban Renewal

Project, the efforts to clean out the area from certain groups including low-skilled and poor immigrants, low-income and disadvantaged groups became visible. Due to many factors, such as considerable

appreciation in values of properties and increasing rents, lots of people have been forced to leave the area. The urban renewal project has neglected the unique demographic, ethnic, cultural and social character of the area resulted from the changing social composition of the neighborhoods especially arising from international and domestic migration flows. The area, affected from a range of policies and planning interventions, has become a deprived settlement, leaving vulnerable groups to further exclusion and disadvantaged positions.

Since the renewal project started in the 2000s, several attempts have been made against the possible negative effects of the project on the residents. Many lawsuits were brought to prevent unjust treatment of local people by civil society organizations. Various platforms, non-governmental organizations and activist groups participated in the grassroots mobilizations. However, the renewal project has already negatively affected many residents due to increasing prices and rents, and displacement of many households. Moreover, many people moved out of Tarlabaşı removed from their existing social networks and businesses.

Therefore, the aim of this paper is to discuss the gentrification processes and resistance movements against the urban renewal projects and displacement, to explore collective movements and resistance attempts and question their roles in preventing the adverse impacts of urban renewal and transformation projects. Understanding the dynamics of the processes of gentrification and resistance movements are vital where ambitious and profit-seeking projects of the central and local governments in Turkey growingly ignore the social realities of urban areas and social problems vested particularly in disadvantaged neighborhoods.

In this paper, first, the concepts of gentrification and displacement are discussed in their relation with neoliberal urban development. Second, resistance movements against urban renewal and urban transformation projects are addressed. The impacts of urban renewal projects and gentrification are discussed based on the case of Tarlabaşı in İstanbul and the ongoing urban renewal project in the area. Based on this case, resistance movements and collective strategies are put forward, which emerged in the area to handle the negative impacts of gentrification and displacement.

2 NEOLIBERAL URBANIZATION, GENTRIFICATION AND DISPLACEMENT

Gentrification was first used as a concept by the sociologist Ruth Glass in 1964, in the conquest of houses in the worker's neighborhoods of London by the middle and upper classes, replacing these houses with luxurious housing units and changing the social character of these areas. Until the 1980s, the concept of gentrification, defined as classical gentrification (Lees et al., 2008), was used to describe and refer to the processes in the 1960s in which middle and upper classes settle the historical areas and inner-city neighborhoods where the working class or low-income people live, by displacing these groups.

Starting from the 1980s, with the change of the nature of these processes and an emerging neoliberal urban agenda, the meaning and scope of the concept has changed significantly. While in the previous periods, the depreciated historical buildings were rehabilitated by the upper and middle-income

groups, the residents leaving in these areas; after the 1980s, this process has started to take place in the form of destruction of the settlements and the construction of luxury residential and consumption areas seen as means of rent rather than the depreciation and restoration of the structures, while maintaining its feature of the displacement of poor and marginal parts of the society by higher-income groups. Particularly different from the gentrification in the 1960s, starting from the 1980s, it covers large-scale urban development and renewal projects emerged as policy goals, rather than unintended policy consequences.

Therefore, gentrification and displacement have been discussed as parts of neoliberal urbanization starting from the 1980s (Smith, 2002; Slater, 2006; Lees et al., 2008). While with the neoliberal period, the urban centers have been transformed into consumption areas of the middle and upper income classes through neoliberal policies and practices including the marketing of cities, preparation of local and global capital for investments, reorganization of urban centers as attraction points for tourists; lower-income groups, who

are situated at the bottom of the labor markets with low wages and under poor conditions, low-skilled immigrants as well as illegal immigrants and asylum-seekers have been taken away from the city centers. The central and local governments take direct and greater roles in the design and implementation of the gentrification processes (Lees, 2012; Sakızlıoğlu, 2014; Sönmez, 2014), called state-led gentrification.

The main motives of gentrification and displacement are discussed in Smith's (2002) study through his rent-gap theory and Ley's (1994) consumption-based theory. To expand on the origins and dynamics of gentrification and displacement as well as the relationships between these processes and neoliberal urbanization, David Harvey introduced the concept of 'accumulation by dispossession'¹ (Harvey, 2003; Harvey, 2008). Accordingly, Harvey claims that displacement comes out as a main policy instrument to transfer urban resources from the public sector to the private sector and from the lower classes to the higher classes. Gentrification and displacement, in this respect, are discussed within the scope of and as a part of contemporary neoliberal urban restructuring. The state is regarded as an active and leading actor of accumulation by dispossession, the elements of which are defined as privatization and commodification.

The economic priorities of the neoliberal period have motivated the central and local governments to undertake large-scale urban restructuring and major socio-spatial transformations that Brenner and Theodore (2002) conceptualize it 'urbanization of neoliberalism'. Neoliberal urbanism prompted the emergence of gentrification as a global urban strategy in the post 1980s and the 1990s (Smith 2002). Neoliberal urbanism has brought about large-scale urban development projects (Swyngedouw et al., 2002) as well as urban redevelopment processes accompanied by the displacement of low-income people from gentrified urban areas. Private developers and governments initiate new redevelopment projects attracted and marketed to 'affluent buyers'. The main argument is that these developments facilitate gentrification – as a result, neighborhoods suffer from displacement (Zukin, 1987; Ley, 1994; Smith, 1996; Zukin, 2008).

It is no doubt that the disadvantaged and vulnerable groups are affected the most from these processes. These groups, who are already suffering from financial problems and in need of affordable housing, are forced to have limited options on housing markets and move away from their neighborhoods.

Moreover, the current literature also draws attention to the loss of social networks as well as loss of social ties and place attachment as the negative outcomes of gentrification and displacement. An extensive literature points out severe impacts of displacement and dispossession for vulnerable and disadvantaged communities (Moulaert et al., 2003; Kuyucu and Ünsal, 2010; Sakızlıoğlu, 2014).

3 RESISTANCE MOVEMENTS AGAINST GENTRIFICATION AND DISPLACEMENT

In the face of the impacts of neoliberal urban policies and practices, cities have become the arenas where new and dynamic urban movements emerge, motivated by specific local problems and combined with global strategies. Linking local issues to the global debates over the right to the city (Harvey, 2008), these movements have been shaped by the engagement of local leaders and neighborhood activists, where the citizens and interest groups themselves have become the main actors. These grassroots movements enter the field of urban policy and governance by challenging the existing power relations, where the central and local governments increasingly remain inactive and/or insufficient to deal with the problems of urban residents.

These resistance movements and grassroots initiatives are rooted in urban social movements shaping globalizing cities and contesting neoliberalism, where these movements respond by addressing and challenging neoliberal urban policies, practices and their negative implications (Pickvance, 2003). Today, contemporary cities host a variety of struggles, fights for the demands and rights of immigrants, refugees, asylum-seekers, people having diverse gender identities and sexual orientations as well as other disadvantaged groups such as the unemployed and the homeless, not limited to racial and ethnic minorities and struggles of working class (Wacquant, 2008). Therefore, the homogenous character of the movements before the 1980s has evolved into a conceptualization with other aspects. New social movements after the 1980s conceptualized by Touraine (1981) and Melluci (1980) besides Castells

¹ According to Harvey, it is the accumulation of capital based on the dispossession of people of their houses, land, wealth and rights – in the context of contemporary neoliberal policy.

(1983), are characterized by interpersonal solidarity against bureaucracy and state power, reclamation for autonomous space, diverse social conflicts, identity claims and identity-based movements, new dominating classes, and so on, which brought to the agenda 'the right to difference' (Castells, 1983).

Those movements have been accompanied by urban protests and resistance against urban renewal/transformation and gentrification. Resistance movements and grassroots mobilizations against urban renewal, gentrification and displacement are widely discussed in the current literature (Newman and Wyly, 2006; Kuyucu and Ünsal, 2010; Lees, 2012; Lelandais, 2014; Sakızlıoğlu, 2014). A part of this literature discusses that these resistance attempts have emerged as resistance against neoliberal urbanism (Peck, et al., 2009; Mayer, 2016) where Lees (2012: 163) explains it as 'Part of resisting gentrification is about resisting dominant paradigms and gentrification is embedded in the paradigm of neoliberalism'. These resistance attempts against gentrification and displacement emerge not only as collective strategies to handle gentrification and displacement processes at local level, but also arise as part of global resistance to 'accumulation by dispossession' (Sakızlıoğlu, 2014). In this regard, the violation of human rights and the loss of properties of people trigger the proliferation of resistance movements against displacement and dispossession.

The literature on urban social movements focus on both organized resistance against urban transformation projects through neighborhood associations or grassroots mobilizations, and collective action of unorganized actors to claim their rights to urban space and amenities; that is, to live out their desired way of life (Lelandais, 2014). According to Newman and Wyly (2006), the resistance strategies, developed at individual or collective level vary from negotiation efforts to demonstrations through community organizations, anti-displacement campaigns or residents' individual efforts. Accordingly, the residents develop strategies at both the household and collective level to handle negative impacts of gentrification and displacement (Sakızlıoğlu, 2014).

4 NEOLIBERAL AGENDA OF ISTANBUL: THE POST-1980S

Istanbul, as the economic center of Turkey, has experienced major economic, social, and spatial restructuring during the neo-liberalization process of Turkey. Through neoliberal economic policies, the economic structure of the city shifted from industrial sector towards service sector. The government declined the public subsidies and investments in industry, but directed the private sector to make investments in the real estate, banking, finance and tourism (Sönmez, 1996). In this period, the economic targets on the city, which aim to achieve economic growth and increase the competitiveness, considerably affected the state's urbanization approach. To make Istanbul a point of attraction for national and international investments, central and local governments encouraged large-scale projects in housing market by giving incentives and making infrastructure investments (Öktem, 2011). In this respect, local authorities, allowed investors to develop new commercial and residential areas in the city. All these developments led to the generation of urban rent as a key tool of capital accumulation and urban development.

4.1 NEOLIBERAL URBAN POLICIES AND PRACTICES IN ISTANBUL

The 1980s are considered a breakpoint for Istanbul. After the 1984 municipality elections, the first metropolitan municipality mayor of Istanbul engaged in significant entrepreneurial interventions to revitalize the city and increase its importance on the global scale (Ekinci, 1994). During this period, making Istanbul a 'global city' became a common purpose, and the central and local governments aimed to upgrade the image of Istanbul as an important cultural and touristic city through tourism-led revitalization projects and major interventions in the historical center of the city (Sakızlıoğlu, 2007).

In line of these purposes, the central government, local authorities and private sector highlighted the requirement of a new commercial center in Istanbul, and undertook major projects for the creation of new central business districts (CBD) within the city. In that sense, the central and local governments decided to stimulate the private sector to generate a new CBD along the Levent-Maslak axis (Öktem, 2011), with the growth of new high-rise office towers, hotel complexes and shopping centers. Enil (2011) indicates that the construction of the two bridges over the Bosphorus increased the accessibility of Levent and Maslak axis, and stimulated the expansion of the CBD. Opening of Tarlabaşı Boulevard to revitalize the cultural

center of Istanbul, Beyoğlu and to provide an access between the new CBD and the old commercial centers was another major intervention regarding the 'neoliberal urbanization' of the city (Sakızlıoğlu, 2007; Enlil, 2011).

Besides, in line with these purposes, the squatter areas in the city center transformed into apartment buildings and middle or upper-middle class neighborhoods. While the early urban transformation projects were proposed with the purpose of the transformation of the squatter settlements, the subsequent projects aimed to transform the historical and inner-city residential areas into new touristic and commercial areas and redevelop the decayed neighborhoods, which led to the rise of gentrification debates. Beginning from the 1980s and 1990s, the central and local governments have undertaken urban renewal and redevelopment projects into their agenda. The urbanization policies and practices in Istanbul have shifted towards the management of urban transformation projects, playing a key role in the neoliberal urbanization of the city.

4.2 RESISTANCE MOVEMENTS AGAINST NEOLIBERAL PRACTICES IN ISTANBUL

According to Lelandais (2016), the recent urban movements in Turkey are comprised of two major attempts. First of all, professional organizations have been active in resisting the recent urban development projects. Second, inhabitants and various neighborhood associations with varying focus and interests have come to the fore with resistance mobilizations with their opposition to neoliberal projects, with discourses of social justice and the right to the city.

Starting from the 1980s, with the gentrification and displacement processes, resistance movements emerged as the residents in transformed areas have been negatively affected. Against the urban renewal projects in İstanbul, neighborhood organizations emerge as the main actors resisting and fighting the negative impacts of these projects. They have actively involved in negotiation processes between local actors, private companies and residents as well as maintained legal struggle through petitions and courts, organized anti-gentrification campaigns and carried out various demonstrations and protests. In some cases, these grassroots initiatives have been exposed to state's reaction and police interventions, even violence and repression.

Many neighborhood associations have been established to protect the rights of the residents and undertake collective actions against urban transformation projects in İstanbul, such as Sulukule Platform and Tarlabası Organization as well as organizations in Gülsuyu-Gülensu and Güzeltepe neighborhoods. Moreover, one of the resistance movements against authoritarian government practices and urban transformation agenda was the Gezi Park movements where various activists and initiatives came together and organized grassroots mobilizations.

5 THE CASE STUDY: TARLABAŞI AND ITS SETTING

Tarlabası is a historical and socio-spatially deprived inner-city neighborhood in the northern part of the Beyoğlu District, which is one of the most important cultural, historical, touristic and commercial centers of İstanbul. Tarlabası area lies on both sides of the Tarlabası Boulevard, the main axis of the district (Figure 1). There are forty-five administrative neighborhoods in Beyoğlu. Tarlabası is not an administrative unit, but comprises eight neighborhoods in Beyoğlu, including Sururi, Kamer Hatun, Kalyoncu Kulluğu, Hüseyin Ağa, Bostan, Çukur, Bülbül and Şehit Muhtar Neighborhoods.

Figure 1 – Location of Tarlabası area in İstanbul

Tarlabası has always been a very mixed and diversified area, in terms of the concentration of various economic, social and cultural activities, as well as its population with diverse ethnic, cultural, demographic, and socio-economic backgrounds of the inhabitants. Located at the heart of Beyoğlu, the area and its population have long been affected from the political, social and economic development processes within the city and the country, as well as from the urban policies and planning interventions.

5.1 TARLABAŞI BEFORE THE 1980S

During the second half of the 19th century, while Beyoğlu (Pera) was developing as a residential area for upper classes, including tradesmen, bureaucrats, foreign bankers and the Ottoman elite, some neighborhoods like Tarlabası became the settlement areas of the middle and lower-middle-classes and workers of embassies. In these periods, Tarlabası area was mostly inhabited by non-Muslim minorities including Greeks, Rum and Armenians.

However, these communities moved out of the neighborhood with the changing political framework that excluded minorities, and a series of events and arrangements, such as the population exchanges in the 1930s, the introduction of Wealth Tax (1942-1944) and September 6-7 Events in 1955. The non-Muslim population were replaced by rural immigrants from the central, eastern and northern parts of the country within the rapid industrialization and urbanization era of the post-1950s.

Tarlabası area became an important destination for immigrants beginning with the 1980s (Dinçer and Enlil, 2003). The area attracted a huge wave of internal and international immigrants in the 1990s. First, Kurdish people escaping from the conflicts in the eastern and south-eastern parts of the country inhabited the neighborhoods in Tarlabası. Second, Tarlabası was inhabited by the international immigrants including the immigrants from Africa and the Middle East countries. The area also became host to Romani people and people with diverse gender identities and sexual orientations.

5.2 SOCIO-SPATIAL DEVELOPMENTS IN TARLABAŞI AFTER THE 1980S

Starting with the neoliberal period in the 1980s, in order to revitalize Beyoğlu district, large-scale infrastructure and urban transformation projects were initiated. Two major interventions radically changed the socio-spatial characteristics of Tarlabası (Dinçer and Enlil, 2003). First, İstiklal Street was pedestrianized, and the buildings along the street were restored and transformed into touristic, commercial and entertainment uses, including arts galleries, cafes, hotels, cinemas, shops, offices and business centers. Second, Tarlabası Street was widened and Tarlabası Boulevard was opened in 1986 by demolishing various historical buildings in the area. The primary aim was to link Beyoğlu through Tarlabası

Boulevard to the new central business district created in the Levent and Maslak Districts. However, while it increased the attractiveness of the area, it isolated Tarlabaşı from the rest of the district and the city. All these interventions resulted in socio-spatial segregation and social exclusion as well as physical and socio-economic deprivation (Sakızlıoğlu, 2014).

Following several legislative regulations that were designed to provide the foundation for urban transformation goals, an urban renewal project in Tarlabaşı was initiated by the Beyoğlu Municipality. With the renewal project, the efforts to clean out the area from certain groups including low-skilled immigrants, ethnic communities, and other low-income and disadvantaged groups became visible. Accordingly, the area was planned to be transformed into luxury residences, offices, shopping centres and hotels (Figure 2). It was claimed that with the new developments in the built environment and economic activities, there would be a plenty of opportunities for the residents and urban renewal would create new job opportunities, better services and infrastructure, and upgrade the social and economic well-being of the residents (Göksu, 2010).

Figure 2 – Views from Tarlabaşı after the Renewal Project (Beyoğlu Municipality, 2016b)

The project has still been in the implementation phase. In 2014, the Council of State (Danıştay) decided that the expropriations have not been in the public interest thus cancelled the expropriations and acquisitions made by the Beyoğlu Municipality. In addition, in 2015, the Council of State decided that the urban conservation area of the Tarlabaşı should be based on a conservation-oriented development plan and it should constitute an integral part of the plan with the planning principles. However, in November 2015, the Beyoğlu Municipality announced that four blocks in Tarlabaşı urban renewal area were put up for sale (Beyoğlu Municipality, 2016a; Beyoğlu Municipality, 2016b). Additionally, the Municipality has recently announced that office uses in the first stage will be completed towards the end of 2016 and the residences will be completed towards the end of 2017 (Taksim 360 Project, 2016).

6 IMPACTS OF THE RENEWAL PROJECT AND STATE-LED GENTRIFICATION IN TARLABAŞI

The aim of the Tarlabaşı Urban Renewal Project was declared as “to stop the collapse by renewing the area, to make the region safer, healthier, livable and integrated with the city, and to create a new life center in Tarlabaşı”. According to the dominant discourse, Tarlabaşı will be “rescued” from the socio-spatial depression and will be transformed into the “Champs Elysées of Istanbul”. The main motivation is that this transformation is vital both for the city’s and country’s economic development. The aim is to make the area a touristic and commercial center and an attraction point, thus foster the economic development of the city.

Although the project was presented as essential for improving the living conditions of residents and the city image, it has not created better housing and economic activities in the area, but served the goals of urban clearance (Dizdar, 2013). The project developers (the local government and the private company) claimed that the renewal project would both upgrade the image of the area and move away the groups that negatively affect the social order. They used the project to reshape the area to attract high-income groups, entrepreneurs and foreign investors. While the project was being designated, the cultural, demographic and social characteristics of the area were not taken into consideration. Designed specifically for touristic activities, the project has ignored the demands and needs of the residents in the area and aimed to attract a different target group comprised of high and middle-class groups and tourists.

The renters with formal tenancy contracts were offered to move to Kayabaşı area, which is located on the periphery of the city, around 35-40 km distance to the city centre (Figure 3). However, since the number tenants with formal contracts was rather low, very few of them could benefit from this option (İslam and Sakızlıoğlu, 2015). Moreover, the movement from the area is an undesirable option for most of the people, since a majority of them works in the service sector jobs in the city centre. Most of the few residents who were able to buy houses in the housing estate in Kayabaşı moved back to the city centre around their old neighbourhoods since they could not have paid their instalments and could not adapt to the new conditions in a highly different setting and social environment than their existing living and working areas in Tarlaabaşı.

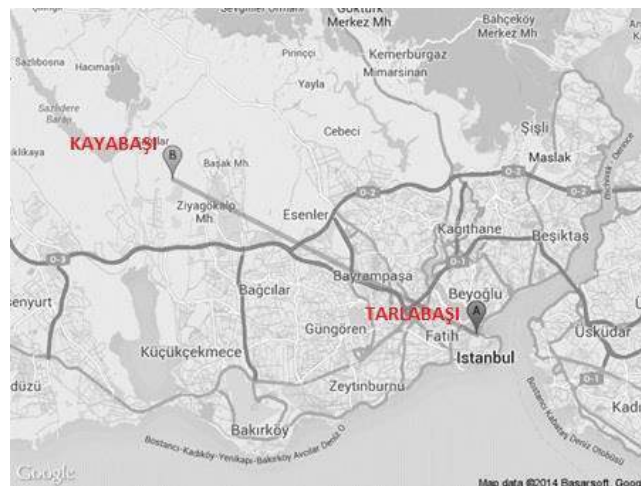

Figure 3 – Location of Kayabaşı in İstanbul

Therefore, the renewal project has already negatively affected many residents due to the appreciation in values of properties and increasing prices and rents, thus many people have been forced to leave Tarlaabaşı, including low-income groups, immigrants and other disadvantaged groups. The diverse population composition of the area has undergone serious changes. Moreover, since the beginning of the project, many residents have suffered from the economic difficulties (loss of properties, etc.), decrease in the housing opportunities for low-income groups, increase in commuting distances, loss of jobs, and increasing distrust of the state and the local government (Sakızlıoğlu, 2014).

The project goes on, and Tarlaabaşı still remains as an area with low-quality housing and jobs. In addition, the area continues to attract international immigrants and most recently, the asylum-seekers from Syria, who are struggling to live in poor conditions and begging or selling things in the vicinity of Taksim Square. Today, Tarlaabaşı is characterized by the persistency of social problems, and it is not difficult to forecast that the transformation process will end without solving social problems but destroying the unique character of the area and its long-established diversity.

7 RESISTANCE MOVEMENTS AGAINST THE RENEWAL PROJECT

With the declaration of the renewal project and the initiation of the renewal process, the residents and civil society initiatives showed reactions and opposition. Since the beginning of the project, the residents, both the property owners and renters, non-governmental organizations, professional chambers and various

activist groups have been directly involved in the resistance movements and grassroots mobilizations against the renewal project and its negative impacts.

In this respect, the Association for Solidarity with Tarlabası Property Owners and Renters was established in 2008 to protect the rights of property owners and renters against the Tarlabası Renewal Project. Although the Association was founded as an organization of property owners, it enlarged itself by including the renters in the area. The organization aimed to inform residents and raise awareness regarding the possible impacts of the renewal project, and search for possible solutions to prevent unjust treatment of the residents. The Association endeavored to protect the rights of inhabitants through negotiation efforts between Beyoğlu Municipality and the private company that undertook the implementation of the project. To compensate the loss of property owners and renters, the Association presented a set of conditions (Sakızlıoğlu, 2014), including commercial space for business holders and shopkeepers; rent allowances for residential renters and renters who run their business in the area; and an extra compensation for business losses incurred due to the project. These compensations were not accepted by the Municipality. The private company announced that it can provide some spaces for commercial use by the businesses, however, the demanded rent allowances were not accepted. As a result, the Association withdrew from the negotiations, and started legal struggles to protect the rights of the residents (Sakızlıoğlu, 2014) and organized lots of protests and demonstrations.

In the following period, the Association applied several times to international courts and organizations, including the European Court of Human Rights (ECHR) and the United Nations Educational, Scientific and Cultural Organization (UNESCO), using legal channels to fight the violation of the rights of the residents. In addition, the Association raised awareness about the project and its negative outcomes by participating various seminars and conferences organized by different institutions and organizations. Although these efforts drew the attention of media and raised awareness about the issue among the public.

8 DISCUSSION IN THE FACE OF THE RECENT DEVELOPMENTS AND INTERVENTIONS IN THE AREA: AN END TO RESISTANCE?

The resistance movements have weakened over time (Sakızlıoğlu, 2014; İslam and Sakızlıoğlu, 2015). Today, most of the organizations, like the Association for Solidarity with Tarlabası Property Owners and Renters are not active anymore. Although this association initiated the resistance in Tarlabası, used collective strategies in resistance movements and contributed positively to some of the pre-existing residents, it could not have prevented displacement nor stopped the implementation of the project.

Recently, some neighborhood initiatives in the area try to support vulnerable communities and fight against unjust treatments of disadvantaged groups. For example, Mülteciyim Hemşerim Solidarity Network tries to support refugees, especially Syrians in the area. This Network has recently organized a press conference named “Do not Touch My Neighbour!” (Mülteciyim Hemşerim Solidarity Network, 2016) with participation of many neighborhood initiatives. Tarlabası Migrant Solidarity Kitchen has also been active in creating solidarity networks among immigrants and asylum-seekers in the area. Tarlabası Community Center, on the other hand, has been working since 2006 to provide educational, social and psychological support to the residents of Tarlabası, especially children, youth and women. It also tries to enhance solidarity networks among the residents and assist disadvantaged groups in resolving problems they face.

Although these initiatives try to support disadvantaged groups, they do not provide long-term and effective solutions to problems in the area due to the continuation of the implementation of the project, the attitude and policies of the central and local governments as well as fragmented nature of these resistance attempts. Although the associations and several initiatives created a resistance, none of these attempts have been able to prevent the implementation of the project. Tarlabası is still suffering from social exclusion and other social problems including social and economic deprivation. Considering the recent developments, the historical, cultural and social destruction of Tarlabası cannot be avoided since the project has already gone through the marketing stage with a flashy website. It is not difficult to foresee that the gentrification in the area will accelerate with the completion of the project.

9 CONCLUSION

Tarlabaşı, which was already affected from earlier political events and developments that harmed the diverse character of the area, has become a victim of a series of neoliberal policies, and a range of radical planning interventions in the post 1980s. While these large-scale and 'prestigious' projects have been the ways of profit-seeking activities of certain stakeholders, they have also been important tools of devaluing differences and stigmatizing diverse identities and lifestyles within the area.

The results of these policies and interventions in Tarlabaşı have been harshly felt by its residents, leaving them suffer from physical deprivation, poverty, socio-spatial segregation, social exclusion and displacement. The impacts have been on the most vulnerable who are exempt from social and economic protection mechanisms: low-income groups, immigrants, and the Syrian asylum-seekers, struggling to live in poor conditions, working informally and sheltering in deprived buildings. On the other hand, due to the transformation project, many of the current Tarlabaşı residents have been bought out, and forced to leave the area, as their houses are sold off to private companies, waiting to be rebuilt or already demolished to enable the construction of upscale residences. Besides the material loss of the residents including loss of houses or businesses, many people have been moved away from their social and business-related networks. The new life in Tarlabaşı serves high-income and 'elite' groups, however, a majority of the inhabitants, with their diverse identities, cultures and lifestyles, do not fit in with this 'modern' and 'upscale' image of Tarlabaşı.

That is to say, the claims of the central government on "Urban transformation and renewal would lead to higher social mobility and better economic performance." seem to fail in practice. The ambitious and profit-seeking projects growingly ignore the social realities of urban areas and their population characteristics, and create new forms of injustice. Gentrification is a reality of Turkish cities like İstanbul, and seems to remain on the agenda in the upcoming periods. Although the associations and several initiatives create a resistance, none of these attempts are able to prevent the implementation of the renewal project as well as negative impacts on residents, as seen in Tarlabaşı case, unless the attitude and approach of the central and local governments change. As emphasized by Lees (2012), "The end point of resistance to gentrification has rarely been an outright victory".

ID 1707 | GATED COMMUNITIES IN TURKEY AS A GOVERNANCE STRUCTURE: ISTANBUL CASE

Hatice Aysun Ozkan¹; Sevkiye Sence Turk²

¹Istanbul Medeniyet University /Istanbul Technical University; ²Istanbul Technical University
ozaysun@hotmail.com ; turkss@itu.edu.tr

1 INTRODUCTION

The privately managed housing areas are the most common examples of decentralization of state centered governance policies and their transformation to society based management practices that can be seen in urban space. These housing areas called 'common interest developments' whose different examples can be traced over the world are such residential areas whose residents form some certain management structures to regularize common rules within contracts. Those housing complexes including various social, physical and environmental features; facilities, services and activity areas are managed by a user group consisted of residents or a representative government body with unique internal structures.

Those privately managed areas commonly known as CID are the fastest spreading housing structure around the world (McKenzie, 2003). CID, seen as a form of privatization of local government also symbolizes the reducing local government dependency and rising trust for market systems. CID areas, whose common characteristics are being privately managed, have various types in various names (McKenzie, 2003; Ruju, 2014; Tummers, 2015; Chiodelli 2015). Gated communities have become the most controversial type of CID included in CID literature which has been spreading over the world since the 1970s. The most well-known and accepted definitions of gated communities generally imply the privatization of public space and restricted access to housing area (Blake and Snyder, 1997). The common view explaining the emergence of gated communities refers to the safety need originating through the effect of global neoliberal restructuring over the social polarization (Tanülkü, 2012). In that sense, gated communities are the structures emerge in the urban space where social housing and public spaces lose their meaning, gentrified, entrepreneur and privatized areas arise while urban regeneration works towards city center, mega projects and imbalanced development create neoliberal city (Hackworth, 2007). Those places isolated via physical and cultural barriers from the rest of the society are supported by an internal governance mechanism. Thus, a private governance mechanism operating certain rules to provide order and maintenance is applied for these housing areas (Atkinson and Blandy, 2009; Soja, 2000).

The studies based on gated communities show the existence of interactive processes between government and other actors. Those processes result in new urban forms by combining with each other (Tedong, Grant and Wan Abd Aziz, 2014). While those new forms cause new types of management, they also provide room to ponder how urban space is managed. Nevertheless, governments can affect the use or discharge of land on different levels. At that point, the concept of governance describes a wide perspective which refers to the coordination of activities stimulating the system and consisting of multiple actors and processes (Jessop, 1998).

Gated communities providing participation of other actors as well as governments create a self-governance structure by performing some functions which are originally met by the government. Therefore, it has been highly discussed that gated communities are qualified enough to provide basic needs and services better than public governmental bodies (Low, 2003). Gated communities referred to as 'micro governments' or 'so-called local governments' are accepted as a new type of regional organization and reform for institutionalization. That gated communities are generally accepted as private management areas empowers their image implying their self-sufficient and autonomous nature. While Bali (2004) emphasizes gated communities as self-sufficient small towns, Çınar, Çizmeçi and Köksal (2006) describes

them as small municipalities having independence by being separated from municipalities. Cséfalvay (2011) the 1980s that the distinctive features of gated communities are not the desire of the rich for being separated from society, privatization of public space, and a common ownership concept providing common use of certain services and facilities in terms of a club good model. Instead, the main distinction is the provision of local public services and goods by privatized procurement and conditions as well as the control of residents of their behavior. Most of the studies regarding the dramatic rise of private residential areas and gated communities have been focusing on their physical structure including fences, gates, security measures, etc. However, Crawford points out that the critical issue is to examine whether private housing areas are the new forms of self-governance or not (Crawford, 2003).

In that sense, it is seen that there is quite limited literature referring to the governance and relation networks between gated communities and planning institutions. However, while present studies have been taking that subject in terms of the demand side, they generally push the managerial relations of actor groups in the process into the background. The aim of this paper is to enlighten and criticize the managerial relations of gated communities in urban planning, to define the existence, competences and restrictions of actors as well as on which stage they participate into the process. This paper includes four sections. In the first section, approaches to managerial identity and existence of gated communities are examined through different examples from various countries. In the second part, the development process of gated communities in Turkey is presented. The effects of changing institutional structure and legal amendments on gated communities is discussed and their internal management dynamics and organizational relations are examined. In the third section, how to assess managerial features of gated communities via a project management approach is defined.

The project management steps and relationships between actors are analyzed through a case study. In the last section, managerial aspects of gated communities are evaluated as a whole.

2 GOVERNANCE RELATIONS OF GATED COMMUNITIES

The rise of the gated type of housing areas emerged in the USA and has been continuing rapidly since the 1980s around the world. This residential form sprawling over world geography has continued to increase because of safety issues, socio-cultural segregation or administrative reasons from the USA to Europe and Asia to Africa (Gooblar, 2002; Atkinson et al., 2005). The rapid growth of gated communities ultimately affects the ways of intervention and regulation towards them. Herewith, many scholars working on gated communities remark that those areas function as operational units (Zainudin and Hussin, 2015). Because regulating the behaviors of residents and conditions of property use while taking collective responsibility of managerial issues via legal arrangements have become a necessity (Atkinson and Blandy, 2006; Blandy and Lister, 2006).

According to Le Goix (2005), residents of gated communities mostly feel like club members who come together to benefit from some certain facilities rather than be a member of society. Therefore, these housing areas are identified with concepts like 'club realm' and 'territorial club economies' (Webster, 2001; Glazse, 2006). Although gated communities provide certain benefits to their residents via contracts, those contracts are also quite descriptive to regulate the rights and behavior of the residents, to define the limits of their life spaces and to determine common duties. Glazse (2003) claims that the club goods theory solely is not enough to explain the historical and regional development of gated communities. In fact, relations between governments, national, regional and local authorities should be analyzed to clarify the increase of gated communities (Atkinson and Blandy, 2005). In a similar way, McKenzie (1998) the 1980s that there are various outer powers beyond ménage à trois between developer, potential residents and the municipality playing in process. Consequently, outputs of the process may be affected by them.

Despite the diverse policies towards gated communities, an overall tendency shows that they are supported by local authorities. McKenzie (2003) -studying rapidly increasing gated housing areas around Las Vegas- states that local governments are quite supportive of gated communities. While municipalities support the increase of gated communities and their management by homeowner associations, land developers are also quite pleased with that tendency. Similarly, Wu (2005) expresses that local governments in China lean towards gated communities because they have positive effects on decreasing public service costs and burdens.

The managerial aspect and governance of gated communities is a broad subject including a large number of dimensions. Several studies have mainly focused on how related planning institutions, planning tools and various actors regulate the effects of gated communities on urban space. Grant (2005) examined the controllability of gated communities by local governments through the Canada example. In his work, Grant states that some municipalities have binding rules for controlling building height, gates and accessibility of roads and regulative conditions are set to design semipermeable areas. Besides, another restriction is the total area of a gated community which is determined as 20 acres at most. On the other hand, Landman (2004) states that the 1980s has the links between planning and gated community through enclosed neighborhoods and security villages from South Africa. Landman states that construction of enclosed neighborhoods is subject to the approval of the related planning authority and they are built according to planning guidelines, whereas security villages are constructed depending on the decisions of the municipal council on development and building permits.

The isolation and separation of housing areas dates back to old times in Israel whose ethno-national, religious, cultural, ideological and socio-economical structure is quite characteristic and has been through a segregation period since the beginning of the country. However despite their physical similarities, several structural differences are observed among gated communities built before and after 2000 (Rosen and Razin, 2008). Especially after 2007, NGOs in Israel have interfered in the problems and challenges caused by gated communities via legal procedures. NGOs putting environmental concerns to the forefront became quite interfering on gated communities locating on the coastline after the 1990s by binding practices. NGOs have become very effective in the control of marinas and their surroundings, prevention of recreational sites from the transformation to private housing and remove of the barriers restricting the accessibility of the coastline.

Another aspect of governance studies on gated communities is the discussion about how the sites use their managerial capacity to carry out the services and their duties. In this way, the concept of governance is mentioned through the tasks and services shared between the planning authority and developer. Gated communities are considered as positive tools to provide public order in South Africa where social segregation is very high because of socio-economic and political conditions (Landman, 2004). The rising crime rate and security needs of a society have encouraged the construction of gated communities. Eventually citizens have created pressure on local governments by demanding private housing areas. There have been two types of gated communities in Israel: enclosed neighborhoods and security villages. While roads remain as public domain in enclosed neighborhood, local governments become responsible for the construction and maintenance of public services. However security villages covering residential as well as mix use functions are mainly built by a developer. A study conducted in Johannesburg shows that residents of enclosed neighborhoods take on the responsibilities of municipalities and take over the maintenance of parks, walking trails, lighting etc. On the other hand, residents of housing areas have been continuing paying their monthly taxes to municipalities. In a similar way large security villages provide several facilities for their residents including golf courses, restaurants, shopping etc. Besides that, municipalities are glad about the property taxes gained by large real estate projects.

That gated communities are functional and operational units and act as governance actors which is another dimension emphasizing their self-governance function. On that point, governance and relations between actors gain importance. The internal management of gated communities and roles of actors can integrate with a series of legal tools regarding urban planning. In this way, the management of a housing area is guaranteed by planning laws and the contracts regulating on-site living conditions. For example in Singapore, common sharing arrangements in gated housings are met by the government. The government carries out that duty via building maintenance and strata management (Wong and Yap, 2003; Pow, 2009).

According to the law, all property owners participate into a joint ownership. Thus, property owners take the responsibility of service maintenance as they benefit from the common properties in the area. Performing tasks is provided by the Management Company (MC) consisting of residents. Every MC is in charge of the implementation of directives in law and collects the management costs from the right holders. Pow (2009) claims that this management system is a way of creating club economy within the borders of a gated community. Another country regulating arrangements related to common sharing in gated communities is Australia. Gated communities in Australia are separated into two groups: high rise buildings and master planned areas. Therefore there are two sets of laws regulating those areas (Sherry, 2009). While the Strata Schemes Act (1973) manages the development of high rise buildings and their title transactions, the Strata Schemes Management Act (1996) regulates managerial issues. On the other side, the Community

Land Development Act (1989) manages the land development process and title transactions, the Community Land Management Act (1989) arranges ongoing site management issues. By enforcing those laws, usage and maintenance of certain facilities could be allocated to specific housing areas. However Sherry (2009) states that commonly shared facilities and services in master planned areas are optional. Because of this, master planned areas in Singapore are generally generated without restrictive agreements. Thus, architectural restrictions in those housing areas are quite minimal and impermanent (Zainudin and Hussin, 2015).

As is seen, managerial conflict and complexity of gated communities is multidimensional. While a planning authority generates legal contents to control development and design conditions of gated communities, other regulations concerning internal management and service procurement of the sites are tried to be implemented. However gated communities emerge in different countries with different motivations diversifies approaches for them.

3 GATED COMMUNITIES IN TURKEY

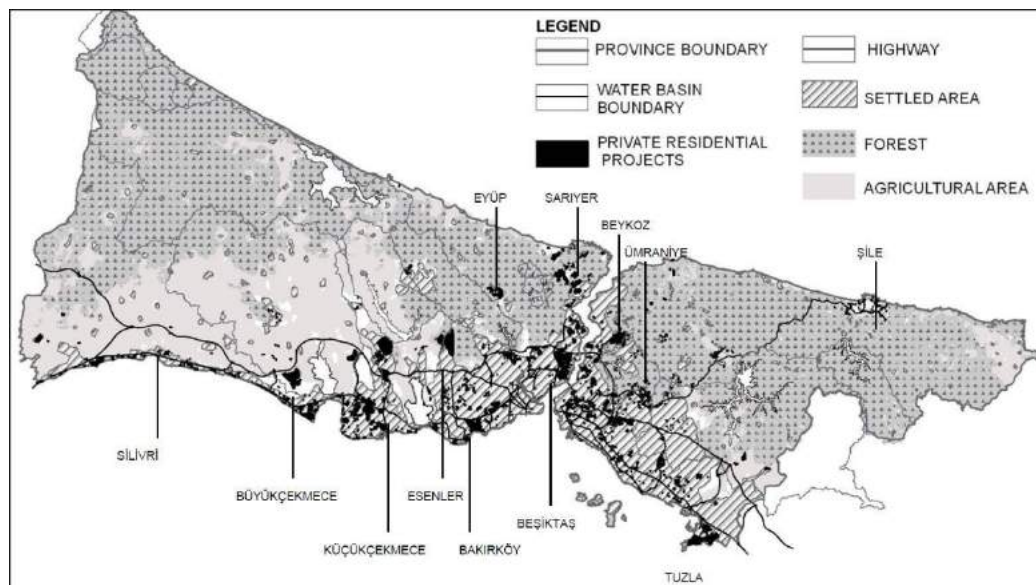

The emergence of gated communities in Turkey has developed in parallel with transition to liberal economy in the 1980s and they predominantly have been built right after 1990. Urban space came into prominence as a result of making the country attractive for investments and integrating it into global capital (İnal Çekiç and Gezici, 2009). In consequence of market crisis in the 1970s, participation and intervention methods of governments in housing market has changed drastically after 1980 (Geniş, 2007). Öncü (1988) states that rising housing demand, housing scarcity and lack of land for housing projects marked that period.

Metropolitan areas and cities entered into the process of being global cities with the pressure of new actors involving housing and the land market. The need for a central public institution -which is supported by certain funds to carry out housing policies- increased in the 1980s. As a result, a series of legal amendments were written and the Mass Housing Authority was established through the Mass Housing Law in 1984. This attempt aims to encourage all the actors in the construction market with the financial support of banks. Subsequently, other legal arrangements were done to attract medium and large scale construction companies and the housing market was tried to be revived. It is seen that municipalities and the private sector tried to be activated by government intervention in the housing market after 1980. Thus, liberal policies conducted have directed housing production towards the high income group. The capital reserved for housing production has focused on 'new elites' (new middle-income group working for finance, banking, tourism sectors, etc.). As a result, early examples of gated communities have started to surround urban space (Geniş, 2007). Gated communities in metropolitan areas have increased as a result of large scale housing development companies increasing right after the 1980s (Keyder, 2000). Those gated communities starting to develop under the economical and political flows of the 1980s have been sought as a new type of suburb because of their peripheral location (Kurtuluş, 2005). The reasons why gated communities have started to spread over peripheral areas are two-sided. While the first one is the desire of high income groups to move away from urban chaos by settling in more qualified areas, the second one is the aim of development companies to create outstanding life standards on the lands whose values are relatively lower but rents are high (Aydın, 2012).

One of the most effective and basic factors -apart from the transformation of social structure and changes of legal and institutional competences enabling large scale housing projects to be developed- has been large and undivided parcels on the periphery. When changes of housing policies are evaluated, the first examples of gated communities seem to have emerged in early the 1990s. In that period, housing areas surrounded by qualified facilities were built for new middle and higher income groups because of the easy access to relatively cheaper and bigger parcels on peripheral areas. Forestry lands and first tier municipalities hosted low-density and sprawled gated communities because of the legal interventions easing land development. However, the effects of neoliberalism sharpened during the 2000s. In that case, the government reflected privatization policies of the planning system and also it intervened in housing policy by restructuring itself with a collaborative and entrepreneurial role. In that context, the government has described tools to be used by public institutions on directing housing policies. MHA has been promoted with a series of new competences to control of the housing market (Candan and Kolluoğlu, 2008; Zariç, 2012). The neo-liberalized role of MHA has not only changed the scale, features and locations of housing investments but also triggered increases of those investments. As a reflection of this situation,

the site selection of gated communities in Istanbul has evolved over time and directed towards the city center by interventionist housing policies, planning implementations of MHA and the Ministry of Urbanism and Environment (MUE) and urban transformation projects. The drastic rise of gated communities in Istanbul has continued during the 2000s and according to Gulumser their numbers increased from 30 to 96 in 2004 (Firdin-Özgür, 2006). While the number of gated communities was assumed as 650 in Istanbul in 2005 (Perouse and Daniş, 2005), Ozkan and Kozaman (2006) asserted that 20% of the housing stock consisted of gated communities. Besides, Aydın (2012) states that 552 gated community projects were released to the market between the years 2005-2009.

When the Istanbul case is examined, it is seen that housing areas including multi-storey buildings, high rise buildings and upscale houses are located mostly around the CBD and partially on peripheral sites. These housing areas developing mainly around the office buildings and shopping malls on the European side and around the CBD have started to rise in new urban development zones on the Anatolian side of city (Akgün and Baycan, 2012).

Map 1- Private Residential Projects in Istanbul (Özkan and Kozaman, 2006)

Gated community projects which have been developing since 2000 generally include different types of housing typologies like multi-storey housing, residences, villas. These sites built up on large-scaled lots not only include different housing typologies but also serve for various income groups like middle, middle-high or high. The laws and other regulations enforced after 2000 by central and local governments have triggered urban development directly or indirectly. Urban regeneration and transformation oriented laws providing extensive competences have encouraged housing developments.

3.1 CHANGING INSTITUTIONAL STRUCTURE ON GATED COMMUNITIES.

The role of the Turkish government in housing policies has changed over the years from passive to partially active and active. While the government currently undertakes the role of entrepreneur, it also acts quite collaboratively with the private sector for housing investments. The broad authorities assigned to central government institutions and most particularly to MHA since the 2000s have been an significant role in the way in which housing investments are directed. The service provider /producer role of local governments previously assigned has evolved with the effect of globalization in the 1980s. Thus, local governments have become tools to distribute those services. While urban governance organs have been considered as companies, citizens have also been defined as customers which features not the public administration but the public management. In that manner, cities have become the focus of capital flows through the transformation of resources transferred from the central government to municipalities (Bal, 2011). Therefore, social centred investments like housing policies have been replaced with private sector investments.

There have been several arrangements in accordance with the globalization tendency during the transition period from government investments to private sector based investments. While privatization based laws have been rising, the central government has downsized, and local governments and the private sector have been empowered (Karasu, 2009). The local governments have taken on the role of being entrepreneurs and collaborators have started to buy services from the private sector. The private sector has gotten ahead in procurement and distribution of basic services such as infrastructure, land development and housing production. That government has started to get strength from the private sector has encouraged market housing investments, but the social role of housing investments has started to be neglected. While the percentage of housing investments in government investments had been decreasing in the early 1980s, several precautions have been taken to enhance the sources supporting housing developments. The most important precaution has become the foundation of MHA in 1984. Thus, municipalities were passivated in housing production. After 2000, MHA's financial resources and activity areas (from industrial areas to tourism, urban transformation etc.) have been extended. The foundation has empowered its identity of being an investor through expanded opportunities (Zariç, 2012). Besides, MHA has gained several expanded rights as a market actor such as investing in residential and non-residential projects, participating into revenue sharing agreements, being responsible for urban transformation projects, establishing a company, getting into a partnership, making /approving its own plans, providing construction permits and expropriating

Apart from the changing role of government institutions, another important issue concerning institutional restructuring is the role of the private sector. The large-scale housing development companies emerged between the years of 1990-2000 in Istanbul which has gotten into the international real estate market with the effect of the Marmara Earthquake (1999) has formed gated communities as a new type of residential structure.

As a result, a large number of companies making unprecedented amounts of mass-production have appeared in the housing market. Those companies paid attention to the need for segregation of new middle and higher income groups and regarded their housing demand. While housing supply in the market has been changing, national construction companies have started to take part in real estate investments by going into partnerships or benefiting from national /international credits and incentives. The private companies have entered into the process of rapid growth in the sense that the construction industry has boomed. While some companies have been producing relatively small projects on small lands, large scale companies have been developing large scale projects providing several facilities. Thus, large scaled construction companies and gated communities have entered into the institutional structuring schema of the housing market as new actors.

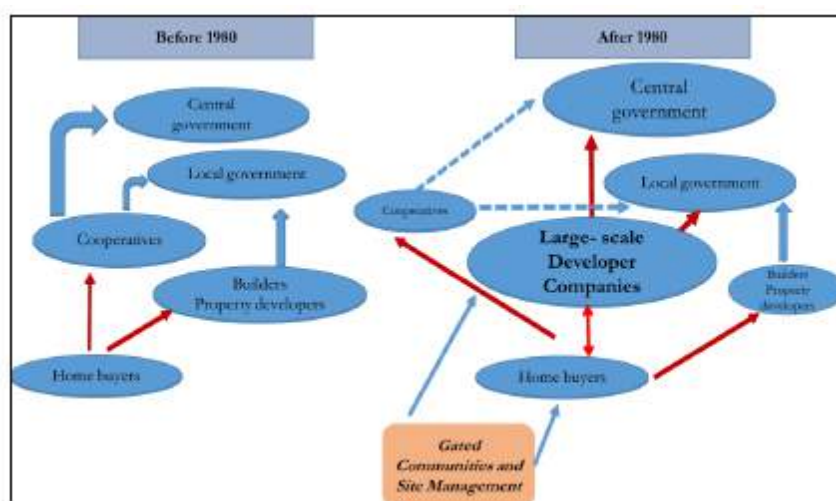

Figure 1- Institutional Structure of Housing Market after 1980

Gated communities having firstly located in peripheral areas and then in the inner city as a reflection of market penetration of national and foreign financed construction companies as well as changing socio-economical structures have their own governance capacity and management structure. Therefore, gated

communities form a governance unit all by themselves in addition to all these private sector institutions and other related actors which have been integrated into public-rooted institutional structuring.

Legal amendments and arrangements regarding residential areas are important tools supported by institutional changes. Those legal arrangements have included detached houses, cooperative housing and mass housing areas with different scales and typologies. However, the fundamental law emphasizing the administrative structure of gated communities is Condominium Law No. 634. In 2007, some additional changes have been made to this law to define 'Mass Houses' which is used for housing areas covering multi-parcels with multi-buildings. Besides that, Rent Law No. 6570 defines commonly shared areas in whole buildings under the title of 'common places'.

When carefully examined, it is observed that the concept of whole building defined by the law legitimizes gated communities. While the Condominium Law lays emphasis on internal management of gated communities, it also covers different issues like establishing management boards and regulating common expenses. However, the law is not descriptive to clarify the way of service procurement. Also, the link between service procurement and local government is not explained.

Apart from Condominium Law, other legal arrangements exist not directly related with management issues of gated communities but encouraging the increase of gated communities. These legal arrangements and housing typologies they have created in urban space are shown in Figure 2.

Period (years)	Economic Situation	Active Actors	Enacted Laws	Housing Models
1920-30	Period Liberal		Law Number 1193	
1930-35	Isolation	*Central government *Local government *Cooperative	Law Number 4370	* Single buildings * Squatters
1940-80	Cooperation Rural	*Local government *Housing co-ops *Builders *Small-scale construction companies	*Regulation Law Number 775 *Cooperative Law Number 3163 *Land Development Law Number 1194	* Squatters * Housing co-ops/ housing sites * Single buildings
1980-2000	Liberal	*Central government *Local government *Private sector/ Large scale construction companies *Small-scale construction companies	Mass Housing Law Number 2885	* Single buildings * Mass housing * Gated communities
After 2000	Neoliberal	*Mass Housing Authority (TODI) *Ministry of Environment and Urbanization (CEU) *Local Government *Private sector/ large scale construction companies	*806, 102, 3272, 3793, 3366 Laws (TODI related law amendments) *Regulation Law Number 3163 *Quota Law Number 4595 *Law Number 4369 *Decree Law Numbered 944 and 948 (CEU related amendments)	* Gated communities * Single building model rehabilitation/ transformation * Rural rehabilitation/ transformation

Figure 2- Legal Amendments and Their Spatial Effects

While the effect of privatization has increased with those legal arrangements since the 2000s, a central government agency, MHA, has been authorized to sustain housing policies. Housing supply policies carried out by local governments in previous periods started to be conducted by MHA which is an example of entrepreneur state. Market housing projects supported by MHA has formed a basis for the increase of gated communities surrounding metropolitan areas. MHA's profit-oriented large-scaled housing projects on valuable lands and Ministry of Urbanism and Environment's authorization to conduct urban transformation projects have resulted in an increase of gated communities as well as large-scaled housing projects.

3.2 ORGANISATIONAL RELATIONS AND INTERNAL MANAGEMENT OF GATED COMMUNITIES

Gated communities are self-enclosed structures because of their managerial role as well as their separative role supported by physical restrictions which makes them inaccessible for public use. That those housing sites are generally operated by internal management units affects their relations with local governments in terms of public service procurement. Accordingly, this situation results in a differentiation of service providing. Besides, service providing and internal management mechanisms observed in gated communities make them more self-sufficient and self-governed. Those public services and other

residential facilities are produced for a fee and they are commonly shared according to the basic principles of 'club goods' or 'club logic' theories which taken from the idea of common ownership (Aydın-Yönet and Yirmibeşoğlu, 2015). The club goods theory is defined as a membership system whose services can only be used by the ones paying the price and assessing the way of service procurement in a hybrid structure which is neither exclusively private nor public (Manzi and Smityh-Bowers, 2005). However, this situation can cause gated communities to achieve autonomy to some extent. Eventually, these relations between gated communities

and local governments may make gated communities more effective for making planning decisions (Firidin- Özgür, 2006). Gated communities and their management organs reaching qualified economical resources and service diversity can use planning notions directly. Göktürk, located in the peripheral area of Istanbul, in the 90s set an example for this situation. Göktürk, preferred by developers because of its affordable prices, have hosted several gated housing projects over the years. In 1993, Göktürk was registered as a municipality shortly before the completion of one of the largest housing project in the region, Kemer Country. This new municipality prepared the plans of the Kemer Country Project including detailed local plans and revision plans (İnal- Çekic and Gezici, 2009).

Even though there have been several studies regarding different aspects of gated communities, the content of public services, service procurement processes and relations between the private sector, local governments and gated communities have stayed in the background. Thus, the relation between the operation of current local governments and the tendency of gated communities to produce their own social- technical infrastructure through their autonomous management stays in the background.

Perouse and Danış (2005) stated that gated communities are self-sufficient towns providing their own services with a claim of being secure, comfortable and semi-autonomous. While gated communities exceeding a certain size can afford their ambulance services, electric generators, water tanks, technical supports and water refining, those services can be provided by private companies. Çınar, Çizmeci and Köksal (2006) also mention in the 1980s that gated communities isolate themselves from local governments by creating their own micro municipalities, and they subsidize basic services such as roads, security, garbage and maintenance of common facilities. Bahçeşehir and Göktürk gated communities in Istanbul have been the typical examples of micro-municipalism. Those two gated communities were legalized and registered as municipalities.

Geniş (2007), who examined the Kemer Country settlement, defines the area as a self-sufficient town and private management area. Geniş also claims that the settlement is separated from the rest of the area not only functionally but also administratively. Geniş further states that Kemer Country residents and the site management unit are considerably effective on the urban texture of the settlement and even on the municipality and central government. Kemer Country, having its own management unit rules and security measures, has been providing its infrastructure and other services. The settlement is managed by a board consisting of shareholders which functions as a private local government. The residents were found more concerned with efficiency and quality of services but they were not interested in participating in decision-making processes.

Candaş (2007), studying gated communities in Istanbul, confirms that Kemer Country's site management had a crew of 250 to serve the community. Those services include maintenance, repair, garbage collection, ambulance, and safety as well as intervention to architectural restrictions. Although there is a separate management unit, grouped villas also have their own managing agent.

Literature studies show that gated communities are considered as a financial support to maintain urban development, and they are largely encouraged by planning institutions. However, it is clearly noted that those settlements create privatized and autonomous managerial loopholes. Uncovering the organizational schema of gated communities in which they are established with external structures is significant to enlighten the administrative and financial relations. This situation requires there to be more explanations of management issues and the financial structure of gated communities in Turkey.

İşlek (2007) states that although mass housing projects had been retaining their dependence to the city until the 90s, the Kemer Country project developed in 1989 was a breaking point. İşlek further states that in the 1980s residents were encouraged to be a part of site management as a way of developing a sense of belonging. Ekdemir Kaya (2010), carrying out a study on three gated communities in Istanbul, points out that all of them are quite self-sufficient in terms of social services. Ekdemir Kaya also adds that those

settlements have homeowner associations (HOA). That managerial body establishes and operates the rules regulating common life. HOAs may impose architectural restrictions on features such as color, material, form to protect harmony. Ekdemir Kaya (2010) takes the study a step further and discusses relations between residents, HOA and the local government. The residents stated that they were not in need of being in direct contact with the local government after they moved to area. They also mention that the municipality neither represents them nor provides their needs, instead HOA is the responsible actor.

4 METHODOLOGY

This paper aims to examine the management capacity of gated communities through self- governance. The research discusses multiple processes starting with planning /construction periods and continuing with post-construction periods. This approach requires describing the actors involved in every single step. Four basic project management criteria (project management, process management, management sources and management tools) have been taken in that study which considers gated communities as a governance structure. Those criteria are defined based on Heurkens's study (Heurkens, 2012).

Project management criterion covering processes from planning and land development to post-construction is divided into 12 steps in terms of this study. Those steps are taken as management events. The steps are defined based on Healey's urban development model (1991, 1992) and Alexander's (2001) land development processes. Other project management criteria were defined in addition to Alexander and Healey's studies. These are sorted as decisions of plan making, making of plans, service maintenance /repair, procurement of new services, on-site managerial directives and management coordination.

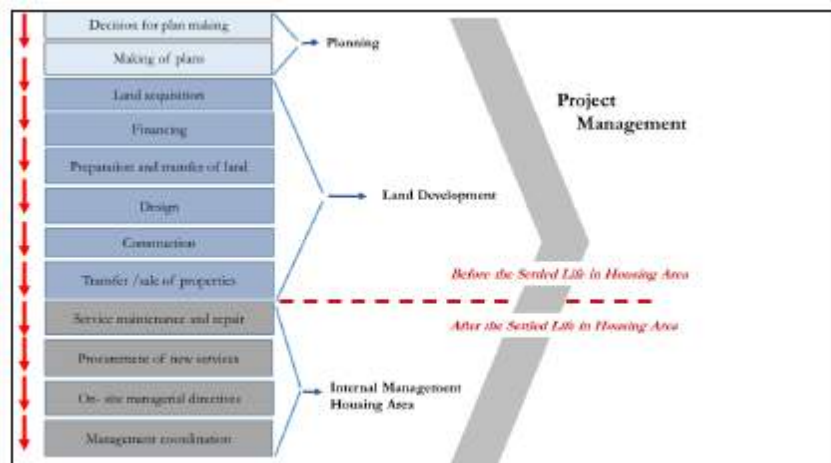

Figure 3 - Steps of Project Management

Defining actors and their roles on land development processes is significant to discuss management capacity of gated communities. While actor groups involved in housing development processes (including gated communities) in Turkey can be ordered as public sector (central or local government), private sector (developer and contractors), residents, site management units (dependent on developer or not), some services are provided via public-private partnerships. Which project management steps are operated by who constitutes a base to analyze management capacity of gated communities. However, those steps may include different actors and additional processes in every single urban development project. For this reason, only one case study area is reviewed to deeply analyze project management steps. In that context, the Avrupa Konutları Atakent 3 project in Istanbul was examined in terms of competences of actors and governance issues.

4.1 CASE STUDY: AVRUPA KONUTLARI ATAKENT 3

Within the scope of study, the housing project 'Avrupa Residences Atakent 3' in the borders of Küçükçekmece Municipality - which has been in the sphere of influence of the city center since 2000 while it was on the peripheral zone in the 80s- is discussed. The project started in 2010 and ended in 2011. The

Halkalı Gendarmerie Command land (19.3 hectares) on which the project is built had the highest land value of the region and it was claimed to be the most expensive land of MHA. The project stays within the borders of different planning areas and it was defined as a 'Mass Housing Area' by local land use plans and a detailed local plan in 2010. According to the detailed local plan, development rights were given as a detached order with a floor area ratio (FAR) of 1.65 while no limit or height criteria for buildings existed. Besides, it was also the 1980s that the housing project should be conducted according to the preliminary project which was approved by the Metropolitan Municipality. After that, the Mass Housing Authority managed the whole process of land development.

The land was constructed on after it was transferred to the Emlak Konut Real Estate Company which is a subsidiary of MHA. It was put out to tender and assigned to ARTAŞ Construction Company in compliance with the 'revenue-sharing model' for building works. ARTAŞ is one of the most experienced and long-established companies which has currently 14 housing projects in Istanbul. Apart from that, the company takes the management responsibility of housing projects which it produces. The project consists of 2262 dwellings, 16 commercial units, indoor and outdoor pools, health and sport centers, a tennis court, a multipurpose sports court, playgrounds, a kindergarten, car parks as well as a market, 2 cafeterias and a generator system which can only be used by residents.

The planning executive of Emlak Konut Real Estate Investment Company (Emlak Konut REIC) was interviewed in this study, examining managerial functions of gated communities to enlighten the relations between site managements, developer companies and public planning authorities. The 12 steps of the project management process and their lead actors were described through oral interviews.

DECISION FOR PLAN MAKING – MAKING OF PLANS

MHA has become the decision maker of the plan making process. After the transfer of ownership, MHA declared the area as a 'mass housing area' in accordance with its planning competences and legal rights. Hence decisions of plan making as well as preparation of plans belonged to MHA. The plans were approved by the Istanbul Metropolitan Municipality (IBB) according to the concerning law. As a result, development rights were determined by MHA.

LAND ACQUISITION

The acquisition of land was realized by MHA as the first step. The project area previously owned by the military was transferred to MHA without charge, and then MHA sold the land to its subsidiary, Emlak Konut REIC. However, there has been another land transfer period from Emlak Konut REIC to the developer. The model 'revenue sharing for land' was carried out to complete the transfer from Emlak Konut REIC to the developer. The model requires selling the land to the developer via the tendering procedure. The developer company assigning the maximum value for land wins the tender pursuant to the law. The company, ARTAŞ Group Construction, won the tender. Once the tendering procedure was over, ARTAŞ designated project details according to previously approved plans. Also, the number of total projected units, list of residential and non-residential units, saleable and non-saleable areas (social or technical infrastructure services commonly shared) were defined in detail. Apart from all these, the total cost and expenses of the project were clearly expressed in the application file. Afterwards the project was presented for Emlak Konut REIC's approval. After the project was approved, preparation of land started.

At that point, another issue is that the dwelling units could be put up for sale since the project and list of total units were approved. The completion of the building process of the entire project is not required to sell dwellings. Thus, a part of construction costs starts to be covered in advance of project completion. Emlak Konut REIC and ARTAŞ also prepared and approved the 'site management plan' to be operated. At a later stage, operation of the site management plan was transferred to ARTAŞ.

FINANCING

This stage including the financing process of purchasing and the preparation of land is run by the developer. The developer winning tender also becomes responsible for further costs.

commercial unit. Once this commercial unit was sold, its sales revenue was transferred to ARTAŞ. In that case, site management is not given a share of the sale. On the other side, revenues and cost of sports facilities are under the responsibility of site management because those facilities are 'common areas' not subject to sale.

SERVICE MAINTENANCE AND REPAIR

The maintenance and repair of infrastructure and social services built up in the project area have been provided by ARTAŞ. Also, site management has been performed by a professional management company owned by ARTAŞ. This company is responsible for service maintenance and repair tasks according to the 'management plan'. There is a specialized support team to solve problems about interior modifications and other repair works. Other environmental and landscaping works are paid and organized by ARTAŞ. In addition to these, garbage collection service, safety and other sanitation services are carried out by the site management company.

PROCUREMENT OF NEW SERVICES

Procurement of new services including maintenance and repair costs are paid by the site management company owned by ARTAŞ. However, procurement of new services may not include social facilities, commercial centres, etc. which require additional building and structures. Emlak Konut REIC does not allow those types of additional developments after the project is approved. Other infrastructural additions such as refining systems, sewer system, and cogeneration are allowed to be built. The condominium owners' board have the right to demand new service procurement. The period of service procurement is actualized with the decision and approval of the general board. However, these types of changes necessitate revision of the management plan. The operation of the service procurement process is carried out by the site management.

ON-SITE MANAGERIAL DIRECTIVES

Directives and rules regulating on-site living conditions are declared to buyers via sale contract. Those rules are also defined with the management plan. The first management plan of the settlement was prepared by Emlak Konut REIC and ARTAŞ jointly. On-site living rules and regulations are published on the website of the site management. The operation and sustainability of rules are monitored by the site management board. Those rules include different subjects like the use of commonly shared areas, monthly fees, safety-cleaning- aesthetic issues, in-house maintenance / repair. The demand to revise those rules is discussed by the general board and then revisions are reflected in the management plan. Although the first management plan was prepared by both actors, further revisions and changes are recast and monitored by the site management company.

MANAGEMENT /COORDINATION

The coordination of management is operated by the site management. Different departments of the site management organ share primary tasks. The site management consists of 3 tiers connected hierarchically. Those tiers from top to bottom can be shown as: the board of management with 5 persons, the site manager and 5 primary departments dependent to the site manager. Those primary departments are public relations, technical works, cleaning, landscaping and security. Apart from these, there is an inspection committee with 3 persons.

The steps and their primary actors of the project management process which starts with the decision of plan making is schematized as follows. When the schema are examined carefully, it is seen that the developer is more effective than the planning authority on post-planning steps. Especially, project design and construction steps as well as on-site management are operated by the developer.

When all the processes and project management steps are considered, it is seen that the first two steps (decision of plan making and making of plans) are run by the central planning authorities (MHA and Emlak

Konut REIC) whereas further steps are primarily carried out by the developer and site management. The local government is not effective on any of those steps. The only interaction between the municipality and the gated community occurred in the planning and project approval processes. The housing project must be accordant with the preliminary project approved by metropolitan municipality.

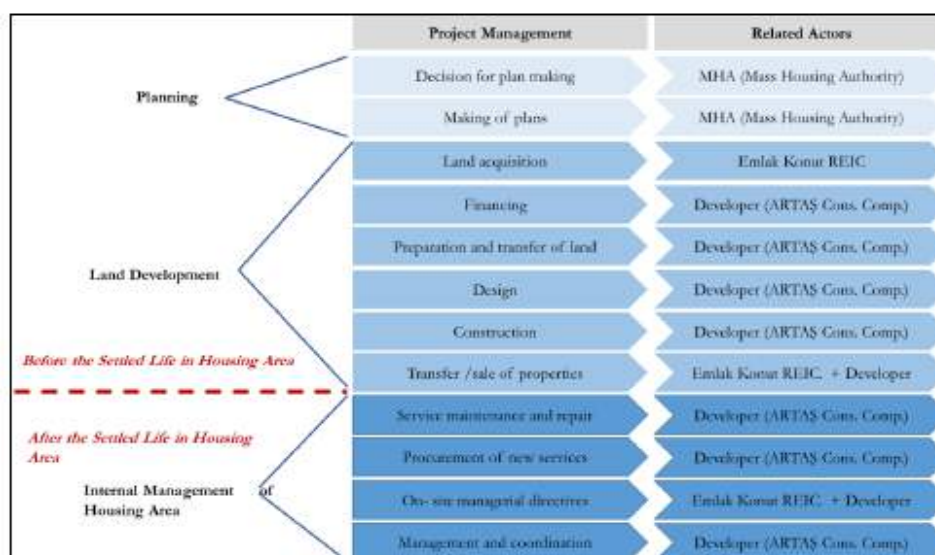

Figure- 5 Project Management Steps and Fundamental Actors

However, because development rights and construction conditions are quite unrestricted and there is no limitation concerning design, the developer is free and independent in the design process. Also, central and local governments do not intervene with the developer to regulate the type (housing, commercial, etc.) and number of functions.

Procurement of on-site services, operation of rules and managerial coordination are arrangements to preserve the existing situation and its operability, and they operate to make living conditions sustainable. And all those facilities are operated through the site management company owned by the developer.

5 CONCLUSION

The phenomenon of governance of gated communities includes several actors and processes. 'Management' of gated communities includes not only the actors inside the walls but also outsiders and the relations between. The capacities and competences of actors can change during the steps, starting with planning and progressing with internal management.

When several examples are examined, it is seen that certain management-related subjects stand out in gated community literature. The countries trying to regulate those housing areas via planning and design guidelines seem to focus on controllability of gated housing areas. On the other hand, discussing the roles of public planning authorities and the private sector on procurement of social and technical infrastructure is another aspect of governance. However, although the governance aspect of gated communities includes those issues, it is more than these. Defining the roles and tasks of actors and their relations is significant to discover operational characteristics of gated communities and to understand how self-sufficient they are.

Although there are different methods concerning land development and planning processes for housing areas, methods on which MHA is directly influential have become more frequent after the 2000s. While one of those methods is the 'revenue sharing model', it requires collaboration between MHA and the developer to some extent. While the central planning authority is active in the planning period, the developer is effective during the post-planning -more specifically on project design- period. The local government stays out of the process. Despite the fact that the central planning authority is competent on making plans, it also liberates the developer in terms of development rights and design. Whereas land preparation, construction and design steps are rather developer-centered, property sales start with

permission of the central planning authority. Because sales revenues are shared between the developer and MHA by nature of the revenue sharing model, both actors seem to be very active at this step. After the settled life starts in the housing area, the central planning authority withdraws from the process. Then the site management unit leads the next steps to preserve the sustainability of the housing area. The residents are not involved in those processes as decision makers or operators.

Accepting gated communities as administrative organizations surrounded by multilevel governmentality requires acknowledging interrelations between those areas and other management units (central or local government organs, developers, public/ semi-public/ private institutions, etc.). Even though the central planning authority is the prior actor starting and monitoring the housing development process, the developer seems to be the actualiser of the work. In fact, the central planning authority starting the process as entrepreneur and employer seems to withdraw voluntarily while the local government is passivated. Having said that, it is not entirely possible to claim that gated communities are fully independent areas having standard management structures. Other examples having different land development processes and actors may create distinctive management structures. Therefore, governance of gated communities is far beyond its boundaries.

1 HOUSING POLICIES FOR AFFORDABLE RENTALS

Cities with a growing population are faced with the challenge to offer sufficient and adequate living space to all income groups. Those with medium to high incomes and a certain financial flexibility have of course bigger prospects to choose from a wider range of available housing offers within the cities. In contrast, for inhabitants with low to medium incomes, it's getting increasingly complicated to have access to affordable rentals, since the increasing demand for housing, e.g. because of the raise of single households, leads to rising prices and to a shortage of low-cost rental apartments. Further, increasing income differences and a large influx of refugees put extra pressure on the sector.

That trend is well known to decision makers in housing policy in almost all European countries. In order to develop appropriate housing conditions for all inhabitants and to ensure equal living space conditions, housing policies are formulated on federal and state level. For instance, suppliers as well as demanders of rental apartments get support by financial subsidies like housing benefits or tax amortisations. Furthermore, the cities are requested to implement housing policies into their urban residential planning documents.

1.1 SITUATION IN GERMANY

Germany is a "county of tenants". Nearly half of the German population lives in a rented apartment. In the cities, the value is still significantly higher, reaching 79% in Munich and 78% in Heidelberg in 2011 (Bertelsmann Stiftung 2012). Only Switzerland, compared to other European countries, has a lower home ownership rate than Germany. As a result, in Germany, funding programs that provide financial support to tenants are extremely important and have a long tradition, such as the Social Housing Promotion. Already in 1950, the first housing construction law came into effect and was replaced in 1956 by the second housing construction law, which was valid with amendments until the year 2001. The Housing Promotion Act was adopted on 13.09.2001 and entered into force on 01.01.2002. In the course of the reform of the federalism, the promotion of housing became the competence of the federal states. In 2007, some federal states, such as Bavaria (BayWoFG) and Baden-Wuerttemberg (LwoFG) have issued their own housing promotion legislation. As compensation for the federal financial assistance, which was overthrown by the federalism reform, the federal states receive up to 2019 annual financial support of currently 518, 2 million euros from the state on the basis of Art. 143 c GG (BMUB 2017a). promotion of housing became the competence of the federal states. In 2007, some federal states, such as Bavaria (BayWoFG) and Baden-Wuerttemberg (LwoFG) have issued their own housing promotion legislation. As compensation for the federal financial assistance, which was overthrown by the federalism reform, the federal states receive up

to 2019 annual financial support of currently 518, 2 million euros from the state on the basis of Art. 143 c GG (BMUB 2017a).

However, the legal provisions differ both from those of the state as well as from one another, particularly with regard to the income limits for Social Housing Promotion (see table 1) (WoFG 2001; BayWoFG; L-Bank 2017).

Level	Reference	Type of household	Maximum income limit (€)
Federal level	Net income	Single person household	12 000
		Two-person household	18 000
		Every additional person	4 100
		Every additional child	500
State Level			
Baden-Württemberg (e.g. Heidelberg)	Gross income	Single person household	47 600
		Two-person household	47 600
		Three-person household	56 600
		Four-person household	65 600
		Five-person household	74 600
		Every additional person	9 000
Bavaria (e.g. Munich)	Net income	Single person household	19 000
		Two-person household	29 000
		Every additional person	6 500
		Every additional child	1 000

Table 1 – Maximum income limits for the Social Housing Promotion

All persons living in Germany are entitled to housing subsidies if they comply with the legal requirements, such as the observance of the maximum income limits (WoGG). There are no entitlements to housing subsidies for recipients of transfer payments, such as unemployment benefit or income support under. The housing subsidy is calculated based on the household income, the number of household members to be considered and the monthly rent. By means of a reform, the housing subsidy increased since January 1, 2016. For the first time, housing subsidy have also become an alternative to basic insurance for low-income households (BMUB 2017b).

According to the Federal Statistical Office, the number of people receiving housing subsidies has declined in recent years. In 2005, a total of 810,864 households received the financial support, compared to only 460,080 households in 2015. In 2010, the number of supported households reached a peak of 1,061,487. Reasons for the fluctuations to be observed are, on the one hand, the reforms that have come into force over the years and, on the other, economic trends, such as the development of the unemployment rate (Destatis 2017a). In addition to the granting of a rental subsidy, many major German cities award residential certificates. With this certificate or permission a person/household is allowed to move into a publicly subsidized apartment at a fixed rental price. These two types of funding are granted to the tenant and are tied to the person and not to the apartment. It is a so called "subject promotion".

In addition to the promotion of the subject (the person itself stands in focus of subsidies), object promotion exists. The city acquires the right to rent the apartment to a legitimate person at a fixed rent and also determines who can move into this social apartment. For this purpose, the landlord receives a financial compensation by paying the difference to the usual comparison rent. However, the number of occupancy controlled flats is currently declining in Germany. In the past two decades, few new social apartments have been built or the occupancy renewed due to unattractive funding conditions for investors. Because of the negative population forecasts in the last years, the Social Housing Promotion was not focused by the politics. New construction activities especially in the lower price segment, was not considered necessary. The number of newly built social apartments was 24,550 in 2015. According to the report of the Committee on Urban Development, Building and Housing of the Federal Government and the federal states, the number of all new built apartments increased by 10,000 in 2016 compared to 2015. In addition to the new building, a large number of modernization measures were supported by the Social Housing Promotion.

Due to the currently low interest rate level, social housing promotion is currently still very unattractive for investors. However, there are other ways to convince investors to build or rehabilitate occupational dwellings. In urban development contracts, for example, a share of subsidized housing on the total housing stock or the assumption of social infrastructure costs can be agreed. Some German large cities, including Munich (SoBoN), have developed so-called building land models, which contain specifications

and quotas which are binding for every investor in the case of a building lease (Drixler et al., 2014). In addition to income, expenditure plays a decisive role in the establishment of funding programs.

Figure 1 – Average household expenditure in Germany 2015 (Destatis 2017b)

Figure 1 shows the average household expenditure of a German household. The largest share, 35.9%, is spent on housing, energy and maintenance. Looking at the same graph for households with an average net income of 1,300 to 2,600 euros per month, the figure is 40.4% (Destatis 2017b). The lower the budget income, the higher the expenditure on housing. In contrast, the available living space decreases the lower the income is. In 2014, a low-income household lived on around 48 sqm, while a household with a medium-income had around 64 sqm, and a high-income household had a living space of around 89 sqm (BMAS 2017).

Due to the increase in refugee numbers, the situation in the large cities has become even more acute. The number of asylum applications filed in Germany has multiplied in the years 2014 to 2016. In 2013 a total of 127,023 applications for asylum were submitted, in 2014 202,834, in 2015 476,649 and in 2016 even 745,545 (BAMF 2016). All these additional people need living space. Because of the regulation, that everyone in Germany and also in Europe can decide where he or she wants to live, it is not possible to lead the development.

1.2 SWEDEN IN COMPARISON TO GERMANY

In Sweden, the quota of ownerships is with 70.6% higher than in Germany (51.9%, Statista.com 2017). The population is only a bit more than one tenth of Germany (9.8 Mio. people, Eurostat 2017), with a population density of 24.06 inhabitants per sqkm. Nearly half of the population lives in urban areas, while not less than one tenth lives in rural areas (see figure 2).

Figure 2 – Proportion of regional structure in Sweden and Germany 2015 (Statista.com 2017)

In Sweden, the quota of housing cost overburden rate is in cities 9.5% and towns and suburbs 6.5% and thus smaller than in Germany with 19.1% and 14.5% in cities and towns and suburbs, respectively.

Otherwise, the overcrowding rate is higher in Sweden than Germany: in cities, it lies at 18.7% and in towns and suburbs at 10.5% (Germany: 5.6% in both regions).

Housing prices have risen over 50% in Sweden from 2010 to 2016 (Germany less than 30% in the same period; Eurostat 2017). Summarizing it can be stated, that both countries are affected by a pressure at housing market in the cities and also in towns and suburbs.

Households with incomes above the maximum limits defined by the federal government or the federal states and thus are not entitled to a financial support or a residence permit have difficulties to find appropriate and affordable housing in many growing German and also Swedish cities. Due to the changed conditions, legal requirements at the federal and state level are no longer sufficient. The municipalities have the possibility to substantiate the specifications more precisely, to adapt them to their local conditions and to concretize them. The German promotional landscape has a long tradition and is much more differentiated than in Sweden. Particularly with regard to legal regulations at state level. One reason for this is the Federalism Reform, implemented in Germany in 2006, which enabled the federal states to have their own competencies in legislation. In contrast, in Sweden, all legal decisions are taken at the level of the federal government and thus do not permit specialization in regional peculiarities. affordable housing in many growing German and also Swedish cities. Due to the changed conditions, legal requirements at the federal and state level are no longer sufficient. The municipalities have the possibility to substantiate the specifications more precisely, to adapt them to their local conditions and to concretize them. The German promotional landscape has a long tradition and is much more differentiated than in Sweden. Particularly with regard to legal regulations at state level. One reason for this is the Federalism Reform, implemented in Germany in 2006, which enabled the federal states to have their own competencies in legislation. In contrast, in Sweden, all legal decisions are taken at the level of the federal government and thus do not permit specialization in regional peculiarities.

2 IMPLEMENTATION AND REALISATION OF AFFORDABLE HOUSING

At the moment there is also a gap in the supply of households between "poor" and "rich" in Germany and in Sweden. At this point, there is a need for action in the municipalities. A number of German and Swedish cities have already launched municipal promotion programs and have successfully applied them. Including, for example, the cities of Munich and Heidelberg in Germany, as well as the cities of Gothenburg and Stockholm in Sweden, the further course will be considered more closely. All cities have a high pressure in housing market in common. Munich is the city with highest rental and purchase prices in Germany. Heidelberg in contrast to Munich is significantly smaller, but has similar big problems providing affordable housing. The Swedish cities Stockholm and Gothenburg are chosen because of their problems within providing affordable housing, as well. Stockholm is the biggest cities and capital of Sweden, Gothenburg as second biggest city started a first pilot project for affordable housing.

2.1 THE CITIES OF MUNICH AND HEIDELBERG (GERMANY)

In the state capital of Munich, a building land decision has been taken into place in 1994, the so-called Socially Responsible Land Use (SoBoN). By means of this decision, developers and investors share the costs and burdens of municipal land-use planning and are obliged to establish a defined amount of occupancy-related housing. In addition, the city of Munich supports, with the so-called "Munich model", middle-income households as well as families with children, so that they can finance a rented apartment within the city limits. The income limits of the Bavarian Housing Promotion Act are the basis for the approval. Another communal housing construction program is the housing policy program "Wohnen in München" (Living in Munich), which is currently being updated for the sixth time and is valid until 2021. One of the focal points is, for example, raising the income limit to increase the number of eligible households to 50–60% of all households (Stadt München 2017a). A current project, which contributes to the urban development goals, pursued by the state capital Munich, is the new urban district "Prinz-Eugen-Park". On the site of the former Prince Eugene barracks, in the east of the city of Munich, a new residential quarter is going to be built on a 30-hectare site. In 2014, the planning of around 1,800 new apartments, of which 50% are publicly subsidized apartments, started. Construction began in 2017. The first inhabitants

are able to move in by 2018. In addition to the municipal housing associations GWG and Gewofag, cooperatives as well as free developers are involved in the realization (Stadt München 2017b).

The city of Heidelberg promotes, apart from the residential property and rented housing for transfer beneficiaries, rented housing for "threshold houses". This subsidy is explicitly aimed at households whose income is higher than the limits for obtaining a residence permit. The funding amounts to a maximum of two euros per square meter of living space per month. For the "Bahnstadt", a district newly built on old unused railway surfaces, a special program was approved. The main focus of the support is on young families. Rental allowances, as well as loans are granted for the formation of property. The promotion is, like the social housing promotion, also income-dependent. In addition to the "Bahnstadt", new residential districts are currently being built on formerly military surfaces, so-called conversion areas. One concept envisages providing at least 70% of the housing stock to different users and income groups at low cost. 30% of these dwellings are to be used as condominium for threshold households (Stadt Heidelberg 2017).

2.2 THE CITIES OF STOCKHOLM AND GOTHENBURG (SWEDEN)

Reaction on the pressure on housing market and rising rental and purchase price was the formulation of building new stocks. Since 2014, Sweden has the goal of constructing 250,000 new flats by 2020. Stockholm's construction aim was set to 8,000 units per year, and Gothenburg's to 3,000–5,000 units per year. That meant a doubling of construction from present levels. The goals are not accompanied with a clearly defined plan, how to achieve the aims, only rental apartments, low-cost units in particular, should be prioritized. In Gothenburg, some projects will be promoted by reduced land prices. Also, the municipal housing companies have been taught to expand construction projects in order to supply 20–30% of the planned new units (Granath Hansson 2017)

As well Stockholm as Gothenburg own nearly 70–80% of the buildable land (Caesar 2015) and thus dominate the land market. Direct allocation is the main land allocation method: The cities can choose the developer they want and negotiate the conditions with them (Caesar 2015). A lack of transparency and clear price-setting methods are assumed of limiting and distorting competition in housing development, e.g. as they might shut out small and/or new players who lack contacts and insight into the process. This process is accompanied by the fact, that the price of land is estimated by internal valuations made by city employees, so the land market is very dependent on city land policy (Granath Hansson 2017).

Neither Stockholm nor Gothenburg has a subsidy program. Beneath, non-profits are almost not existent in Sweden. Even the Swedish municipal housing companies are expected to act on market-like terms. In Gothenburg, a first social housing project has been initiated with the aim to create 25% low-rent and 25% mid-rent apartments in a new development project. No investment subsidies are provided to the mainly public developers, but incentives in the form of low land prices, high acceptable rents in the remaining 50% of units, and promises regarding construction volume have been made. The project can be seen as a pilot project (Granath Hansson 2017).

3 CONCLUSIONS

In Germany there are currently more instruments available to support and promote affordable housing than in Sweden. One reason for this is, without a doubt, the higher proportion of people living in Germany. The large number of established programs is evident at land level, and particularly at municipal level. Both object and subject support are operated, which is generally considered to be positive. Nevertheless, Germany has not yet reached an optimal status quo. In order to tackle and resolve the challenges of the "affordable housing" more quickly and in a more focused way, it is necessary to improve the awareness of the problem (in politics) and to increase the financial resources (by the federal government and the federal states). Not always desired developments and processes (on the housing market) can be smoothly controlled and regulated. Especially at the municipal level, efforts should be made to react to concrete negative developments.

On the German examples of the cities of Munich and Heidelberg, it is clear that, on the one hand, permanent instruments and programs could be established, but innovative approaches and concepts could also be highly legitimate and effective. Up to now, Sweden has only been able to draw on experience

gained from a pilot project in Gothenburg on the topic of "affordable housing" with a focus on low-income households. But here, too, new long-term insights will be gained, which can be the basis for pioneering political decisions.

For Sweden and Germany, it is noticeable that households that are most exposed to the problem of finding an affordable housing are not well-known and cannot easily be identified as an independent group of the population (in statistics). This results in a significant action (for politics and science). Only when the affected actors (households) can be clearly identified and characterized on the housing market, convincing and effective measures can be derived and applied profitably. In addition to the households, which depend largely on state aid from a financial perspective, households with low but also medium income are less and less in a position to access affordable housing. These so-called "threshold households" are described and defined differently in the literature, and can also vary widely from state to state or from municipality to municipality due to different rental price levels.

However, threshold households are indispensable for the functioning of a municipality and need to be more focused. Unfortunately, the characterization and the quantification of this group of persons represents a barrier, which has so far been difficult to overcome, since the necessary statistics on income are not, or only to a limited extent, available.

T11 | HEALTHY AND LIVEABLE CITIES

CO-CHAIRS: TIJANA DABOVIC; PIERRE LACONTE; NUNO MARQUES DA COSTA

The achievement of healthy and liveable cities is related to the development of the best practices not only on the health promotion, but also on the promotion of more inclusive cities. Urban problems such as: social and economic exclusion, poor air quality, traffic congestion, waste production, industrial emissions etc. faced by elected officials and urban managers are marked by strong social and territorial disparities as result of a multidimensional set of factors. In this context, public health policy changed from a focus on the disease to a more holistic and, at same time, territorialized perspective.

Since 1986, when the World Health Organization launched the Healthy Cities movement, policy and planning for healthy cities was centred on urban poverty, inclusion, participatory governance, as well as on social, economic and environment determinants of health.

In the more recent period, the increasing concern about creating healthier and more liveable cities in the political agenda is grounded on a sense of urgency and an ever more participative intervention and demands of different stakeholders. Policy actions and spatial interventions in areas like urban mobility, climate change, urban regeneration, resource use, health care, waste management, food systems, social inclusion or economic development, among others, are efforts that generally contribute to some effective improvements. EU is strongly supporting these actions and initiatives, especially integrative and innovative solutions in urban planning, technology, food systems and transportation through different formal and informal agreements, institutions and projects funding. However, the issue is also of contextual nature and strongly rooted in the values of particular city dwellers and economic actors and their capacity to change mind-sets and behaviour regarding urban production, consumption and living in general. It is believed that contextualising and building a long-term common purpose and co-responsibility among different stakeholders in pluralistic arenas will enable evolution of incremental improvements to a systematic change. In this aspect, the Track strongly relates to the Congress' theme: Spaces of Dialog for Places of Dignity: Fostering the European Dimension of Planning.

Finally, we encourage the presentation of papers focused on the discussion and presentation of initiatives and best practices for promoting and improving health and livability in our cities. We would also like to invite academics and practitioners to share critical and constructive, as well as normative and contextual perspectives about the extent of their possible replicability.

ID 1359 | THE RIGHT PATH TO HEALTH: THE WALKABILITY OF A EUROPEAN MEDIUM SIZED CITY CALLED GUIMARÃES

ABSTRACT: The relationship between the act of walking and city space has been over the years object of numerous approaches both by academics and researchers. Nowadays there is an increase in empirical research, above all from areas such as public health, urban planning and transportation, that results from the application of measurement instruments both of the built environment (BE) and of walking, understood here as a form of physical activity (PA) with recognised benefits for health. The exploration of the BE-PA relationship is based on validated instruments that seek to clarify this equation. Developed in countries like USA, Canada or Australia these are less common in the European context. This paper intends to demonstrate that the combined use of information resulting from spatial audits and population surveys are important tools in the planning of proximity of medium sized cities like the case study, Guimarães, thus incorporating the human dimension in the planning process as advocated by Jan Gehl. The measurement instruments developed in recent years are diversified, containing objective and subjective measures. This research was based on the following BE audit tools: the Systematic Pedestrian and Cycling Environmental Scan; the Analytic Audit Tool; the Irvine-Minnesota Inventory; the Measurement Instrument for Urban Design Qualities; the Pedestrian Environment Data Scan; and the Microscale Audit of Pedestrian Streetscapes; incorporating too, the urban elements referred by Gehl. Despite the study aim focus on the development and confirmation of objective measures, two subjective tools were observed: the Neighborhood Environment Walkability Scale because is the most used internationally; and the Assessing Levels of Physical Activity for being that developed for the evaluation of environments for PA in Europe. In these studies, PA is usually measured using internationally validated questionnaires, such as the International Physical Activity Questionnaire (IPAQ). Thus, after identifying the city areas according to their degree of walkability, assessment tools of the variables to be explored were applied. So, a new audit tool was developed having as reference the above mentioned ones, Gehl theories, and the urban context found. With regards the inhabitants survey, PA evaluation questions were based on IPAQ, being reformulated to better understanding by respondents. Given the relatively small scale of the city of Guimarães respondents were asked to indicate on a map appended to the survey the routes they made to six utilitarian destinations and six leisure destinations in order to assess both transportation and leisure walking. The routes made by the subjects were mapped and correct destinations identified, being that, their features were evaluated according to the items of the developed audit tool. The assessments were made using CAD surveys, orthophotomaps, Google Street View and by direct observation through site visits. The developed audit tool presents itself as an instrument that can be easily replicated in similar contexts. Data collected allow the analysis of the correlation between spatial variables, reported walking levels and health indicators, thus identifying the elements that have the greatest relevance in this equation.

KEYWORDS: built environment; physical activity; health; spatial audit tool; inhabitant survey.

1 INTRODUCTION

Population's health has been from long an important issue for urban planners. Since epidemiological evidences relating sedentary lifestyles with an increase in non-communicable diseases, i.e. chronic diseases, appeared in the 70's and 80's of the 20th century, that physical activity (PA) and its relationship with the built environment (BE) has become a subject for different areas of knowledge such as, urban planning, transportation, public health or exercise science and physical activity (Sallis et al. 2004).

Walking, being a moderate form of PA, can help tackle one of the most burdensome problems in today's society if included in people's daily activities. So, in recent years, and informed by the BE-PA research, the walking environment has regained interest, walkability research became pertinent and urban design theories have been enlightened by scientific evidences. So, measurement instruments of both walking and

the BE appeared as valuable tools of evidence-based urban planning and, to some extent, determinant means of a conscious city healthy plan.

One of the European countries where physical inactivity is more worrisome is Portugal; 64% of Portuguese never exercise and 55% who said that had walked for at least 10 continuous minutes in the last 7 days reported having walked in total 30 minutes or less (EC, 2014). Thus, a high percentage of the Portuguese population do not accomplish the recommended levels of daily PA. Despite that, a huge effort has been made in the last decades by Portuguese municipalities to improve walkability conditions in urban areas. So, it is relevant to understand if, to higher levels of urban quality and walkability conditions correspond, better health behaviours.

In what regards the case study, it is important to know if a municipality like Guimarães, recognised as an example of good urban design practices, shows an increase in the overall walking habits and consequently in the health of its inhabitants. Therefore, this paper refers to an evidence-based research carried out in this social and urban context where, to measure PA levels and BE influences, multidisciplinary assessment methods were developed. Its main objective is to clarify what are the most relevant elements of the BE that affect PA levels, if the macro-scale features, as has been recognised in the literature, or, if instead, the streetscape elements appear as having more weight. Being its main purpose to produce evidences that inform the design and planning of healthy urban environments.

2 BACKGROUND

Assessment methods of BE and PA are important instruments on the planning process of healthy urban environments. The most commonly used instruments are those derived from subjective evaluations either from BE or from PA assessed by questionnaires. Objective measures of the BE, can be derived from spatial audits or result from the insertion of large amounts of data (e.g. census data) into Geographic Information Systems (GIS) (Brownson et al. 2009); whereas those from PA, come from detailed measures from pedometer, accelerometer, among others, being GPS also used to relate behaviour with environment, being sometimes, the information collected, also inserted into GIS.

Subjective assessed BE elements can range from land-use-mix or aesthetic to safety from crime and traffic (Brownson et al. 2009). Objectively assessed features inserted in GIS are mainly the three components of walkability indexes or the 3D's, density, diversity and design, that is residential density, land-use-mix and street connectivity, being distance to transit and destination accessibility less frequent (Cervero and Kockelman, 1997; Ewing and Cervero, 2010). Also considered as objective are the ones resulting from spatial audits, despite that, some of them, depend on individual evaluations from the technicians that perform the audit, being considered as subjective, like e.g. the feeling of safety or the pleasurable character of the environment towards walking (Brownson et al. 2009). The most common audited elements are those from the streetscape like, number of elements of street furniture, trees and lightening, land uses (i.e. commercial, residential), sidewalk coverage, street maintenance, existence of public spaces and recreational facilities, safety from traffic and crime, architecture and aesthetic appeal, among others (Brownson et al. 2009). Less measured are e.g. the numbers of people per street segment, level of noise, existence of dogs nearby, among others (Brownson et al. 2009).

There are several international validated instruments to assess the BE for PA. Those that are subjective are e.g. the Neighborhood Environment Walkability Scale (NEWS) (Saelens et al. 2003) or the Assessing Levels of Physical Activity (ALPHA) (Spittaels et al. 2009). Instruments that objectively assess the BE can be, at a larger scale, the GIS, and at a smaller scale, several audit tools as e.g.: the Systematic Pedestrian and Cycling Environmental Scan (SPACES) (Pikora et al. 2002); the Analytic Audit Tool (AAT) (Brownson et al. 2004); the most long the Irvine-Minnesota Inventory (IMI) (Boarnet et al. 2006); the one that attributes greater importance to the perceptual qualities of urban design the Measurement Instrument for Urban Design Qualities (MIUDQ) (Ewing et al. 2006); the pragmatic Pedestrian Environment Data Scan (PEDS) (Clifton et al. 2006); and the most recent and the one that embodies critically the features of the precedents the Microscale Audit of Pedestrian Streetscapes (MAPS) (Millstein et al. 2013).

In these studies, PA is usually classified by different domains, like: transportation walking, leisure walking or total walking; transportation cycling, leisure cycling or total cycling; active transportation (AT), being considered as walking and cycling for transportation; Moderate-to-Vigorous Physical Activity (MVPA);

Leisure-Time Physical Activity, among others. The International Physical Activity Questionnaire (IPAQ) (Booth, 2000) is one of the most used assessment documents for the PA internationally.

More recently, also in use, are mobile phones apps. These tools allow to geo-reference in space and in real-time PA. Access to social networking platforms like those from e.g. MapMyRun (Adlakha et al. 2014) or MapMyFitness (Hirsch et al. 2014) are also important tools, these provide large amounts of information on PA habits, permitting to revise the behaviour and relate it to the physical context. Another tool in use is the SenseCam, this is a wearable camera that each individual can transport, which permits to collect and contextualise e.g. AT of subjects (Oliver et al. 2013). Although these tools present considerable advantages, there is still a lot of difficulties in analysing the large amounts of data resulting from this kind of approaches.

GIS assessments rely on data previously collected and audits are made by in loco assessment or through Google Street View, since this has been validated as a reliable instrument for auditing streets environments (Rundle et al. 2011). Subjective assessments either from the BE or from PA are made by online, mail, telephone or face-to-face interviews. The use, in a study, of tools that generate objective measures of the BE and subjective measures of PA, has been considered as the ones that produce statistically the stronger associations, this is due to the fact that, when the BE is measured objectively less assessment errors are made, and when the PA is reported its different domains are better dissociated from each other (Ding et al. 2011). This is the case of the study here presented.

3 METHODS

First, we computed a GIS walkability map (developed elsewhere) to assess the macro-scale urban features (i.e. intersection density, slope, residential density, and land-use-mix) of the all county, city centre and centre parishes. The composed map results from the application of the equation: $walkability = [(2 \times \text{intersection density}) + (2 \times \text{slope}) + (\text{residential density}) + (\text{land-use-mix})] / 6$. We chose 8 neighbourhoods to be studied, 4 that present a high walkability level and 4 with a low walkability level. Then, through literature search on the instruments that seek to measure the BE for PA and the PA itself, we made a critical analysis of the ones most used internationally, related them to Jan Gehl's urban theories and observed the social and urban context of the case study, to developed two instruments that clarify the reality found and could enlighten the BE-PA relationship at the micro-scale level.

Although this research focus on the development and confirmation of objective measure, two subjective instruments were observed, the NEWS which was developed by Saelens et al. (2003) and the ALPHA build up by Spittaels et al. (2009). The NEWS, because it is the most used internationally and the ALPHA, because it is the one used for evaluations of BEs for PA in the European context.

The NEWS evaluates resident perception regarding the neighbourhood BE related to PA namely: residential density; land-use-mix; access to services; street connectivity; quality and presence of places to walk or cycle; neighbourhood character or aesthetics (i.e. presence of trees, shade, litter, views, interesting things to look at like buildings and natural sights); safety from crime and traffic; and general neighbourhood satisfaction (Saelens et al. 2003).

The ALPHA has a similar structure to the prior, the NEWS, assessing: residential density; access to local facilities; quality and presence of places to walk or cycle; safety from crime and traffic; neighbourhood pleasantness for walk and/or cycle; street connectivity; and home, work and school environment (Spittaels et al. 2009). This tool focus both on the walking but also on the cycling environment which is an activity with more expression in Europe than in the USA, Canada or Australia (where the NEWS is more applied) and has as an advantage the fact that, in addition to neighbourhood assessment, includes the home, school and workplace environment to. These two tools allows to compare results across countries with similar urban morphologies being widely applicable to large sets of population once they rely only on telephone or internet surveys.

As Brownson et al. (2009) stated, audit tools are the most interesting instruments to assess the quality, appearance and sensations of a particular environment, since they rely on direct observation and their results can be easily translated into urban design directives. So, in addition to the subjective instruments referred, the NEWS and the ALPHA, several objective tools were compared, so the most used and

operationalised audit instruments reviewed were the above mentioned ones, the SPACES, the AAT, the IMI, the MIUDQ, the PEDS, and the MAPS. The choice lies in these, because they represent a complete sampling of what it is most used in this research field.

The SPACES was developed having as reference the Australian context and it is organised in four sections: the type of buildings/features; the walking and cycling paths; the street assessment; and the overall assessment (Pikora et al. 2002). It is a short and practical direct observation instrument that was designed to assess the road and its surroundings (Pikora et al. 2002; Lee and Talen, 2014).

The AAT assess land use environment, transportation environment, facilities, aesthetics, signage, and the social environment (Brownson et al. 2004). Including more items than SPACES was however developed to be easily applied in the field, being the average time spent per street segment of around ten minutes (Day, 2007). The AAT is specially adapted to capture information on BE features related to the transportation environment and land uses (Brownson et al. 2004).

The IMI is the most long containing 162 items, which are categorised into different groups: accessibility; pleasurability; perceived safety from traffic; and perceived safety from crime (Day, 2007). It is the most detailed and permits the evaluation of both macro- and micro-scale BE features allowing to assess e.g. the street pattern of an entire area or the detailed scale of a street environment (Lee and Talen, 2014, p.373).

As Lee and Talen (2014) postulate, quantitative measures tend to omit qualitative factors. There is where the MIUDQ audit tool fits. Based upon human behaviour research and on the work of urban design theorists like, Camillo Sitte, Kevin Lynch, Gordon Cullen, Jane Jacobs, Christopher Alexander, Jan Gehl, William H. Whyte, Amos Rapoport and others, the MIUDQ measures the levels of five qualities of space: imageability; visual enclosure; human scale; transparency; and complexity (Ewing et al. 2006). It seeks to measure subjective qualities of spaces through an objective method.

The PEDS was created for the United States reality and is based on the SPACES. The elements that are measured are grouped in the following: environment; pedestrian facility; road attributes; and walking and cycling environment (Clifton et al. 2006). It was developed to measure the physical environments, natural and built, related to walking (Clifton et al. 2006).

The MAPS (Millstein et al. 2013), and because it is more recent, tries to include both the teachings from urban design theories and the scientific evidence resulting from the application of the referred audit tools. It is based on the AAT and it measures: street design; transit stops; sidewalk qualities; street crossing amenities; and features impacting aesthetics (Cain et al. 2014). It was created to fill a gap in the literature, being appropriated to the measurement of the micro-scale features, measures considered as less explored than macro-scale ones. The MAPS include a short version, the MAPS mini version, with only 15 items.

Thus, we have: the identical SPACES and PEDS, easy to apply tools with reduced number of items; the AAT and the MAPS that assess similar features like land uses and transport related elements, being the last constructed having as reference the first; the IMI that includes the major number of items considered as the most complete; and the MIUDQ that seek to quantify the qualitative aspects of the urban design of street environments.

As stated, besides of the critical analyses of the referred audit tools, Jan Gehl's urban theories were also considered in order to compute the new assessment instrument. Jan Gehl in his book, "Cities for People" (2010), says: "A city that invites people to walk must by definition have a reasonably cohesive structure that offers short walking distances, attractive public spaces and a variation of urban functions" (Gehl, 2010, p.6); which can be translated into some parameters like, good density, high street connectivity, being aesthetically appealing and pleasant (i.e. beautiful architecture, presence of public art, existence of interesting urban furniture, having different things to look at, well design details, views, among others) and a mixed land use. Another of his postulates, is the importance given to the human dimension, which to him, is a key element of a good city planning (Gehl, 2010). Thus, the author points as important factors when planning a human scaled urban space, safety, protection, reasonable dimensions, urban furniture and visual quality (Gehl, 2010). Translating this to measurable features we have, traffic and crime safety (i.e. number of traffic signs and number of street lamps), elements that protect from climate conditions like trees and on-street shadings, dimension of different elements, street furniture and aesthetics. The author points also as deterrents of walking small sidewalk width, level of hindrance (i.e. number of elements at the sidewalk that function like opponents, disturbing walking activities), and time spent at crossings (Gehl,

2010, p.91), which were also included in the new audit being the last, measured by the existence or not of a walking sign at crossings. The author further advocates that there is no topic with greater importance to cities life than active, open and lively edges, with buildings that produce short units with many doors and carefully design details at the ground-floor level (Gehl, 2010, p.88). So, from this it can also be taken another lesson which can be included as some measurable feature like: number of doors, percentage of façade with greater transparency, and aesthetics. The author also points as important the number of people observed, level of noise, existence of places to sit and open views (Gehl, 2010). Whereas that in the case study some of the above mentioned features like, crime rate or level of noise were not determinant, and once the city in question does not present high levels of them, being not alarming, these were not included. In what concern the number of people per street, this was not included as one of the features because, it is beyond the scope of the case study here presented. Places to sit and existence of open views were also included. Many other things could be extracted from Jan Gehl's urban lively places theories but, as Zook et al. allege, there is a difference between places and features that support walking and those that lead to a sense of urban liveliness (Zook et al. 2012, p.216).

In addition, the urban context of the place to be studied is of great relevance when constructing a specific audit tool. Guimarães is a city located in the northwest of Continental Portugal that belongs to the Ave region, has an area of 240,955 km² of which 2,6 km² are green areas, with a population of about 158 124 inhabitants dispersed by 48 parishes being its population density of 656 inhabitants per km² (CMG, 2017). The district is characterised by having a small centre and periphery with intense urbanisation and diffuse industrialisation developed along the valleys, road and rail system (Domingues, 2006). Its historical centre has been classified as Cultural Heritage of Humanity in 2001, the city was European Capital of Culture in 2012 and European City of Sport in 2013, because of that, along the years, many improvements in its streets, public spaces and buildings have been made both in the city centre and in the periphery, but in this last area much is still to be done. Thus, the city of Guimarães can be characterised as, having a centre relatively small, with streets and public places of great interest, its spaces can be characterised as presenting human scale, with outskirts with low levels of urban design quality, bad accesses and lack of basic infrastructures like sidewalks. So, the developed audit tool should be able to assess areas with diverse urban qualities, and above all, that are related to the propensity to walk.

Beyond space, the behaviour must be assessed to, in order to relate it with the features of the physical environment. The most commonly used instrument to assess different domains and levels of PA is the IPAQ (Booth, 2000). So, and in what concerns the inhabitant survey, the IPAQ questions were criticised and reformulated to better understanding by subjects. The IPAQ questions that were rewrite were those used to measure transportation walking, leisure walking and MVPA, leisure and work related (for more details on the IPAQ see, telephone and self-administer, long and short version in Booth, 2000). The inhabitant's surveys is also structured to collect information about socio-demographic variables, physical inactivity related diseases, subjects evaluation about Guimarães spaces and its qualities to contain walking, and routes made to six utilitarian and six leisure destinations by having a map appended to the questionnaire form.

4 RESULTS

The developed audit instrument, is divided in three parts, street segments, crossings and geographical area, is characterised as being short and practical and widely applicable, has its roots in the most recent audit tools, in the urban design theories and on the context of a specific environment which is typical of settlements from the diffuse urbanisation of the European countries, and its items, disposed by six groups which are, land use, sidewalks, traffic, structures and natural elements, distinctive architecture and public art, physical disqualification, and crossings, are these; 1) percentage of buildings per street segment with active uses at the ground-floor level; 2) percentage of street segment with sidewalk; 3) width of the major part of the sidewalk; 4) percentage of sidewalk damaged per street segment (or that has no sidewalk) 5) percentage of hindrance per street segment (or that has no sidewalk) 6) percentage of street segment that is covered by trees, awnings, or built structures; 7) how many lighting elements are present; 8) how many benches or other places to seat exists (including bus stops benches); 9) how many doors are present; 10) how many elements of urban furniture are present (including planter boxes); 11) what is the average height of buildings in this side of the sidewalk; 12) how many transit stops are present; 13) how many elements of traffic control are there (such as signs, traffic lights, on-street bumps); 14) the street is predominantly of three, two, one, or zero traffic lanes (pedestrian); 15) how many open views do you

observe for each side of the segment; 16) how many public spaces are present (e.g. parks, squares, gardens); 17) how many street trees are present; 18) how many public art elements are present; 19) percentage of distinctive buildings (distinctive, cultural or historical buildings, and landmarks); 20) what is the proportion of street segment that has windows on the ground-floor within a 15 meter of the sidewalk (or the street if there is no sidewalk); 21) what is the percentage of buildings and outdoor spaces that are not well maintained (e.g. presence of vacant lots, abandoned buildings, garbage, graffiti, broken windows, abandoned cars et al.); 22) how many pedestrian walk signals are present; 23) how many crosswalks are present; 24) how many sidewalk ramps are present. There are also seven items that assess the macro level features of the area in which the subjects lives that are: 25) walkability classification; 26) connectivity classification; 27) slope classification; 28) land-use-mix classification; 29) residential density classification; 30) number of street segments by routes; 31) number of crossings by routes. Thus, in total the audit tool has 31 items.

In what regards the inhabitants survey the questions proposed are: 1) do you walk during the week for at least 10 continuous minutes; 2) In the days that you walk, how many days of the week did you walk for transportation purpose (e.g. to do errands, go to work or school, go shopping, ...), and how many days of the week do you walk for leisure; 3) how much time did you spent walking for transportation purpose; 4) how much time did you spent walking for leisure purpose; 5) how many days of a week did you practice physical activity or any activity that makes you sweat or increase your heart rate (e.g. playing any sport, dance, take care of the garden, do the housework, carry heavy weights) for at least 10 continuous minutes (please do not include walking); 6) in the days that you practice those activities how many time did you spent per day; 7) in Guimarães where did you walk most frequently; 8) do you go by foot to any of these destinations. Can you indicate the route that you make on the map; 9) which place do you like the most to walk in Guimarães, and why; 10) do you usually walk in another city, where and why; 11) what is your weight and height; 12) gender; 13) what is your professional status; 14) what is your education level; 15) do you have any of these diseases; 16) what is your age. Attached to the questions listed above the tool has also an appendix, an A3 map of the all city centre and its periphery neighbourhoods (the areas chosen according to their degree of walkability classified as high walkable or low walkable). The possible answers to the above questions are: 1) yes/no; 2) days per week for transport/days per week for leisure; 3) hours and minutes; 4) hours and minutes; 5) days per week; 6) hours and minutes; 7) neighbourhood/city centre/public park/other; 8) multiple answer school/work/supermarket/ grocery store/ market/pharmacy/... and other, and park/square/garden/gymnasium/coffee shop/restaurant/... and other; 9) free answer; 10) free answer; 11) meters/kg; 12) male/female; 13) employed/unemployed/retired/domestic/student; 14) basic/secondary/superior; 15) diabetes/ cardiovascular disease/dyslipidemia/osteoporosis/cancer/depression/other; 16) number of years. Thus, the questionnaire has 16 questions from which, two are open questions and two others are made in order to permit to geo-reference the subject's routes.

The two instruments are useful tools to assess both the BE and PA levels. Data from the two assessment tools allows the statistical analysis of the association between dependent variables (transportation walking, leisure walking, and MVPA) and independent variables e.g. those from the BE. The instruments presented have been applied to the field and the average time spent was of about 10 minutes for each. The spatial audit tool was developed in order that the assessments could be made through the computer, thus saving work time by sparing in loco visits, being possible to make the assessments at any time in any place. The units of analysis are the segment and the crossing, as is the case of the former. The inhabitant's questionnaire was developed to be appropriated to be applied in face-to-face interviews.

5 DISCUSSION AND CONCLUSIONS

It is widely accepted in this research field the use of validated instruments, above all, to permit the international comparison of results, but, the assessment tools available were not adaptable to the social and urban reality found. This is due to the fact that the majority of the existent instruments are developed in countries with social context and urban morphologies very different from the ones of the European reality of medium sized cities.

The assessment instruments constructed have their roots in urban design, transportation, urban planning, public health and physical activity research. The one that assess the BE, tries to include the most relevant elements of the walking environment of a medium sized European city. The questionnaire, seek to gather

the most important information on PA habits, behaviours, personal characteristics and opinions, in a quick toll that is easily applicable in a face-to-face interview.

The one that assess the space is influenced, above all, by the MAPS because, being this, the most recent, it contains the teachings of the former. Objectively assess the BE features instead of subjectively as is the case with the NEWS and the ALPHA, it is not so long as the IMI, it is oriented to assess the walking environment not having elements of the cycling one, like is the case of the SPACES and PEDS, because this behaviour does not have greater expression in Guimarães, it was attributed more relevance to aesthetic features than in the case of the AAT, it include some of the features that compose the MIUDQ, like percentage of ground-floor transparency, without including it in a subjective class or group, and does not include so few information like the MAPS mini version, or so many, like the case of the full version of the MAPS, allowing to develop a research without having to have a very large sample of subjects to make the statistical analysis possible and strong. Thus, the developed audit tool must meet the criterion of a short instrument in order to be possible to statistically analyse a sample of subjects not too big. The questionnaire critically evaluates the most used PA assessment tool, the IPAQ, proposing new and more easily to understand questions, assessing to, personal characteristics, behaviours, and opinions.

As the main purpose of the study is to assess the macro- and micro-scale features that affect PA levels, and as previously a walkability map was constructed and the macro features were already evaluated, the spatial audit tool proposed is ideal to assess the micro-scale elements of the streetscape. Thus, this is composed by elements of the previous audit tools referred, from some resulting from Gehl's urban theories and from the analysis of the urban context found. We search to gather in one small tool the fundamental elements of the street environment, adapting it to the urban reality of the European medium sized cities, that is why e.g. some urban forms, typical from North America, like the cul-de-sac are not present, as is the case of the MAPS.

We search to construct a small tool that includes items that can be easily assessed through the combined use of instruments like CAD surveys, orthophotomaps, and Google Street View, so it could be easily applicable. Thus, the developed audit tool is widely applicable and relevant, being small and practical in what to the field work might concern. The inhabitants survey allows the statistical analyses of the expected associations of BE and socio-demographic variables as well as those related to health i.e. PA levels, BMI and reported diseases. Thus, walkability was measured at different scales and its results were compared with behaviour and health outcomes. Through this analysis we can highlight what are the most relevant BE features of healthy urban environments if the macro- or the micro-scale as Cain et al. (2014) advocate. For a better and faster application, a tablet version with an interactive map should be developed.

Assessment methods of BE-PA equation are relevant instruments to the planning process of healthy urban places, through the developed audit tool and questionnaire we can assess the most important micro-scale urban features and related them with macro-scale ones, the behaviour and health of an entire population.

ACKNOWLEDGEMENTS

This research was financed by Fundação para a Ciência e a Tecnologia (FCT) through the PhD grant SFRH/BD/76311/2011. This work was developed with the total support of CERIS (Civil Engineering Research and Innovation for Sustainability) from Instituto Superior Técnico, Lisbon University. We also like to thank to Guimarães municipality for making available the required data.

1 INTRODUCTION

The spatial distribution of public amenities and the spatial access to them has been a constant focus in geographical research for decades (Smoey-Tomic et al., 2004). The government of China recognize the significance meaning of public health, the outline of the national fitness programme (2011-2015) (General Administration of Sport of China, 2011) was proposed. During the 5 years from 2011 to 2015, enormous Chinese citizen took participate in daily physical activities, however the quantity of space for physical activities always cannot meet citizen's needs. Accessibility to physical fitness facilities have received a growing attention as a public health concern in China.

There is another fact that the aging has become a more and more serious global society issue, the relevant research has pointed out that China's population of older adults might constitute a larger proportion than youngsters. They estimated that the 60-64yrs group will become the largest portion of population in 2050 and the 60 age and older might be the highest proportion of population in 2100 (Banister et al., 2010, as cited in Zhang et al., 2012). According to the national fitness report of China (General Administration of Sport of China, 2013), the aging group is the prime group who take participate in daily physical activities. Research has shown that adequate physical activities can be beneficial to older adults' health and relevant results have already showed that regular physical activity could reduce hospital admission and the mortality in chronic obstructive pulmonary disease to a certain degree (Garcia-Aymerich et al., 2006). In order to keep both mentally and physically health, it is important for older adults to do daily physical activities properly. For those older adults who live in winter cities, long and extreme cold temperature poses a major barrier to participate in daily physical activities. Poor accessibility to physical fitness facilities may lead to the decrease of frequency for older adults in winter cities. Considering this situation, the accessibility to physical fitness facilities may play an important role to keep good health of older adults in winter cities in both developing country and developed country.

Zhou et al. (2008) summarized that "spatial accessibility is a vital index in the relevant research on healthcare (Wang & Luo, 2005), job access (Wang, 2001; Wang & Monor, 2003), transport (Pooler, 1995), location analysis (Ying et al., 2006) and so on". However, there is a limitation on research related to spatial disparities by taking older adults as subjects in winter cities.

2 DATA AND METHODS

In this research, Nangang district of Harbin was taken as an object to assess the accessibility of physical fitness facilities for older adults who took part in daily physical activities. Nangang district is the most representative area of Harbin and Harbin is a typical winter city of China.

2.1 DATA

According to the equation of the two-step floating catchment area method, the data collecting was divided into 3 parts including the supply, the demand and the measurement of travel distance (Song et al., 2013). In this research, the supply part was represented by the area with physical fitness facilities, while the older adults who have the biggest potential to take part in daily physical activity stood for the demand part. The travel distance measurement was implemented by Network Analyst of GIS 10.1 from the participant's home of older adults to the physical fitness facilities.

2.1.1 THE SUPPLY: PHYSICAL FITNESS FACILITIES

A total number of 551 areas with physical fitness facilities in Harbin has been investigated by the Harbin administration of Sport. In this investigation, Harbin administration of Sport has showed the statistic with details, they provided the most accurate and comprehensive source of the specific numbers of area with physical fitness facilities and their location in every subdistrict in 2015. In Nangang district which was the main object of this research, there were 278 areas with physical fitness facilities in this district, it can be seen that physical fitness facilities are clustered in the Nangang District (Figure 1). To well understand spatial distribution of physical fitness facilities for older adults in Nangang district of Harbin, currently each area with physical fitness facilities was geocoded in GIS 10.1. Nearest subdistrict index was calculated and density of physical fitness facilities was mapped by the implementation of kernel density estimation (Figure 5). Results of these analysis are reported below.

2.1.2 THE DEMAND: POTENTIAL OLDER ADULTS WHO TOOK PARTICIPATE IN PA IN WINTER

The study focuses on the Nangang district of Harbin which is the most important district in Harbin, the area is 116km² with the total population of 1.27 million inhabitants. Important government agencies, organizations, CBD are gathering in Nangang district. It is also the district with the longest history in Harbin. Nangang district was divided into 18 subdistrict (Figure 2). There are no more data for a smaller scale because subdistrict is the minimum research unit for demographic data, subdistrict was taken as the research unit in this study. Based on the data from the Sixth Population Census of China (the most recent census), the population of age over 60 is 235280 with the percentage of 18.54% and the population of age over 65 is 156520 with the percentage of 12.33%. Considering the definition of aging society by UNESCO, the issue of aging society becomes increasingly pressing.

To obtain more details about the demand, self-administrated questionnaires were applied in order to acquire basic information of older adults doing daily physical activity in the winter of winter cities in detail. 400 participants with 272 valid questionnaires were accomplished online. According to the result of self-administrated questionnaire, young elderly whose age in 60-69 has the biggest potential to take part in the daily physical activity in winter among the older adults, with the percentage of 68.75%. In this research, young elderly (age in 60-69) was taken as the object for this research to represent the older adults group. The density of older adults who took part in daily activity in each catchment area varies differently (Figure 7).

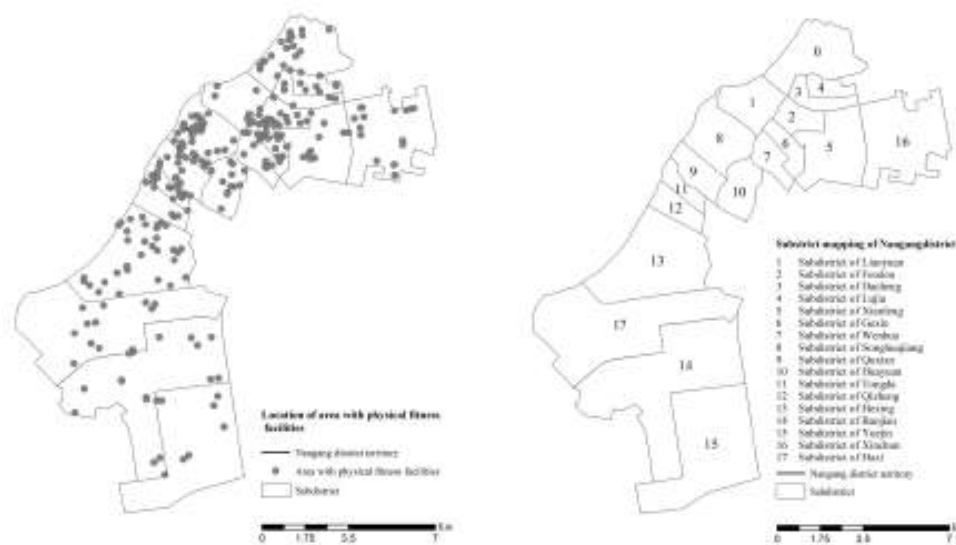

Figure 1 - Location of area with physical fitness facilities Figure 2 - Subdistricts of Nangang

2.1.3 MEASURING TRAVEL DISTANCE

One of the most important parameters in spatial accessibility is the measuring of distance between the supply and the demand locations(Ngui & Vanasse, 2012). Measures including counting the number of facilities contained within census tract (Luo, 2004) to computing the number of facilities inside a given Euclidean or travel-time distance of demand location(Apparicio et al., 2008; Lovett et al., 2002) has already been implemented in GIS. In this research, based on the function of Network analyst of Geological Information System (GIS), Origination Destination was applied to measure the shortest travel distance(Radke & Mu, 2000) considering the scale of data resource. By using this analyst, the travel distance is measured based on the road system of city which can provide more accurate distance from participants' home to areas with physical fitness facilities. The road system of Nangang district is download by the Baidu Map form the internet (Baidu Map is the most accurate internet map of China). According to the results of questionnaires, since older adults mostly prefer walking time less than 15minutes, 3 thresholds of travel distance(time) were selected based on the walking speed of young elderly with 83.7m/min (Bohannon, 1997), which were distance of 5-minute, 10-minute and 15-minute walking distance.

2.2 METHODS

In this research, self-administrated questionnaire and two-step floating catchment area method were both implemented in order to assess the spatial accessibility of areas with physical fitness facilities.

2.2.1 SELF- ADMINISTRATED QUESTIONNAIRE

This self-administrated questionnaire was accomplished online from 2016.12.7 to 2017.1.17, there were a total accumulation of 400 questionnaires to 272 valid samples were collected with the 68% effective rate. Self-administrated questionnaire was generally used in health and health services' investigation(Bowling, n.d.,2001). Self-administrated questionnaire was applied in this research because self-administrated questionnaire could get more subjective responses than interview or other method of questionnaire in order to avoid exaggerated positive results in research of health-related questions like quality of life, engaging in behaviours and activities and so on(Presser & Stinson, 1998; Tourangeau et al., 1997; Vuillemin et al., 2000; Weinberger et al., 1996). In addition, doing selfadministrated questionnaire online can provide a more convenient access for interviewees to accomplish the questionnaire at any location in any time. In this research, self- administrated questionnaires were accomplished with the purpose of finding which group of older adults have the biggest potential of joining in daily physical activities and what characters of PA behaviors they have in the winter of the winter city. Since this study was focused on the

older adults of winter city, all interviewees were chosen in areas with physical fitness facilities of Nangang district randomly with the age over 60. Questions in the questionnaire were focused on acquiring basic information like where and when they chose to do daily PA, what is the average frequency and the time span of daily PA. The maximum length of time span from home to an area with physical fitness facilities by specific mode of transportation which is one of the most important parameters of the 2SFCA method was also collected. In addition, the disparity of PA behaviors' seasonal characters, especially in summer and winter was considered.

2.2.2 TWO-STEP FLOATING CATCHMENT AREA METHOD

The spatial distribution of public amenities within cities and the access to these amenities have been a central focus in much geographical research (Smoey-Tomic, 2004). Assessing the spatial accessibility is vital to the allocation of public infrastructure. The government generally take spatial accessibility as one of the prime principles of public service distribution. Quantitative measures of evaluating spatial accessibility has been applied, including buffer zone method, minimum distance method, travel cost method(TCM). In this study, 2SFCA method was implemented because it need to take both the supply and the demand into consideration. In this research, 18 subdistrict was taken as the research object combining with the population of older adults who have the biggest potential to be participants of daily PA.

The first step, searching all population of locations k (demand location k) for each area with physical fitness facilities j within the threshold of travel time d0 from the catchment area j (area with physical fitness facilities j). Summing up R j which is the supply-to-demand ratio within this catchment area(Radke & Mu, 2000):

$$R_j = \frac{S_j}{\sum_{k \in \{dk | f \leq d_0\}} D_k}$$

For the next step, searching each area with physical fitness facilities j (supply locations j) for each demand location i within the threshold of travel time form location i and summing up the supply-todemand ratio R j at those locations to obtain the accessibility A0 1 at demand location i (Radke & Mu, 2000) :

$$A_i^F = \sum_{\{dj | f \leq d_0\}} R_j = \sum_{j \in \{dj | f \leq d_0\}} \frac{S_j}{\sum_{k \in \{dk | f \leq d_0\}} D_k}$$

3 RESULTS

According to the data collected by the Harbin administration of Sport and the field research by us, in this research, the physical fitness facilities of Nangang not only include facilities for people doing sports, but also areas providing space for local citizen doing daily physical activities. In order to optimize the research, all physical fitness facilities are divided in to 3 modes' space based on their opening degree of locations which including: 1) space in neighborhood; 2) space in public space; 3) space in campus. The distribution of three modes of physical fitness facilities is shown in the figure 3.

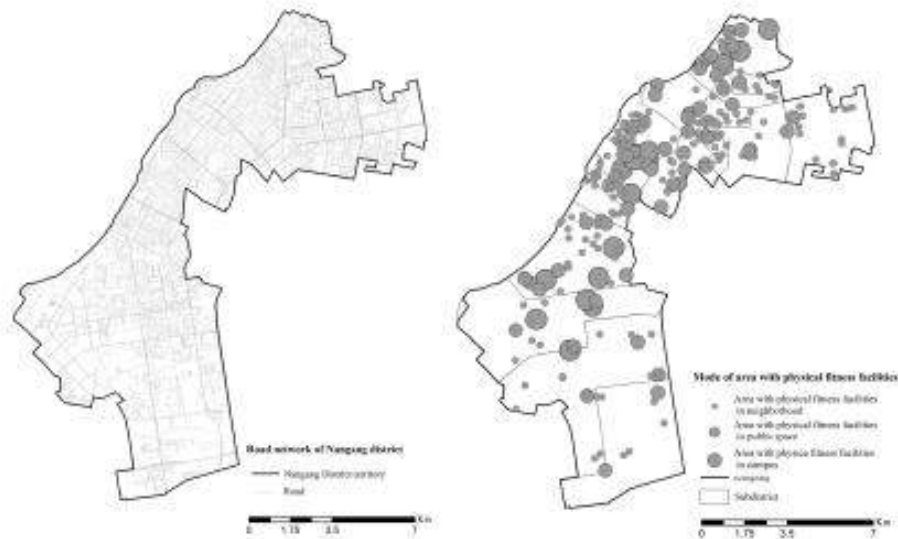

Figure 3 - Road network of Nangang district Figure 4 – Mode of area with physical fitness facilities

3.1 RESULTS OF SELF- ADMINISTRATED QUESTIONNAIRE

6 results were found from the self-administrated report on the physical activity behavior in winter of younger older adults in winter cities: 1) older adults whose age was between 60-69 had the largest proportion of people who insist doing daily PA, which means young elderly was the group of older adults who has the biggest potential to take participate in daily PA; 2) most older adults keep doing PA in winter although winter cities' temperature in winter is extremely low, with a 24-hour average in January of only -18.4°C (-1.1°F) (Harbin Municipal Government, 2011); 3) the frequency of doing PA in winter is lower than that in summer, although young elderly insists on doing PA in winter, 23% respondents have a lower frequency in doing PA in winter than summer; 4) the time span of doing PA one time in winter is shorter than that in summer, within a percentage of 9% respondents spent less time on doing PA in winter than that in summer; 5) older adults have a tendency to choose a nearer place to do PA especially in winter, statistic showed that 6% older adults prefer a homenearer place to do PA, while the distance from home to area with physical fitness facilities seem not so much important in summer than that in winter; 6) for older adults, 15-min walking distance from home to area with physical fitness facilities are the maximum length of time that can be tolerated which has the largest proportion of respondents.

3.2 RESULTS OF ACCESSIBILITY SCORE BY IMPLEMENTED 2SFCA METHOD

By computing and evaluating the spatial accessibility index at the time of walking in 5 minutes, 10minutes, 15minutes. Our results show that significant difference of accessibility exists in each subdistrict. Within 5 minutes, the spatial accessibility score range from 0 to 0.067. Within the time of 10 minutes, the score of spatial accessibility ranges from 0 to 0.308. When walking-time increasing into 15 minutes, the accessibility score ranges from 0.018 to 0.713. Accessibility scores were calculated to show that evident spatial disparities exist in the research area (Figure 5).

Figure 5-1-Accessibility score at 5-min

Figure5-2- Accessibility score at 10-min

Figure 5-3- Accessibility score at 15-min

Figure 5 - Accessibility distribution within the threshold of 5-min, 10-min, 15-min

4 DISCUSSIONS

Based on the result of self-administrated report, 15-min walking distance is the maximum length of time for older adults walking from home to area with physical fitness facilities in winter in Harbin. In this research, 5-min, 10min, 15min were taken as the threshold and 2SFCA Mode was applied to assess the spatial accessibility of an area with physical fitness facilities. The accessibility score was defined in 5 levels which were “lower”, within the score range from .00 to .06, “low”, within the score range from .06 to .15, “moderate”, within the score range from .15 to .31, “high”, within the score range from .31 to .7, “higher”, within the score range from .7 to 2.7. Three facts were discovered in the research.

4.1 THE ACCESSIBILITY SCORE WAS LOW IN GENERAL IN THE WALKING TIME OF 5 MINUTES

Results in the figure 5 showed that spatial accessibility disparity vary greatly. Within the threshold of 5-min walking time, the accessibility of an area with physical fitness facilities in Harbin is low in general. There was 8 out of 18 subdistricts was at the out of catchment area with the accessibility score of 0. 1 of 18 subdistricts had an accessibility level of “low”, the other 9 subdistricts had an accessibility score of level of “lower”. As the growing of threshold, the accessibility score grows as whole. The area without catchment

has decreased into 2 subdistricts and the accessibility score of level “moderate” has increase into 4 subdistricts. There is no out of catchment area when the threshold increasing into 15 minutes. One subdistrict has an accessibility level of “higher”, 7 subdistricts has an accessibility level of “high”, 2 subdistricts has an accessibility level of “moderate”, only 2 subdistricts is left with the accessibility level of “lower”. According to the self-administrated, the maximum length of time from home to area with physical fitness facilities to do daily PA is 30min. From the Table 1, the growing tendency is evident that all accessibility score grow within the threshold grows from 5minutes to 30minutes. Even though the spatial accessibility score grows with the threshold, considering the situation that older adults prefer to choose a nearer place to do daily physical fitness facilities in winter, the spatial accessibility for older adults is still quite low. There is a fact that the allocation of amenities is irrational.

Table 1 - Growing tendency of accessibility score

4.2 THE CITY CENTER HAS HIGHER SPATIAL ACCESSIBILITY OF PHYSICAL FITNESS FACILITIES THAN OTHER DISTRICTS

From the Figure 5, it is clearly that the allocation of areas with physical fitness facilities was not even. The center of the city has the higher accessibility of physical fitness facilities than other districts. There is a tendency that the accessibility of an area with physical fitness facilities decreased from center to two sides gradually.

In Figure 5-3, 4 subdistricts have a higher level of spatial accessibility was shown and all these 4 subdistricts are in the center of city. It is obvious that city center has higher accessibility of transportation and higher density of road network, which make older adults get easier access to the city center to take participate into daily physical activities than other parts of city. Another fact is that most city events and

activities happens in the city center since there are more amenities in city center than other parts of the city, which make daily physical fitness activities happens much easier and make city center has a higher density of physical fitness facilities than other part of the city (Figure 6). Considering the equation of 2SFCA method, 3 factors can affect the results which are population, location demand and the measurement of travel distance (time). The matching of population supply and the location demand is more rational in these 4 subdistricts. Comparing with Figure7, these 5 subdistricts who have higher spatial accessibility all have a moderate number of older adults' population.

Figure 6 - Kernel density of area with physical fitness facilities

4.3 MISMATCHING BETWEEN THE PHYSICAL FITNESS FACILITIES ACCESSIBILITY AND THE POPULATION OF OLDER ADULTS

Based on population data from the Sixth Population Census and by Arc GIS 10.1, the density of young elderly (60-69) was showed in Figure 7. The cluster range from shallow to dark means the density from low to high. In order to optimized the research process, we divided the density into 5 levels, which are “lower”, “low”, “moderate”, “high”, “higher”.

Figure 7 - Density map of young elderly

Figure 8 - total population of young elderly

Comparing the density map (Figure 7) of young elderly with the accessibility assessment within the index of 15 minutes (Figure 5-3), the subdistrict that has the highest density of young elderly does not have the highest level of spatial accessibility. The other 4 subdistricts who have the better level of spatial accessibility all have a moderate density of young elderly. On the other hand, those subdistricts with lower accessibility always within a lower density of young elderly. This mismatching phenomenon exists in 17 of 18 subdistricts with a percentage of 94.5%.

From the view of the total amount of young elderly population, the mismatching between the total population of young elderly with spatial accessibility is more evident (Figure 8). The accessibility score for 3 subdistricts with highest quantities of young elderly were in the level of moderate and low. 6 subdistricts have better quantities of young elderly have a spatial accessibility at a level low and level lower. At the same time, those subdistricts with higher accessibility of physical fitness facilities all within a moderate or low quantities of young elderly. That's also prove the mismatching phenomenon between accessibility and population, which means the uneven spatial distribution of amenities exists in Nangang district of Harbin.

5 CONCLUSIONS

Access to physical fitness facilities will continue to be the focus of attention among those contentious issues in developing countries in the next decades. It is necessary to implement methodological methods of analysis in order to determine where is the proper location for areas with physical fitness facilities and other facilities or amenities, aiding in planning of amenities allocation in a more rational way. Our research has implemented the application of the 2SFCA method in order to demonstrated the phenomenon of the uneven distribution of areas with physical fitness facilities in Nangang district of Harbin by three facts from the results of the assessment, which including the spatial accessibility in each subdistricts vary greatly from each other, city center has a better accessibility of physical fitness facilities than other parts of city and the mismatching phenomenon exist between the accessibility of physical fitness facilities and the older adults' population of each subdistricts. However, although 2SFCA method was testified that it can estimate the areas with accessibility of physical fitness facilities, more optimized method could be used to have more precise estimation on spatial accessibility in a more detailed resource. More detailed results could be discovered if there was more detailed data of the supply and the demand at the same time. Although it has limitation, this research is also a good example in the integration of GIS approached to the assessment of city amenities spatial accessibility.

ABSTRACT: The literature has highlighted the association between social and economic determinants and physical and mental health. Several studies have stated that the positive correlation between socioeconomic status and health is different between countries and welfare states in Europe. On the other, the current financial crisis might have modified this relationship. Due to all the above, the aims of this research are to analyse the relationships between self-perceived health status and socioeconomic variables in Europe at NUTS 2 level (European regional statistical unit) focusing on the influence of the spatial factor during the financial crisis. Taking into account the focus on spatial effects, the analysis includes the continental regions and the closest ones, removing from the analysis the remote and far regions in order to assess the geographic influence. Moreover, in order to consider spatial relationships between regions, this research combines simple linear, spatial lag, spatial error and geographically weighted regressions. The analysis has related to the health status with macroeconomic indicators (income of households by inhabitant, GDP per capita in PPS and unemployment rate), social indicators (tertiary education rate and at-risk-of-poverty rate), and health indicators (crude death rate, hospital beds rate, life expectancy and medical doctor rate) during 2008-2014. Four models for each year have been designed using classical and spatial regression methods. The models show that self-perceived health is explained significantly by unemployment, risk of poverty, tertiary education and medical doctor rates for 2008, 2010 and 2014. In addition, life expectancy, hospital beds and death rates show collinearity worsening the models. Finally, the results support the objective of the research: the regression models improve when the geographical location and distance between analysis units are considered. Missing data and the lack of other interesting socioeconomic variables at regional level together with the ecological fallacy are the main limitations of this study. The results support the existence of contextual effects among European regions that varies the association between socioeconomic measures and health status throughout the time. The findings also points out the relevance of social context in explaining the differences in individuals' states of health. Thus, the spatial analysis have stated that the macroeconomic

indicators do not explain significantly the self-perceived health status in contrast to the social indicators during the financial crisis.

1 INTRODUCTION

The literature has highlighted the association between social and economic determinants and physical and mental health (Angner, Ray, Saag, & Allison, 2009; Bartley, Sacker, & Clarke, 2004; Wilkinson & Marmot, 2003). Several studies have stated that the positive correlation between socioeconomic status and health is different between countries and welfare states in Europe (Adams, 2003; Alvarez-Galvez, 2016; Alvarez-Galvez et al., 2013; Alvarez-Galvez, Rodero-Cosano, García-Alonso, & Salvador-Carulla, 2014; Eikemo, Bambra, Judge, & Ringdal, 2008; Frijters, Haisken-DeNew, & Shields, 2005). Income inequalities within countries could harm the self-perceived health status (Costa-Font & Hernández-Quevedo, 2012, p.; Nummela, Sulander, Heinonen, & Uutela, 2007; Wilkinson, 1996, 1997). In Europe, research has been focused on analysing this relationship, obtaining different and, sometime, unexpected findings (Fritzell, Nermo, & Lundberg, 2004; Grossman, 2000; Smith, 2004). Therefore, including income as explanatory variable is a necessary but not sufficient to disentangling the diversity and complexity of other social dimension that could also lead to these inequalities (Marmot, 2010).

In general, little attention has been paid to those social determinants that could have a direct impact on the well-being and health of populations. Álvarez-Galvez et al. (2013) compared the relationship between three different measures of socioeconomic status (income, education and occupational status) and the self-perceived health status for a sample of European countries during the period 2002-2008. They found that differences in self-perceived health in Scandinavian countries and Anglo-Saxon countries exhibits a higher relationship with economic dimensions (income and occupational status), whereas southern and eastern countries these differences are linked to educational differences. For example, in Spain, the universal access to a public health system has led to less difference in self-perceived health despite the rising income inequalities during financial crisis. On the other hand, occupational status and education gain in importance in a country with over-qualified workers that do not have working conditions with the pay levels in line with their educational attainment (Allen & Velden, 2001; Chevalier, 2003).

Therefore, to get a better understanding of the effects of crisis on self-perceived health status is necessary to include economic as well as social dimension. Moreover, all these variables should be studied within their spatial framework. Enriching studies in such a way allows a better applicability of public policies, improving the detection of those areas where shortage are discovered (García-Alonso, Pérez-Naranjo, & Fernández-Caballero, 2011) and the implementation of concrete actions. In addition, the range of variable selected to study the relationship with self-perceived health status can be enlarged (García-Alonso, Salvador-Carulla, Negrín-Hernández, & Moreno-Küstner, 2010; Moreno-Küstner, García-Alonso, Negrín Hernández, Torres-González, & Salvador-Carulla, 2008; Prieto-Lara & Ocaña-Riola, 2010).

Due to all the above, the aim of this research is to analyse the relationships between self-perceived health status and socioeconomic variables in Europe at NUTS 2 level (European regional statistical unit) focusing on the influence of the spatial factor during the financial crisis.

2 SCOPE OF STUDY AND METHOD

The analysis has related to the health status with macroeconomic indicators (income of households by inhabitant, GDP per capita in PPS and unemployment rate), social indicators (tertiary education rate and at-risk-of-poverty rate), and health indicators (crude death rate, hospital beds rate, life expectancy and medical doctor rate) during 2008-2014. Once analysed the multicollinearity, some of the independent variables had to be eliminated, that is, income of households by inhabitant, GDP per capita in PPS, crude death rate, hospital beds rate and life expectancy, remaining as risk factors the unemployment rate, tertiary education rate and at-risk-of-poverty rate medical doctor rate in study. We analyse different geographic areas that allow us to assess the global effect of the crisis at the level of European regions (NUT2), whose data are available in Eurostat and in the European Social Survey. Taking into account the focus on spatial effects, the analysis includes the continental regions and the closest ones, removing from the analysis the remote and far regions in order to assess the geographic influence.

Moreover, in order to consider spatial relationships between regions, this research combines simple linear, spatial lag, spatial error and geographically weighted regressions. The simple regression analysis finds a linear relationship between a dependent variable and a set of explanatory variables, by minimizing the sum of squared prediction errors, hence, least squares. The analysis assumes the errors have a normal distribution with mean of zero, homoscedastic and uncorrelated. When the variables has spatial correlated, these assumptions may not always meet. Thus, it is necessary to resort to other methods. To be able to introduce the spatial dependence there are two distinct ways: as an additional regressor in the form of a spatially lagged dependent variable or in the error structure. The spatial lag model is appropriate when the focus of interest is the assessment of the existence and strength of spatial interaction. Spatial error model is appropriate when the concern is with correcting for the potentially biasing influence of the spatial autocorrelation, due to the use of spatial data (Anselin, 2001). Finally, Geographically Weighted Regression (GWR) is other of several spatial regression techniques. This provides a local model of the variable or process you are trying to understand/predict by fitting a regression equation to every feature in the dataset. GWR constructs these separate equations by incorporating the dependent and explanatory variables of features falling within the bandwidth of each target feature.

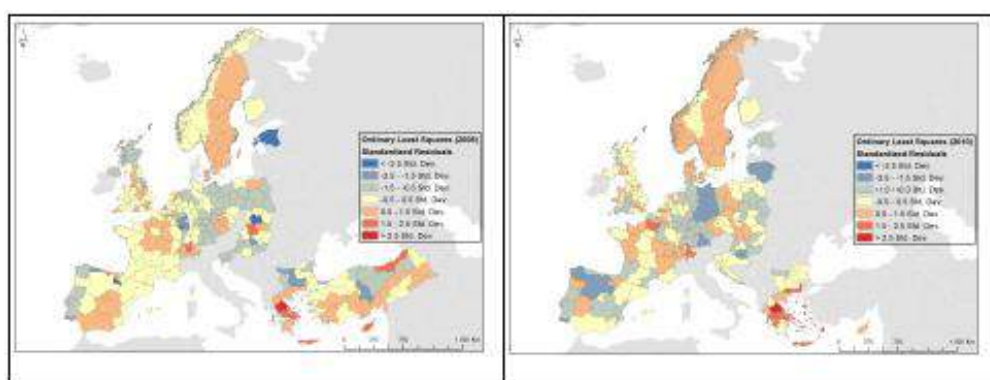

3 RESULTS AND DISCUSS

The results of OLS regression are shown in Table 1. During the whole period 2002-2008, it can been observed that the greater the educational level, the greater the self-perceived health status. Just the opposite happens with the relationship between unemployment and self-perceived health status. In addition, the relationship between deprivation and self-perceived health status gets worse along the period.

Variable	β Coefficient 2008	β Coefficient 2010	β Coefficient 2012	β Coefficient 2014
Constant	3.40***	3.28***	3.59***	3.79***
Unemployment	-0.03***	-0.01***	-0.00	-0.01**
Risk-of-poverty	0.02***	0.01***	-0.00	-0.01**
Tertiary education	0.01***	0.01***	0.01***	0.01***
Medical doctor	0.00*	0.00*	0.00	0.00***

Table 1 – β Coefficient of the OLS Regression
Source: Authors' elaboration.

Maps in Figure 1 show that self-perceived health status got worse across many European countries, especially for year 2012. Northern and Mediterranean areas exhibit the lowest values for the variable.

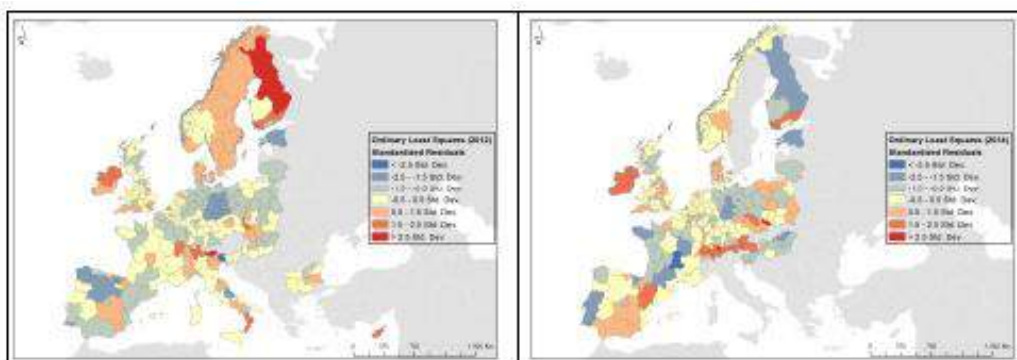

Figure 1 – Ordinary Least Square Regression 2008-2014. Source: Authors' elaboration

Focusing on SLR results (Table 2), similar but smoothed pattern than in the previous one can be observed. Tertiary studies and unemployment are significant along the whole period of study, this is an expected but weaker behaviour. On the other hand, the values for the lag variable indicates that this type of regression could not be appropriate for the study.

Variable	β Coefficient 2008	β Coefficient 2010	β Coefficient 2012	β Coefficient 2014
Health-lag	0.37*	0.8***	0.56***	-0.01
Constant	2.00***	0.40	1.46**	3.84***
Unemployment	-0.02***	-0.00	-0.00	-0.01**
Risk-of-poverty	0.01***	0.01**	-0.00	0.01**
Tertiary education	0.01***	0.01***	0.01***	0.01***
Medical doctor	0.00**	0.00	0.00	-0.00***

Table 2 – β Coefficient of the Spatial Lag Regression
Source: Authors' elaboration.

Maps in Figure 2 allow us to identify the smoothed effects in the decrease of self-perceived health status. This could indicate that effect of crisis on self-perceived health status appears lagged in the time, that is, the worst results appears since 2014.

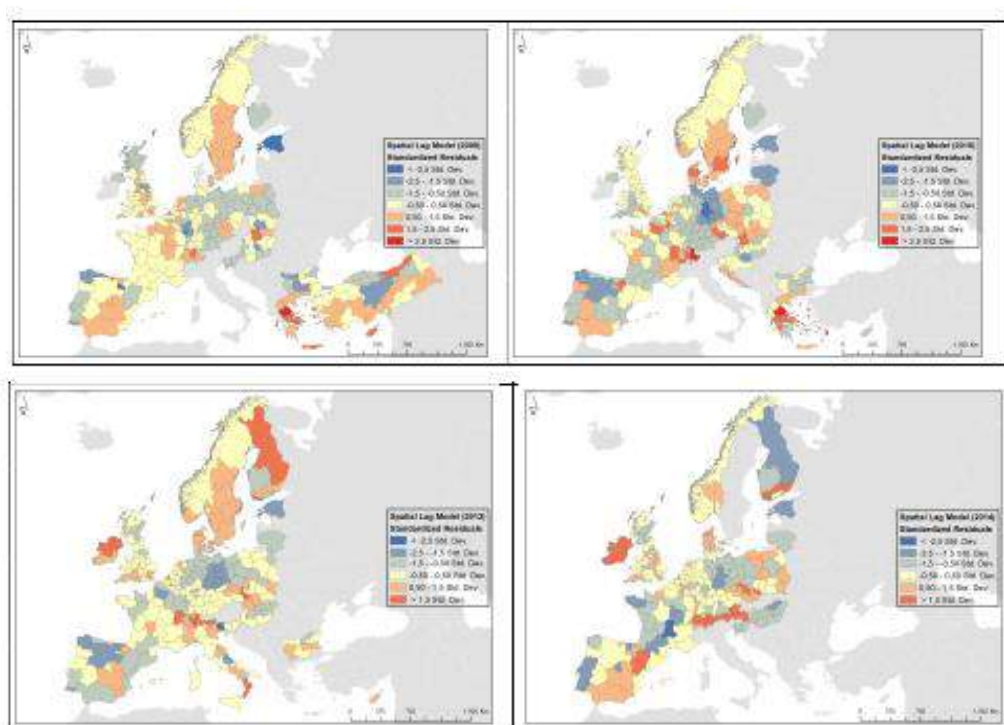

Figure 2–Spatial Lag Regression 2008-2014

Table 3 shows the result for SER. As in the previous analyses, education exerts a positive influence on self-perceived health status, which has remained more or less constant during the period, whereas unemployment and deprivation exhibits a negative influence, rising over the years, especially in 2014. In this occasion the medical doctor per inhabitant does not appear to have any influence on the explanatory variable, as in the cases mentioned above.

Variable	β Coefficient 2008	β Coefficient 2010	β Coefficient 2012	β Coefficient 2014
Constant	3.41***	3.51***	3.63***	3.78***
Unemployment	-0.02***	0.00	-0.00	-0.01*
Risk-of-poverty	0.01***	0.00	-0.00	-0.01**
Tertiary education	0.01***	0.01***	0.01***	0.01***
Medical doctor	0.00*	-0.00	-0.00	0.00*
Lambda	0.79***	0.85***	0.57**	0.15

Table 3 – β Coefficient of the Spatial Error Regression
Source: Authors' elaboration.

Maps 3 shows that self-perceived health status was worse in the Mediterranean area at the beginnings of the period of study. As time goes by, this situation spread among the remaining European regions. The worst situation is reached at the end of the period.

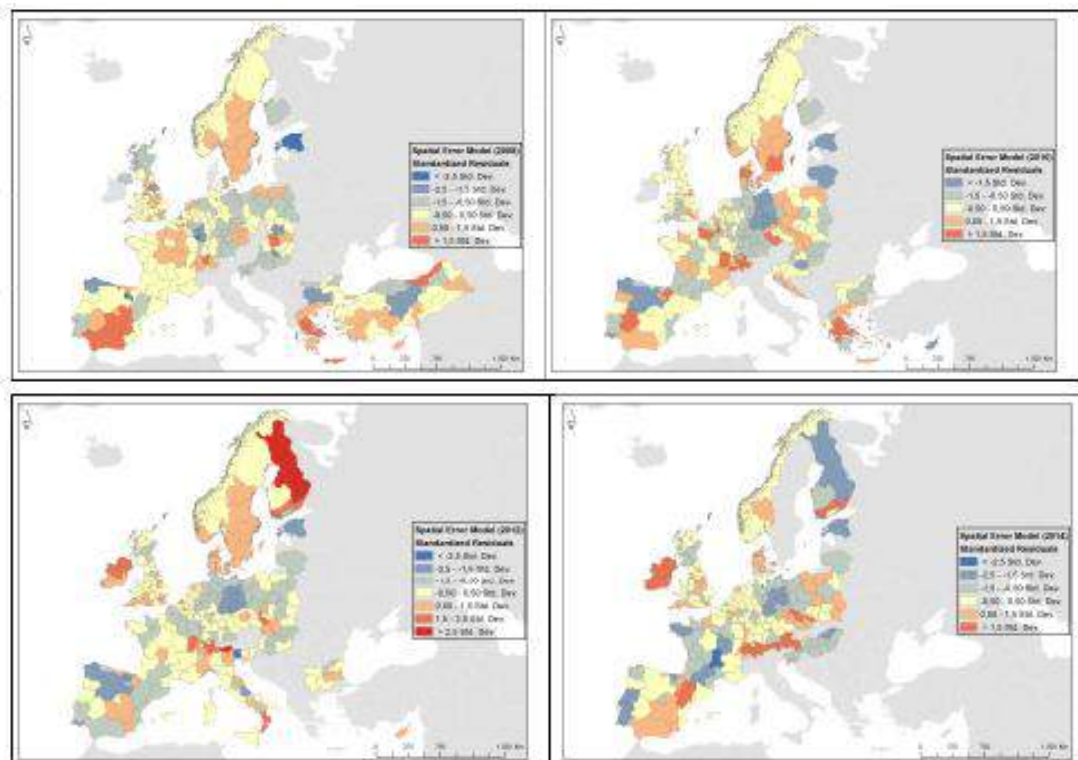

Figure 3–Spatial Error Regression 2008-2014. Source: Authors' elaboration.

Finally, the results for GWR (Table 4) indicates that the most parsimonious model amongst all the years correspond to 2012. This result is the same as in the three previous models, but the explained variability is slightly lower.

GWR	2008	2010	2012	2014
Residual Squares	5.70	4.90	7.10	4.89
Sigma	0.16	0.16	0.18	0.16
AIC	-193.94	-182.60	-135.62	-162.79
R ²	0.52	0.57	0.43	0.46
R ² Adjusted	0.48	0.51	0.39	0.41

Table 4 – Statistics GWR
Source: Authors' elaboration.

Although maps in Figure 4 shows a situation quite similar to the previous one, the GWR model fits better the relationship among the explanatory variables and the self-perceived health status.

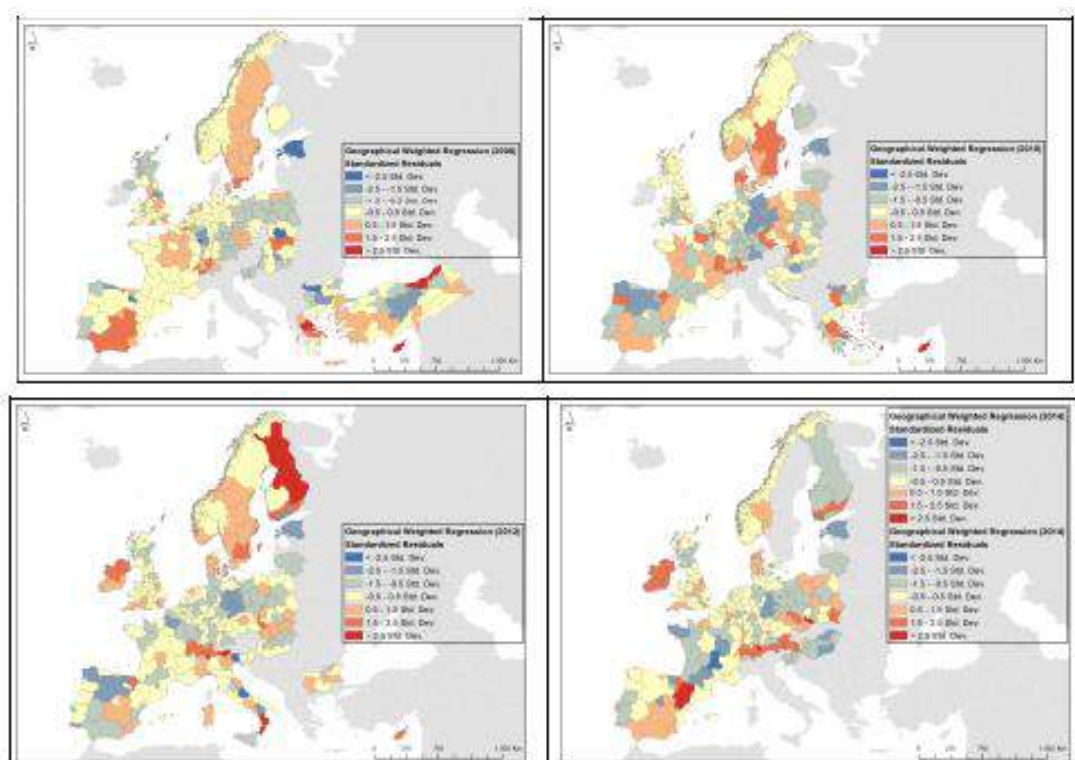

Figure 4– Geographically Weighted Regression 2008-2014. Source: Authors' elaboration.

After comparing the four models, it can be concluded that those techniques that taking into account the spatial factor seem to be more suitable to study the relationship between self-perceived health status and the selected explanatory variables, especially the GWR model. In general, all the explanatory variables has a slight effect on self-perceived health status, with the exception of the number of doctor per inhabitant that do does not exert any effect. Education has a positive and constant effect for the whole period, whereas unemployment and deprivation has a negative effect, which gets worse over the years, especially during the last part of the period. Finally, we can state that self-perceived health status gets worse over the years, reaching a peak in 2014. The lagged effects of crisis on the health can explain this. Even so, it should be noted that these effects are moderate since the variations of self-perceived health status is quite slight or non-significant.

4 CONCLUSION

Missing data and the lack of other interesting socioeconomic variables at regional level together with the ecological fallacy are the main limitations of this study. The results support the existence of contextual effects among European regions that varies the association between socioeconomic measures and health status throughout the time. The findings also points out the relevance of social context in explaining the

differences in individuals' states of health. Thus, the spatial analysis have stated that the macroeconomic indicators do not explain significantly self-perceived health status in contrast to the social indicators during the financial crisis. However, the results for 2012 are contradictory and need further analysis.

ID 1489 | URBAN GREEN SPACE AND THEIR IMPACTS ON PHYSICAL ACTIVITY LEVELS OF OLDER PEOPLE: EXPLORING APPROPRIATE METHODOLOGIES

Ruibing Kou¹; Geraint Ellis²

¹Queen's University Belfast; ²g.ellis@qub.ac.uk
rkou01@qub.ac.uk; g.ellis@qub.ac.uk

1 INTRODUCTION

Extended life expectancy and the decrease in the birth rate have led to a global concern of population ageing (Garin et al., 2014) and is resulting in increasing pressures on public health expenditure. Evidence has shown that physical inactivity among older adults is associated with higher mortality, morbidity and an increased burden of non-communicable diseases (NCDs) worldwide (Adams et al., 2014; Arango et al., 2013; Woodcock et al., 2011). Although regular physical activity (PA) brings health benefits, there are high levels of physical inactivity within the general population. Worldwide, 31.1% adults are physical inactive (Hallal et al., 2012), in terms of older adults (aged 60 years and above) the proportion meeting physical activity guidelines ranged from 2.4 to 83.0% in a review of fifty three studies (Sun et al., 2013). In Europe, it was found that 60–70% of older adults fail to meet physical activity guidelines (Eurobarometer, 2010). Low levels of physical activity of older adults is clearly a very substantial public health challenge.

There is a growing body of research that examines the relationship between the built environment and physical activity (Handy et al., 2002; Nagel et al., 2008; Rech et al., 2012). It is widely recognized that physical activity is affected by a wide variety of built environment-related attributes, including street connectivity, residential density, land-use mix (Clifton et al., 2009; Lawrence D. Frank et al., 2005) as well as sidewalks, trails, recreational facilities, parks (Ferdinand et al., 2012), traffic density and speed, crime and safety and so on. (Ferdinand et al., 2012; Prezza et al., 2001). Besides, Physical activity can be categorized into four domains, including transportation, recreation, household and occupation, and each of these are influenced by different aspects of the built environment. For example, PA in the household and occupation domains appears to be less related to the relationships with the built environment (Van Cauwenberg et al., 2011), but transport and recreation offer key opportunities for interventions to promote health. This is critical for older adults who are more likely to suffer from a decrease in physical functions, and thus they are more vulnerable to be impacted by built environment barriers towards PA (Forsyth et al., 2009; Rantakokko et al., 2009). However, there is limited research focused on this specific demographic group (Van Cauwenberg et al., 2011; Cunningham and Michael, 2004). Therefore, it is imperative to enhance our understanding on the relationship between the built environment and physical activity, to

identify opportunities to improve the physical activity levels of older adults, as a strategy to help reduce in social and health care.

The built environment is a very broad and complex concept, among all environmental settings, urban green space (UGS) appears to play a prominent role in facilitating PA. UGS is defined as “all publicly owned and publicly accessible open space with a high degree of cover by vegetation, e.g., parks, woodlands, nature areas, and other green space within the city boundary” (Schipperijn et al., 2013, page 110). UGS provides important settings for physical activity at low cost, especially for leisure-time activities like walking and cycling (Veitch et al., 2012), and for generating wider psychological, physiological, social and economic benefits (Hunter et al., 2015; Veitch et al., 2014). The availability and accessibility of UGS appear to be closely related to increased levels of physical activity (Hunter et al., 2015; Schipperijn et al., 2013), which offers important opportunities to improve the physical activity levels of older adults. Recent studies show that higher levels of physical activity are frequently related to urban green attributes, including proximity (Kaczynski et al., 2009, 2014), size and design features (Kaczynski et al., 2008), walking/cycling paths, wooded areas, open spaces, water features, lighting, pleasant views, bike racks, parking lots, and playgrounds (Schipperijn et al., 2013). However, there are still inconsistencies in this research field. For example, a research by Hillsdon et al. (2006) has found no significant relationship between access to urban green space and physical activity in recreational physical activity domains, contrary to some other studies. In another review of sixty papers, discrepancies existed cross studies addressing the relationship between greenspace and obesity-related health issues (Lachowycz and Jones, 2011). A combination of conceptual and methodological issues may help explain for the mixed results among studies (Koohsari et al., 2015).

The fact that most research has been undertaken in the US and Australia (Hunter et al., 2015), may also explain some anomalies, so it is important to conduct further research in other parts of the world. Different countries may vary in urban morphology, street layout, population density, climates and socioeconomic status. Thus, research results and recommendations for the US or Australian cities may not be directly adapted to other contexts, such as European cities nor any other developed countries (Schipperijn et al., 2013).

Furthermore, a large body of research showed that the usage of urban green space engaged with physical activity is less desirable (Cohen et al., 2010; Edwards et al., 2015; Lackey and Kaczynski, 2009; Veitch et al., 2015). Most research is also cross-sectional and observational. Therefore, there is a need for further studies to identify the relationship between urban green space and physical activity, for older adults in European contexts and for this to be used to develop more effective strategies and recommendations to policy-makers, and other stakeholders.

This work examines this issue by focusing on the special role of urban green space and by reviewing the different methodologies that can be used to understand built environment influences on older people's PA. To do this, we first review the ways of measuring PA in older adults, this is followed by considering the role of urban green space and finally suggests a research design for exploring this issue, using a case study from Belfast in the UK.

2 A REVIEW OF CURRENT METHODOLOGICAL APPROACHES

2.1 MEASUREMENTS OF PHYSICAL ACTIVITY LEVELS

A key element in evaluating built environment influence on PA is to gather accurate data on PA itself. Physical activity can be measured through a wide variety of methods, including self-report questionnaires, activity dairies, heart rate monitors, accelerometers, pedometers, and doubly labeled water (Prince et al., 2008; Sallis and Saelens, 2000; Sirard and Pate, 2001; Troiano et al., 2008). Indeed, there is a much greater body of research that has focused on children, adolescent and adults (Armstrong and Welsman, 2006; Baquet et al., 2007; Kohl et al., 2000; Sirard and Pate, 2001; Trost et al., 2000, 2002; Welk et al., 2000), compared to those over 60 years. Therefore, identifying reliable and validated measurements of physical activity for older people requires further evaluation.

2.1.1 SELF-REPORT MEASURES OF PHYSICAL ACTIVITY

Self-reporting is defined as self-administered or interviewer-administered questionnaires, activity logs or diaries, and for young children, proxy reports (Sallis and Saelens, 2000). Self-report measures are widely used and are a convenient way to assess physical activity. These are relatively simple to conduct and can gather data on domain-specific physical activity behaviors from a large number of people at low cost (e.g. i.e. older adults are walking for leisure or walking for transportation), but the overall daily physical activity patterns might not be accurately developed (Davis and Fox, 2007; Murphy, 2009).

Several self-reported physical activity questionnaires have been tested with adequate validity and reliability. An international reliability and validity study on International Physical Activity Questionnaire (IPAQ) was conducted by Craig and his colleagues in 14 centers in 12 countries during 2000 (Craig et al., 2003). This study concluded that IPAQ is a reliable instrument that can be used to assess the physical activity of a wide variety of demographic groups (18-65 years old) in diverse settings. Another physical activity questionnaire ¼ Global Physical Activity Questionnaire (GPAQ), was further developed from IPAQ showed content reliability and validity in a study carried out by Bull et al., (2009) in nine countries, suggesting that GPAQ is a reasonable instrument to monitor physical activity on general population worldwide. Age-neutral physical activity questionnaires such as IPAQ and GPAQ are widely used worldwide on large samples, as they are easy to conduct and require low budget. However, most age-neutral questionnaires focus on sport and recreational activity which has been shown only account for a relatively small proportion of older adults' daily physical activity (Washburn, 2015). Older adults tend to engage in more moderate intensity activities such as walking, and household activities such as gardening, with less sport and exercise (Davis and Fox, 2007). Therefore, physical activity questionnaires that are designed for general population may be less precise with older adults. In this case, some physical activity questionnaires have been intentionally developed for older adults, including Community Healthy Activities Model Program for Seniors (CHAMPS) (Carlson et al., 2012; Lim et al., 2005; Nathan et al., 2014; Td et al., 2006), Yale Physical Activity Questionnaire (Dipietro et al., 1993), Modi Wed Baecke Questionnaire for Older Adults (Voorrips et al., 1991) and the Physical Activity Scale for the Elderly (Washburn RA, 1999). These also provide good reliability and validity and have been employed in a large number of studies focusing on older adults (Washburn et al., 1993; Washburn, 2015; Washburn, 1999). Questionnaires that are exclusive for older adults are expected to provide more precise and valid outcomes than the age-neutral ones (Harada et al., 2001). Thus, it is higher recommended to employ questionnaires that are specifically designed for older adults.

However, self-report measures have inherent limitations, which have been widely discussed among researchers, demonstrating concern over the accuracy of self-report data on physical activity. Key issues here include social desirability bias resulting in over-reporting of physical activity (Warnecke et al., 1997), and recall bias, which may be a challenge when working with older adults. Recalling physical activity requires higher levels of cognitive ability and memory, while older adults are more likely to have poor memory and lower cognitive ability (Murphy, 2009; Sallis and Saelens, 2000). Moreover, fluctuations in physical and mental health may also reduce the accuracy of self-report (Rikli, 2000). Sallis (2000) pointed out that other self-report instruments like activity logs and diaries also have limitations as well, they are limited by response rates and how much do participants could follow instructions. To overcome these limitations, objective measures such as accelerometers are increasing used in studies, with a key drawback of not being able to provide information on domain-specific activities.

In sum, it appears that self-report measures have specific advantages in obtaining information on the proportion of exercise achieved by different domains of physical activity and how these may be broadly related to relevant environmental settings. Self-report measures do have value in the role of clarifying the relationship between physical activity and the built environment of older adults, but if accurate amounts of physical activity need to be recorded, objective methods should be employed to increase the reliability and validity of physical activity data.

2.1.2 OBJECTIVE MEASURES OF PHYSICAL ACTIVITY

Objective measurements of physical activity are increasingly used to overcome the limitations of self-report measures. This has included the use of heart rate monitors, activity monitors and doubly labeled water. These can be complementary to self-report measures, and a combination of the two types of measurements can obtain even more accurate data on the patterns and amount of physical activity.

HEART RATE MONITORS

Heart rate monitors are primarily used for estimating approximate energy expenditure during PA. It has been demonstrated that heart rate is correlated with VO_2 and energy expenditure during physical activity (Welk et al., 2000). However, numerous factors can influence the accuracy of data collected using heart rate monitors. Melanson (1996) pointed out that other factors such as caffeine or stress can increase heart rate. In terms of older adults, they are more likely to take medication that may influence cardiovascular function, during resting and exercise (Rikli, 2000). Furthermore, in a study focusing on children, it was suggested that under active conditions heart rate outcomes were more significantly associated with direct observation measures compared with inactive conditions, this may result in an error of mean heart rate (Welk and Corbin, 1995). It is widely recognized that older adults undertake different types of PA compared to young people who are more likely to participate in higher intensity physical activities for longer time. Older adults tend to engage more in moderate intensity physical activity like walking and household physical activities. Thus, it is logical to assume that the same errors may occur when researching PA in older adults. It has been suggested that heart rate monitors can be combined with motion sensing devices to reach a higher accuracy for data collection (Welk et al., 2000).

DOUBLY-LABELED WATER

Double-labeled water measurement is widely considered as a “gold standard” to measure accurate energy expenditure over time, both for lab and field-based studies on physical activity. It is a method that tracks carbon dioxide produced from metabolism to detect energy expenditure, using specific isotopes in labeled water (Murphy, 2009; Welk et al., 2000). However, this tends to be expensive and requires specialized expertise, so is not an ideal method for studies in larger field and epidemiological areas (Murphy, 2009). With respect to the older population, this technique may also be problematic in relation to older adults as some medication could impact water retention, or seniors may have medical conditions that influence the circulatory system conditions could also confound the accuracy of this technique (Rikli, 2000).

PEDOMETERS

Pedometers are instruments that can provide objective information on step counts, and they are less expensive than many other techniques such as accelerometer or doubly-labeled water, but have advantages and disadvantages similar to other motion sensors. They are easy to use but with less accuracy and precision. Lacking sampling abilities, pedometers do not provide detailed information on frequency or intensity of physical activity, so they cannot detect energy expenditure and physical activity patterns (Murphy, 2009; Welk et al., 2000). There are also questions of their use with older adults, because their accuracy decreases at low speed (Cyarto, et al, 2004; Le Masurier and Tudor-Locke, 2003) and with people who have gait patterns and obesity (McClung et al., 2000). Thus, pedometers might not be an ideal method for older people, although efforts have been made to improve the accuracy of pedometers working at low speed, such as equipped them with piezoelectric components. For example, the Stepwatch-3 is a pedometer with a piezoelectric component which could provide more precise data on physical activity at low speed than others (Foster et al., 2005).

ACCELEROMETERS

Accelerometers are enabled to measure physical activity objectively using motion sensors to record the amount, intensity (including approximate estimates of energy expenditure), frequency and duration of activity (Davis and Fox, 2007; Murphy, 2009). Accelerometers can assess PA on a minute-by-minute basis, over days or weeks if needed (Davis and Fox, 2007). Therefore, they have a significant role in studies that endeavor to identify the relationship between PA and the built environment. However, accelerometers are unable to capture what kind of activity older adults have performed. Therefore, with the absence of domain-specific information, we do not know the aims of physical activity in the older adult population (i.e. whether they are walking for leisure or for transportation).

However, Some researchers have also expressed concern about the accuracy of accelerometers due to the placement of monitors and the number of days worn (Murphy, 2009). In a lab-based study for older

adults, Sumukadas has found that even the choice of on which hip the monitor is worn can lead to different outcomes (Sumukadas et al., 2008). It is also suggested that participants' compliance with wearing protocols could pose a difference on the final outcomes. It might be problematic with older adults as they are more likely to suffer from poor memory and cognitive impairment, failing to attach the equipment in the required position on time (Esliger, 2009; Wilcox et al., 2001). However, a large sample study of healthy European older adults aged 70 and above, has shown high levels of compliance and few administrative problems in final results, demonstrating that accelerometer appeared to be a feasible instrument for assessing different aspects of physical activity in the old population (Davis and Fox, 2007).

From all reviews above, each measurement technique comes with its own advantages and disadvantages, there is no single method for a highly accurate measurement of physical activity for older adults. To summarize, before deciding which physical activity measurements to be employed, it is necessary to very critically reflect on what information is required to answer research questions. Considering the advantages and disadvantages of both self-report and objective measures, a combination of measures may be able to provide a more precise, comprehensive and valid assessments (Atienza et al., 2011; Harris et al., 2009), this appears to be a potential way to reducing bias and increase accuracy in physical activity assessments of older adults.

2.2 MEASUREMENTS OF URBAN GREEN SPACE AND THEIR RELEVANT ENVIRONMENTAL CONTEXTS

There is a growing evidence base suggests that green space is related to people's mental and physiological health (Ward Thompson, 2011), and that green space also creates economic, social and environmental benefits (Crompton, 2001; Kaczynski et al., 2009; Orsega-Smith et al., 2004). The links between general health and green space provision derive from contacts with natural environments, social interaction and physical activity (Ward Thompson, 2011). Therefore, it is logical to assume that well-designed green space with high accessibility and availability could improve the physical activity levels of older adults and benefit their health. And thus, should be a strategic way to boost health ageing and ageing in place. However effective policy must be based on an accurate understanding on how public green space and their surrounding areas influence physical activity of older adults. Except for PA measurements for older adults, as has described above, measuring PA-related built environment variables is another key issue in this study area.

Built environment measurements can be based on both perceived or objective influences on PA. Subjective influences focus on questions including perceived safety, noise problems, self-rated quality of life and satisfaction with the neighborhoods (Burton et al., 2011; Carlson et al., 2012). Physical activity frequencies in the nearest UGS have also been examined (Schipperijn et al., 2013), usually by using checklists and questionnaires. As regard to objective built environment influences, key variables including street connectivity, block size, land use mix and residential density (Burton et al., 2011), often using Geographic Information System (GIS) (Dyck et al., 2011; Edwards et al., 2015; Leslie et al., 2007).

Technological developments are also providing new data and analytical opportunities, such as using Google Street View to capture a range of built environment attributes objectively, thus avoiding onsite survey (Kelly et al., 2013; Rundle et al., 2011). Meanwhile, most instruments have been focused on assessing the broad urban built environment and community environment scales, including housing (Iwarsson et al., 2007; Werngren-Elgström et al., 2009), neighborhood environment (Villanueva et al., 2014) and a broader urban environment context (Purciel et al., 2009), with limited emphasis on parks (Alves et al., 2008; Kaczynski et al., 2014). Furthermore, most studies pay attention to adults, adolescents and children rather than older adults.

These are clearly identified gaps amongst research related to physical activity, built environment and older people.

Although this review has focused on key attributes of urban green space, it is also important to note that these spaces functions depend substantially on their wider contexts. Thus, a number of studies have examined the qualities, attractiveness and size of parks, as well as the influence of proximity to parks, trying to explore if these variables are related to PA. (Cohen et al., 2010; Edwards et al., 2015; Kaczynski et al., 2009; Schipperijn et al., 2013). Relevant measurements of the built environment for physical activity

can be grouped into three categories: 1) perceived (self-reported) environment measures; 2) observational measures; 3) GISbased measures (Brownson et al., 2009).

2.2.1 PERCEIVED (SELF-REPORTED) ENVIRONMENT MEASURES

Questionnaires are widely used to gauge the influence of the built environment by interviewers or by self-administered methods. Brownson et al. (2009) review measurements for the perceived environment, including Perceptions of Environmental Support Questionnaire, Neighborhood Environment Walkability Scale (NEWS). NEWS is the most widely used to measure inhabitant's perceptions of the built environments (Brownson et al., 2004; Cerin et al., 2006), along with its abbreviated version ANEWS. Its reliability for youth (NEWS -Y) has been examined by Rosenberg et al. (2009), and future research will focus on a version for older adults (Cerin et al., 2006; Garin et al., 2014; Leslie et al., 2005; Saelens et al., 2003).

Meanwhile, some researchers continue to develop specific questionnaires for their own studies. for example, in the study by Schipperijn et al. (2013), used a questionnaire to rate the importance of different features in green space, finding significant associations between the preferred features and PA-related features. This suggests that instead of restricting research to physical activity-supported factors such as pitches, tracks and pavements, park users' self-rated preferences could also provide important insights for future research.

2.2.2 OBSERVATIONAL MEASURES

Unlike perceived-environment measures, researchers have developed measurements to observe the built environment using both in person and virtual tools. Table 1 illustrates observational instruments for the built environments can be used to measure different geographical scales. At the community level, there are instruments such as Neighborhood Active Living Potential (Craig et al., 2002), Physical Activity Resource Assessment (PARA) instrument (Lee et al., 2005), Senior Walking Environmental Audit Tool (SWEAT) (Cunningham et al., 2005), Neighbourhood Design Characteristics Checklist (NeDeCC) (Burton et al., 2011) et.al; at the park level, there are Bedimo-Rung Assessment Tools–Direct Observation (BRAT–DO) Instrument (Bedimo-Rung et al., 2006) , Environmental Assessment Of Public Recreation Spaces (EAPRS) tool (Saelens et al., 2006), the Public Open Space Tool (POST) (Edwards et al., 2013), System for Observing Play and Recreation in Communities (SOPARC) (McKenzie et al., 2006) et.al and at the trail level, there are Path Environment Audit Tool (PEAT) (Troped et al., 2006), Microscale Audit of Pedestrian Streetscapes (MAPS) tool (Millstein et al., 2013) et.al.

Geographical Scales	Instruments
Community level	Neighborhood Active Living Potential
	Physical Activity Resource Assessment (PARA) Instrument
	Senior Walking Environmental Audit Tool (SWEAT)
	Neighbourhood Design Characteristics Checklist (NeDeCC)
Park level	Bedimo-Rung Assessment Tools–Direct Observation (BRAT–DO) Instrument
	Environmental Assessment of Public Recreation Spaces (EAPRS) Tool
	Public Open Space Tool (POST)
	System for Observing Play and Recreation in Communities (SOPARC)
Trail level	Path Environment Audit Tool (PEAT)
	Microscale Audit of Pedestrian Streetscapes (MAPS) Tool

Table 1 - Observational instruments for the built environments

EAPRS is a very comprehensive instrument for measuring the physical environment of public parks and playgrounds, covering a wide variety of features, including paths, water areas, eating/drinking facilities, aesthetics and so on, and it shows high reliability (Saelens et al., 2006). It has been frequently used in studies to characterize the features of UGS (Edwards et al., 2015; Kane et al., 2015; Lackey and Kaczynski, 2009; Schipperijn et al., 2013). However, just as EAPRS is a very comprehensive audit tool, even a revised version has 646 items (Saelens et al., 2006), which is very time-consuming to conduct, thus an abbreviated version of EAPRS more physical activity-related and older adults-related is expected. SOPARC is another reliable and feasible instrument that focus on park usage and physical activity

behaviour (Wen et al., 2007). This instrument is commonly used among park-based physical activity studies (Cohen et al., 2009; Hunter et al., 2015; Tully et al., 2013; Veitch et al., 2014).

Other instruments, such as NeDeCC, which is used to measure residential environment at an individual level, can improve our understanding on how physical environments of an individual's house (from front door to wider community) affect their wellbeing (Burton et al., 2011). The Microscale Audit of Pedestrian Streetscapes (MAPS) is another approach to measure details of streetscapes to create a activityfriendly environment (Cain et al., 2014; Millstein et al., 2013).

Technological developments such as Google Earth and Google Street View have stimulated built environment measurements that do not require on-site survey (James et al. 2016; Bader et al. 2015; Vanwolleghem et al. 2016; Rundle et al. 2011). Remote observation approaches such as the Public Open Space Desktop Auditing Tool (POSDAT) (Edwards et al., 2013) and the Computer Assisted Neighborhood Visual Assessment System (CANVAS) (Bader et al., 2015) have advantages of lower cost, less time consuming and an ability to larger and more geographically dispersed areas (Edwards et al., 2013).

2.2.3 GIS-BASED MEASURES

GIS-Based measures here refer to measures that utilize existing spatial data such as address and census boundary identification (Brownson et al., 2009). GIS-Based measures are frequently used to evaluate physical activity-related built environment variables such as walkability, proximity to UGS (Lawrence D. Frank et al., 2005). GIS-based measures offer very important approaches to make assessments on the built environment rapidly, but there are some concerns regarding the accuracy of GIS data (James et al., 2016) or the ways of using GIS-based measures to assess walkability, such as whether using footpath networks or road center lines as a proxy (Ellis et al., 2016) etc. These are described below.

ACCURACY OF GIS DATA

Lin et al., (2010) and Hajna et al., (2013) have suggested that GIS is an effective approach to measure walkability objectively. It comes with key advantages such as assessing large areas rapidly and make comparisons within and across study areas (Ellis et al., 2016). It has several drawbacks such as being reliant on routinely available spatial data and its reliability (James et al., 2016). Although the GIS measures has been approved validity and reliability by Purciel et al. (2009), there is still evidence has shown that only 28.7% data overlapped between national data sets and observer-verified data for a park located at St. Louis, MO (James et al., 2016). Thus, it is suggested that on-site survey is expected to improve the accuracy of GIS measures, especially for small scale studies. Indeed Schipperijn et al., (2013) recommend not simply rely on municipal data, but adding observer-verified entrance data to a new GIS layer for assessing the proximity to urban green space.

MEASURING WALKABILITY

'Walkability' is defined as "the extent to which the built environment supports and encourages walking by providing for pedestrian comfort and safety, connecting people with varied destinations within a reasonable amount of time and effort and offering visual interest in journeys throughout the network" (Southworth, 2005, page248). Walkability has been broadly considered as an indicator that positively correlated with higher levels of physical activity. Therefore, how best to measure walkability has great significance.

There are two key aspects for the walkability measurements, which are the use of footpath networks and road center lines respectively. Mostly, road center lines have been used to measure walkability, and indeed, in some urban morphologies, road center lines do reflect the full pedestrian network as mostly footpaths are being sidewalks along roads. This is more applicable to North America and Australia, as their urban morphologies characterized in gridiron layout (Ellis et al., 2016), and these have been the settings for most physical activity studies (Hunter et al., 2015). However, in the case of other urban forms with more segregated sidewalks, road center lines could be less effective as a proxy for pedestrian connectivity, potentially leading to distortions in walkability assessments. Chin (2008) and his colleagues have examined whether connectivity would be different when incorporating street networks or pedestrian

networks. The results turned out to be quite different, connectivity for some conventional neighbourhoods improved by up to 120% when pedestrian networks were adopted. In line with this study, another study in the context of the Northern Ireland also suggests significant differences between the two walkability indices from the results of Wilcoxon signed-rank sum tests, independent of the 5- minute and 10-minute network buffer zones (Cruise et al., forthcoming). Thus, in the cases of footpaths do not paralleled to roads, pedestrian networks appear to work as a more effective proxy than road center lines alone, taking into account that the influence of nonmotorized networks such as footbridges, trails through green space (Cruise et al., forthcoming; Ellis et al., 2016).

Therefore, in studies trying to explore the relationship between physical activity and urban green space, it is more reasonable to employ a network that reflects all potential paths for older adults. What is more, the walkability index has been developed and deployed mainly in the North American and the Australian context, there is, therefore, how accurate walkability could be measured with this index in the UK context is a question that worth to figure out in the next stage (Ellis et al., 2016).

MEASURING DISTANCE TO URBAN GREEN SPACE

From existing literature, it is not difficult to find that measuring distance to urban green space has attracted great research interest from researchers (Alves et al., 2008; Bedimo-Rung, 2005; Hooper et al., 2015; Oh and Jeong, 2007; Schipperijn et al., 2010). This is probably because that in line with previous studies, it is suggested that the frequency of use of UGS has significant association with the distance to it (Nielsen and Hansen, 2007; Schipperijn et al., 2010). Although we could not say that the increase in the frequency of use of UGS is absolute with higher levels of physical activity of older adults, but we can at least claim that increasing numbers of frequency of use of UGS is likely to improve physical activity levels of older adults. Therefore, how most effectively measure the distance to UGS is a critical issue needs to be addressed.

There are three main approaches measuring the distance to UGS: measured by self-evaluated distance, Euclidian distance and trail networks. In addition, if we take UGS area size in to consideration, it could also be measured by how many hectares exist with a pre-determined distance (Schipperijn et al., 2010). It is suggested by Herzele and Wiedemann (2003) that the minimum size for a community park is one hectare, although they admit that these suggestions are come from planning guidelines instead of empirical studies. In terms of other methods to measure the distance to UGS, contrary to convention wisdom which frequently judges self-evaluated distance with significant reporting bias. Schipperijn et al., (2010) and Scott et al., (2007) have found that self-evaluated distance works as a better proxy to indicate the frequency of use of UGS. Although this method has not been tested with reliability and validity among older adults, it underlines the importance of how individual's personal experience could make a difference to the use of UGS. In addition, using footpath network has been shown to be a more accurate method to measure UGS proximity than using Euclidian distance (C. Lee and Moudon, 2008; Oh and Jeong, 2007; Schipperijn et al., 2013).

METHODOLOGY DEVELOPMENTS AND CHALLENGES: THE COMBINATION OF GPS, ACCELEROMETER AND GIS.

The combination of GPS, accelerometer and GIS has been termed as spatial energetics by James et al. (2016), and it is defined as "the incorporation of high-spatiotemporal resolution data on location (e.g., GPS combined with GIS) and time-matched energetics (e.g., accelerometer to measure physical activity and sedentary behavior) to examine how environmental characteristics, space, and time are linked to activityrelated health behaviors" (page793). GPS data could provide time-indexed geographic coordinates, which can be used to indicate the locations participants has been; to measure the speed of movement; to understand behaviour among various locations (Jankowska et al., 2015). Using accelerometer to measure physical activity objectively are now available at low cost (Troiano et al., 2014). GIS is capable to assess large areas rapidly.

Developments in accelerometer, GPS and GIS offer us a distinct perspective of view to assess physical activity objectively with detailed and dynamic environmental contexts. With these technologies researchers are now able to put forward research questions about what kind of activities are undertaken at specific times in certain places. Spatial energetics data has largely overcome some drawbacks of previous

measures, for example, reporting bias from self-report methods, lack of environmental contexts by accelerometers or pedometers. The technology has led to a range of methodological development, while compared with traditional measurements such as heart rate monitors, pedometers, this method has a very high potential but because it is in its early stage of development, it still poses a variety of methodological challenges, across aspects of concept, analysis and ethics (James et al., 2016).

Section two of this paper has reviewed current methodological approaches that have been used in healthy planning studies. From this review, it is clear that each instrument has a specific purpose and there is no single way to obtain comprehensive and holistic data. It is important to identify potential bias within each instrument and reduce it as much as possible before the study formally begins. In the next section, we will consider potential data sources, leading to a discussion of a research design examining how urban green space could impact the physical activity levels of older adults.

3 EXISTING DATA SOURCES

3.1 OVERVIEW OF DATA SOURCE

This research aims to measure what attributes of urban green space may support and impede physical activity of older adults, and to offer recommendations for interventions that can be made to urban green space to improve the physical activity levels of older adults. An enhanced understanding of physical activity behaviour of older people in green space will benefit wellbeing in society and reduction in further health burdens. With this aim, it is significant to capture the data on physical activity patterns, physical activity levels of older adults and the usage of urban green space. Using a case study from Belfast in the UK, this research draws data from three datasets (see table 2): 1) the Northern Ireland Physical Activity Survey (SAPAS); 2) System for Observing Play and Recreation in Communities (SOPARC); 3) Healthy Urban Living and Ageing in Place: Physical Activity, Built Environment and Knowledge Exchange in Brazilian Cities (HULAP). SAPAS captures the overall physical activity levels of the general population; SOPARC captures the usage of local parks and HULAP offers detailed and dynamic activity data of 300 older adults. Supported by these three robust datasets, it is possible to build a comprehensive image on the physical activity patterns and physical activity levels of older adults.

Project	Time	Sample amount	Participants	Method
SAPAS	2009/10	4653	Adults (aged 16+)	Face to face interview using CAPI
SOPARC	2010/11	Not Pre-Determined	—	Direct observation
HULAP	2016-2019	A Minimum of 300 Participants	Older adults (aged 60+)	Questionnaire; GIS, GPS and Accelerometer.

Table 2 - Overview of three data sources
CAPI: Computer-assisted personal interviewing

3.1.1 THE NORTHERN IRELAND PHYSICAL ACTIVITY SURVEY (SAPAS)

SAPAS assessed the physical activity levels of adults aged 16 years and over in Northern Ireland across four life domains including home, occupational, active travel and recreation. This survey was undertaken from 2009 to 2010, a total number of 4,653 participants was selected stratified randomly and interviewed face to face using Computer Assisted Personal Interviewing (CAPI). It is a cross-sectional survey which provides robust and comprehensive national wide data on physical activity levels among adults. (Donnelly, 2010)

3.1.2 SOPARC STUDY IN BELFAST, UK

SOPARC (System for Observing Play and Recreation in Communities) is a direct observational tool that can provide information on context of parks, physical activity patterns among park users and their gender, activity levels and estimated age.

Unlike other methods including GPAQ and IPAQ which provide detailed data on a specific respondent, SOPARC is more likely to offer us a picture of random individuals' physical activity levels in the park context at a specific time point.

The instrument was conducted by Belfast City Council at six sites in Belfast, UK including Victoria Park, Orangefield Park, Flora Street, Dixon Playing Fields, Cregagh Glen, Civic Square and Clarawood Estate.

Observations was conducted from the last week in July 2010 and last week in January 2011. Thus, the use of a good range of urban green space of the general population can be provided.

3.1.3 HEALTHY URBAN LIVING AND AGEING IN PLACE: PHYSICAL ACTIVITY, BUILT ENVIRONMENT AND KNOWLEDGE EXCHANGE IN BRAZILIAN CITIES (HULAP)¹

HULAP is a three-year project that was launched in 2016 by a research team with multi-disciplinary background from the United Kingdom and Brazil. The project addresses a wide variety of issues regarding urban planning, health inequalities and policy makers with an aim to enhance understanding of impacts of built environment on physical activity on older adults, providing evidence to relevant institutions or stakeholders to develop policies for increasing the physical activity levels of older adults and reducing health burdens in the future hopefully.

The project uses both objective and subjective data based on a sample of 300 older adults come from Northern Ireland aged 60 years and over will wear accelerometers (Actigraph GT3X) and Global Positioning System (GPS) (Qstarz BT-Q1000XT) for seven consecutive days and completing a short survey. These three datasets are all cross-sectional data with focus on physical activity, but varied from research methods, demographic groups, environmental contexts and so on. This offers robust data on different aspects of physical activity and the usage of urban green parks.

3.2 PROPOSED RESEARCH DESIGN

3.2.1 RESEARCH DESIGN

Figure 1 shows the elements of the study and how they are related. This includes appropriate physical activity measurements for older adults and the built environment measurements will be identified through literature review, meanwhile key gaps will be identified to refine research objectives. It also involves preliminary study of SAPAS and SOPARC data. Findings from the preliminary analysis will be complementary to and validated by HULAP project. The additional research could include further qualitative methods involving older park uses, such as focus groups.

As noted above, SAPAS will provide holistic and comprehensive data on physical activity of general population and will allow some insights into the overall physical activity behaviours of older adults; SOPARC gives direct observation data on the use of six parks in Belfast, UK and older adults activity with then and in the HULAP research project, it achieves data on physical activity of 300 older adults living in Belfast, UK objectively and subjectively. However, with only three hundred of older adults in HULAP, it is not clear how many of the participants will actual do physical activity in urban green space. In sum, the three datasets are complementary to each other, and provide useful insights for determining which interventions can be made to urban green space to improve the physical activity of the old.

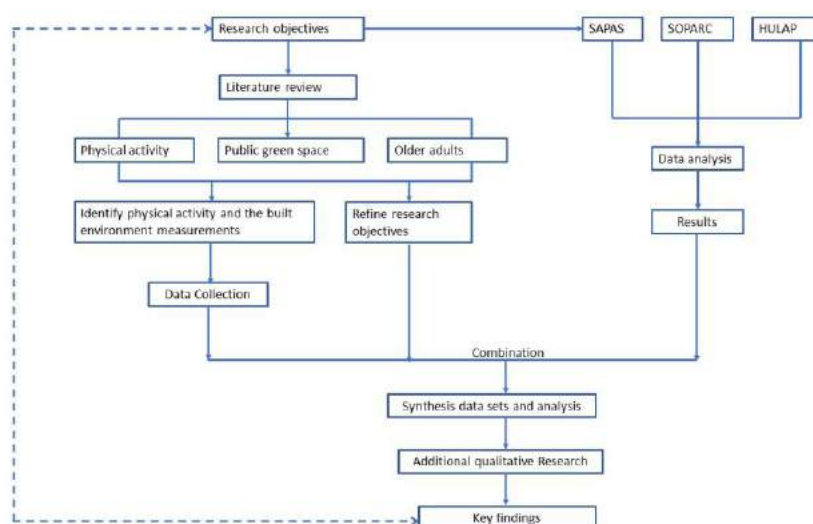

Figure 1 - Diagram of the research design

3.2.2 METHODS

Table 3 shows the three methods that will be used to collect the built environment data, including GIS-based measures; Environmental Assessment of Public Recreation Spaces (EAPRS) and Microscale Audit of Pedestrian Streetscapes (MAPS), each of these focuses on a different geographical scale. At the macro level, the GIS-based measures will be used to assess the walkability of the neighbourhoods around the six observed parks. The walkability index includes four components: residential density, intersection density and land use mix and retail floor area ratio (Frank et al., 2010). At the micro level, EAPRS is used to capture the features of urban green space. To further identify the relationship between the built environment and physical activity it is suggested that the segments between parks and participants' houses should be measured, using Microscale Audit of Pedestrian Streetscapes (MAPS). The approach will also contribute to the development of a new tool: MAPS for older adults. In terms of the physical activity measurements, approaches employed within the three data sources are listed in table 4.

Geographical scales	Macro scale	Micro scale	
Object of measurement	Walkability	Street dimension	Park dimension
Quantitative measurement	GIS	Microscale Audit of Pedestrian Streetscapes (MAPS)	Environmental Assessment of Public Recreation Spaces (EAPRS)
Qualitative measurement	Focus group	Focus group	Focus group

Table 3 - Measures of the built environment

As noted above, this research has access to three robust datasets and combined with the use of these additional tools, it will be possible to address the key research questions. Additional qualitative research, using focus groups are scheduled to supplement and test the findings from literature review and data analysis.

Subjective measures	Physical activity questionnaire (From SAPAS)	Tailored physical activity questionnaire (From HULAP)	Intercept survey (From SOPARC)
Objective measures	Accelerometer combined with GPS and GIS		
Direct observation	SOPARC		

Table 4 - Measures of physical activity of older adults

4 CONCLUSION

This paper has reviewed a number of methods that can be applied to objectively and subjectively measure physical activity on older adults and the built environment including neighbourhoods, streets and green space. How best to measure physical activity levels of older adults and urban green space are two key issues in this study, improper methods may result in potential error in final results. Traditional physical activity measurements such as questionnaires, interviews and heart rate monitors, in addition with traditional built environment measurements such as perceived built environment measures and observational measures, they are appeared to provide single and static information. While spatial energetics research not only assess physical activity levels but also provide information across temporal and spatial units (James et al., 2016). It offers us novel perspectives on improving our understanding of how older adults interact with the built environment rather than single aggregate measures. Every method comes with inherent advantages and drawbacks, there remains no single way to capture comprehensive and solid data to deduce research questions. Before data collection formally begins, it is suggested to take different aspects such as research objectives, time, budget, and target population into full consideration leading to ideal research methodological approaches.

1 INTRODUCTION

Planners in many major urban areas are facing challenges affecting lasting community wellbeing (LCW), which is a key foundation for overall sustainability. LCW involves people's immediate and long-term satisfaction with decent individual and socio-ecological daily lives mainly within the scales of the neighbourhood and city-region. Community recognizes the multiple and flexible relationships of people, typified by mutual commitment and support. While the concept of community does not entail living proximity and geographical organization (e.g. on-line community, professional community, etc.), we use the concept here with emphasis on the maintenance of community in neighbourhoods, which are geographically organized areas for people living close to each other, but in many cases do not have (or have lost) community characteristics. Neighbourhoods could be considered the base level for community characteristics that are desirable for lasting wellbeing, and that build up to the city-region's level of community cooperation towards sustainability. In these terms, community is a useful perspective for considering the sustainability of daily lives.

With this perspective, comparative study of city-regions with different sizes, such as Lisbon and Tokyo, becomes possible because what matters for decent individual and socio-ecological daily lives within community (and potential or visible progress towards sustainability through them) at neighbourhoodscale is more shared than different. With recognition of what is similar, difference will be presented as a fascination (thus respectful and enjoyable), rather than something impossible to comprehend (thus fearful and hopeless).

This paper presents key features of LCW as an analytical framework and reports on an evolving comparative study of LCW centred on two city-regions – Lisbon and Tokyo – that are very different in size, history, culture and other characteristics. The viability of this comparison rests on the common features of

LCW, which embrace notions of healthy and liveable cities. The research takes a bottom-up approach informed by literatures related to LCW, each city's own forward-looking planning documents, current and emerging initiatives, public discourse and direct experience. Similarities found demonstrate the value of common features, while differences suggest the key importance of understanding contextual factors. This research also attempts to understand changes in mind-sets and behaviours regarding health and liveability among people in these cities.

2 SIGNIFICANCE OF COMPARING LISBON AND TOKYO

Lisbon and Tokyo are in many ways very different city-regions. For example, downtown Tokyo (the 23 Special Ward Area, formerly City of Tokyo) has as big a population as the whole of Portugal (around 9 million). However, both cities share the following characteristics that make comparison possible and interesting:

- Long histories - History as a city began in Lisbon around the 800 BC and Tokyo started to form its urban area in late 12th century.
- Traditional values – Both cities possess valued cultural heritages but old values often endorse unwillingness to challenge established practices.
- Vulnerability to seismic disturbances - The most recent and destructive earthquake disaster happened in 1755 in Lisbon and in 1923 in Tokyo.
- Unrivalled domestic centres – Both cities are unrivalled socio-economic centres of their countries, though currently both face a no- or low-growth economic future.
- An assumption that the economy is a “bottomless-box” - Unjustifiable levels of public spending have been persistent, even though they have not demonstrated net benefit to the residents' lasting wellbeing in the city-region.
- Urban sprawl – Lenient controls on growth have resulted in unclear urban borders.
- Ageing population – People over 65 years old are expected to constitute about 40% of the urban population by 2050 in Tokyo city-region and 35% in Lisbon by 2060.
- Neighbourhood-scale functions and identities – Many neighbourhood-scale livelihood activities are accessed by walking or cycling, such as grocery shopping and schooling.

Both Lisbon and Tokyo city-regions have maintained characteristics as connections of neighbourhoodscale communities despite the history of uncontrolled urban growth. Such neighbourhoods are based on traditional values and have ageing populations. These city-regions also share large amount of conventional public spending (continuous large-scale urban redevelopment projects) that have not been significantly challenged by the local residents, even though this spending focus has often neglected neighbourhood-scale community activities and not demonstrated net benefit to residents' lasting wellbeing. The shared issues and characteristics will inform LCW framework generated in the section 4.

3 METHOD

We compare how planning for LCW has been approached in Lisbon and Tokyo through comparison, with particular attention to five illustrative and emerging features: vicinity, sense of place, urban (and suburban) farming, safety and learning. The comparison rests on the application of the five features as a framework that recognizes the noteworthy LCW-related issues facing the two city-regions. The five features have been generated as a synthesis that combines: (i) attention to the broad literature related to LCW, (ii) professional experience in a multiplicity of urban assessment and planning cases over the years, and (iii) implicit attention to generic requirements for progress towards sustainability, founded on sustainability assessment generic criteria by Gibson et al (2005). We have undertaken literature reviews and field research in both cities before starting dialog among the researchers. A visiting researcher walked with a local researcher through the neighbourhoods in both city-regions. The literature reviewed focused on forward-looking planning documents from government organizations in both the cityregions, and journal articles relating to LCW. The researchers had a dialog based on the three kinds of information (first-hand knowledge from the professional experience and field research, issues recognized by the local planners, and LCW considerations) in order to narrow down the focus with insights. A framework based on emerging features and sub features was created and applied to describe situations and issues of LCW in

neighbourhoods and city-regions in Lisbon and Tokyo in an attempt to illustrate changes in mind-sets and behaviours regarding health and liveability among people in these cities. Then the results are compared to identify similarities and differences, strengths and gaps, and implications for future planning in Lisbon and Tokyo. This serves as a test to turn the LCW framework more generally applicable in other cities facing similar challenges.

This study does not highly prioritize quantified data analysis, although descriptive stats may be used to show general past trends. In contrast, many studies in neighbourhood indicators seek precise and unbiased predictions of neighbourhoods' future through quantified data analyses (for example, Kingsley et al 2014), which requires precise boundaries of neighbourhoods. As discussed in the following sections, this study addresses neighbourhoods as areas that have flexible and dynamic boundaries depending on personal capacity and preference in distance to walk and cycle to obtain goods, services and activities on daily basis, and build up to city-region. It does not require rigid setting of neighbourhood boundaries.

However, there are administratively defined areas with fixed boundaries, such as municipality and city, which may or may not fit to neighbourhood and city-region. In this sense, a municipality could also be a unit for community if it offers organizations or relationships for mutual help among people. Thus, the results of the study would inform not only individual residents, their groups and interactions between them, but also those who work for government bodies that administer municipality or wider areas.

4 FRAMEWORK

4.1 OPERATIONAL DEFINITIONS OF THE KEY WORDS

In this section we develop an analytical framework to discuss how planning for LCW is approached in Lisbon and Tokyo through comparison, which recognizes the noteworthy LCW-related issues facing the two city-regions. In order to do so, key words such as lasting, community, neighbourhood, city-region, and wellbeing require careful operational definitions, to understand what LCW means for this study. The operational definition of LCW combined with the insight to issues and characteristics shared in both Lisbon and Tokyo (see section 2) will help to consolidate the framework.

4.1.1 NEIGHBOURHOOD, CITY-REGION AND COMMUNITY

In this paper community is understood as a relationship of people linked by individual participation, interaction and cooperation to support development of personal capacities for resilience and strengthen connections with other individuals and bodies who participate in groups such as families, schools, corporations, neighbourhoods, other organizations and collaborations of those (Murphy 1985 cited by Dangi and Jamal 2016, Buffel et al 2014, Khanlou and Wray 2014). Communities do not require living proximity and physical boundaries, and an individual may take part in multiple communities. Thus communities can overlap to form complex relationships of people. Most of the relationships, however, would stay within neighbourhood and city-region scale, where most of individual daily lives would go on physically and geographically.

Neighbourhood is a socially organized area with geographic location in which residents to go about their daily lives, living in reasonably close proximity but not necessarily being close friends or relatives (Elliot et al 2014, Kingsley et al 2014). Neighbourhood in this definition emphasizes a place where people have ability to obtain goods, services and activities on daily basis. Litman (2003, cited by Roseland 2012) calls this "accessibility", which assumes automobile and truck, transit, cycling and walking as modes, with focus on increasing transport system efficiency and safety through land use. Neighbourhood in this study advocates accessibility particularly by walking and cycling, considering that Lisbon and Tokyo have maintained vicinity of communities with ageing populations, as have many other city-regions. Such neighbourhoods would have flexible and dynamic boundaries depending on personal capacity and preference to walk and cycle some distance. In this sense, rigidly fixing and determining neighbourhood boundaries is not necessary, and probably impractical at least for this study. However, it is important to be clear about what neighbourhood means to inform creation of an analytical framework of LCW.

While the concept of neighbourhood does not necessarily entail functioning mutual support, having community characteristics is desirable for lasting wellbeing at the appropriate scale (e.g. mutual support among neighbours and people from local schools, etc). Many neighbourhoods of that sort build up to city-region (co-workers, school mates from city-regional high school or university, etc.) level within which community characteristics can also be found. City-regions can be grasped as structures of direct and indirect interdependence of people's activities, with context-dependent shifting boundaries over time, hopefully giving rise to diverse entrepreneurial and innovative outcomes (Scott, 2006, Collin et al 2003). With these notions, this study addresses the city-region as a flexible and dynamic area based on direct and indirect interdependence of people's activities for diverse entrepreneurial and innovative outcomes, connecting neighbourhoods with accessibility by transit as well as by foot and bicycle.

Overall, this study considers space of neighbourhoods as special areas with community characteristics building up to the city-region (also with community characteristics). The key organizational concepts are: - A neighbourhood as a socially organized area with flexible and dynamic geographic location to where people live in close proximity but not necessarily being close friends or relatives, and go about daily life with accessibility by foot and bicycle;

- A city-region as a flexible and dynamic geographic location based on direct and indirect interdependence of people's activities for diverse entrepreneurial and innovative outcomes, connecting neighbourhoods with accessibility by transit as well as by foot and bicycle; and
- A community as a relationship of people linked by individual participation, interaction and cooperation to support development of personal capacities for resilience and strengthen connections with other individuals and bodies who participate in groups such as families, schools, corporations, neighbourhoods, other organizations and collaborations of those.

4.1.2 WELLBEING

Wellbeing in a neighbourhood and city-region with community characteristics is satisfaction with individual life based on subjective evaluation of hedonic (looking for maximization of pleasure and minimization of pain) and eudaimonic (looking for realization of one's potential pursued through self-motivated, self-disciplined and prudent efforts) richness of human wellness and happiness (Elliot et al 2014, Boniwell 2016). It is also the collective evaluation of equitable and healthy access to good quality of goods, activities and essential community assets and services (such as food and housing; working, learning and recreation; transportation, parks, natural area and public space; and healthcare) (Merric and Martin 2014, Litman 2003) backed by interpersonal relationships for mutual help.

Community wellbeing can be significantly affected by global issues, such as climate change, globalized economic activities, immigration and refugee. In many cases, however, communities have limited capacity to directly counteract such issues by mitigating climate change (Gibson 2017), influencing decisions of multi-national corporations, ending the conflict happening somewhere far, and so on. Therefore, important factors of community wellbeing are not only creativity for providing personal and social satisfaction, but also resilience as capacity to respond to and accommodate change and disturbances. These capacities are obtained by community's characteristics to support development of personal capacity for resilience and strengthening relationships with others in the collaborative groups.

4.1.3 LASTING

The term "lasting" covers both immediate and long-term time frames. The specific time lengths of the "immediate" and "long-term" periods vary depending on the context. Thus it is difficult and probably insignificant to precisely define the time frames of "lasting". However, when an operational definition is demanded, it is useful to look into implications for future generations who are powerless at the point of decision making, which implies more than 100 years ahead. Prolonging community wellbeing is based on the maintaining the integrity of socio-ecological systems (Ostrom, 2009) and maintenance of their life support functions, while paying attention to intra- and intergenerational equity (Kumagai et al, 2010). In this study, "lasting" implies the idea of embracing benefits of both current and future generations, and celebrating creativity and resilience of community for providing wellbeing. It entails behavior change and acknowledgement of culture including policy and governance. Culture as "that complex whole which

includes knowledge, belief, art, morals, law, custom, and any other capabilities and habits acquired by man as a member of society.’ (Tyler 1870: 1 cited by Avruch 1998: 6). A policy is like a road-map with defined objectives, priorities, rules and mechanisms to implement the objectives that provide guidance to subsequent activities, while governance can be understood as ‘the totality of interactions, in which government, other public bodies, private sector and civil society participate, aiming at solving societal problems or creating societal opportunities’ (Meuleman 2008: 11).

4.2 HOW EXISTING LITERATURES ADDRESS LCW-RELATED MATTERS

The literatures precisely addressing lasting community wellbeing have not been found, but there are articles providing insights about community wellbeing and related lasting values (see Table 1 for summarized contents). Both of the reports from Organization for Economic Co-operation and Development (OECD 2015) and Canadian Index of Wellbeing (CIW 2016) are based on their original indicators, which provide strictly parallel data sets to measure the current status of national-level wellbeing (member countries for OECD and Canada for CIW). Baldwin and King (2017) focused on social sustainability realized through public built environment promoting behaviors and mindsets that are good for community. Reviewing the literatures has revealed that this study shares many features with OECD (2015) approaches, which pay attention to such factors as housing, community (as support network), life satisfaction, recreation, health and safety. Also, Baldwin and King (2017) support our notion that sense of place is important for wellbeing.

This study recognizes the following possible issues relating to the approaches taken by the existing literatures. They inform framework creation for this study. The possible issues are:

- If the indicators were set too rigidly to obtain strictly parallel data sets, it would be difficult to pay particular attention to illustrative and emerging features of the case-specific situation of LCW.
- If the domains and indicators were too many, it would be difficult for wide variety of participants to understand the wellbeing situation in shared manner for deliberation.
- If the premise of the framework presents norms too rigidly (e.g. study and work for income to access to goods and services, behave well for community towards sustainability, etc.), similar problems as described above could occur.

Source	Lasting	Community	Wellbeing
OECD Better Life Index (2015)	The purposes are measuring the current status of wellbeing in the member countries, and encourage citizens' involvement in policy debate. Time scale behind the research is not clarified.	The “social connections” dimension is translated as “community”, and defined as strong social network that provides emotional support and access to jobs, services and other material opportunities.	The 11 dimensions are: income and wealth; jobs and earnings; work-life balance; housing; environmental quality; health status; education and skills; social connections; civic engagement and governance; personal security; and subjective wellbeing.
Canadian Index of Wellbeing (2016)	The purposes are to identify core Canadian values (wellbeing) and provide a comprehensive portrait of quality of life in Canada. Time scale behind the research is not clarified.	Focus is on “vital community” as a domain of wellbeing. Community seems understood as relationships among people, private, public and non-governmental organizations that foster individual and collective wellbeing.	The presence of the highest possible quality of life in its full breadth of expression focused on but not necessarily exclusive to: good living standards; robust health; a sustainable environment; vital communities; an educated populace; balance time use; high levels of democratic participation; and access to and participation in leisure and culture.
Baldwin and King (2017)	Social sustainability as people's quality of life now and in the future is sought. The premise is that planning and design of our public built environment should promote “pro-community behaviours” (behaviours and psychological responses that are good for community, as associated with social capital and cohesion).	Community is a group or networks of people who share a common sense of belonging based on shared connections such as geographic proximity, interests, socio-demographic characteristics, experiences, emotional links or other common purposes.	A pro-community outcome that socially sustainable urban communities can achieve. Same as quality of life and health.

Table 1 – How existing studies address lasting community wellbeing

4.3 FRAMEWORK FOR LASTING COMMUNITY WELLBEING

4.3.1 LASTING COMMUNITY WELLBEING

Based on operational definitions and in face of the current state of the art above, this study describes LCW as satisfaction with individual life based on subjective evaluation of hedonic and eudaimonic richness of human wellness and happiness. It also includes collective evaluation of equitable and healthy access to good quality of goods, activities and essential community assets and services (such as food and housing; working, learning and recreation; transportation, parks, natural area and public space; and healthcare). The LCW is supported by interpersonal relationships for mutual help, which embraces benefits of both current and future generations, and celebrates creativity and resilience to prolong wellbeing at neighbourhoods connected by walking, biking and transit to build up to a city-region. It requires behavior change and acknowledgement of culture.

4.3.2 ANALYTICAL FRAMEWORK FOR LCW

The operational definitions of LCW provide a foundation for generating the analytical framework of this study. Issues recognized both in Lisbon and Tokyo (vulnerability to seismic disturbances, urban sprawl, ageing population, and unjustifiable levels of public spending), and common characteristics based on traditional values (unwillingness to challenge established practices and resilient neighbourhood-scale communities) also inform the framework creation.

Similarities shared by Lisbon and Tokyo revealed the value of the neighbourhood-scale communities, wherein people can feel sense of place and belonging, moving by foot and bicycle, connected by transit or other kinds of soft transportation to build up to city-region. Neighbourhood in this sense emphasizes human-scale setting, which is highly relevant for discussions of planning for embracing health and liveability. Vicinity as physical and mental accessibility by foot, bicycle, trams and other soft transportation provides people the feeling that desired wellbeing-related objectives are close by. It allows people to move based on their capacity and preference, providing sense of place as individual feeling of autonomy, belonging, and social-ecological integration. Such feelings are linked to livelihood activities such as local commerce, artisan production, local public amenities and life support services, and inclusive activities. These features are valuable for neighbourhood and city-region with ageing population.

In terms of resilience, recreating and maintaining urban (and suburban) farming are particularly important for city-regions with a history of urban sprawl to absorb shocks from future socio-ecological disturbances (Kumagai et al 2014), such as outgoing enterprises, incoming immigrants, and natural disasters. Urban (and suburban) farming also provides bases for local food production, ecological services, local public amenities, and learning about socio-ecological integration. Vicinity, sense of place, and urban (and suburban) farming together provide important basis for LCW, but they must come with safety particularly in terms of transportation safety, crime prevention, and reduction of disaster damages. Lisbon and Tokyo share significant vulnerability to seismic and flooding risks, which are at least partially multiplied with uncontrolled sprawl and continuous large-scale urban physical development that have not demonstrated net benefit to neighbourhood-scale wellbeing. This failure may be a result of public unwillingness to challenge established practices often coupled with inertia in adopting new routines to respond to new challenges. There is a positive side of being based on traditional values that has contributed to the maintenance of neighbourhood-scale communities in Lisbon and Tokyo. However, LCW requires behaviour change and acknowledgement of culture in order to embrace benefits of both current and future generations, and celebrate creativity and resilience of community to prolong wellbeing. People who favour traditional values need to learn for developing their capacities and engaging in meaningful deliberation about responding to new challenges (Kumagai 2016).

Based on the argument above, the following five key features and related sub features were identified, drawing on the literature and field research:

- Vicinity— physical and mental accessibility by walking, bicycling, trams and other soft transportation (less car-dependent), feeling that desired wellbeing-related objectives are close by and that collective social relationships are relevant to individual liveability

- Sense of place – individual feeling of autonomy, belonging, and socio-ecological integration (linked to livelihood activities such as local commerce, artisan production, local public amenities and life support services, inclusive activities)
- Urban and suburban farming – food production (local agriculture and aquaculture), ecological services (retaining permeable surfaces, biodiversity, improved air quality), absorbing shocks from socio-ecological disturbances, local public amenities, learning about socio-ecological integration (connectivity to the land)
- Safety – reduction of disaster damages (especially seismic and flooding), crime prevention, transportation safety
- Learning – capacity building for personal resilience and strengthened collaborations, realizing meaningful community deliberation.

The list of sustainability-related emerging features and sub features provides a framework as a new entity.

It was applied to the reviewed plans from both cities to obtain implications throughout comparison.

5 CASE COMPARISON

5.1 LISBON

The shift to prioritizing lasting wellbeing is recent in Lisbon municipal planning and perhaps often undertaken on other premises, while it is not consciously perceived as contributing to LCW. However a number of actions, including measures in the latest master plan, adopted in 2014, as well as the municipal strategy for climate change and the increased space for cycling and walking reveals increasing focus of concern, attention and investment on the quality of public space, green infrastructures, slow mobility, solutions of urban proximity and increased public engagement. In addition municipal programmes such as the BipZip that promotes local partnerships, are contributing to creating LCW. The five features of the LCW framework can be illustrated in Lisbon as follows:

VICINITY

- Neighbourhood regeneration and improving quality of life, for example by improving the proximity of services, facilitating soft mobility (walking and bicycling), creating walkable streets with no traffic, promoting local commerce and the sense of community
- Higher quality public space, with shaded resting areas, major urban riverfront restoration, reduction of traffic lanes and introduction of more street trees and green road dividers, to enable walkability and liveability, as well as the possibility of enjoying the public place.

SENSE OF PLACE

- Promotion of space multi-functionality, including day care centres, residential housing, nursing homes and multifunctional spaces for seniors, sport facilities and activities (open runs, marathons, etc.), encouraging a healthy lifestyle, and adoption of legislation to protect the local commerce
- Increased walkability and cyclability of the city, together with improved cafes and esplanades, also delivers an improved sense of place through a greater enjoyment of the city, which however is increasingly affected by exponential tourism in the city that starts to keep citizens away from the most popular places that feature Lisbon

URBAN AND SUBURBAN FARMING

- At least in the last 10 years urban and suburban farming has been promoted in municipal land, including abandoned farmlands in Lisbon city and region (in Lisbon municipality and other municipalities in the city-region) to help less resourced families compensate for their low family economic income

- Originally to promote urban farming and recreational activities, such green spaces are now accounted as means to increase ecological services (namely by allowing better water infiltration through increased permeable surfaces) and serving as adaptation measures to climate change, with a general approach to green infrastructures.

SAFETY

- Increased seismic resistance of buildings and the capacity of city run-off, namely linked to green infrastructures as adaption measures to climate change, with benefits to reducing exposure to flooding events.

LEARNING

- Innovative forms of public engagement, including participative budget design, programs for social innovation and start-ups to enable community learning processes, and attempts to mitigate unemployment, but also to engage the youth in creative activities

This is happening at the same time that tourism is exploding with levels of demand never seen before. Historical built heritage is being rehabilitated and conserved and new business development conditions are created to attract people and promote wealth generation activities. But no doubt there are also visible signs of the emergence of the five features listed above.

5.2 TOKYO

The latest annual planning reports issued by Ministry of Land, Infrastructure, Transport and Tourism (MLIT) on development of the Capital Region (MLIT 2017) is analysed here as the main information source through the lens of the LCW framework. The Capital Region consists of Tokyo's city region and its hinterlands. The plans for Tokyo still retain the long-standing assumption that economic growth can and should continue forever and will automatically deliver wellbeing (e.g., development of a more efficient road system including three ring-road expressways overarching the region for the 2020 Olympics and engineering-centred disaster prevention). However, the plan promotes and recognizes changes in mind-sets and behaviours regarding LCW embracing health and liveability among people living in the city region. These changes are illustrated according to the framework as follows:

VICINITY

- Promoting municipal plans to concentrate public facilities for elderly- and child-care services around train stations and networking them throughout redevelopment projects.

SENSE OF PLACE

- Encouraging remote working and/or fewer work hours to improve system modularity of businesses, and let people spend more time off work.
- Improving landscape, schools and other cultural facilities, urban parks, healthcare and welfare (elderly and child-care) capacities (these items are recognized separately, but can be integrated in terms of sense of place).

URBAN AND SUBURBAN FARMING

- Putting abandoned farmlands back in production, promoting community farmlands, and recognizing multi-facet benefits (food production, ecological services, disaster evacuation, local amenity) of urban farmlands.
- Applying more biodiversity-friendly methods in public (shore protection) works.

SAFETY

- Prioritizing improvement of overall counter-disaster (especially against earthquake and flooding) capability (hard infrastructure, rescue plans and self help).

LEARNING

- Promoting government-led programs to build the capacities of NPOs (non-profit organizations) and individuals (MLIT 2014, TMG 2014).

It is evident that the official plans recognize changes in mind-sets and behaviours regarding LCW embracing health and liveability. However, the focus of the plans is still large-scale growth-oriented construction projects and the plans lack attention to their possible impacts on lasting wellbeing in communities. For example, the plans emphasize significance in developing more efficient road system (particularly for freight traffic of goods and industrial wastes), but they do not deal with consequent safety and environmental (e.g. noise, vibration and exhaust) issues for residents in the neighbourhoods. Also, urban and suburban farming is encouraged in the plans, but possible land contamination (due to industrial use in the past and 2011 disaster) is not clearly addressed. These characteristics imply unwillingness to challenge established practices as general mindsets of people in Tokyo. However, changes in mind-sets and behaviours towards more sustainable lifestyles is increasingly crucial, as it is highly questionable that such large-scale development projects are appropriate for a city with an ageing and declining population. Attentions to changes regarding LCW embracing health and livability have just emerged in the plans for Tokyo.

5.3 SIMILARITIES AND DIFFERENCES

The plans for Lisbon and Tokyo commonly recognize that conditions are being created that translate into a benefit of attention to matters related to LCW, and show some intention to promote actions such as small-scale farming on community lands with improved physical accessibility as well as a sense of belonging to a place. However, in both cities, unwillingness to challenge established practices coupled with inertia in adopting new routines to respond to new challenges is still visible in preserved overconfidence on engineering solutions and over-spending of public money relating to them. Also due to the same attitude, community learning has been largely government driven rather than community-based and independent. Overall, governments in both cities, rather than community organizations, have so far led initiatives to strengthen LCW-related characteristics. Even as if, like in the BipZip programme in Lisbon, the municipality aims to promote the programme through local partnerships with citizens, local organizations and the local commerce. But there are clearly insufficient bottom-up initiatives that start from citizens' initiative directly.

The differences include particular distinctions between the existing transportation systems in the two cities, as well as people's overall degree of passiveness to government initiatives. For example, Tokyo is planning for concentration of public facilities around existing train stations that are accessible by walking, bicycling or bus links, thus creating a vicinity space, while Lisbon addresses streets and districts for placing multi-functional facilities close to people. On the other hand, the residents in Lisbon have better chance to participate in urban decision making, for example through participative budgeting, better access to information on municipal planning and strategies, while those in Tokyo seem to demand less on such crucial means to engage more actively and effectively in urban decision making.

Features	Similarities	Differences
Vicinity	Improved physical accessibility and belonging are sought.	Solutions are different (Tokyo utilizes existing train station networks, while Lisbon takes street and district as unit).
Sense of place	Unwillingness to challenge established practices is evident.	Changing work style (for shorter work hours) is promoted in Tokyo. Lisbon encourages street community initiatives and small local commerce to create sense of place.
Urban/suburban farming	Small-scale farming on community lands is promoted.	Possible contamination must be addressed in Tokyo.
Safety	Over-confidence on engineering solutions is evident.	Information (maps etc.) is more accessible in Lisbon.
Learning	Government-driven community learning is leading changes.	The government-led programs are campaign for volunteer work in Tokyo.

Table 2 - Similarities and differences between Lisbon and Tokyo over the emerging features

5.4 STRENGTHS AND GAPS

An evident strength of both Lisbon and Tokyo is that neighbourhood-scale livelihood activities still remain there, so people in these cities maintain a sense of place and would well understand the notion of a city region as a collection of neighbourhoods. Another strength is that governments have started to initiate projects and programs that feature sustainability-related characteristics at the neighbourhood scale. But people are not willing to challenge government initiatives. Because the government decisions in both cities have predominantly engaged engineering-centred solutions, it is crucial to change the thinking, behaviour and understanding of development, to encourage learning to appreciate and apply non-engineering solutions, and to engage people effectively in dealing with complex issues and options. It is important also to encourage people to develop and apply their capacity to engage with the government decision-makers even when that engagement may challenge the established practices. The challenge is how to encourage such behavioural changes for lasting community wellbeing both among the government decision-makers and non-government people living there.

6 CONCLUSIONS

Throughout the study, we have observed signs of change in Lisbon and Tokyo, particularly in terms of promoting community farming and improving the quality of public space and physical accessibility to public service facilities. These changes suggest a shift in values from basic economic priorities to more LCW-related initiatives. But such actions have not been mainstreamed yet. Thus, as implications for future planning in Lisbon and Tokyo (and for other cities facing similar challenges), our study also suggests continuing challenges that call for needs to encourage:

- People's confidence and sense of independence to participate in community deliberations;
- More innovative behaviour by decision-makers, planners and community residents; and
- Greater emphasis on initiatives and public engagement at the neighbourhood scale.

LCW-related initiatives are promising and often attractive but also challenging. If LCW is assumed it may increase the sense of ownership of the community in relation to its living place with benefits to the urban management capacity that will then be shared with the community. However adopting LCW involve matters of great complexity and require significant changes in thinking and behaviour. In Lisbon and Tokyo, and probably in many other cities, mainstreaming LCW-related initiatives requires mutual willingness of the community residents and government decision makers to work together, to agree on common grounds and share a common vision to the development of the city, even if it controverts past conducts. The neighbourhood with community characteristics, highlighting human-scale setting, offers an attractive base for innovative initiatives.

ID 1577 | CONNECTING FOOD WITH PLANNING PROFESSION: A REVIEW PAPER ON THE DEVELOPMENT AND EVOLUTION OF URBAN FOOD PLANNING, EDUCATION AND RESEARCH

Hsiu Tzu Betty Chang¹; Chi Yun Lee¹

¹Department of Urban Planning, National Cheng Kung University
hsiutzuchang@mail.ncku.edu.tw ; fanchuntzu@gmail.com

ABSTRACT: The food system has been noticed by planning profession since the World Health Organization launched the Healthy Cities movement in the 1980s. As the result, countries gradually started to focus on the health, agricultural and urban food security issue and make efforts to create healthier and more liveable cities ever since. Food system has been regarded as production and consumption of food in general and could be divided into the policy and planning dimensions. Food policies are about agriculture, economic development, logistics and education can cooperate with each other in policy actions or how non-governmental organisations, farmers and other different stakeholders can work with the government. The spatial planning of urban food is related to how we can improve the access for people to get the healthy food and how to implement the sustainable urban food planning. In addition, urban design concerning the application of productive landscape and other tools are also parts of spatial interventions to urban agriculture and food city. Although food planning has gradually been discussed in recent years, there has been a lack of systematic review about this planning trend. In this paper, we reviewed the literature related to the subject of urban food planning since 1980. Through analysing articles in planning related journals, we created the literature maps and descriptive statistics that document the current development of food planning literature and organise them by the definition, themes, history, typology, evolution and future direction of food in connection with the planning research, practice and education. We wish to contribute to this emerging planning and design paradigm that concerning about food, public health, sustainability and the new rural-urban relationship.

KEYWORDS: healthy cities, food planning, urban agriculture, literature review, planning trend

1 INTRODUCTION

The food system has been noticed by planning profession since the World Health Organization launched the Healthy Cities movement in the 1980s. This reflects the increasing public concern on the food safety, food security and its relationship to toward a healthy and liveable environment. Food system contains two parts, including production and consumption, and could be considered by its policy and planning dimensions. In the policy dimension, it is about the cooperation between agriculture, economic

development, logistics and education sectors or the relationship within governmental sectors, non-governmental organisations, farmers and other different stakeholders. The planning cares about the spatial domain, regarding the location of the agricultural land, the availability of food and how to achieve a sustainable food planning. As for urban design, it can be related to the productive landscape and other tools to raise the public awareness on food issues.

Food issues have been discussed in different disciplines and the purpose of this paper is going to identify the emerging themes and topics in food planning in order to identify the potential research gap in planning discipline. While growing number of papers on the food subjects published in planning literatures, there is no comprehensive and systematic analysis on how this subject has been discussion in our profession. Therefore, the goal of this article is to identify the trends in food planning, using online literatures as the database, to discussed the similarity and difference on the subject of discussion on the food systems and food planning by the general public, academia, and planning scholars.

2 LITERATURE REVIEW

Pothukuchi & Kaufman's(1999) ground-breaking work "Placing the food system on the urban agenda: the role of municipal institutions in the food systems planning place the food issue in the centre of attention in the contemporary planning literature. They pointed out the rationality of behind such advocacy:

"Air, water, and food are the three essentials of life. Clearly, it would be extraordinarily difficult to have high-quality human settlements without high-quality air, water, and food. Planners have been heavily involved in efforts to improve the quality of air and water through air and water pollution control programs. But the third leg of the essential life tool, food, has been virtually ignored by planners. If planners are truly concerned about improving human settlements, they need to incorporate food issues into their working models." (Pothukuchi & Kaufman, 1999, p.8)

Besides of the basic necessity of life, they also highlighted the food issues are planning issues due to its relationship to local economy, public health, quality of neighbourhoods, urban sprawl, and many others. An year after, Pothukuchi & Kaufman's(2000) in another article "The food system: A stranger to the planning field", further discussed the key food topics at that time and identify planning actions improve the food systems, with particular focus from the social equity of food accessibility. As the results, literatures on the food issues has emerged in the area of food deserts (Battersby and Crush 2014), food security(Lang and Miao 2013, Opitz In addition, we used "Food", "Agriculture" and "Farm" as keywords to define the food-related hot topics in the planning literature. Finally, we made the cross-comparisons among topics in these subsets of literatures. The hot topics are decided by its frequency of appearance on the web and ranked accordingly. The purpose of the comparison is to discover the research gap in food-planning research in urban planning discipline. (Figure1)

Figure 1 - Research Design

3 GLOBAL DIMENSION

The Google Trends website allows researchers to download data for almost all countries at no cost and to download time series of any search term's popularity over time (provided enough people have searched for it). For these reasons, Google Trends is an attractive data source for social scientists. (Mellon, 2013)

Here we use Google Trends as the primary tool to search “Food Planning” and find the popular theme of interest by the general public. The keywords are “food planning” and searching dates are defined from 2004/1/1 to 2016/12/31. There are two classifications, “Related Topics” and “Related Queries”, in the results of Google Trends. Each classification ranks interrelated topics in two ways, “top” and “rising”, and each way lists 23~25 words. In this research, we choose “Related topics” to analyse and 50 topics are collected in our database (Figure2).

Figure 2 - The process of the global food-planning relate search

In the result of “Food Planning” searching, “Health” and “Nutrition/ Nutrient/ Academy of Nutrition and Dietetics” are in both ranking at the top and rising in the global food-planning discussions. This result shows that in the public pay more attention on food in relationship to health-related issues. Besides, it came to a conclusion that the popular topics in food planning in the world from 2004 to 2016 are dietary or entertainment-related. On the rising side, we see “Food security”, “Planning Commission”, “Vegetable”, “Food systems”, “Marketing” and “Business plan” are getting its popularity in the world. In this case, it reflects that the public are more interested in social and economic issues comparing to the spatial discussion, such as the urban planning which is appear in the last position of the ranking table. (Table 1).

	TOP	RISING
1	Food	Food security
2	Outline of meals	Month
3	Menu	Nutrient
4	Party	Food truck
5	Eating	Planning Commission
6	Health	Vegetable
7	Diet	Nutrition facts label
8	Plan	Breakfast
9	Event management	Food systems
10	Nutrition	Marketing
11	Budget	Buffet
12	wedding	Academy of Nutrition and Dietetics
13	Catering	Business plan
14	Cooking	Goal
15	Management	Budget
16	Family planning	Event management
17	Food and Beverage	Eating
18	Food Network	Health
19	Week	wedding
20	Company	Cooking
21	Wedding Planner	Management
22	Cost	Food
23	Fast food	Family planning
24	Dinner	Menu
25	Urban planning	Outline of meals

Table 1 - The searching results from the global dimension

In general, these topics are always discussed enthusiastically in the world, then gradually draw the academic attention. It might because the academic articles need more time to be published and lead to a lag concern on topics. Overall, the academia dimension provides a more detailed observation in the food planning. It is necessary and important to look into the academic literature to study the types of food planning issues had been discussed.

4 ACADEMIA DIMENSION

In the academia dimension, we have divided the keyword search into three part. One part is going to observe the number of different periods recognizing the time when it appeared lots of articles about food planning. Another part is going to find the hot issues in the academia dimension before 2016. The last is to identify important journals in this search.

Vitiello(2014) and Pothukuchi(2015) both discussed about the food planning from an evolution perspective. Use “Google Scholar” as the primary tool. We search “sustainable food planning” “food systems planning” “urban food planning” and “community food planning” to find literatures in four different scales. At the time

scale, we take “1980” as the first time division because it is the time that World Health Organization launched the Health Cities movement. Besides, according to the publication date of “Placing the food system on the urban agenda. The role of civil institutions in food systems planning”(Pothukuchi and Kaufman 1999), it takes “2000” as another time division for the reason that the above article is famously regarded as the new millennium of the food planning (Figure3).

Figure3 - The process of the academia data search by different time divisions

The growing scholar attentions on food planning issues was after 2000, despite WHO launched Health Cities movement was 1986. Besides, “Food systems planning” was the topic that mostly covered among four levels and this can be made a conjecture that most of the people talked about the food issue on the country scale (Table2 and Figure4).

Keywords	~1979	1980-1999	2000-2016	total
Sustainable Food Planning	0	1	420	421
Food Systems Planning	2	31	757	790
Urban Food Planning	0	2	301	303
Community Food Planning	0	8	75	83
Total	2	42	1553	1597

Table 2 - The result of the academia data search in different periods

Figure 4 - The bar chart of the academia data search in different periods

To identify the hot topics among the academic research on food planning, we collected the 99 journal articles from “Google Scholar”, excluding the review paper, non-English articles, incomplete articles, theses and books. Second, we review the articles and selected those with keyword listed. Lastly, we categorize these keywords and put them in groups according to their similarity and rank them according to their frequency of appearance. (Figure5). Among those article database, there are only 66 articles contains keywords and 576 keywords in our database. “Agriculture”, “Policy”, “Local” and “Security” ranked as the top four keywords that appeared more than ten times.

Figure 5 - The process of the academia data search

Times	Keywords
21	agriculture
15	policy
14	local
14	security
8	development
7	land
7	public
7	social

Table 3 - The table of the academia data search by Keywords lists

The above mentioned 99 articles also used to identify the journals that contribute to the food planning subject and with the important articles. Journals related to agriculture, justice, social and policy show the importance in this research. The table below list journals that included more than two popular articles in searching in google scholar. The most prominent journal in this analysis is International Planning Studies (Table4). International Planning Studies is a journal focusing on the challenges that urban, regional, and national and international levels facing in the planning.

Journal	Frequency
International Planning Studies	17
Agriculture and Human Values	9
Journal of Planning Education and Research	9
Local Environment: The International Journal of Justice and Sustainability	5
International Journal of Sociology of Agriculture and Food	3
Journal of Agriculture, Food Systems, and Community Development	3
Journal of the American Planning Association	3
Land Use Policy	3
Food Policy	2
Geography Compass	2
Journal of Environmental Policy & Planning	2
Journal of Hunger & Environmental Nutrition	2
Regional Studies	2

Table 4 - The journals with popular food-planning related articles

As urban planner, we need to be more sensibly aware of food issues in our lives(Pothukuchi and Kaufman 1999). Therefore, in the following research, we do the similar search on the urban planning literatures and identify the hot issues in the urban planning academia field and will be used to identify the potential research gap in the next step.

5 URBAN PLANNING ACADEMIA

First, we need to decide which journals are important in the urban planning academia. Second, find articles which have "food", "agriculture" and "farm" either in the title or in the abstract during 2000, the time has the significant growth, to 2016. Third, collect all listed keywords of selected articles and analyse the number of occurrences of words to point out main topics the urban planning academia (Figure6).

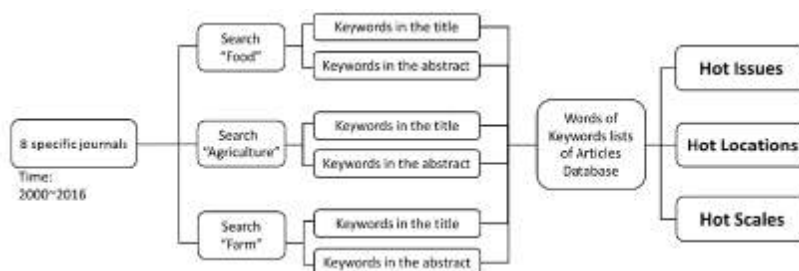

Figure 6 - The process of the urban planning academia data search

Referring to "Urban Studies & Planning Research Guide: Journal List" of the library of University of California, San Diego, we choose eight main journals and search the specific keywords to find food-related articles, including Environment & Planning A, Environment & Planning B: Planning & Design, Environment & Planning C: Government & Policy, Environment & Planning D: Society & Space, Journal of Planning Education and Research, Journal of Planning Literature, Urban Affairs Review and Urban Studies. There are 232 articles collected and 66 of them with keyword listed. The table5 below was the particular outcome which shows the words that mentioned more than 5 times, and these subjects are policy, agriculture, security, land and governance, that are mainly related to security or health. As we discussed in the literature review, the current literature on food planning are socially related. The spatial-oriented keywords, such as land, accessibility and the network show the relatively lower frequency in this research. As the result, we can conjecture current research efforts have made more attention on the social rather than the spatial terms.

Times	Keywords	Original Keywords
13	Policy	policy,policy-making,policy-mobilities,political-sensibilities,politics-of-possibility,political-ecology,new-political-spaces,food-policy,environmental-policy-making
12	Agriculture	urban-agriculture,agriculture,peri-urban-agriculture,agroecology,agrofood-standards,agricultural-change,agricultural-soil-carbon-projects
12	Security	biosecurity,food-security,Biosecurity,Biosecurity-governance,community-food-security,food-in/security,securing,security
10	Land	land-use,Conflicts-over-land,farmland-amenity,land,Land-grab,land-grabbing,landscape,land-scarcity,land-use-change,rural-land-management
8	Governance	governance,risk-governance,urban-climate-governance,urban-governance
7	Economy	bioeconomy,urban-economy,carbon-economies,economic-integration,evolutionary-economic-geography,local-economic-development,urban-economics

6	Desert	food-deserts,food-desert
5	Network	actor-network-theory,agrifood-network,alternative-food-networks,network-design,networks-of-practice
5	Environment	built-environment,environmental-lifestyles,food-environment,food-environments,obesogenic-environments

Table 5 - The table of the urban planning academia subjects searched by keywords

To put the spatial theme in the centre of food planning discussions, we further analyse the articles by its geographic location of study. We found most of the articles discussed the subjects or area in European countries, while South American countries did not attract the attention. Different regions have different food issues identified. For example, when it comes to European(Reynolds 2010), most of the food issues focus on the sustainable topics. When it comes to the North America (Cohen and Reynolds 2014, Pothukuchi 2010), Africa(Battersby and Crush 2014) or Asia(Lang and Miao 2013), the subject is socially related, in terms of health, justice and security (Opitz et al. 2015) (Table6).

Continent	Times	Country	Times	Original Keywords
Europe	34	Europe	8	Europe, European, Europeanising, Europe's
		British	4	British
		England	12	England, England's, Kingdom, Leeds, Cardiff, London
		Nederland	3	Dutch, Netherlands

Table 6 - The geographic area of food-related research in urban planning

Nowadays, we talk about food issues always at a city scale. In the “Avoiding the Local Trap: Scale and Food Systems in Planning Research”(Born and Purcell 2006), it considered the food issues with a view to the scale. Authors thought that the local or community level was before other bigger levels, according to the ecological sustainability, the social and economic justice and the food quality and human health. It reminded the public that it should not draw the equal sign between the local food and the healthy food. The local healthy food is assembled by the concept of fresh, healthy, short distance, justice and so on. At the end of the article, it brought up that the network approach can offer an alternative solution to the local trap. From this point of view, the scale of discussed issues is also important (Table7). The provincial level was the most mentioned keywords, and secondary levels were global and city. We seldom talked about the national scale of food issues. and it might be the neglected point of food issue. National food issues are related to food distribution in countries. Besides, if we can discuss food issues from the perspective of the central government, food issues can enhance the importance to a certain degree. In addition, it is worth to be noticed that the local scale shows its number of occurrence out of the expectation. It shows the trend that the public began to concerned about the food in their neighbourhood. About all, food issues are extensively discussed in every scale.

Scale		Times	Original Keywords
International		14	global, globalisation, globalization, world
National		1	national
Regional		11	Regional, metropolis, metropolises, Metropolitan
Provincial	urban	13	cities, city, municipal
	rural	25	rural, ruralities, suburban
Local		8	communities, community, community-based

Table 7 – The scale table of the urban planning academia data search

When we looked into abstracts of every articles and sorted them into four themes, we can also get a similar result as the result of the analysis of keywords lists collection. According to Sustainable Food Planning (Andre Viljoen and Wiskerke 2012), it classify food-related topics into four domains: Social relevance, Environmental relevance, Economic relevance and Spatial relevance. In the social relevance, it concludes the health, the food culture, the sustainable lifestyles and the food consumption. And in the environment relevance, it is about the organic food, the food production, the ecological footprint, the waste management and the biodiversity. When it comes to the economic relevance, it always talks about the employment and income, the food growing supplies, the local trade and the food processing. In the spatial relevance, it is related to the public open space, the accessibility, the land use and the planning. Besides, in order to know the evolution of the urban food planning from 2000, we count the proportions of each subject in every year. There are 238 articles analysed in this study, and each article is categorized into one domain. On the basis of above characteristics, you can see the result of classification in the figure7 and the table6.

As you can see, the society domain always got the higher amount in every year especially after 2012. The amount of articles of the economy domain was always more than the environment domain before 2013, but recently the environment domain got the notice in the urban planning academia. As for the spatial domain, it got a lower attention of the urban planning academia. This might be a crisis because we should

put the most effect on the spatial operation in the urban planning. However, the result showed the opposite direction. Except the urban planning, there is seldom professional field that will care about the spatial issues. If the urban planner continues to ignore spatial food issues, we will come down to a terrible life quality and fall to build a sustainable food city.

	economy	environment	society	spatial	Total
2000	1	2	3	0	6
2001	1	1	1	1	4
2002	10	1	15	0	26
2003	2	2	5	1	10
2004	3	1	6	2	12
2005	4	3	5	0	12
2006	1	3	5	1	11
2007	3	4	7	2	16
2008	3	2	10	0	15
2009	1	0	3	2	7
2010	5	3	9	1	18
2011	5	3	4	3	15
2012	4	0	7	1	12

2014	3	4	7	1	15
2015	3	3	14	1	21
2016	4	7	12	1	24
Total	53	40	119	17	230

Table 6 - The table of the urban planning academia data search by title

Figure 7 - The number of articles of each subject in every year after 2000

In all 17 articles about the space, most of them focus on the policy. There are eight articles related to the policy discussion. Reframing the foodscape: the emergent world of urban food policy(Moragues-Faus and Morgan 2015) talked about a new food governance system in Malmö and Bristol. It brought out this kind of new governance needs a close cooperation between governments and civic organizations. Even though it might be a challenge to create a local-based food planning within complex governance systems, we should not give up devoting to building a sustainable food city. Second more are seven articles discussed the accessibility and the location of the retail, food desert and the network in the urban area. Besides, there also two paper discussed the food land use. Planning on the Edge: England's Rural — Urban Fringe and the Spatial-Planning Agenda(Nick Gallent, Marco Bianconi and Andersson 2006) looked into the multi-dimension food planning, including the management, the policy and the land use, on the edge of cities which are always to be the rural area and related to the location of the food production. Colonist Household Decision making and Land-Use Change in the Amazon Rainforest: An Agent-Based Simulation(Deadman et al. 2004) discussed in a relatively smaller scale in the farm planning. We

discussed a lot on food issues but seldom tried to develop a systematic food planning to those problems to create a sustainable food city.

6 CROSS-COMPARISON

Different topics show their importance in three dimensions (Table 8). For example, "Health" ranks first in the global dimension but it ranks fourth in the academia and shows the low importance in the urban planning academia. According to the concept, other topics in the ranking show the same meanings of their rankings.

	Global	Academia	Urban Planning Academia
1	Health	Agriculture	Security
2	Nutrition	Policy	Policy
3	Security	Security	Agriculture
4	Food Network	Health	Land
5	Economy	Justice	Governance

Table 8 – The ranking table of hot issues in different dimensions

We need to notice the subjects that are outside the urban planning but located at the global dimension and the academia dimension (Figure 15). In general, the common subject is security and it is also the top three theme in all dimensions. It indicates that we have put lots of effort on it and followed it closely for a long time. Comparing the global dimension and the academia dimension, "Health" and "Security" are both critical issues. Look into the academia dimension and the urban planning academia dimension, besides security, "Policy" and "Agriculture" are both identical issues. Then regarding the global dimension and the

urban planning academia dimension, there is no common subject except the security. It is a noteworthy view that the urban planning did not notice the issues that the global has already noticed on food issues, such as "Food Network" and "Nutrition". These two subjects are relatively important in the urban planning academia

Figure 15 - The original diagram of hot issues in different levels

7 CONCLUSION

In the "The Food System: A Stranger to the Planning Field", it also became aware of the similar situation. "Planning texts over the last few decades have provided a comprehensive overview of the planning profession while identifying several central topics. These include physical planning and urban design, land use, economic development, social planning, growth management, real estate development, public infrastructure, environmental planning, urban transportation, housing, historic preservation, and technology planning (Catanese & Snyder, 1988; Chapin, 1972; Levy, 1988; So & Getzels, 1988). None of these texts includes planning for the community food system, and few of the specialisations described allude to the food system." (Pothukuchi & Kaufman, 2000, p.3)

Therefore, we need to focus much more on the spatial planning in the food system, such as how to connect the public space, the visual amenity, the transportation systems, the land use planning to the food systems in the future. As the "Feeding the City: Towards a New Research and Planning Agenda" concluded, "more comparative and comprehensive studies of the emerging urban food strategies are necessary to fully capture the potential of fast-growing cities in creating or recreating more sustainable social, economic and environmental linkages with their surrounding regions." (Sonnino 2010). The

advantage and the importance of the urban planning is that we have a relatively greater power than other non-spatial professional fields in cities. We need to make good use of our particular tools to solve food issues, instead of staying in the discussion of social issues. Moreover, according to the study, we have already discussed lots of social issues of the food planning and got a roughly clear context. As the result, it is time to put our effort on the spatial discussion and think more comprehensively on the spatial food issues to create a sustainable food city.

ID 1582 | RESEARCH OF TRAVEL BEHAVIOR INFLUENCE FACTORS OF THE AGED AND SUGGESTIONS OF THE SENILE APARTMENT SITING

Qinshi Li¹; Kang Cao¹

¹Zhejiang University

qinshi_li@126.com ; 1195820813@qq.com

ABSTRACT: This article aims to discuss the siting of the senile apartment from the perspective of travel behavior of the aged. The aged spend much more time on the indoor activities in the apartment than the travel behavior. However, travel behavior, an important component of human life, can energize the aged and motivate their socialization. Currently the siting of the senile apartment from the view of travel behavior remains to be studied. To select the proper siting of the apartment based on the physical and psychological characteristics of the aged as well as their transportation will energize them and promote them to participate in more social activities. Their social identification will thus be lifted. Their ability of independent living can be largely preserved and their life quality in the apartments be improved. This article is summarized into four parts. First of all, it proposes that the proper outing is significant for the health of the aged in the apartments by analyzing the outgoing characteristics of the aged from the physical, psychological, and social attribute perspectives. Second, the types of outgoing of the aged are analyzed. According to the outgoing purpose, the travel behavior of the aged can be categorized into four types: shopping, medical, leisure, and cultural pursuits. The outgoing types have different promotion on the aged and require different siting. Then it proposes the influence factors for the outgoing of the aged include the internal factors such as age, gender, financials, and the external factors such as distance and scale. Different outgoing purposes are influenced by different factors. The travel for shopping, for example, is influenced by the internal factor of financials and the external factor of scale. The travel for medical care is influenced by the age and the scale. The travel for leisure is influenced by the age and the distance. The travel for cultural pursuits is influenced by the age, scale, and distance. In the end, this article exhibits that the site selection of the senile apartment should be based on the reachability of the travel behavior for the aged. This article builds an evaluation system for the indices based on the influence factors. Some suggestions for the siting are proposed: 1) small business should be enough near the siting; 2) general hospitals should be easily reached; 3) nearby leisure and entertainment venues, and 4) cultural facilities should be considered. This article discusses the four types of outing and proposes the corresponding site selection strategies. However, problems still exist. Firstly, individual difference will lead to different effects. Secondly, a perfect siting for the apartment of the aged that satisfy all the requirements does not exist. Moreover, more factors including the scale of the apartment, the ground rent, and the planning, should be considered. Thereby, the most proper siting scheme should be planned in terms of the evaluation system of the indices. Proper siting will help the aged to merge into the society, identify with themselves, and enjoy their twilights years in the apartments.

1 INTRODUCTION

Population of the aged has reached 230 million in China by the end of 2016, consisting of 16.7% of the total population. The government provides income support for the aged as well as social, welfare and health services, meanwhile the old man will also be a significant opportunity for social products and services (eg Golledge and Stimson, 2013) 1 There will be a trend of development for the senile apartment from welfare towards aspects of professional, comprehensive, high-end, profitability, etc., and the senile need to focus more on high-level requirements of the aged.

Travel behavior is of great significance to the aged, which can promote the energy of the aged and stimulate their socialization. Further, Menec has shown that the higher the overall level of activity of the aged is, the stronger the sense of happiness will be, the greater the positive function of activity can reach, and the lower the rate of mortality will become (eg Menec, 2003). 2 However, at present, the majority of the senile apartments are located in the remote areas between the urban and rural with the advantage of the cheap rent, good environment, and large areas, which leads to serious problems such as no convenient transportation, inconvenient visit, and lacking of travel behavior. Especially some senile

apartments are closed, and the aged activities are limited within the old apartment. Compared with other time, the old man travel behavior time is very short.

The research on the aged travel behavior in the senile apartment is rare. Existing research is majorly performed from the perspective of maximizing the equity to meet the survival needs of the aged, failing to give full consideration to their physical and psychological needs. This article, based on humanization, attempts

to make the aged from making a living to enjoying their life from the perspective of outing actives. This article proposes advices of senile apartment siting, according to the physiological and psychological characteristics of the aged, the travel behavior influencing factors, and the influence of the facilities configuration space model over the travel behavior of the aged (eg Chai, 2010)³.

2 TRAVEL BEHAVIOR CHARACTERISTICS OF THE AGED

This paper studies on the people aged 60 and above, according to the actual circumstance and the retiring age of China. Stepped into the old age, the aged travel behavior will be affected by the changes of their physical, psychological and social attributes. The phenomena are specific to their group.

A series of changes take place in shape and the function of the body of the aged, and the sensory system are aging and declining. The psychological of the aged changed. On the one hand, they are prone to depression and loneliness, and to reduce travel behavior. On the other hand, the aged are easy to produce negative emotions including emptiness, wayward, restlessness and anxiety without good social activities and interests. The social attributes of retired old man change as they are turned into the role of bystanders and consumers from participants and organizers. The social network established through the jobs is lost, as well as the commuter travel and part of the social travel. They are becoming less sociable and have less living space.

Overall, the aged have less frequency, less time and shorter distance of travel behavior compared with the young (eg Feng and Yang, 2015).⁴ The way of travel behavior for the aged reduces, with the main way by walking and by bus. The range of travel behavior is more onefold, and the frequency is relatively fixed.

3 CLASSIFICATION OF TRAVEL BEHAVIOR OF THE AGED

Travel purpose of the aged gradually changes from the survival travel to consumer travel (eg Feng and Yang, 2015).⁵ This paper focuses on the aged residing in the senile apartment, who have less family fetter but more self-pursuit. According to the travel purpose, the travel behavior of the aged can be categorized into four types: leisure, shopping, medical needs, and cultural pursuits. The travel types have different promotion on the aged and require different sitings.

3.1 THE TRAVEL FOR LEISURE

Compared with the aged living in past who are only living for their families, the aged of contemporary era has more leisure time, and their leisure area radius is expanding. The leisure preferences are personalized and the recreational consumption is more diversified (eg Wang et al, 2011).⁶ In accordance with the extent of leisure activities, they can be divided into the home leisure and the outdoors leisure. In accordance with the contents of leisure activities, leisure activities can be classified as leisure for delight and leisure for fitness. Leisure activities of the urban aged are mainly for physical exercise and walking in the park. In this paper, the object of study mainly includes urban public green space at all levels.

3.2 THE TRAVEL FOR SHOPPING

The travel for shopping of the old man is different with the general consumers, mainly for the following reasons: 1. Less outing. The declining of the body function leads to the decrease of outing ability. 2.

Purchasing power decline. Most of the old man discourage consuming as their income falls. 3. Particular family role. Compared to the old man living at home, the aged in the senile apartment have thinner relationships with their children, and narrower range of the objects they need to buy as well as lower purchasing power. on the other hand, objectively, the elderly has more discretionary time, and their transportation cost is low; Subjectively, the demand for daily shopping of the urban aged is increasing, and their shopping intention is more abundant (eg Han, 2015). 7 In this paper, the object of study not only includes large business such as various shopping centers and supermarkets, but also includes convenience stores and street stores.

3.3 THE TRAVEL FOR MEDICAL

The travel for medical is a negative but necessary travel for the old. If we equip the senile apartment with enough medical devices, the old man can check-up, solve minor illness within the senile apartment, and can reduce the travel for medicals. However, there are only less than sixty percent of the senile apartment equipped with simple medical equipment, and up to twenty percent of the senile apartment have neither professionals, nor the basic medical devices (eg Wang, 2016)8. The smoothness of the travel for medical will reduce the worries of the aged, and it should be a factor to be considered in the siting of the senile apartment. In this paper, the research objects are mainly general hospitals and community hospitals.

3.4 THE TRAVEL FOR CULTURE PURSUIT

Among the five demands proposed by Maslow that will accompany a person's whole life, the emotional needs, the demands of belonging, esteem and value realization will not reduce with the aging body. Religious beliefs can provide relief for elderly people, eliminate the worry and fear of death, and eliminate their loneliness. The senile apartment should give them concern and support (eg Lei and Ban, 2014). 9In this paper, the objects of study are mainly all kinds of religious facilities.

4 ANALYZE THE FACTOR INFLUNCE FOR TRAVEL BEHAVIOR OF THE AGED

The main influence factors of the aged travel behavior include the individual social and economic attributes (internal factor) and the environmental factors (external factor). Individual social and economic attributes (internal factor) include social attribute, economic attribute, family attribute, and personal property; the environmental factors (external factor) include urban services, facilities supply and so on. This paper discusses the influence of the internal factors on all kinds of outside activities with qualitative descriptions, from the aspects such as age and gender. The analysis of the characteristics of different kinds of facilities space structures in quantitative ways is emphasized. The degree of influence is measured using the frequency of travel behavior as a positive index.

4.1 ANALYZE THE FACTOR INFLUENCE FOR THE TRAVEL FOR LEISURE OF THE AGED

4.1.1 INTERNAL FACTORS

Crawford and Godbey proposed the leisure constraint hierarchy theory, where constraints are divided into three levels including the personal internal restraint, the interpersonal constraints, and the structural constraints (Han, 2015). 10 As the age increases, the frequency of travel for leisure of the aged living in the senile apartment is reduced to an average of 3.02 times per week, which is lower than the aged outside; the range of travel for leisure of them shrinks. The leisure space distance of people over 75 years of age is most concentrated within 0.5 km, while the leisure space of people between 55 and 75 years of age is larger and concentrated within 3 km.

Genders have few influence on the travel for leisure. Travel frequency of the old woman living in the senile apartment is slightly higher than the males of the same age; leisure activity of the aged in the senile apartment is mainly concentrated within distance of 1 km. Within the scope of the leisure activity distance

of about 3 km, the proportion of men is higher than women, while the percentage of elderly women is higher when leisure travel distance is within about 1.5 km.

4.1.2 EXTERNAL FACTORS

The travel for leisure of the aged subject to the distance attenuation law in general, but there is a space phenomenon that discontinuous jumping concentrated. There is the phenomenon that leisure activities are concentrated at some certain distance bands, forming the nested circle-like spatial structure of leisure activity. Taking 30%, 60%, 90% as indicators, different circles of regions are divided into basic leisure activity circle, expanding leisure activity circle, special leisure activity circle and senior leisure activity circle, according to the proportion of activities focused. The circle where the leisure activity of the aged concentration accumulates to 95% is regarded as the boundary of leisure activity space.

Thus, the leisure space structure pattern of the aged live in the senile apartment can be summarized as follows:

- I. Basic leisure circle (circle range of the distance from the senile apartment is 0 ~ 0.5 km). The senile apartment of small scales always tends to distribute in the community. The range of this layer roughly equals
- II. to the community's scope where the senile apartment is located. The aged in this circle mainly utilize the green space in the senile apartment, the green space in the community, fitness equipment etc.
- III. Expanding leisure circle (circle range of the distance from the senile apartment is 0.5 ~ 1.0 km). The range of this layer roughly equals to the range of the district's scope. The aged in this circle mainly utilized the green space of the district, flowers and birds market and the nearby parks.
- IV. Senior leisure circle (circle range of the distance from the senile apartment is 1.0 ~ 3.0 km). The aged in this circle mainly utilized the city park, the square, the public green space and the elderly leisure activities organizations, etc.
- V. Special leisure circle (circle range of the distance from the senile apartment is 3.0 ~ 5.0 km). A minor part of the young old may take part in some activities organized by the aged organization, to have a long journey.

Figure 1 – the leisure Space structure of the aged in the senile apartment
Source: draw by author

4.2 ANALYZE THE FACTOR INFLUENCE FOR THE TRAVEL FOR SHOPPING OF THE AGED

4.2.1 INTERNAL FACTORS

Form the view of individuals, gender, age, income and family life cycle have a significant impact on the consumer behavior. In addition, the individual's consumption idea and attitude also affect the consumer behavior patterns. Research shows that a learned behavior takes up a large proportion of the consumption activities of the aged, especially of the lower level of daily commodity shopping. Depending on individual

experiences and habits, the process of making consume decision becomes simpler, and the consumer behavior becomes the daily repeated activities (eg Chai, 2010).

With the growth of the age, the frequency of travel for shopping of the aged decreases gradually. Especially after 75 years old, most old people don't go out for shopping; The space of consumer behavior is shrinking. The way of travel for shopping is simplified. And travelling on foot becomes the vast majority way to shopping for the aged.

Gender differences in: the shopping frequency of the old women is higher than the old man. The old women prefer the accompanied shopping, while more than half of the old men prefer to shopping alone. From the view of spatial distance, due to the discrepancy in trip modes, shopping space dimension of the old men is broader compared to the old women.

4.2.2 EXTERNAL FACTORS

The completeness of the commercial space layout has a direct impact on the characteristics of the space of the consumer behavior. For the aged, the spatial distribution affects their frequency of travel for shopping. The configuration of the community-level commercial facilities affects the lower-level commodity consumption activities. The configuration of the city-level commercial facilities affects the high-grade commodity consumption activities.

According to the spatial distances of shopping of the aged in the senile apartment, there is a rule that with the expanding of distance the shopping frequency declines. 65% of the shopping activities take place within distance of 0 – 1.0km to the senile apartment, and the drop rate of the frequency of the travel for shopping basically remains the same, but further than 1.0 km the frequency of the travel for shopping decreases much faster.

The spatial structure pattern of shopping of the aged live in the senile apartment can be summarized as follows:

- I. the first concentrated shopping circle (circle range of the distance from the senile apartment is 0 ~ 0.5 km). 35% of the shopping activities of the aged live in the senile apartment are concentrated in this circle. This circle brings together the low level of business services, such as convenience stores, small supermarkets, small fruit shop, etc.
- II. the second concentrated shopping circle (circle range of the distance from the senile apartment is 0.5 ~ 1.0 km). 30% of the shopping activities of the aged live in the senile apartment are concentrated in this circle, and the attenuation rate is 5%. This circle is the zone of transition for the commercial service facilities from low-level to senior, and it has brought together some medium-sized supermarkets and a small number of large supermarket.
- III. the first dispersed shopping circle (circle range of the distance from the senile apartment is 1.0 ~ 1.5 km). 18% of the shopping activities of the aged live in the senile apartment are concentrated in this circle, and the attenuation rate is 12%. In this circle distributed large-scale supermarkets, shopping plaza, fruit supermarket, etc.
- IV. the second dispersed shopping circle (circle range of the distance from the senile apartment is 1.5 ~ 2.0 km). 10% of the shopping activities of the aged live in the senile apartment are concentrated in this circle, and the attenuation rate is 8%. There are usually a number of senior business services, such as a large supermarket, markets, shopping plaza, etc.

Figure 2 – the shopping Space structure of the aged in the senile apartment

Figure 2 – the shopping Space structure of the aged in the senile apartment
Source: draw by author

4.3 ANALYZE THE FACTOR INFLUENCE FOR THE TRAVEL FOR MEDICAL OF THE AGED

4.3.1 INTERNAL FACTORS

Age has significant effects on travel for medical needs of the aged. The nature law of gradual recession of the body leads to that with the increasing of the age, the monthly frequency of travel for medical needs increases gradually. Medical travel behavior differs significantly among individuals. The frequency of travel for medical needs is related to the aged body quality and the concepts of healthcare, and more importantly affected by distances, technology, prices, waiting time and other factors. In addition, whether the hospital is a health care fixed-point units also affects the choice of the aged. They would rather go to the further hospital if nearby hospitals are not healthcare fixed-point units. Therefore, the influence of this factor should also be considered. Compared to travel for shopping and leisure activities, the influence of distances on travel for medical is not so obvious within a certain distance.

Gender also plays an important role in the health function of the aged. Senile pathology and sociological studies have shown that women's health functions are inferior to men in many aspects. However, from the points of the statistical results, the difference in the frequency of travel for medical is not very obvious. But there are differences in the spatial structure of medical needs for the aged. More men than women tend to go further for medical services.

4.3.2 EXTERNAL FACTORS

Taking 30%, 60% as indicators, different circles of regions are divided into basic medical activity circle, expanding medical activity circle and senior medical activity circle, according to the proportion of activities focused. The circle where the aged medical activity concentration accumulates to 95% is regarded as the boundary of leisure activity space.

The spatial structure pattern of medical needs for the aged live in the senile apartment can be summarized as follows:

- I. Basic medical activity circle (circle range of the distance from the senile apartment is 0 ~ 0.5 km). Within this circle, the aged mainly utilize the medical service of the community health service stations, as well as the medical service of the clinics inside the senile apartment. Excluding the activity of using the medical facility within the senile apartment, 20% of the medical activities of the aged live in the senile apartment are concentrated in this circle.
- II. Expanding medical activity circle (circle range of the distance from the senile apartment is 0.5 ~ 1.0 km). The distance of this circle is also the limit range of travel for medical on foot. In addition to community health service centers, this circle has some high-grade hospitals.

- III. Senior medical activity circle (circle range of the distance from the senile apartment is 1.0 ~ 3.0 km). This circle is far from the senile apartment, and the frequency of travel for medical tends to decline. But the decline rate is not obvious. This is because that the travel for medical taken within the circle mostly is seeking for senior hospital or municipal hospital. With the increasing of distance, the level of medical facilities is higher.

Figure 3 – the medical Space structure of the aged in the senile apartment
Source: draw by author

4.4 ANALYZE THE FACTOR INFLUENCE FOR THE TRAVEL FOR CULTURE PURSUIT OF THE AGED

4.4.1 INTERNAL FACTORS

During 2000 to 2010, the proportion of the aged who have religions remain between 14% and 17% (eg Huang et al, 2015)¹². The religious participation rate of the aged in China is comparatively high, and it gradually increases with age increasing. Gender have great influences on religious travels. The percentage of women participating in religious activities is twice as much as the men. The believers among the aged living in the senile apartment at least take up more than 15%, where most have beliefs in Buddhism or Christianity. As a result, the distance of the religious buildings also needs to be considered for siting of the senile apartments.

4.4.2 EXTERNAL FACTORS

The aged who participate in cultural activities tend to have a strong will, and their travel resistance is comparatively stronger. But it is also restricted by external conditions that, since the distance of religious places is more than half an hour's drive, the frequency of outgoing for culture pursue plummeted. The size of the religious sites has little influence on religious travel of the aged. The numbers of religious places near the senile apartments are quite different. Some senile apartments have many nearby religious places, while some have little.

5 SENILE APARTMENT SITING EVALUATION INDEX SYSTEM

Space is an important carrier of the interact of the aged and the external environment. Reasonable spatial layout and construction can promote the travel frequency of the aged (eg Wan, 1994).¹³ An evaluation index system for siting of the senile apartment is provided, that taking the aged activity space as the breakthrough point, and giving full consideration to the effects of external factors. Based on above analysis, the weights of external factors are different, mainly due to the fact that different purposes of travel behavior have different influence degree for the life of the aged, and different purposes of travel behavior have different demands on surrounding facilities. Thus, a reasonable evaluation index system will help to evaluate the location of the senile apartment intuitively and accurately.

Under the condition of a given temporal and spatial constraints, the time-space range that an individual could physically reach, is expressed in the space-time as space-time prisms or potential path area. To understand it from the angle of activity, the potential path area refers to the area an individual is able to get to, after a fixed activity, under the condition of guarantee that next fixed activity can be reached on time. It is the activity circle of the aged. The volume, the area or the number of opportunities for activity is likely to be used as measure index of accessibility (eg Chai, 2014)14.

The senile apartment siting evaluation index system is based on travel behavior of the aged from four aspects: the travel for leisure, the travel for shopping, the travel for medical, the outgoing for culture pursue. Each index can be divided into secondary indicators from the distance, radiation scope, scale and so on. Combined with literature review method, the Delphi method (invited 3 experts engaged in endowment facility from colleges, 2 experts engaged in social welfare from civil affairs bureau and 2 directors of department of the senile apartment to set up an expert panel, and determined the indicators after two rounds of feedback) and the actual situation of the senile apartment, build a hierarchical structural model of senile apartment siting evaluation index system based on outgoing activity of the aged.

goal level A	First level indicator (system level B)	Second level indicator (index level C)
main indexes of the senile apartment siting evaluation based on travel behavior of the aged	Travel for leisure	travel distance, Natural Environment
	Travel for shopping	travel distance, type
	Travel for medical	travel distance, rank
	Outgoing for culture pursue	travel distance, type

Table 1-main indexes of the senile apartment siting evaluation based on travel behavior of the aged
Source: draw by author

First of all, the secondary indicators are different in units and can't be compared directly. Thus, in the model the method of maximization of dimensionless is used to quantify the criterions. Then, we established an evaluation system with hierarchical structure, and determined the subordinate relations between the upper and lower level elements. Assuming that the upper level of element as a criterion have dominated relationship to the next level of elements, the corresponding weights are assigned according to their relative importance under the criteria. The assignment of the Criteria Importance weights based on the Intercriteria Correlation(CRITIC) method mainly includes the subjective experience method, analytic hierarchy process (AHP), principal component analysis (PCA), Delphi method, etc. The evaluation index system of the senile apartment siting evaluation based on travel behavior of the aged and the judgement matrix for comparison between every two indexes are presented by a comprehensive calculation which uses the expert method and Analytical Hierarchy Process (AHP), and the weight of each indicator were determined.

First level indicator	The primary index weight	Second level indicator	Secondary index weight	combination weight
Travel for leisure	0.28	travel distance	0.78	0.22
	0.28	Natural Environment	0.22	0.06
Travel for shopping	0.25	travel distance	0.63	0.16
	0.25	type	0.37	0.09
Travel for medical	0.35	travel distance	0.55	0.19
	0.35	rank	0.45	0.16
Outgoing for culture pursue	0.12	travel distance	0.36	0.04
	0.12	type	0.64	0.08

Table 2-weights of the main indexes of the senile apartment siting evaluation
Source: draw by author

The using of analytic hierarchy process (AHP) provides a new thought and method to evaluate the location of the senile apartment objectively and accurately. It is important to note that the demand of the index is relatively high. So, it is a tricky filter link in index, and must go through several rounds of discussions and modifications, and get the acceptance and approval of the authorities as much as possible. Only in this way, the results on the basis can have the meaning of the further promotion. Thus, this article took a more

lavish description to describe the internal and external factors, put forward the selection of quantifiable indicators, and light on expert review process and data processing.

The evaluation index system has many functions. Firstly, we can see the impact of external factors directly. For example, the distance of green space for travel for leisure from old apartment is the most important parameter that affects the travel behavior of the aged, and the distance of the culture facilities surrounding the senile apartment has the minimal influence; In addition, when other conditions are similar, the planning of site selection which is more advantageous to the aged can be evaluated by the evaluation index system, so as to provide a strong basis for site selection.

6 REFLECTION AND PROSPECT

This article discusses the four types of outing and proposes the corresponding site selection strategies.

1. There should be complete facilities around the senile apartment to stimulate the travel behavior of the aged. 2. Give priority to the demand of travel for medical of the aged. We should give priority to the most important needs of outgoing as the aged have a lot of travel behavior. Facility requirements are hard to be considered in every aspect in the selected location and the first consider is the most important requirements of the aged. Especially if the senile apartment cannot provide basic health care, the location should be near the hospital. 3. Relative to the scale and quality of green space, the distance from the senile apartments to the green space is the most important. 4. More small business should be distributed in the area close to the senile apartment. Relative to the large shopping centers, small business services surrounding the senile apartment is more important. 5. Although rarely aware of, the cultural facilities, especially the religious facility also have a strong role in promoting the travel behavior of the aged.

However, problems still exist. First, individual differences will lead to different effects. Second, a perfect siting for the apartment of the aged that satisfy all the requirements does not exist. Moreover, more factors including the scale of the apartment, the ground rent, and the planning, should be considered. Thereby, the most proper siting scheme should be planned in terms of the evaluation system of the indices. Proper siting will help the aged to merge into the society, to identify with themselves, and to enjoy their twilights years in the apartments.

1 INTRODUCTION

Design and planning actions to improve urban health and well-being are well-recognised as some of the key drivers and indicators of sustainable, inclusive and resilient urban and community development world-wide. Yet, due to rapid growth and transformation, increased densification, hybridisation and intensification, our cities continue to generate problems, stress, harsh conditions and inequality, instead of becoming healing, empathetic, inclusive and safe environments for all.

Our understanding and experience of the built environment are primarily built around multi-sensory, emotional and symbolic modes of exchange with space (Merleau-Ponty, 1962; Pallasmaa, 1996; Pérez-Gómez, 2006). Active multi-sensory and emotional dialogue with all environmental stimuli, including positive distractions, textures, materials, colours, signage, culture-specific clues, way-finding and overall aesthetic atmosphere, profoundly shape our understanding of the built environment and are vital for physical, psychological and social well-being of all ages. However, while architecture has immense potentials to engage the immediacy of people's experiences more effectively than other art forms (Holl et al., 2006), our contemporary cities are more than often either sensory overwhelming or sensory depleting, which results in physical, mental and emotional stress. Stress is the major cause of diseases, pandemic depression and death in the developed world (WHO, 2002), with more than 50% of deaths worldwide stemming from chronic non-communicable diseases that are instigated by the continuous exposure to numerous and intense stress conditions of contemporary cities (OxHA, 2008).

2 SCOPE AND OBJECTIVES

The contemporary shopping environments have long been criticised for manipulating with people's sensory and emotional reactions through employment of sometimes very sophisticated design 'strategies' (such as theming, 'total landscaping', 'mallification' and 'Disneyfication') in order to achieve higher consumption goals (Crawford, 1992; Dovey, 1999, 2010; Mitrasinovic, 2006; Pimlott, 2008-9.). Such strategies are seen as negative as they affect users' behaviour and well-being negatively as well as promote social exclusion. However, consumption represents a dominant part of our everyday practices today, and it is inscribed in almost all types of physical spaces we use. Since consumption is an inherently spatial, political, aesthetic, ethic and economic practice, "spaces of consumption are always produced as a field of forces, exchanges and interactions" (Styhre and Engberg, 2003, p. 120). Shopping malls have become influential model for various urban developments (including healthcare) and are tightly knitted into the everyday environment of many dense Asian cities, such as Singapore, Hong Kong or Tokyo. In these cities, they may arguably be seen as perpetual laboratories of "positive stress" (positive distractions), while blurring the boundaries between the indoor and the outdoor, private and public.

Accordingly, the scope of this paper involves investigation of the role of multi-sensory approach to achieving holistic healing outcomes, while focusing on contemporary shopping spaces, in spite of their manipulative design, quasi-publicness and profit-oriented motifs. Creating health-supportive and ageing-friendly environment goes beyond the bounds of healthcare and eldercare facilities as well as beyond hygiene, universal design and curing. The premise is that in order to trigger suggestive and positive relationships between space and users, all segments of urban developments would need to acquire an active role of healing.

The main objectives of this paper are:

- To review and discuss the role of multi-sensory experience in shaping health-supportive and ageing-friendly built environments; and
- To investigate the capacities of contemporary consumption spaces to overcome the mere consumption motifs and to acquire an active health-supportive role.

3 RESEARCH APPROACH AND METHODOLOGY

Qualitative approach employed in this study involves two main phases:

- Discourse analysis and research instrument development, based on a comprehensive literature review of theories and design practices related to multi-sensorial experience, health-supportive and elderly-friendly environment;
- A comparative case study analysis of four consumption spaces in Singapore and Belgrade, Serbia, which combined combines spatial explorations, first-person observations, participatory photo-journeys, multi-sensory mapping, interviews and on-site questionnaires.

4 MULTI-SENSORY EXPERIENCE – LITERATURE REVIEW

Sensory urban experience is not entirely new topic in architectural and urban design discourses, mostly stemming from the phenomenological approach and other disciplines, such as social sciences, human geography, anthropology, cultural theory and environmental psychology. At the beginning of the 20th century, a number of writers, including Georg Simmel (1997) and Walter Benjamin (1999), to name some, emphasised the importance of a multi-sensory approach for understanding rapid changes the modern cities of that time were experiencing. Human geographers, such as Relph (1976) and Tuan (1977), further focused on creation of the sensory and cultural meanings of places.

It has often been argued that people's senses have been considerably impoverished by monotonous environments and through the dominance of vision (Degen 2008; Pallasmaa 1996; Jay, 1993). According to Zardini (2005), due to an increasing preoccupation with the visual and the hygienic, standardisation and sanitisation, the perceptual sphere is under continuous erosion. Such a "trend" can be traced since the Renaissance and the Enlightenment, through rationalist, functionalist and modernist approach to design, in which the space should discourage close physical encounters (Degen and Rose, 2012). The result is either an aggressive and stressful environment or a "homogeneous sensory experience" (Erwine, 2014) of the "decorporealised space described by a fear of touching is a space dominated by the eye, where the body and tactile reality are extinguished by the dominance of visuality" (Diken, 1998, p. 72). According to Gibson (1986), however, the senses are not passive receivers, but rather aggressive seeking mechanisms, even though people are not aware of that most of the time. In this process of active and unconscious seeking, all bodily senses are involved simultaneously, with major effects manifested in space through their irrevocable interdependence. For Zumthor (2006), the main role of design is creating atmospheres to facilitate better and more diverse interactions with space. If understood as an elaborate choreography of theatrical and phenomenal experience, architectural space has the ability to evoke memories and emotions, trigger senses and represent associations; in other words, the sense of being 'here', 'being' and 'becoming' in the world.

In the recent years, there has been an increasing interest in the senses (e.g., Degen, 2008; Low, 2015; Urry, 2000), what Howes (2005) calls "sensory revolution", emphasising that sensory experiences are central to the design of urban built environments. Some of the main focuses of such studies and writings

include: relationship between the sensory and the social dimensions, cultural perception and history of sensibilities (Classen, 1993; Stoller, 1989), the notions of ambiance and atmosphere (Böhme, 1993; Thibaud, 2011) and design for the senses (Holl et al., 2006; Pérez-Gómez, 2006; Pallasmaa 1996, 2009; Zumthor, 2006).

Another valuable group of recent studies focus on mapping, analysing, and measuring sensory dimensions of urban spaces and everyday experiences (e.g., Adams et al., 2007; Degen, 2008; Degen and Rose, 2012; Malnar and Vodvarka 2004; Naghizade and Ostadi, 2014). Study by Lucas and Romice (2008) is one of the rare attempts to systematically employ sensory experience in urban design research and practice, based on notational systems and multi-sensorial multi-modality. Similarly, yet from sensory ethnographic perspective, Palipane (2011) developed a framework of sensory production of urban space based on socio-sensory perception and multimodal mapping technique for documenting diverse multi-cultural place-making practices. She argued that many recent urban regeneration projects failed to create environments that are sensitive to the existing demographic milieu and that promote activity of the neighbourhood, due to a focus on visual and spatial experience and a neglect of understanding the multi-sensory qualities of a neighbourhood as a whole. Research by Pink (2008) and Rogerson and Rice (2009) also link senses to place-making practices.

5 MULTI-SENSORY EXPERIENCE AND HEALTH- AND AGEING-SUPPORTIVE DESIGN

Demographic predictions state that by 2025 population aged over 65 will reach 10% of total global population (United Nations, 2015). It has also been predicted that by 2050 the number of the dementia patients will reach 131.5 million globally (Prince et al., 2015). Such estimates are even more dramatic in Asia, where by 2030 the elderly will reach 18% of total population, and 19% in Singapore. Moreover, the elderly of the future will be more educated and more independent; they will work longer and will thus have different needs and aspirations than the elderly today. It is, thus, important to enrich the understanding of the spatial, perceptual, emotional and support needs of the “new elderly” in order to design better urban settings that would enable more meaningful and joyful “ageing in place” and “active ageing” and enhance the overall well-being of all ages. Passive and isolated (non-integrated) support through provision of healthcare and eldercare facilities and services may not be sufficient for the new generations of the elderly. New paradigm in ageing-friendly design and planning sees non-healthcare environments in general, and housing environments in particular, as supportive and therapeutic devices for the new elderly who are encouraged to build up their physical and mental ability levels at different stage of ageing. While the designing according to universal design principles is already a norm, it should be further challenged to stimulate the elderly both physically and mentally, promote walkability and social interaction, inclusion and care. In this sense, multi-sensorial experience, including textures, materials, colours, signage, culture-specific clues, way-finding and overall aesthetic atmosphere become the agenda for new architecture and urban design that is sensitive and supportive to all ages.

This is further emphasised by a number of recent studies that acknowledged the associated declines in sensory and cognitive functions with ageing (e.g., Crews and Campbell, 2004; Humes et al., 2013). For instance, by the age of 80, almost 50% of the older adults have some elements of motor impairment (Buchman and Bennett, 2011), about 40–45% of adults older than 65, and 83% over the age of 70 report some degree of hearing impairment (Cruickshanks et al., 1998) and 60% of people aged above 80 show problems with odour identification (Murphy et al., 2002). Sensory impairments, particularly in vision, hearing and motor functions, not only increase the risks of developing various diseases, such as Alzheimer’s or Parkinson’s disease (e.g., Meshulam et al., 1998), but also have an immense impacts on almost all aspects of daily living of the older adults. Some of these include problems with physical activity and mobility, navigation and spatial orientation, challenging the elderly in performing basic daily life activities (Haanes et al., 2014), increasing risks of falls and accidents (Lopez et al., 2011), communication difficulties (Heine and Browning, 2004), social withdrawal, lower levels of independence and autonomy (Andressen and Puggaard, 2008; Heine et al. 2013), depression (Capella-McDonnall, 2011; Chou, 2008) and poor quality of life (Chia et al., 2006; Fischer et al., 2009).

Various non-verbal methods are now used in (some) dementia care and nursing homes to stimulate the senses, increase alertness, reduce agitation and re-establish the sense of self-hood, namely sensory

stimulation, multisensory stimulation (MSS), multisensory environment (MSE), and 'snoezelen' (Lykkeslet et al., 2014; Riley-Doucet, 2009; Vozzella, 2007). However, many of such methods still remain in the realm of "decoration", "special rooms" and "treatment strategies", neglecting the capacities of spatial design (of both indoor and outdoor environment) to embed carefully orchestrated multi-sensory stimuli and in such a way become integral and active component of care and provide continuous healing benefits, in terms of both treating sensory impaired conditions and slowing down sensory and cognitive decline of the elderly adults.

A qualitative study of nursing homes by Bengtsson and Carlsson (2005) emphasised the importance of the outdoor environment for the older adults, with key design aspects related to users' comfort (sensitivity to weather, familiarity, security and calmness) and to access to surrounding life (capacity for outdoor activity, sensual pleasures, surroundings as a way to keep up to date and social potential). Many studies pointed out various elements of senior housing design that enhance residents' social well-being, including green outdoor spaces to facilitate senior residents' social integration in the inner-city (Sugihara and Evans, 2000). Sensory and aesthetic ambiental qualities surrounding nursing home may alleviate stigma and negative public's perception of nursing homes and the elderly and contribute to their better physical and social integration with the surrounding communities.

Stress has been widely understood in its negative connotation – as distress. However, research in environmental psychology suggests that human well-being is fostered when physical surroundings provide a moderate degree of positive stimulation (Berlyne, 1971). Hans Selye (1978) first introduced the term 'eustress' which refers to good or positive responses to external stressors. A person's state of health is determined by the degree to which an individual's (positive) supporters respond successfully to various (negative) stressors. Roger Ulrich's (1991a, 1991b) 'Theory of Supportive Healthcare Design' involves 'positive distraction' in healthcare spaces, an environmental feature or element that incites positive feelings and holds attention without taxing or distressing the individual and in such a way blocks or reduces worrisome thoughts. Apart from psychological effects positive distractions also have positive physiological effects manifested in lower blood pressure and/or the lower production of stress hormones. According to psycho-neuro-immunology (PNI), negative emotions, particularly those that are chronically suppressed (such as depression, rage, fear, frustration, etc.) can have negative physical impact and in fact manifest as a physical disease. In other words, the illness originates in the misbalance of the immune system triggered by the psyche – the state of mind. On the other hand, positive emotions have positive impact on overall state of body and mind. Finally, Ulrich (1991a) recognises nature (waterscapes containing calm water, trees with broad canopy, deep landscapes and fresh flowers), smiling or caring human faces, pet animals, music and positive cultural artefacts as the most effective positive distractions. Similarly, in their "Attention Restoration Theory" Kaplan and Kaplan (1989) argue that the viewing of wild nature has a restorative effect in engendering physical and emotional relief from mental fatigue. As a result, patients exposed to views of nature have averaged a shorter postoperative stay (Ulrich, 1991a).

There is a growing agreement between researchers from various disciplines that well-designed and aesthetically pleasant spaces make people happy and satisfied, give them high self-esteem and, thus, positively affect their mood and health (Kolstad, 2001; Parker, 1990). As a result, happiness and positive emotions (stemming from an appreciation of the built environment) have received more prominent attention in more recent architectural design research. Finally, various medical studies have shown that "the psychological state of happiness" was a better predictor of coronary risks than any other clinical variable (Linton, 1995). The 'Total Healing Environment' is a concept emerged in healthcare and in response to the holistic understanding of health and well-being. It refers to therapeutic design that supports and contributes to the state of complete bodily, mental and spiritual health and well-being of a person. The 'Total healing environment model', developed by Patrick E. Linton (1995), also relies on the assumption that positive emotions have positive impacts on human health and that the most powerful healing potentials can be found in each human being. The model consists of two overlapping and interdependent continuums – between the external and internal environment, and between physical and psycho-spiritual environmental elements, and as such is essentially phenomenological. Birgit Cold (2001) states that we all intuitively know, consciously and subconsciously, what well-being is and how it feels, although this intuitive feeling is usually suppressed or overcome by cultural norms and social conventions.

The concept of therapeutic landscapes (sometimes inappropriately equated with therapeutic gardens) broadly refers to places that have capability of enhancing physical, mental and spiritual healing of their users (Gesler, 1992). While the core strategy include the creation of health supportive environments, the

concept also extends beyond the physical spaces to include every day and personalized place-related memories and promote healing benefits (Gastaldo et al., 2004). In other words, a combination of 'hard' and 'soft' design elements is required in order to boost a holistic sense of physical and social wellbeing through meaningful dialogue with spaces and among space users (Landry, 2000). Elderly and dementia-friendly environments, therefore, should not only seek to preserve safety and physical well-being, but also to empower communication and everyday activities (Prince et al., 2015).

6 CASE STUDY ANALYSIS: MULTI-SENSORY EXPERIENCE AND SHOPPING ENVIRONMENTS

This paper looks at 4 case studies of shopping malls in Singapore and Belgrade, Serbia. namely: VivoCity (shopping mall) and CityLink (underground pass-way and mall) in Singapore, and DeltaCity (shopping mall) and New Millennium (shopping centre) in Belgrade, Serbia, each representing different spatial configuration and the level of complexity, as well as specific relationship with its surroundings (Figure 1). The analysis consisted of spatial explorations and first-person observations, participatory photo-journeys, multi-sensory mapping, interviews and short on-site surveys.

7 PARTICIPATORY PHOTO-JOURNEYS

In each selected space, 10 participants were asked to pursue two photo-journeys followed by two in-depth interviews and a survey. The time of the walk given was limited to 30-45 minutes. All participants took their walks individually.

First – 'Seductive' Journey: During this walk, the participants took 10 photographs of whatever they wanted (except that they were not allowed to take photos inside any of the retail stores). In this journey, the participants were not informed of the purpose of the investigation in order to avoid possible biased outcomes. For the same reason, the route of the walk was not controlled. The intention was to indirectly explore the participants' first affective, emotional and sensory reading of the specific place, and thus uncover which elements of space attracted them most.

First Interview: After the first walk, all participants in their own words described their subjective experience and the overall atmosphere of space, without any interference of the investigator, after which they described each photograph using five keywords, and further elaborated on what exactly attracted their attention.

Figure 1 - Case studies [arranged according to the level of spatial complexity, from left to right]: New Millennium – 'centralised' type; CityLink – 'linear' type; DeltaCity – 'ring' type; VivoCity – 'infinite' type (Source: by author)

Second – ‘Sensory’ Journey: After the first interview, the researcher explained to the participants the purpose of his work. With that in mind, the respondents pursued the second journey and took another 10 photos, this time focusing on positive and negative multi-sensory stimuli available in space. They were allowed to take photos of the same spaces and elements again. In this more focused walk, the participants were asked to take a similar route, so that the outcomes from the two walks are more comparable. After the second walk, each participant explained the dominant sensorial stimulations and moods in each photographed space, and evaluated how pleasant or comfortable the detected stimulations were.

Survey: The final phase involved completion of a short questionnaire, based on environmental psychologists’ research on atmospherics and the approach-avoidance behaviour method (Mehrabian and Russell, 1974; Donovan and Rossiter, 1982), as well as on ‘sensory slider’ and ‘sensory radar’ techniques proposed by Malnar and Vodvarka (2004) and Lucas and Romice (2008), respectively.

Multi-sensory Mapping: All the photographs taken by the participants were carefully mapped out, providing important information on spatial allocation and rhythm of sensory clues identified during the walks.

8 COMPARATIVE ANALYSIS AND KEY FINDINGS

The analysis of all the information gathered consists of photo-analysis, ‘quasi-statistical’ analysis of survey data and mapping and spatial analysis.

Photo-Analysis. The photo-analysis included photo-motifs and keywords assigned to photographs by the participants. Overall, interestingly, the most frequently captured motifs in both walks relate to social activities and shopping, followed by the space atmosphere (Figure 2). Natural elements and people, as parts of social space, are recognised as the most positive attractions in space, which lines with research findings on positive distractions in hospital settings (see, e.g., Kaplan and Kaplan, 1989; Ulrich, 1991a, 1991b). No significant difference between the motifs taken in the two journeys was noticed.

Figure 2 – Photo-motifs (Source: by author)

The keywords analysis shows that the participants predominantly tend to seek for positive stimulations in space (Figure 3). Moreover, they tend to perceive and describe the space more favourably after the second walk, which may be related to increased familiarity with space and so-called ‘forgiveness factor’,

which is defined as the voluntary “process that involves a change in emotion and attitude regarding an offender” (APA, 2006, p. 5). Once the user gets to know the space better, understands its logic and articulates his/her reactions towards it, his/her appreciation of space tends to grow in spite of the initial negative attitude. Such a finding may be particularly useful for the design of often stigmatised healthcare environments.

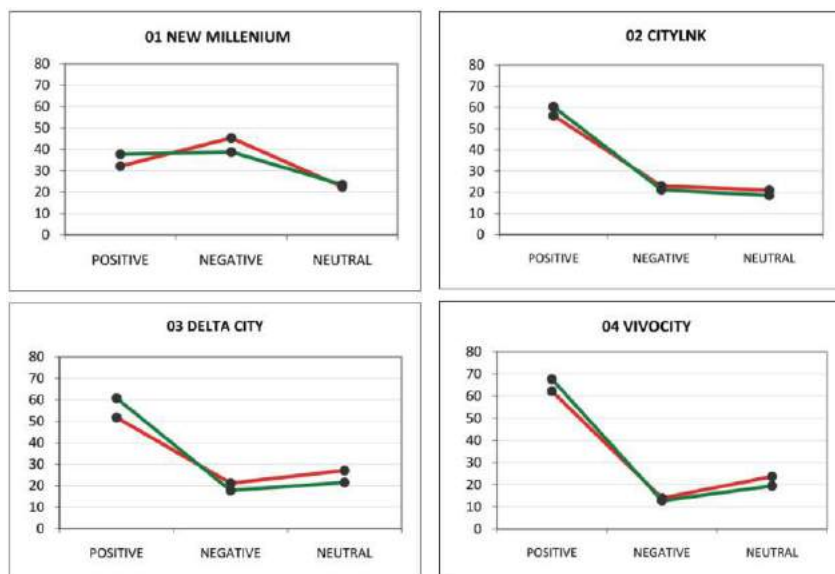

Figure 3 – Keywords (Source: by author)

Quasi-statistical Analysis. Key survey findings show that consumption space users tend to seek positive stimulation. The richness and arrangement of overall sensory information available in space considerably shape users’ subjective perception of and emotional response to shopping environments. Spaces with higher intensity and diversity of positive sensorial stimuli possess higher level of attraction (seductive value) and trigger higher sense of pleasure and happiness (Figure 4). Similarly, more complex, hybrid and organic typologies are perceived as more attractive and pleasant.

Sensory mapping. Similar findings are depicted through comparison of photos taken in two walks. A considerable number of photographs have been repeated in two journeys (Figure 5), which indicates the significant relationship between the initial reaction to space (seductive response) and the intensity of positive sensory stimulation. While showing the rhythm of most dominant seductive (red) and sensory (green) clusters (Figure 6), these complex yet quite consistent patterns show that complexity of space does not refer solely to its layout and interior-exterior relationship, but also to the arrangement and diversity of sensory ambiances.

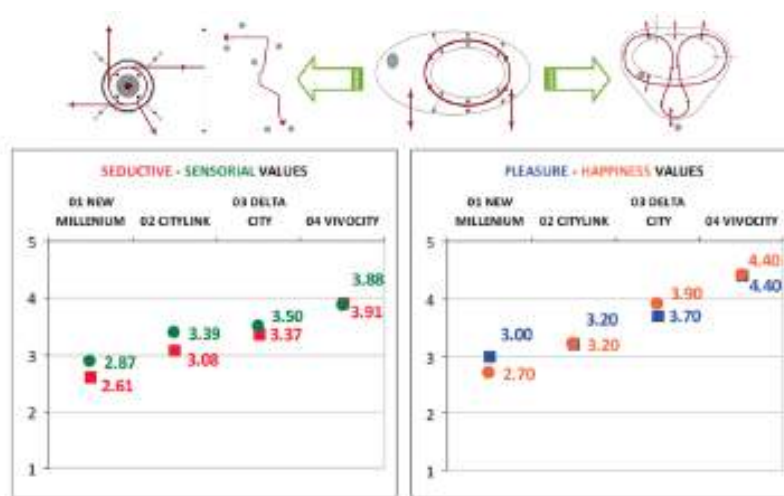

Figure 4 – Relationship between the seduction and sensorial richness levels (left);

Relationship between the pleasure and happiness levels (right) (Source: by author)

Figure 5 – Repeated photographs taken during seductive [top] and sensory [bottom] walks in DeltaCity, Belgrade, Serbia (Source: by author)

Figure 6 – Multi-sensory map of DeltaCity, Belgrade, Serbia – seductive walk (red) and sensory walk (green) (Source: by author)

Additional findings. Apart from the central guided themes that have been addressed by the participants during the interviews and that generally confirmed the ideas already advocated or explored in existing theory and research, a number of themes spontaneously occurred, without any guidance or intervening of a researcher. The themes are organised into three main categories, namely: bodily and mental self-awareness (ego), micro-events (surreal/hyper-real/phatasmagoric experience of space), and perception of health.

Bodily and Mental Self-Awareness (Ego). Bodily and mental self-awareness was addressed by participants in various ways, namely: narcissistic and intimate associations (self-reflection, memories, professional self), in relation to other people (familiar and unfamiliar), and in relation to space appeal (camouflage and mimicry, sense of being in place, performing conventionally less appropriate activities). Interestingly, the participants who showed greater self-awareness generally appreciated overall space more positively. Some of the responses are illustrated below.

NARCISSISTIC MOTIFS AND PERSONAL MEMORIES

CityLink06: This is a narcissistic shot. My name is Karthik and then you have “K” up there. This is actually BreadTalk sign. I also liked the lighting. (Figure 7 left)

VivoCity09: This is obviously a pillar. This is where I first met Fiona. She was waiting for me there and I couldn't find her. It is a place to wait and take a break from walking. (Figure 7 middle)

SELF-AWARENESS IN RELATION TO SPACE

VivoCity05: That's my foot on the warm wood. [...] I like walking on wood, it stimulates your feet. You wear shoes every day and shoes are what you're supposed to wear in public. Usually when you take your shoes off, it's very private, it's your house, it's when you're on vacation. You don't take your shoes off in the office usually. (Figure 7 right)

Micro-events and Phantasmagoric Experience. During both journeys, the participants took a considerable number of photographs that may belong to the realm of phantasmagoric and surreal experiences, charged with temporality, irrational and subconscious aspects. These experiences include various non-programmed micro-events, often instigated by the juxtaposition of unexpected spatial elements and the subjective mind-mood states of the perceivers.

Figure 7 – Narcissistic Motifs, Personal Memories and Performing less appropriate activities (Source: by author)

An attempt at simulating the outdoor café areas and street atmosphere in CityLink underground mall or triggering illusionary cooling sensations in VivoCity (by providing an oversized statue of a snowman or a hanging figure moving in the air) are some of the examples (Figure 8). This is particularly interesting, since, due to the tropical climate, outdoor areas in Singapore are not very intensively used. People prefer air-conditioned space.

CityLink02: This one [photo] is a continuation from the food spaces. You walk on and you see the restaurants that are not behind glasses, but they are totally open. So you can sit anywhere inside; there is no mystery about it and it feels quite outdoor in a very indoor environment. It was a dinner time and it was pretty crowded so the sound coming from them [people] actually felt pretty good. You could staff in the restaurants and the waitresses talking to each other. It felt like you're really outside in the street. (Figure 8 left)

VivoCity02: What attracted my attention in this particular place is more of the snowman statue, I think, because it is huge, makes the mall feels friendlier and opposes to the heat. It doesn't really make me feel cooler, but with the fountain next to it, it actually brings freshness of to body and thoughts. (Figure 8 middle)

VivoCity08: This is quite funny. From far away I thought it was a real person hanging. It stands out. I think it's cute. It actually can move when the wind blows. That's when I realised that the wind was actually blowing. It's so hot out there. Sometimes you think there is no wind at all. (Figure 8 right)

VivoCity05: That was actually for the doll which swings in the wind. I like the wind, and then I found the doll. It was just windy atmosphere up there, fresh. (Figure 8 right)

Figure 8 – Street atmosphere in indoor environment, snowman in the tropics, wind-swinging sculpture (Source: by author)

Perception of Health. Through photographs and their explanations, the participants expressed common understanding of health and well-being, linking them to: natural elements, social activities (children, people relaxing and chatting) and hygiene. However, while the direct and visual access to nature has been highly appreciated by the participants, in certain cases it was somewhat counterproductive. A window may symbolise freedom, but bad views can alter the attention towards the more appealing interior of the mall. Other examples are related to restricted access to available outdoor space, even though the exit exists. As a result, the first positive impression turns into a disappointing one.

A small number of photographs also showed limited understanding or misunderstanding of health, such that smoking or fast-food were perceived as 'healthy'. Another set depicted negative associations towards health, referring to and using terms such as: the clinical and sterile environment, states of negative physical and mental conditions or illness (headache, distress, depression, claustrophobia, and even tombs and death) and the lack of safety coming from the subjective perception of certain materials and spatial elements.

9 CONCLUSION

Multi-sensory and emotional experience of space and active dialogue with all environmental stimuli, including positive distractions, textures, materials, colours, signage, culture-specific clues, way-finding and overall aesthetic atmosphere, profoundly shape our understanding of the built environment and are vital for physical, psychological and social wellbeing of all ages. Most health and space related theories and research concerned with multi-sensory experience predominantly focus on the design of (indoor) healthcare environments, demonstrating the various difficulties in their implementation and application (Goh et al., 2009). However, healing is no longer (as if it ever was) limited to the process of curing, neither only to healthcare institutions. Public space has traditionally been at the core of everyday life in cities, and its roles and capacities in (re)establishing itself as a focal point for the community and in supporting successful ageing-in-place and healthy active living need to be revisited.

Key findings in this study show that consumption space users tend to seek positive stimulations. To a certain extent, the consumption spaces are seen as laboratories of positive distractions, in which the richness and careful arrangement of overall sensory information considerably shape users' subjective experience and good mood. The presence of nature, micro-climate, wayfinding, access, safety and hygiene, but also subjective bodily and mental self-awareness, crowd and shared identity, social activities and phantasmagorical experiences, are perceived as important ingredients of "healing places" and as "stress fighters". While the findings indicate some capacities of contemporary shopping spaces to overcome the mere consumption motifs, trigger positive sensory, mental and emotional reactions in users, as well as boost their self-esteem, and, thus, positively affect their sense of subjective well-being, this does not mean that these environments are considered 'healthy'. These positive effects are clearly only the by-products of consumption experience.

Multi-sensory approach to consumption space design, however, may provide fruitful means for uncovering the capacities of all city spaces to become therapeutic and healing 'tools', prevent sensory and cognitive decline, alleviate stigma and negative public's perception of healthcare and eldercare environments, and contribute to their better physical and social integration with the surrounding neighbourhood communities.

1 INTRODUCTION

1.1 WHY AIRFLOW IS IMPORTANT

Nowadays, more than a half of the world's population lives in urban areas. By 2045 this number is expected to surpass six billion, reaching 66 percent by 2050 (United Nations, 2014). People decide to choose cities as their living place for various reasons, such as developed labour market or wide range of services. Unfortunately, highly urbanised areas, despite their understandable economic and living-standard advantages, suffer from serious environmental and development problems caused by erroneous planning decisions.

City climate is clearly related to general climatic conditions occurring in a selected geographic region, however, it is also dependent on factors such as land use, building geometry or street canyon design. Luke Howard in his renowned work "Climate of London" 200 years ago proved that urban climate differs from the rural one and noticed the urban heat island (UHI) occurrence. Indeed, the city of Warsaw, an object of this study, is distinguished by a lower access of solar power, higher air temperature and shorter period of frost incidence as well as lower relative humidity, bigger cloud cover, higher rates of rainfall and lower wind speed (Stopa-Boryczka, Kopacz-Lembowicz, Wawer, 2001).

Rapid changes of temperature, wind and humidity also affect comfort and health of the people as well as energy consumption and air quality (Elliason, 1999). Thus it is important to enable achieving conditions of thermal comfort especially in a hot and humid climate, through increasing wind velocity (Kato & Hiyama, 2012). Ensuring proper airflow in urban areas should be one of the key environmental issues tackled by governments and city mayors. However, T. R. Oke points out that it implies a critical choice between four goals: to maximize shelter for pedestrians by not exposing them to strong winds, to maximize dispersion of pollutants and minimize their impact on inhabitants and vegetation, to maximize urban warmth and to take full advantage of solar energy. We have to take into consideration that large amount of harmful compounds detected in the air of urban areas where human activity is intensified is not only a result of increased emission but also an effect of the strong surface drag in rough structures and limited effectiveness of dispersion of pollutants (Suder & Szymanowski, 2014).

Therefore this study was set to analyse changes in morphology and terrain roughness in Warsaw in years 2002 – 2016 and related changes in city's aerodynamic properties, including ventilation corridors.

1.2 AIR FLOW CORRIDORS IN WARSAW'S PLANNING DOCUMENTS

The issue of air flow corridors and regeneration of air has been present in Warsaw's planning documents since 1916, when "The Initial Draft of the City of Warsaw Regulations", also known as "Tolwiński's Plan", named after the author, has been published. Tolwiński stated that: "the ease and recklessness which the builders of the city apply to taking away lands from its inhabitants (also citizens) is startling (Tolwiński, 1948). In order to prevent this issue from occurring he set down 6 air flow corridors consisting of continuous green areas, areas at the banks of Vistula river, as well as cemetery areas, all creating a sun-shaped system. On those territories total prohibition of building construction was enforced. Each of the following Warsaw's planning documents published before 1939 respected those guidelines.

During Second World War 84% of buildings located by the left side of the river were demolished. Such serious material losses lead to the creation of the Plan of Reconstruction and Restoration of Warsaw. That document, written in 1946, implied preservation of pre-existing air flow corridors and the emergence of the

new ones which were to be created by railway lines as well as lines of big city transportation. That plan

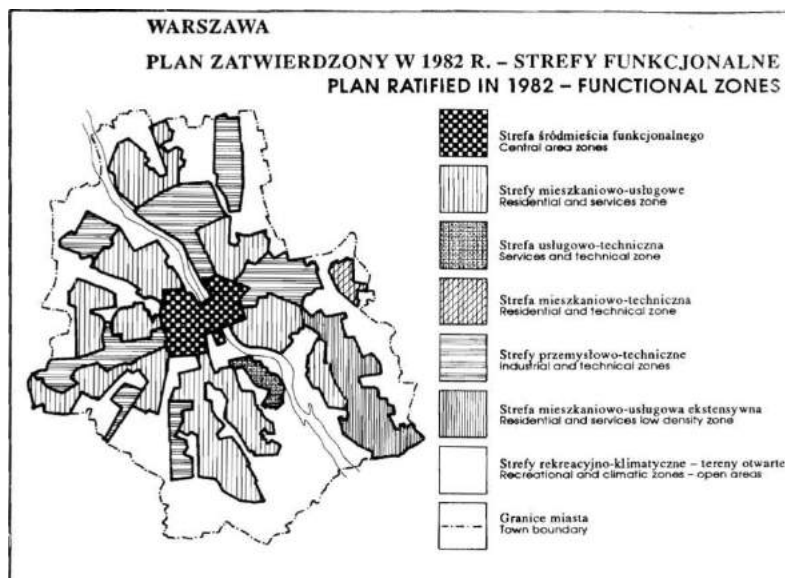

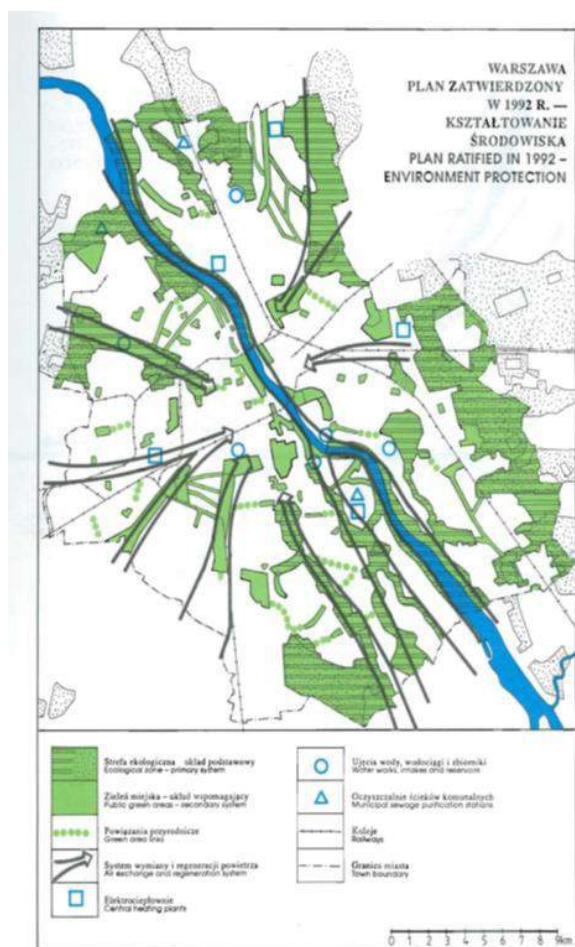

Figure 1. Air flow corridors in 1982 (white colour). Source: National Council of Warsaw, 1982.

In 1982 the Prospective Plan of General Spatial Development for the city of Warsaw was created, which changed the definition of air flow corridors in the city. Above all, it included short buildings territories as well as green areas, sport areas, and land lot areas. The plan named them “recreation and climatic spheres – open areas” (Rada Narodowa m.st. Warszawy (National Council of Warsaw), 1982).

Finally in 1992, Local Spatial Development Plan of the city of Warsaw marked 8 significantly smaller corridors than those proposed by the Plan of Reconstruction and Restoration of Warsaw (Rada Warszawy (City Council of Warsaw), 1992).

1.3 ISSUES CONCERNING AIR QUALITY IN WARSAW

Air quality in Poland has significantly improved since 90'. This was a period of rapid transformation of national politics and economy in post-soviet countries, including Poland. Over the years Poland as a signatory of international, and later European, conventions and programmes had to fulfil its obligations in terms of reducing emissions of pollutants, moreover it forced technological development in energy and industrial sector. Amount of annual emission of greenhouse gases in 2012 has decreased by almost 30% in comparison with 1988 (Krajowy Ośrodek Bilansowania i Zarządzania Emisjami (The National Centre For Emissions Management), 2014). However, Supreme Audit Office in 2014 claimed that norms of air quality established in European Union's regulations and implemented in Poland had not been completely carried out by Polish government.

Figure 2. Air flow corridors in 1992 (arrows). Source: City Council of Warsaw, 1992.

Particles which are emitted into our atmosphere can cause adverse effects on human health and the condition of ecosystems. Human activity leads to the emission of gases such as sulphur dioxide, carbon monoxide, ammonia and volatile organic compounds, which subsequently can react and form new pollutants. Air can also be polluted by toxic metals or methane and benzene. However, the most harmful for our health are particulate matters with diameters of 2.5 and 10 micrometres (PM_{2.5}, PM₁₀), nitrogen oxides (NO_x), tropospheric ozone and cancerogenic benzo-alpha-pyrene (B(a)P) (WHO, 2017). In 2013 PM_{2.5} pollution caused over 48 000 premature deaths in Poland. (European Environmental Agency, 2017)

Emissions of CO are still high, emission of B(a)P– even the highest in Europe (European Environmental Agency, 2016). World Health Organisation in 2016 revealed that 33 out of the 50 most polluted cities in Europe are in Poland. Results of annual valuations conducted by Inspectorate of Environmental Protection unequivocally indicate that low emission phenomenon deriving from commercial, institutional and household fuel combustion together with transport sector are the most responsible for inadequate air quality condition in Poland. In 2012 over 88% of total PM₁₀ concentration limit exceedances were contributed by emissions connected with individual house heating. Poles use low quality fuels and combust waste in unsuitable installations as an effect of unsatisfactory social awareness, but also because of economic reasons (Ministerstwo Środowiska, 2015). Voivodeship Inspectorate of Environmental Protection reports that causes of line emissions of air pollutants exceedance in Masovia, where Warsaw is located, are lack of city bypasses, technically obsolete vehicles and bad condition of road surfaces. What is important, substantial influence on air quality has also the inflow of pollutants from outside of voivodeship as well as secondary emissions of gases (W.I.O.Ś (Voivodeship Inspectorate of Environmental Protection), 2016).

People in Masovian Voivodeship and Warsaw are mostly struggling with problem of air pollution caused by particulates such as TSP (Total Suspended Particles), PM₁₀ and PM_{2.5} (IOŚ-PIB, 2016). In 2016 daily limit value of PM₁₀ (50 µg/m³) concentration established by EU Ambient Air Quality Directive was exceeded in every zone of voivodeship. On Niepodległości avenue station, in a centre of Warsaw, this norm was surpassed 85 times, while the limit is set at 35 days a year (Figure 3). The average concentration of PM₁₀ particulate was around norm (40 µg/m³ a year) yet maximum value of PM₁₀ concentration noted in the central station equalled 552.7 µg/m³, exceeding a daily norm 10 times. To compare, in 2002 it was 215,8 µg/m³ while average year concentration was similar. There is a noticeable downward trend in the number of exceedances in years 2005 - 2016, however annual pollution values had not significantly dropped over that time and since 2012 they slightly fluctuate about acceptable limit (Figure 3).

Figure 3. Trend of pollution by PM₁₀ in years 2005-2016 on Niepodległości avenue station. There was no data about number of exceedances for year 2012. Source: own study based on data from Voivodeship Inspectorate of Environmental Protection.

Spatial dispersion of concentration of substances such as: particulates, nitrogen and sulphur dioxides, carbon oxide and benzo-alpha-pyrene indicates that highest levels of air pollution occur in central districts of Warsaw, especially in Śródmieście. That situation motivated us to analyse how topography of the city can affect the airflow performance and to make an attempt of identifying barriers formed in urban and planning processes over time.

2 DATA

Data for the study were derived from Land and Property Register from Geodesy and Cadastral Office (Ewidencja Gruntów i Budynków EGiB), on the basis of an agreement between Warsaw University of Technology and the Office. Acquired Land and Property Register consists of buildings geometry, number of storeys in the buildings and the year of construction. 0,3% of the total number of records did not contain number of storeys and were excluded from the the first phase of the study (terrain roughness analysis).

More detailed data were prepared for the air flow analysis. Building characteristics were obtained from Topographic Objects Database (Baza Danych Obiektów Topograficznych BDOT) for year 2014. Geometry and location of the buildings were validated using aerial photographs. Data concerning number of storeys for each building were complemented using aerial photographs and other sources. In both cases height of buildings was calculated using number of storeys multiplied by estimated height (3 m).

Meteorological data for the study was obtained from website Weather Online, generating forecast on the basis of international databases (WeatherOnline).

3 METHODOLOGY

Indicators and urban parameters were determined in order to obtain appropriate spatial development effects (spatial order). Basic urban indicators include intensity, density of buildings and weighted average building height, which provide information on the extent of usage of construction sites. These indicators should be interpreted together as they can provide sufficient information about the characteristics of the built environment and assess the quality of the place as a place for living. Moreover, in our study we choose these few urban indicators to see how urban morphology impacts air flow in the city. Our choice was mainly based on the study "Correlation between Urban Morphology and Wind Environment in Digital City using GIS and CFD Simulations" (Yin J., Zhan Q., Xiao Y., Wang T., Che E., Meng F., Qian Y., 2014) in which the relationship between specific indicators and city ventilation was investigated. It has been found that there is a correlation between urban indicators and wind conditions in the city - a strong linear correlation between building density and average wind speed at pedestrian level, while the intensity and average building height show a weak, but existing correlation.

In this paper the intensity of development (I_n , equation (1)) is calculated as the ratio of the total building area (PC) to the surface of the site (PT, and the site is a mesh net):

$$I_n = PC/PT \quad (1)$$

The intensity of terrain development is complemented by information such as:

- building density (G_{zab} , equation (2)), is the index of the sum of the cubature of the building (K) to the site area (PT):

$$G_{zab} = K/PT \quad (2)$$

- weighted average number of storeys (LK , equation (3)), is the ratio of the total area of the buildings (PC) to the built area (PZ) (the area occupied by the buildings):

$$LK = PC/PZ \quad (3)$$

To fully understand mentioned formulas, it is necessary to clarify some terms (explained in standard PN-ISO 9836:1997):

- total area of the building - the sum of the area of all storeys of buildings in a given area, calculated in the outer contour of the wall / walls,
- built area - the sum of the floor area of all buildings in a given area, calculated in the external wall / wall contour,
- cubature of a building (cubic volume of a building (gross)) - the sum of the product of the total floor area and its height.

Urban standards/norms take the form of regulations defining the relationships between urban indicators and the appropriate capacity of communication service and the size / availability of service areas (shops, education, health, culture, recreation, etc.).

In Poland, urban norms functioned during the Polish People's Republic. But after 1990, as a result of system changes (as well as demographic determinants, the growth of the automotive industry and the conditions of housing investments and land prices), most of the assumptions became obsolete and the application of norms ceased to be justified. When formal limitations ceased, the practice immediately surpassed the normative framework.

In Poland for almost 30 years no central urban standards have been applied (under the Land Spatial Planning Act 1994 the competence to set local urban development standards was passed to municipalities). The lack of mandatory regulations establishing spatial health and social minima causes numerous abuses: the implementation of housing complexes with too dense development, lacking basic social infrastructure, public access to sports and recreation areas and access to public transport (Dąbrowska - Milewska, 2010).

Calculations of the indicators (Fig. 5 - 13) within the study were made in a cartographic grid 100m x 100m covering the whole area of the city. The net mesh area (10000 m² / 1 ha) is the area for which the indicators were calculated.

In order to reflect the location of buildings in the meshes properly, the layer of buildings was cut through the mesh. So when the building is in two mesh nets, it will be counted in both of the meshes according to what surface it occupies in each, not just one. Height of the building was calculated on the basis of number of storeys. Average height of storey was assumed 3m.

All calculations were made using ESRI's ArcGIS software.

The main aim of the project was to analyse changes in the morphology of Warsaw in 2002 – 2016 period and related changes in its aerodynamic properties. Methodology of the survey was based on methodology proposed by M. S. Wong et al. (Wong, Nichol, To, & Wang, 2010). Terrain roughness was analysed on the basis of the Frontal Area Index (FAI), a parameter for estimating aerodynamic resistance of the urban surface. FAI is the total area of the facets of buildings in an area, where windward facets cover these located behind them, divided by surface of the area (equation (4)).

$$\lambda_f = \frac{A_{facets}}{A_{plane}} \quad (4)$$

Test plot given in the study was defined by the square 500m x 500m grid net. Frontal area of objects depends on the direction of airflow. Moreover, each wind direction was weighted accordingly to the frequency of its occurrence in the analysed period: (N - 7%, NE - 6%, E - 15%, SE - 15%, S - 12%, SW - 9%, W - 27%, NW - 9%).

Figure 4. Data for frontal area index calculation. Source: own study.

Roughness index values gave basis to the wind corridor identification. For this purpose, 50m x 50m net grid was created and used for frontal area index (FAI) calculation, aiming to obtain results precise enough for a city scale study (Hsieh & Huang, 2016). Later, for each of four cardinal wind directions (W-E, NW-SE, N-S, SW-NE) was generated a grid classifying FAI for respective direction into ten classes. Then they were used as a distance weight grids for Least Cost Path (ESRI) analysis method generating a corridor between each pair from 144 barrier points chosen around the city's administrative border. Each pair was classified into the closest basic direction to a geographic azimuth between these points and a path between them was calculated on respective grid. That all identified wind corridors between sampled barrier points and throughout the city. In the following paper results for two most frequently observed winds are presented: W-E and NW-SE (Figure 18, Figure 19).

Airflow performance was visualized using computational fluid dynamics methods in Air Flow Analyst software. Elevation model was established using Airborne Laser Scanning data from 2011. Due to limited available computing power and marginal impact of the Warsaw landform on the results, elevation data was later ignored in the study.

4 RESULTS

4.1 URBAN INDICATORS CHANGE ANALYSIS

Urban indicators calculations resulted in maps showing city-wide urban indicators for the years 2002, 2009 and 2016 (Fig. 5, 6, 8, 9, 11, 12). Moreover, it was possible to determine the change in these indicators in years 2002-2016 (Fig. 7, 10, 13). Analysis of the results allows us to designate areas of intensive urbanization in Warsaw and areas under-invested in recent years.

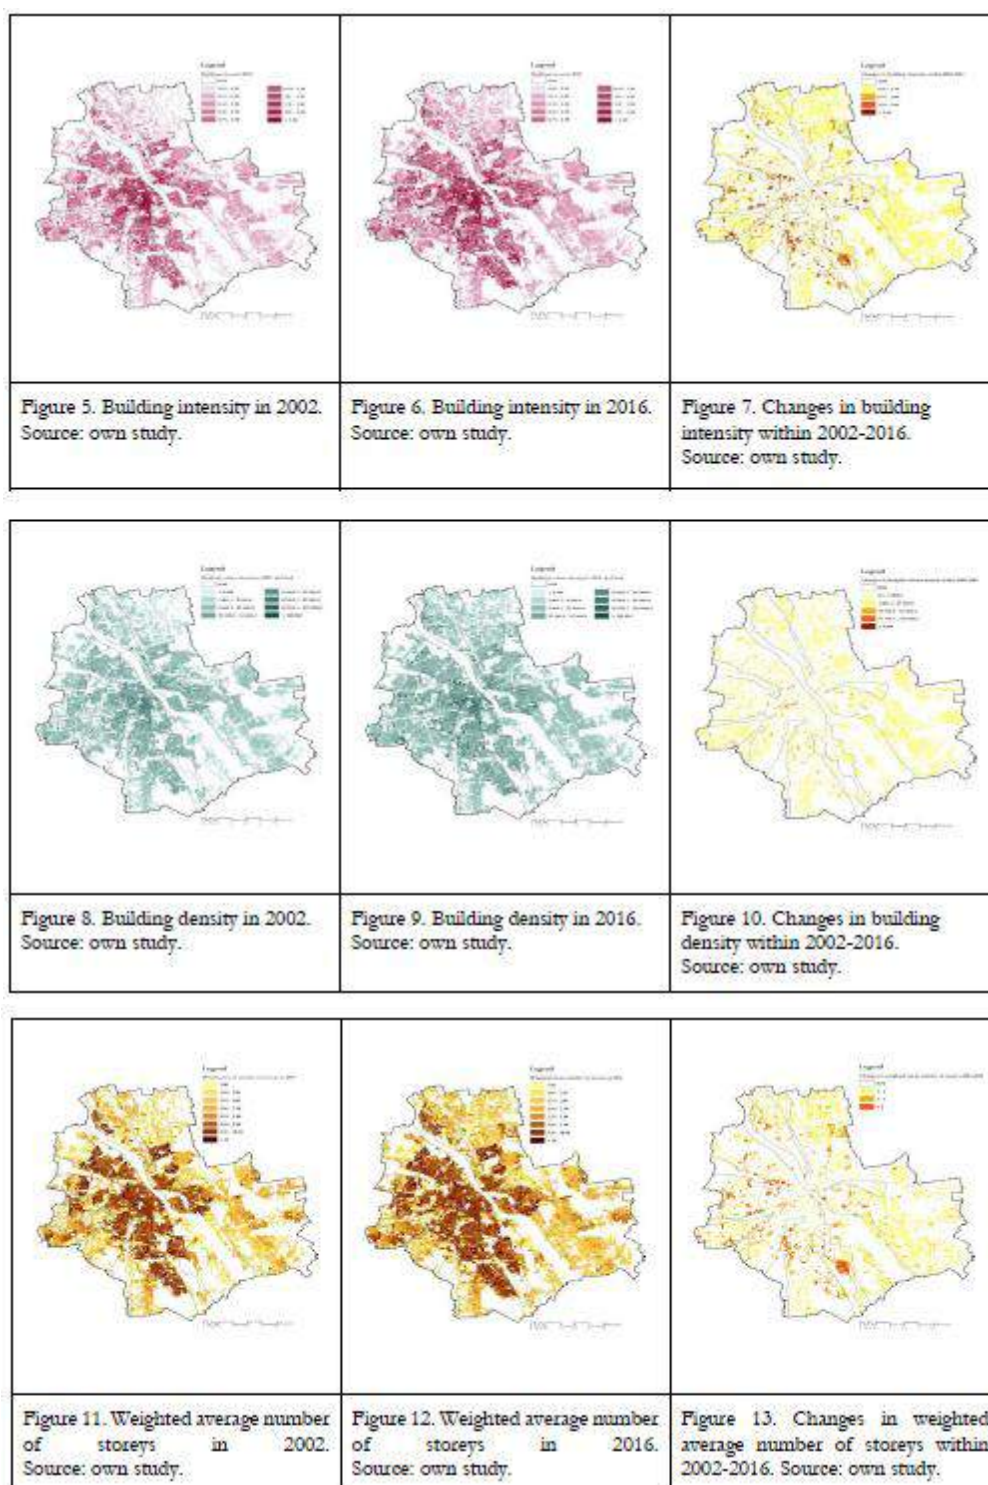

Increase in value of the indicators over the years could be observed, especially in Wilanów district, Ekopark estate, located in ventilation corridors Skorosze estate (very intensive multi-family housing without public space), Górcze estate (along Obrońców Grodna avenue) and Młynów estate.

It is possible to observe the development of new buildings on the eastern side of the Vistula River - yet building intensity is relatively small and the predominant number of storeys does not exceed three storeys. The biggest changes are located on Praga Południe district.

On the west side of the Vistula, the intensity of development is intensified in the following districts: Żoliborz, Wola, Ochota, Ursynów, Mokotów and Włochy.

From the performed analysis an overall trend of supplementary development and diffused urbanisation can be observed. New developments adapt undeveloped terrains on the city outskirts, as well as along thoroughfares and railroads. Furthermore, a disproportion occurs between eastern and western part of the city. The north-eastern part of Warsaw characterizes less densely built up area than the rest of the city. This, combined with an insufficient coverage of planning document, results in spread of development of highly urbanised settlements.

In the context of the city ventilation project, this analysis allows to designate investments that are located within the city ventilation corridors.

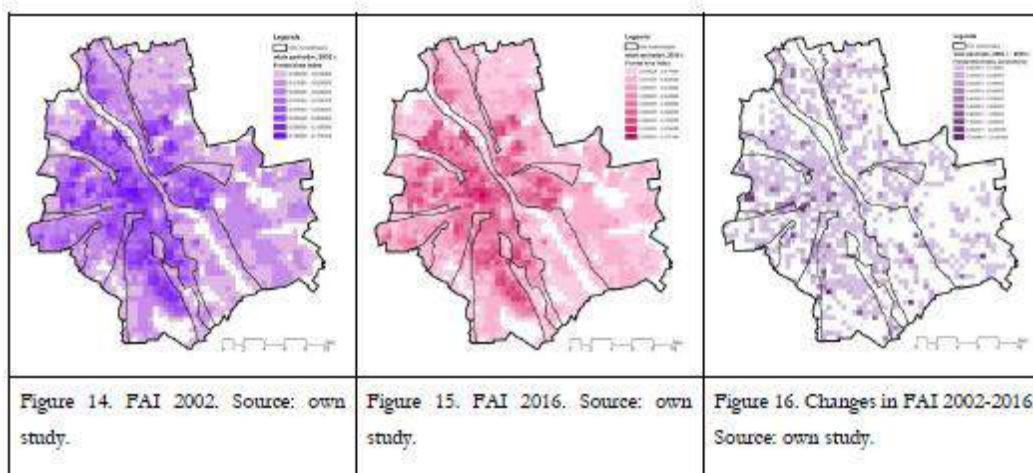

There is a noticeable increase in the intensity of development in corridors ventilating the city, which disrupts its natural ventilation. This leads to the formation of negative phenomena such as smog or urban heat island (Stopa-Boryczka, Kopacz-Lembowicz & Wawer, 2001).

The above maps do not show which buildings were built on areas covered by local planning documents and which are not. This aspect is worth later investigation.

4.2 ROUGHNESS TERRAIN ANALISYS

As a result, we achieved FAI values in 2002, 2014 and 2016 (Figure 14, Figure 15); FAI percentage increase in 2002-2016 enables to identify areas where new investments have a particularly negative impact on the air exchange and air regeneration system in Warsaw (Figure 16).

The highest value of the Frontal Area Index was noted in 2016. The greatest changes in the indicator value during period 2002 - 2016 could be seen in the corridor of river Vistula and in the corridor of Bemowo district. The greatest changes in surface facades of buildings frontal to the west wind can be observed in the Western Railway corridor and in the Bemowo corridor. This is related to the passage of corridors, parallel to the direction of the west wind. Definitely a negative phenomenon that can be observed is the increase of the building density at the end of the Bemowo corridor and the narrowing of the western, Mokotów and embankment corridors (Figure 17), which may significantly reduce effectiveness of these ventilation areas.

Figure 17. Changes in Frontal Area Index in Warsaw in 2002-2016 within ventilation corridors. Source: own study.

4.3 AIR CORRIDORS IDENTIFICATION

Least Cost Path analysis for two, most frequently observed winds (W-E and NW-SE) were generated (Figure 18, Figure 19). Analysis, basing on the terrain roughness indicator, used 50m x 50m grid and resulted in potential frequency of occurrence (standardized) of the air flow in given net.

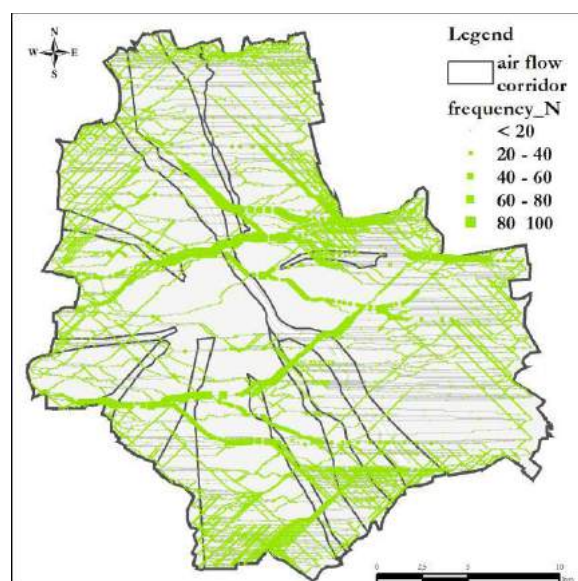

Figure 18. Least Cost Past analysis results, wind W-E, 2014. Source: own study

Airflow from western and eastern direction is highly evident. Its path goes through principal communication arteries. High probability of wind occurrence is visible on the dominant transportation corridors. Main paths can be seen along the railways, mostly along surroundings of Gdański bridge, Okęcie airport, allotments in Mokotów district and Arkadia Park, also at industrial plants near Grot-Rowecki Bridge and near the city boundaries (which might be a result of the methodology imperfection). What can be obviously seen from the model is that the city center is excluded from the ventilation system. Moreover, our predicted wind paths for the western wind do not coincide with the corridors designated in the Strategic Concepts of Conditions and Directions for the Spatial Development of Warsaw.

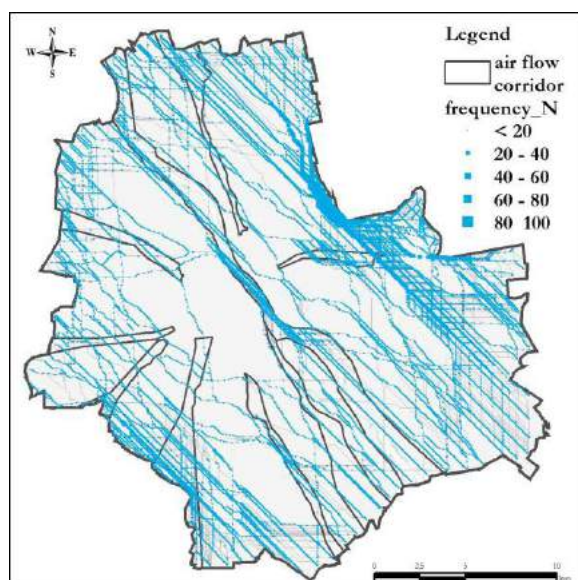

Figure 19. Least Cost Past analysis results, wind WN-ES, 2014. Source: own study.

Results of the Least Cost Path analysis for the oblique wind, northwestern-southeastern, approximately overlap with contours of eastern Bemowo, embankment and Vistula corridor. Winds representation here also misses the city centre; it dominates in the Vistula area, while the west wind is present in the communication arteries. In the south eastern part of Warsaw there is no definite course of the ventilation corridors (e.g. Wesoła district), which is in line with the model results for the oblique wind. The greatest value for the LCP is found at the eastern border of the city, but due to its location it is not clear for interpretation. Vistula river, as well as airport and railway areas, play a significant role for both wind directions.

5 DISCUSSION

Scope of our analysis was limited due to lack of reliable data concerning building geometry and cubature. Data derived from Geodesy and Cadastral Office had a limited number of records concerning year of construction of each building. Also, height of building was not always complete in the obtained database. Therefore, for air corridors modelling, data was manually complemented, which entails risk of errors. What is more, two sources concerning height of buildings were used. One was number of storeys provided by Geodesy and Cadastral Office and the other was our interpretation of aerial photographs, which could result in imprecise input of data for further study. In the future research height data should be obtained from airborne laser scanning.

Next generalization in the study was forced by no meteorological data available during the main phase of our research. The data was generated by using a model collecting information from international sources in Europe.

The other limitation was caused by the simplified methodology used in the study. Assumption that the height of the building is equal to the multiplication of number of storeys and their dimensions was necessary, however, it simplifies the building's bulk to a great extent. Moreover, adopted methodology does not take into account turbulence in airflow in a rough area and other movements related to fluids. We assumed a linear air flow through the city and the absolute limitation of its motion when encountering a barrier (building). It does not fully reflect the real movement, however, our goal is to develop a simplified model, while maintaining the required accuracy of the results. In the city scale research, taking into account the available computational power, such an approach may be sufficient. However, the results obtained should be verified in reality or in a different calculation method. Computational Fluid Dynamics software could be used only on a small part of the investigated area, which was caused by lack of available computing power for such analyzes and no funding of our research - which was a great limitation.

Misinterpretation of the results of the study could be caused by adopted grid division. While the urban indicators analysis and terrain roughness calculation were aimed at obtaining more general, viewable results; the Least Cost Path analysis gave more precise results (based on the 50m x 50m grid). Adopted mesh division could be misleading, especially when concerning thoroughfares: wide streets, potential air flow corridors, could be omitted in the analysis when divided between grid areas. In conclusion, it is highly advisable to use the smallest grid possible, although computing time and cost need to be considered.

Adopted methodology assumed arbitrary designation of points generating air streams, in equal intervals, along the city borders. This implies the occurrence of errors at the boundary of the study. In order to optimize analysis for the peripheral districts, the scope of the study should be extended, taking into account the adjacent municipalities.

Additionally, influence of the green areas was not included in the survey. Greenery is a factor of a great value, nevertheless not yet adopted in our methodology, due to its differentiated impact on the city climate. Green areas increase roughness of terrain and consequently reduce the speed of wind and simultaneously cool air and increase its humidity, which as a result stimulates air movement. Defining impact of the greenery requires further analysis and subsequently is to be included in our model.

6 CONCLUSIONS

Before World War II Warsaw was provided with airflow corridors full of greenery. Over the years, green wedges were degraded to marginal role in city-development politics. Consequently, green corridors was replaced by communicational arteries. Today, they mostly stretch alongside railways. Undoubtedly, these terrains are very attractive for new investment plans, therefore they should have proper protection.

Unfortunately, building in airflow corridors is possible due to decisions of building conditions (Decyzja o Warunkach Zabudowy i Zagospodarowania Przestrzennego). This document establishes ways of management and conditions of development of terrains not included in local zoning plan and in case it is not public purpose investment. However, this conditions do not have to be compliant with Strategic Concepts of Conditions and Directions for the Spatial Development of Warsaw (SUiKZP) regulation according to which terrains of airflow corridors ought to be protected. Generally, it is deficiency of

development strategies in Warsaw which makes new investments a kind of chaotic filling of empty, frequently green, spaces within a city.

Housing in Warsaw is concentrated on a left side of Warsaw, however changes in building intensity can be also observed on the other side of the Vistula River. Hence, there is a noticeable increase in the intensity of development in the corridors ventilating the city. Lack of municipal planning politics led to uncontrolled development of the airflow corridors. Moreover, not including proper protection of the airflow corridors in planning documents had an impact on aerodynamic properties of the city and its ability to ventilate. It also negatively affected green areas which play crucial role in air regeneration process.

Results of the study revealed that city centre, as the most densely developed area, has impaired airflow performance. Simultaneously, it is the area of the highest pollution levels, where accumulated pollution has no possibility to be dispersed. Therefore it is crucial to induce the air movement in the downtown area. Whereas it is unlikely it this district for buildings to be demolished and the development area to become less intensive, it is crucial to stimulate the flow and ventilation capabilities by other methods. This can be achieved through introducing high greenery that cools the temperature and increases its humidity, thereby stimulates its vertical motion (convection).

Contamination of air alongside with smog episodes are still a substantial problem in Warsaw and a real threat to its inhabitants' health or even live. There is no fully effective remedy, however authorities ought to use all possible political, strategic and financial tools to protect green terrains and make the city more sustainable. The key point is to reinforce planning politics and to include these assumptions in Strategic Concepts of Conditions and Directions for the Spatial Development of Warsaw study and to prioritise its regulations. It is also important to promote proecological behaviors among inhabitants to reduce pollution from individual sources. Furthermore, as it is line sources which are the main cause of these condition, it is recommended to reduce traffic in a city centre by all means.

The aim of the study was to analyse changes in the morphology of Warsaw and relate changes in its aerodynamic properties. It could not be done without ensured access to full, qualitatively good and available data from Land and Property Register, containing year of construction and height of the objects, as well as from Voivodeship Inspectorate of Environmental Protection, which could be analysed to illustrate real condition of air in chosen corridor. However, it is possible to calculate urban indicators using the actual height of buildings obtained by photogrammetric method, which would increase the accuracy of the analysis. Credibility of the results might also be increased by consideration of landform and land cover in future analysis. Moreover, the aspect of new buildings developed on the areas covered by local planning documents is worth later investigation. It means that standards and suggestions how to design housing to not disturb airflow are ought to be set. Also, according to our study, placement of airflow corridors does not coincide with paths of corridors obtained from modeling, which implies a need to carry out observations in situ to confirm our results.

In conclusion, proposed methodology for analysis of airflow conditions of a city to evaluate and create planning documents could be taken into consideration. It might appear to be a cheap but still effective tool for these purposes.

ID 1654 | GEOGRAPHY OF “SUSTAINABILITY WITHIN URBAN FOOD STRATEGIES

Lorenza Sganzzetta¹

¹Politecnico di Milano

lorenzamaria.sganzzetta@polimi.it

ABSTRACT: The whirling population growth that is affecting global cities is causing an enormous challenge to conventional resource-intensive food production and supply and the urgent need to face food security and sustainability concerns. Cities can be the starting points of these strategies and they need to strike a balance between the localization of their food chains, reconnecting food with its place of provenience, and the globalization and market pushes. Urban Food Policies or Food Strategies can provide an interesting path for the development of this new agenda within the imperative principle of sustainability. But which are the main components of these policies? Most the food plans include actions related to three main dimensions that falls within the umbrella of what the food planners call “food

sustainability” that are food security and equity, environmental sustainability itself and cultural identity and, at the designing phase, they differ slightly from each other according to the degree of approximation to one of these dimensions. An essential observation can be made about the relationship between these dimensions and geography. In statistical terms, the US and Canadian policies tend to devote a large research space to health issues and access to food; those northern European show a special attention to the environmental issues and the shortening of the chain; and finally the policies that, even in limited numbers, are being developed in the Mediterranean basin, are characterized by a strong territorial and cultural imprint and their major aim is to preserve local production and the contact between the productive land and the end consumer. This means that the relationships between food sustainability, public policies and the comparative study of the different cases are important in order to find solutions and ideas to future planning dispositions. Moving from these assumptions, my article, with primary and secondary data, would reflect on the current mapping of the Urban Food Policies, on the reasons why such priorities are located in those geographic areas and on the effectiveness of the practices they produce.

1 INTRODUCTION

The whirling population growth that is affecting global cities¹ is rising an enormous challenge to conventional resource-intensive food production and disclosing the urgent need to assure food security and respond to sustainability concerns. Even if it is a multi-scalar problem, cities are firstly required to deal with a practical challenge: setting policies, governance models, processes, and concrete territorial interventions to create sustainable food supply and distribution systems. Cities, in fact, can be the starting points of these strategies aiming at the re-localizing their food chains, reconnecting sites of food consumption with its production place, in spite of the globalization and pushes of the food market.

Within this landscape, the scientific literature is focusing on agro-food re-localization initiatives and on the idea of fulfilling cities’ demand with local and environmentally sustainable products². Coherently, several UFPs are adopted by urban governments in the attempt to limit the unsustainable provisioning of the city; they are oriented to a new geography of the food chain that gives birth to new food production practices. This increasing interest in UFPs is also consequent to the growing citizens’ preoccupation about food quality.

Urban Food Policies, encompassing planning dispositions and governance processes, are contributing to a crucial international debate on sustainable, healthy and secure food provisioning of the city. Cities are therefore protagonists of a serious urgency (time is limited by the speed of population growth) and active agents in the creation and adoption of UFPs as answers to this urgency. Such policies are developed within rich and active political environments characterized by a dense local relational network and by rich international cooperation assuring important experiences sharing and transfer, as well as frequent fashion phenomena that risk to vacuum strategies and policies with respect to their initial goals.

Many UFPs are enabling and activating new food production practices, which are transforming land use and landscape production, and try to satisfy the initial objectives that have inspired the policies and strategies themselves. This explains why UFPs provide an interesting research field when challenged by the practices that they are activating and enabling in urban environments.

2 THE MAIN DIMENSIONS OF AN EFFECTIVE FOOD SYSTEM

What exactly do food planners mean by 'sustainable' food system? There are many different dimensions and sub-objectives that are stated in the general planning document as defining an effective food system, and what falls within the scope of the term 'sustainability' when dealing with food production and consumption systems. Strictly speaking, sustainability implies the use of resources at rates that do not

¹ FAO, 2014

² 2 Deverre C., Lamine C., 2009, Les systèmes agroalimentaires alternatifs. Une revue des travaux anglophones en sciences sociales, Economie rurale

exceed the capacity of the Earth to replace them¹. In the objectives of these Food Strategies, an effective food system is encompassing a range of issues such as food security, health, safety, affordability, and quality; as well as the strength of the food industry in terms of jobs and growth; or still in terms of critical issues like climate change, reduction of biodiversity, water scarcity and soil pollution.

These exposed above are the main reflexive trajectories identifiable in the literature when exploring the dimensions of a food system, which are referred to at most when dealing of UFPs.

It is relevant to identify what sustainability is referred to in Urban Food Policies and which are its dimensions.

From a first exploration of the UFP literature, different dimensions appear to compose this concept which is far too complex and multifaceted.

Security. "Food security exists when all people, at all times, have physical, social and economic access to sufficient, safe and nutritious food which meets their dietary needs and food preferences."² It can be defined as a bi-modal problem because both under nutrition and over nutrition affect a regular and healthy nutrition choice of the consumers and provoke chronic diseases. This problem is reinforced by reliance that consumers still have on highly processed food sourced from distant locations.³

Equity. Another important dimension in UFPs, connected to the first one, seems to be the equal possibility for all ages, sex, social class and ethnic group to access to healthy food. All the discussions on "biological" food, sold at non-affordable prices are now under the lenses of the food policy designers. Alternative Food Networks, such as Slow Food's Terra Madre forum or the Otago Farmers Markets, described by Parkins and Craig in their article⁴, illustrate some attempts to deploy the cultural value of land and the existence of a different network where farmers are somehow protected by global market with public incentives and consumers are provided with affordable and short-chain food, in a virtuous circle. Morgan and Sonnino theorized that also Urban Agriculture and the idea of re-localization of the food production might contribute to the affordability and the decrease of the prices of food.⁵

The current neo-liberalist and individualist market trend is affecting also food production/consumption and threatening the way of life of small production farms that made up a large part of the (at least European) productive campaigns, based instead on a strong sense of community and mutual support. To react, it is needed to integrate "community economies" in order to sustain bottom-up changes and recreate what Gibson-Graham calls "ethic of care"⁶. In this direction, other researcher are trying to understand the critical role of social capital for mutual benefit and of networks in the creation and resilience of alternative food systems⁷.

Environmental impact. This dimension is one of the most delicate because the current food production system is challenged by the degradation and loss the agricultural land also related to loss in biodiversity,

¹ A resource-efficient Europe – Flagship initiative of the Europe 2020 Strategy, <http://ec.europa.eu/>. The flagship initiative for a resource-efficient Europe under the Europe 2020 strategy supports the shift towards a resource-efficient, low-carbon economy to achieve sustainable growth.

² Food security is a flexible concept as reflected in the many attempts at definition in research and policy usage. Essentially, food security can be described as a phenomenon relating to individuals. It is the nutritional status of the individual household member that is the ultimate focus, and the risk of that adequate status not being achieved or becoming undermined. The latter risk describes the vulnerability of individuals in this context. As the definitions reviewed above imply, vulnerability may occur both as a chronic and transitory phenomenon. Useful working definitions are described below. Food security exists when all people, at all times, have physical, social and economic access to sufficient, safe and nutritious food, which meets their dietary needs and food preferences for an active and healthy life. Household food security is the application of this concept to the family level, with individuals within households as the focus of concern. (Fao Corporate Document repository, 2013)

water scarcity, and resources depletion¹. Even if the scale of intervention of Urban Food Policies is quite limited, cities can make the difference because they are at the same time producers of a serious urgency and the key actors for developing a response.

Cultural identity. Embedded in the definition of "Food security" there is also the concept of "culturally acceptable", that means that a consumer must have the possibility to access to food that belongs to his traditions and history and satisfies his preferences². Furthermore, cities that are now experimenting the reconnection with the traditional productive vocation of their lands (for example the case of Langhe e Roero recognition as wine producers by UNESCO Heritage) can pass through a process of recasting themselves on the territorial hierarchy, with a new identity³.

3 METHODOLOGY

Urban Food Policies represent one of the most frequently discussed themes in the context of sustainable development and food security studies, even if currently a small number of cities concretely developed an active UFP.

In this work were analyzed cities that published an official document, objectives and timing of implementation and some of those that are part of the Milan Urban Food Policy Pact (MUFPP), an international protocol, engaging the largest number of world cities for the development of food systems, based on principles of sustainability and social justice⁴.

It was necessary to use both the scientific and the gray literature, as much of the news about sustainable food strategies, implemented or part of bottom-up initiatives, derive from informal sources, such as newspaper articles, specialist magazines, networks of professionals and interviews.

During the analysis of the different dimensions that compose the concept of 'food sustainability', made through case-studies literature and official documents, it was detected that in many cases the Urban Food strategies start their genesis from a specific need or entry point, such as health or environmental problem, and then have to cope with more different issues, interdependent between them.

For this reason, were identified three main policy approaches that represent the orientation of these urban strategies at their first stage.

4 DIFFERENT POLICIES APPROACHES

Along with the literature review and following three main dimensions, were identified three correspondent policy approaches that start their vision from different entry points and different needs.

FOOD SECURITY AND EQUITY

The first, initially developed in the USA (New York City), Canada (Toronto) and UK (London) faces a context where the food industry impacts upon the economic, social or environmental aspects of the city life. Supplying this huge, demanding and competitive market it provides employment for many tens of thousands of people, who work in settings as diverse as world-scale retailers, niche manufacturers and contract catering companies. Together, these economic opportunities contribute to the success of these cities' world-class economy.

⁴ <http://www.milanurbanfoodpolicypact.org/>

However, as many are slowly becoming aware, there are problems associated with this abundance; and the City both contributes to, and has responsibility for, some of these problems.

Too many people are suffering from obesity and this generates a health cost problem that, for example in New York City, was tackled with a strong federal intervention.

Here the first studies on public health related to food unsustainability started during the Bloomberg's mandate (2002-2013), when the city of New York received a huge federal grant to be oriented on obesity and chronic diseases researches. These new public concerns were in line with the general trend of Western countries always more interested in food quality, food security and sustainability of production and consumption. Furthermore, the city needed to reduce its public costs and the large spread of junk food related diseases were calling attention on the "American unhealthy way" and filling the hospitals of new cases. Therefore, Bloomberg launched the campaign "New York City Obesity Task Force Plan to Prevent and control Obesity"¹. Many actors both public and private activated and created connections in order to share knowledge and participate in the construction of scientific grounds on food sustainability and security, until the municipality created a body dedicated to research and development, the Nyc Food Policy Center².

Equally, the city of Toronto and London, in their programmatic documents, state as first objective the construction of a health-focused food system.

Connected to this first policy approach focuses on the social problem of equal access to food and on the economic one of a fair market for small holders/producers and consumers. Even this approach is clearly observed in the US and Canadian cities, such as New York and Toronto where were set different initiatives in order to facilitate people that are not able to exercise the choices enjoyed by the majority to be part of a just food system³.

FOOD ENVIRONMENTAL IMPACT

This approach, widespread in other cities of Northern Europe and Canada, focuses on the environmental impact of food on the supply of organic and regional food in the public procurement and on a sustainable food transport and logistics system.

Basically, these cities are working on the re-appropriation of the land and on agro-food re-localization initiatives, based on the idea of fulfilling cities' demand with local and environmentally sustainable products⁴.

The aim of developing a sustainable peri-urban agriculture, in this specific geographical area, implies an evaluation of the production capabilities of the lands and of the weather conditions and risks to employ many resources.

FOOD CULTURAL IDENTITY

The third food policy approach is moving its first steps in a context characterized by a deep cultural awareness of the importance of food history and tradition, such as the Mediterranean basin.

⁴ Deverre C., Lamine C., 2009, Les systèmes agroalimentaires alternatifs. Une revue des travaux anglophones en sciences sociales, Economie rurale. people eat are homogeneous and standardized products, which come from a globalized non-place-based value chain.

In this region, the idea of concretizing a healthy and traditional food habit in a regulatory framework is relatively new and, for the moment, there are few examples of rising Urban Food Policy in France, Spain and Italy.

The main objective for all is to sustain the traditional agriculture and to rediscover the regional traditional recipes and products, reinforcing the re-connection between the food and the land of provenience. We can call this approach identity-based, because it aims to strengthen the regional food culture of the cities interested and recasting them on the territorial hierarchy, with a new identity based on a representative product.

This last group of policies tries to avoid what Ilbery and Kneafsey call “placeless foodscapes”¹, where the relationships between the food and the place where it is produced are broken and what most of

In all the approaches, the network is moving with a declared participatory approach and almost every month citizenship, non-governmental associations, researchers are invited to take part in public councils and to express their opinions in the field of food security and equal access.

One of the most active actor on the international panorama now is the city of Milano, that, starting from the signature of the Milan Urban Food Policy Pact (MUFPP)², is advocating an international protocol, engaging the largest number of world cities for the development of food systems, based on principles of sustainability and social justice.

This overview of examples of UFPs is aimed at capturing the most important contents and structures of the policies, the governance models and the most important imagined results and effects of the policies themselves.

5 FROM POLICIES TO PRACTICES. WITNESSES FROM THE CITIES

The three main policy approaches, briefly introduced before, result in many practices and initiatives, implemented in order to achieve the declared objectives.

Within the policies of the first approach, New York City food Policy strongly represents the relevance of food security and access for low-income families. The first lines of the Food Metrics Report of 2016 say:

“Food insecurity is the lack of access, at times, to enough nutritionally adequate food for an active, healthy life for all members of a household. Food insecure families may worry that food will run out before they have enough money to buy more, eat less than they should, or be unable to afford to eat balanced meals. New York City is committed to working towards a city where everyone has enough nutritious food to eat, through a range of initiatives in partnership with community-based and nonprofit organizations.”³

To put in practice this aim, the city is running a program called Health Bucks that is a pioneering farmers’ market incentive program that intended to reduce food insecurity among NYC residents by increasing access to and affordability of fresh fruits and vegetables through farmers’ markets in low-income neighborhoods. Health Bucks was started in 2005 by the NYC Department of Health and Mental Hygiene (DOHMH). In partnership with local community groups, DOHMH District Public Health Offices (DPHOs) distribute \$2 coupons — or “Health Bucks” — redeemable for the purchase of locally grown fresh fruits and vegetables at farmers’ markets in the South Bronx, North and Central Brooklyn, and East and Central Harlem (DPHO areas). At farmers’ markets accepting SNAP benefits via the EBT system, consumers have an added incentive. For every \$5 in EBT purchases, an additional \$2 Health Bucks coupon is provided, to be spent then or at a later time. Local community-based organizations (CBOs) in DPHO areas also distribute coupons directly.

¹ Ilbery, B. and Kneafsey, M., Producer Constructions of Quality in Regional Speciality Food Production: a Case Study from South West England, 2000, Journal of Rural Studies

² <http://www.foodpolicymilano.org/en/urban-food-policy-pact-2/>

³ Food metrics report 2016

Data from the Food Metrics Report state that in some neighborhoods the redemption rate of these coupons was quite high and the city is working on collecting more specific data from the community-based organizations (CBOs) that are concretely distributing the Health Bucks coupons.

Another interesting example of the Security and Health-based policy approach is the Bristol Food Policy. In this case, the body deputed to the implementation and advocacy of the policy (The Food Policy Council¹) published a specific and coherent aim:

“The aim of the Bristol Food Policy Council is to ensure that Bristol residents and visitors have access to Good Food. The Food Policy Council defines Good food as being: vital to the quality of people’s lives in Bristol. As well as being tasty, healthy and affordable the food we eat should be good for nature, good for workers, good for local businesses and good for animal welfare.

To underpin this aim the FPC have agreed 3 principles:

Good for people – everyone should have access to information, training and resources that enable them to grow, buy, cook, and enjoy good food.

Good for places – the public and policy-makers should support and value food enterprises who promote local jobs, prosperity and diversity, and treat workers well.

Good for the planet – food should be produced, processed, distributed and disposed of in ways that benefit nature. These elements to underpin all food related work in the city Green Capital 2015² food priorities Building on the Bristol Good Food Plan the Green Capital 2015 food priorities are:

- Promoting healthy, affordable & sustainable food to the public
- Increasing access to affordable good food
- Making food growing/production visible across the city
- Scaling-up urban agriculture
- Encouraging healthy eating in schools
- Reducing wasted food
- Transforming catering & procurement”³

Even if it is relevant the mention of the city as Green Capital 2015, it is still guiding the principle of healthy food in the food policy. In this direction, the city implemented a pilot to offer Bristol inhabitants that are patients with long-term health conditions, access to community kitchens and nutritional advice – for example a ten-week course designed for people diagnosed with heart disease or diabetes.

Furthermore, the municipality directly funded Buzz Lockleaze, a community shop selling affordable fresh produce to the local community and encouraging healthy eating through training, workshops and volunteering.

Both in the NYC and the Bristol case, the focus on healthy food comes for a more general and historical problem of the city with the public health costs and with the spread obesity of their populations

In the environmental issues approach, addressed to reduce the food miles of the urban food system, many cities are implementing the promotion of peri-urban agriculture and of the growth of green belts, like for example Amsterdam food strategy that developed the Green Metropolis Plan⁴ to preserve and develop the green areas in and around Amsterdam and is implementing many programs in the public canteens to improve the consumption of food produced locally and less invasive for the natural environment.

¹ The rationale for establishing a Food Policy Council is to create a high-level strategic grouping combining the different elements of the food system (including production, processing, distribution, retail, catering, consumption and waste disposal) with the common objective of achieving a healthier, more sustainable and resilient food system.

² The Bristol method, How to become a more sustainable food city. Bristol 2015 European Green Capital. <https://www.bristol2015.co.uk/method/>

³ <http://bristolfoodpolicycouncil.org/>

⁴ www.ccre.org/docs/amsterdam_food_strategy_vermeulen.ppt

Canada too, and, in particular, the city of Vancouver is demonstrating a strong interest in the “food print”, the ecological footprint of food¹, that is the impact on the environment of the steps that constitute the food chain, from the production to the final consumption and include the depletion of different natural resources.

The first objective of the food plan is to increase the consumption of “local” food and its definition of “sustainable food system” is oriented on the preservation of the environmental well-being.

“According to our City of Vancouver mandate, The Vancouver Food Policy Council works to help improve food sustainability in Vancouver, where food is local

Why local and sustainable food? Seeking to increase local and sustainably produced food means:

- reducing or eliminating pesticides, fertilizers and hormones
- ensuring safe and fair working conditions for farm workers
- providing humane conditions for animals
- protecting and enhancing habitat and biodiversity
- and reducing energy consumption and polluting emissions in food production, processing, distribution and waste management.

Just and sustainable food system The City of Vancouver defines a just and sustainable food system as one in which food production, processing, distribution, consumption and waste management are integrated to enhance the environmental, economic, social and nutritional well-being of our city and its residents²

Therefore, in 2009, on the eve of hosting the 2010 Winter Olympics, Mayor Gregor Robertson declared Vancouver’s goal to be the Greenest City in the World by 2020. Building on a comprehensive city sustainability plan that includes targets for zero carbon, zero waste, and healthy ecosystems, urban agriculture and sustainable food systems emerged as a foundational plank in the city’s greening strategy. Local food is one of 10 key action areas identified in Vancouver’s Greenest City 2020 Action Plan, with a goal to increase city-wide neighborhood food assets by a minimum of 50% over 2010 levels (City of Vancouver 2010). In the 2013 Vancouver Food Strategy, the City of Vancouver made advancing urban agriculture (including community gardens and urban farming) one of its top five priority action items for advancing a just and sustainable food system in the city (City of Vancouver 2013). From the City’s point of view, urban agriculture can contribute to the availability of local food through farmers markets, Community Supported Agriculture programs, community gardens, school cafeterias, and community centers. Urban agriculture initiatives may also contribute to the green economy and the advancement of public education and food literacy related to food production, processing and consumption in Vancouver³.

The identity-based approach promotes and sustains the “traditional production” or a production that preserve the old traditions related to food. Many initiatives can better explain this trend, like Slow Food organization (SF) an international movement founded in Italy and operating in many countries, on all continents. It started in 1989 by launching a campaign that focuses on “Good, Clean, and Fair” food²⁸. One of SF’s operative tools is the Slow Food Foundation for biodiversity whose primary goal is the preservation of old traditions linked to food, with the specific aim of preserving the diversity of locally grown crops and traditional crop management systems. Over the years, the foundation has developed several projects; one of these is the Slow Food Presidia project, which started in 1998. The holistic vision that characterizes the SF approach is not limited to the environmental, social, and economic aspects of sustainable development; rather, while taking them into account, it tries to define a more complex pathway to preserve the existing breadth of knowledge for future generations.

There are not many examples of food policies that have a high level of approximation to this dimension, but it is possible to say that the tendency of the food plans based in the Mediterranean basin and, in particular in Italy, are strongly promoting a sort of “geographical belonging of food” and giving attention to cities and regions as cultural cradles of specific foods.

² <http://vancouver.ca/people-programs/vancouvers-food-strategy.aspx>

³ <http://vancouver.ca/green-vancouver/greenest-city-action-plan.aspx> 28 PETRINI C., FURLAN C., HUNT J., SLOW FOOD NATION: WHY OUR FOOD SHOULD BE GOOD, CLEAN, AND FAIR, 2005, RIZZOLI.

Such as the territorial food plan of Pisa, that made the food, its symbolic capital, its cultural and economic implications, a development lever for rural areas and characterization for the regional food system¹.

This is probably explicable with general social and cultural factors of these areas, where the different populations are deeply anchored in the food culture.

6 CONCLUSIONS

Cities all over the world are facing many familiar challenges, the unsustainability of the current food systems that are supplying our tables are a common obstacle. Most of the Urban Food Policy or, more in general, Food Strategies are focusing their efforts on the dimensions of food security and accessibility, environmental sustainability and cultural identity of the food. But the specific accent that every plan is putting on one of these issues, as more relevant than the others, is oriented and mediated by their local context. Urban food systems and politics inevitably depend on the features and circumstances of a city, including: historical and cultural factors, strength and basis of the local economy, geographical setting and natural resources, infrastructure, and societal and political factors, such as governance structures and the strength of the state and of civil society. Consequently, UFPs take different forms around the globe. Each one is dependent on its local context, which determines the aims, objectives and actions that are appropriate and achievable.

Finally, there is not a common model of “sustainable food system” nor a common set of tools or planning disposals that a city can implement to achieve this goal, but many different examples of good practices and wise public bodies that are trying to accommodate the new trend, considering the social, historical and geographical context and the local need of their regions.

ID 1677 | WORLD EXHIBITION AS A TOOL FOR THE PROMOTION OF HEALTHY AND LIVEABLE CITIES: CASE STUDY MILAN, ITALY

Lea Petrović Krajnik¹; Damir Krajnik¹

¹University of Zagreb, Faculty of Architecture, Department of Urban Planning,
Spatial Planning and Landscape Architecture

lea.petrovic@arhitekt.hr; damir.krajnik@arhitekt.hr

1 INTRODUCTION

Mega-events, such as world and international exhibitions, the Olympic Games, other sports and cultural events, are intrinsically complex processes. Their planning, organisation and realisation require the engagement of a large number of people and financial resources for the successful realisation of the event. In addition, the success of the event depends on numerous social, economic, political, spatial and other factors that are often unpredictable and can significantly increase effects of the event that can be recognised in long-term on the local, regional and national level.

While hosting mega-events, the attention of a large number of people from all over the world is focused on this specific event that has its own specific roles in the realisation of that event. According to Maurice Roch (2000) mega events involve combinations of political and economic elites, together with cultural elites and professionals that are operating within and between urban, national and international levels, and working together to produce the event and to manage their effects. They can be conceived as temporary “cultural and physical bridges” between elites and the people. In mega-events people are active members of international cultural movement and they are involved in international communication that is taking place.

Compared with other mega-events, world and international exhibitions last the longest and attract the greatest number of visitors. For the purpose of the exhibition, the most suitable site to meet all set-up parameters and for which it is desirable to conceive the long-term use is chosen. For every exhibition, the specific topic is set to which all participants correspond with the conception of their pavilion and presentation.

The exhibition topic is always in line with global trends and promotes the technology, science and progress towards the concepts of sustainable development.

In addition to the main event, during the exhibition in the city and region a number of accompanying cultural, scientific, professional, sport events are organised to promote the exhibition theme and can contribute to comprehensive positive effects. For this reason, world and international exhibitions can be considered as platforms for education and promotion of innovation and for a comprehensive awareness of the importance of the sustainability aspects and sustainable development for humanity in the 21st century.

Organisation of the exhibition can significantly contribute to the development of the host city and the region through numerous interventions in infrastructure, suprastructure and ecostructure, that are directly or indirectly related to the event, and remain as the exhibition heritage improving the overall quality of life of their inhabitants. (Petrović, 2009)

The aim of this paper is to show how world exhibitions contribute to the promotion of the health and liveable cities, putting emphasis on the world exhibition EXPO 2015 which was held in Milan, Italy.

2 WORLD EXHIBITION AND BUREAU INTERNATIONAL DES EXPOSITIONS

Although the roots of world exhibitions date back to the time of Mesopotamia and Ancient Egypt, the first modern world exhibition was held in London in 1851 under the name Great Exhibition of the Works of Industry of All Nations. In the period from 1st May to 11th October 1851, Great Britain with colonies and 25 countries from all over the world presented their achievements in industry, art and craft in Cristal Palace in Hyde Park that was visited by 6,039,195 visitors (Bureau International des Expositions).

Great success of the first World Exhibition held in London led to the increase in frequency of the organisation of exhibitions. Exceeding frequency of 19th century exhibitions and disregarding established rules of the organisers in the early 20th century led to the need for institutionalisation and the establishment of legal frameworks for organising the world and international exhibitions. For this purposes and based on the Paris Convention of 1928 an intergovernmental organization Bureau International des Expositions (BIE) with headquarters in Paris, France was established with the aim to control the frequency, candidacy, selection and process of organising world and international exhibitions.

According to the BIE the main objectives of the exhibitions are: reinforcing the international relations, promotion of culture and education, encouragement of development of the city and region, careful actions in the environment from the aspect of sustainable development and urban renewal and experimentation with technical and scientific innovations of future development.

3 EXPO 2015 MILANO

The celebration of the centenary of the 1906 World Exhibition (held with the theme of transport on the occasion of the opening of Passo Sempione) prompted reflection on the reorganisation of such an event in Milan. In October 2006, the Prime Minister sent a letter of intention to the BIE, and the candidacy was confirmed in 2008. In the meantime, two thematic forums were held in Milan and Rome with the aim of discussing themes among international experts.

The company Expo 2015 SpA was founded for the organisation, realisation and management of EXPO 2015 Milano including the construction of infrastructure directly related to the exhibition site. In 2011, the company Arexpo SpA was founded in order to conduct the process of transformation of the exhibition area into post-exhibition period.

At the world exhibition Expo 2015 Milano there were 145 participants in the period from 1st May to 31st October 2015. In that period, the Expo site was visited by 21,500,000 visitors (Bureau International des Expositions).

A new vision of Expo's role was conceived. The intention was to interpret the event and its legacy in a new way including also thematic culture. Expo 2015 Milano strived to define a new thematic type of architecture and to focus on the relationship between human beings and nature. The pervading theme, engagement with visitors, involvement of counties in thematic clusters and contribution of enterprises and civil society were innovative aspects included in the concept of exhibition.

Expo 2015 SpA paid close attention to the sustainability of the event, which resulted in various programmes and projects through all stages of preparation and implementation of events based on the social, economic and environmental aspects of sustainability. Priority was on environmental sustainability and the use of advanced methods and technologies in construction Expo site and in organizing the event.

Expo Milano 2015 was the first exhibition that used tools to manage environmental, social and economic impact. The Event Sustainability Management System enabled the increase in overall level of sustainability. The planning phase, the preparation of site and implementation and management phase obtained the UNI ISO 20121:2013 certification. There were two special guidelines set in order to prevent, reduce and manage environmental impact related to the presence of participants on the site. Sustainable solutions were applied in planning, construction, dismantling and reuse of the pavilions and the implementation of green procurement criteria for the procedures in purchasing goods and services.

3.1 THEME FEEDING THE PLANET, ENERGY FOR LIFE

Nowadays food production and consumption have grown exponentially. Improper food production and environmental pollution have led to the need of thinking about how to feed nature, achieve balance between growing food requirements and methods of boosting production. Reflections should be directed on feeding the environment in which we live and from which we draw sustenance.

Therefore, issue which interweaves the environment and food, theme Feeding the Planet, Energy for Life was chosen for Expo 2015 Milano. The world exhibition is an ideal place for exchange of views through talks on food and sustainable use of resources, on the right to healthy, safe and sufficient food for the whole planet, sharing of production and consumption models that are respectful to the environment and social equality. It is also an opportunity to remind people of ancient techniques of food production and preservation of ancient knowledge and make researches for new technological applications.

The intention was that organizer and participants cooperate in order to present excellence in the methods, techniques and rules of food production, strategies to combine production with energy sources and the safeguarding of natural resources. (Expo 2015 Milano)

Figure 1 - Location of the Expo 2015 Site in relation to the City of Milan and its metropolitan region

3.2 EXPO SITE

For the purpose of the event, a location in the north-western part of Milan was selected, which was mostly unbuilt area and partly agricultural area. The selected area of 110 ha forms a part of the greenbelt of Milan (Parco Agricolo Sud and Parco delle Groane) and represents a significant link between rural and urban space. The area is easily accessible via the railway infrastructure (underground, regional and high-speed

rail lines) and the road infrastructure (A4 and A8 highways and bypass) and is located near the Rho-Pero trade fair complex. (Figure 1)

In 2009 group of five architect (Stefano Boeri, Ricky Burdett, Joan Busquets, Jacques Herzog and William McDonough) made a conceptual Masterplan for Expo 2015 site (Herzog & de Meuron, 2016). In the preparation of Masterplan, the great attention was paid to the following topics: actual theme of urbanisation, regarding limitation of the consumption of land, ensuring the permeability of the largest possible surface area, intelligent use of resources, possibility of reutilization of structures and materials in post-exhibition phase, encouraging of use of public transport, production of energy from renewable resources, sustainable waste management and internal water processing.

The exhibition site represented the Expo theme in its physical form. It was conceived as a single landscape, an island surrounded by a canal. Water, as a key element constituted an integral part of the site through a system of canals that were conceived on the model of network of rivers and waterways characterized for the Milan and Lombardy.

Figure 2 – Layout of Expo 2015 Site Milan, Italy

There were two main axes, Decumanus running east-west and Cardo running north-south. Pavilions of participant countries were placed along Decumanus (35m x 1500m) and the sites for Italy and its regions, provinces and cities were conceived along Cardo (350 m). Main iconic elements of the exhibition hosting the major events were places on the four cardinal points: the Mediterranean Hill, the Open Air Theatre, the Lake Arena and the Expo Centre. In total, there were 70 independent pavilions built, 9 clusters (Coffee, Rice, Cocoa, Spices, Fruit and Legumes, Cereals and Tuvers, Agriculture and Nutrition in Arid Zones, Islands, Sea and Food and Bio-Mediterranean), the Cascina Triulza pre-existing structure, 4 thematic areas (Pavilion Zero, Biodiversity Park & Slow Food, Children's Park and Future Food District) and one in the Milan Triennial complex and 5 structures for events (the Lake Arena, The Open Air Theatre, The Open Plaza, Auditorium and Conference Centre). Symbol of Italy's participation was the Tree of Life, a tower sculpture of steel and wood that produces sound and light shows with spectacular fountain displays. (Grimaldi, 2015)

Participants were given greatest freedom in design of pavilions, although their obligation was to offer interpretation to the exhibition theme (processes of agricultural production, technologies, research in food sector). In the pavilions, there were spaces for sampling and selling characteristic products.

Figure 3 – (1) The Mediterranean Hill, (2) The Lake Arena and Italian Pavilion, (3) The Tree of Life

The Cascina Triulza was the only pre-existing structure located within the Expo Site. It was a traditional farmhouse from the late 1800s (a total surface area of 7,900 m², which was reconstructed for the purpose of Expo using sustainability criteria in compliance with the LEED NC standard (GOLD level certification). During the event, the structure hosted civil society with debates and exchanges of ideas and experience with the question of food, that is managed by the Triulza Foundation, a network of various national and international third-sector organizations.

Around 20% of the area was covered with vegetation. The buffer zone toward nearby motorways and railway lines was created by planting trees on the perimeter using planting techniques requiring limited maintenance. Great attention was paid to the landscape arrangement. There were 8 gardens, 3 major piazzas, 25 minor piazzas, The Mediterranean Hill, tree-lined rows of bushes arranged on the Expo site. (Grimaldi, 2015)

From the very beginning the idea was to reuse structures and equipment used for exhibition (interior furniture, outdoor and street furniture, bins for waste collection, plants, office furniture and equipment, expo village furniture). The green works and structures (seats, pergolas, paving) were planned for dismantling for reuse after the event. (Grimaldi, 2015)

The company Arexpo SpA with the majority of public capital has been conducting the process of developing and implementing the transformation of the area in the post-exhibition period. It was necessary to elaborate a Master plan for urban transformation of the whole area and to conceive a Business development plan. In 2016 guidelines of the strategic development plan and its evaluation were developed. It was conceived that in the area where the exhibition took place, the scientific technological park of international significance will be arranged. A science technology park (STP) should be dedicated to the research of the most advanced technologies in the fields of health, nutrition and sustainability, called project "Italia 2040 (Monaci, 2015). The Park is designed to facilitate knowledge transfer between universities, companies and research centres around the world.

The area, well-equipped with infrastructure and easily accessible has a high development potential and is appealing to both public and private Italian and international companies. The area is designed to live 24/7 thanks to mixed functions - culture, sports and entertainment, housing, the tertiary sector, shopping areas etc. (Arexpo)

3.3 PROJECTS AND PROGRAMS

Programme "Towards a sustainable Expo" aiming to stimulate and encourage greater attention to sustainability, was created by Ministry of the Environment and Protection of Land and Sea and Expo 2015 SpA. The intention was to limit the environmental impact, highlighting the most relevant solutions and disseminating them as a legacy of Expo. There were 4 categories: Sustainable architecture with references to the project for the Pavilions and Exhibition areas, Sustainability of food offered by refreshment of catering services, Application of green procurement criteria for furniture, packaging and merchandising.

Because the urbanization of Expo site caused the loss of 160 equivalent hectares in term of ecological value, there was a special ecological reconstruction programme conceived in order to balance the loss.

The area covered by the programme surrounds the exhibition site in the North West Milan. Expo 2015 SpA together with Regional Body for Services to Agriculture and Forests will carry out planned compensation interventions.

For the purpose of monitoring actions in all exhibition phases Expo 2015 SpA presented the Environmental Monitoring Programme – EMP (noise, vibrations, atmosphere, underground water, surface water, drinking water, waste water soil, eco-system, fauna and vegetation). Monitoring of same sensitive elements was made according to the further assessment method “Delta VIP”.

Expo 2015 SpA developed an Inventory to calculate greenhouse gas emissions produced by the organisation of the Expo (UNI EN ISO 14064:2006 standard). If inventory estimation will be confirmed, the implemented initiatives would allow offsetting 100% of the emissions under the responsibility of the event through specified interventions (energy requalification projects for public buildings in Milan, Rho and Arese, purchase on the voluntary market of credits).

Smart city project Smartainability (“Smartness” and “Sustainability”) was conceived in Ricerca Sistema Energetico of the GSE Group in cooperation with Expo Milano 2015 and technical partners. The intention was to measure quantitatively and qualitatively how a city can result sustainable by using a “smart” technology.

Some specific actions were made during the event in order to ensure food safety (document inspections, sampling and analyses of food, equipment, environments and personnel) as well as to prevent food waste (collection of perishable products organized). Separate Waste collection was organised at the exhibition site that enabled the recycling and the production of various re-products.

During the Expo, there were numerous additional events under the name Expo in the City (exhibitions, talks, events of fashion and design, activities for families, sports and special concerts, recreational and cultural programme) held in the exhibition Site, in the city of Milan and its metropolitan region. (Figure 4) There were also international events organized related to sports (canoe, kayak and water-skiing world championship, amateur races) and recreation (a series of itineraries for walkers and cyclists to discover green and agricultural areas organized by the FAI).

Figure 4 – Accompanying events - Fashion week activities in Piazza Gae Aulenti

Thanks to the virtual environment, people interested in the theme of the event that were not able to visit Expo 2015 Milano, had an opportunity to make online visits that offered 3D exploration of the Site. The project allowed the greatest possible number of people access to the exhibition spaces increasing awareness of the importance of Expo Milano 2015 theme.

Spreading the events content was also taught through the implementation of school project. Teachers and students were invited to study Expo theme in classrooms and on the exhibition site. There were more than 170 Italian universities that joined the project “La Università in Expo”.

Programme Feeding knowledge, as a strategic initiative, aimed to develop and share knowledge as a main tool of finding concrete solutions for fighting food insecurity. The programme was the backbone for the setting up of a Euro-Mediterranean Centre of Knowledge for Food Security.

WE-Women for Expo programme placed female culture at the centre of Expo. Women participated in expressing themselves on nourishment for body and nourishment for freedom and intelligence and the alliance between food and culture.

Thanks to the project “Expo is Now” more than 500 meetings were organised between companies. There was a support to organize Business Forums on National Days.

The Milan Charter is a joint document that calls upon all citizens, associations, firms and institutions to unite their responsibilities to ensure future generations the right to food. Italian and international expert have worked to identify the primary issues regarding sustainable use of the world’s resources. It addresses 4 major theme within the right to food: the economic and productive models capable of ensuring sustainable development in economic and social spheres; the existing types of agriculture capable of producing a sufficient amount of healthy food without damaging water resources and biodiversity; the best practice and technologies to reduce inequality in the cities, where most of human population is being concentrated; and recognition of food not only as a source of nutrition but also as a key element of social and cultural identity. The intention was to adopt rules and policies at the national and global level capable of ensuring a fairer and more sustainable future for the planet. (Expo 2015 Milano; Expo 2015 SpA, 2015)

3.4 INTERVENTIONS IN THE CITY INFRASTRUCTURE, SUPRASTRUCTURE AND ECOSTRUCTURE

The exhibition was the occasion to revitalize the historic place and symbol of Milan Darsena - city dock. In the preparatory period of the exhibition, according to the project of architects Edoardo Guazzoni, Paolo Zizzatto and Sandro Rossi with Studio Bodin & Associés, the project of reshaping the ancient dock and adjacent spaces (investments of 19 million Euros) were realised to remain in the legacy of Milan and the Lombardy region. The project covered the renovation of the promenade, the rearranging of Piazza XXIV Maggio as a green area and almost completely pedestrian area, planting the garden and arranging the garden at the site of the former Bobino restaurant. Preservation of important artefacts like 15th century bridge, the remains of the Viaredda dock and the foundations of the 16th century city wall were enabled. New footbridge for pedestrians and cyclist connecting two river banks were conceived. The replacement of the old municipal market with a new structure along Viale D’Annunzio, a stretch of the Ticinello canal is reopened and redeveloped. (Grimaldi, 2015)

In the centre of Milan there was the Expo Gate built according to the design of Alessandro Scandurra. It was located between the Sforza Castle which was the epicentre of the world exhibition in 1906, and Via Dante as the strategic transportation axis. The Expo Gate was conceived as a first meeting place to present the Expo theme to the public. It was composed of two identical pavilions hosting different functions (ticket office and information desk, along with a small conference space and a shop a multipurpose space hosting a program of inter-cultural events and workshops) inspired by the criteria of sustainability, constructive economy and intelligence. The buildings look light-weight and airy during the day, while at night they become translucent, self-illuminated objects. An open-air public plaza is located between the pavilions, visually aligned with the Sforza Castle beyond. (Expo Gate / Scandurrastudio Architettura, 2015)

Figure 5 – Expo Gate as a part of a project Expo in the City (Expo in Città)

In 2008, an urban-architectural competition for the transformation of Cascina Merlata (50 hectares), located west of Cimitero Maggiore and south of the Torino-Milano highway, was carried out. The authors of the three-award-winning works (Paolo Caputo Partnerships, Antonio Citterio and Partners and Mario Cucinella Architects) were invited to jointly develop a new Masterplan (90 ha). The Masterplan (Caputo Partnership groups, Citterio-Viel & Partners, Antonio Citterio, Patricia Viel) was adopted in 2011 and included an area for the construction of the Expo Village (8 hectares). (Ordine e fondazione degli architetti, pianificatori, paesaggisti e conservatori della provincia di Milano, 2017)

The housing development Cascina Merlata, apart from housing, includes the accompanying public and social facilities (kindergarten, schools), the renovated Cascina Merlana with public facilities, commercial centre and urban park of 20 ha. The Urban Park forms a part of a system of “green strips” of Milan through which bicycle trails are passing all the way to the city centre. (Cascina Merlata)

In the first phase, the complex of 3 residential buildings (investor EuroMilano S.p.A.) located in the northern part of Cascina Merlata served as accommodation of the exhibition staff, and after the completion of the event was converted into subsidized housing. The heart of the whole project is the largest settlement of Social Housing in Italy consisting of 11 tower buildings, developed by different design studios (Cino Zucchi Architetti, Cappai and Segantini Associati, Mario Cucinella, Pura, B22, Teknoarch) that are developed according to the most advanced principles of sustainability for a district in class A and with zero emission.

Figure 6 – Expo village located within Cascina Merlata

The architectural concept was based on the premise that quality living is strongly influenced by the quality of public and/or private space in the surroundings. The buildings were organized around a central space, and organized as a configuration of three towers. A solar power analysis was conducted, evaluating the number of hours of direct sunlight per day on each surface: based on these variables, attention was paid to the orientation and size of transparent facade surfaces to optimize daylighting in each interior space. In the ground floors, there were communal spaces that accommodated green areas and spaces for collective use. Despite the limited budget for the project, the buildings achieved Class A classification. In fact, the inclusion of high efficiency systems (solar panels, district heating, radiant floor heating, air handling units) combined with highly insulated envelope (facade coating, low emissivity double glazing) enabled the reduction of annual consumption for winter heating. (Expo village, 2015)

In the preparatory period of the events, there were other interventions realised that were indirectly related to the event. The interventions were related to the restructuring of public facilities (schools) and infrastructures (roads), the Rho-Expo station was renewed, new lines of public transport were introduced etc.

4 CONCLUSION

The research shows that the organisation of world exhibition contributes to the promotion of the health and liveable cities on several levels.

By choosing a suitable event theme which is related to current problems in space, the reflection on the subject matter is stimulated, and the whole world responds to the set theme by building their pavilions and/or conceiving their presentation at the mega-event. The world exhibition in Milan strived to contribute to the current theme of food and sustainability in order to raise the overall awareness of their significance on the local, regional and global level.

Conceiving the event, construction of the site, conceiving and realising the subsequent use of the exhibition area are comprehensive processes involving a large number of experts from different fields. The sustainability concept that has been incorporated in all phases has encouraged all involved professionals to contribute to the sustainability of the overall project and to the sustainable development of the city of Milan and its metropolitan region. Liveability of the site in post-exhibition period depends on the adequate usage scenarios and facilities implemented in the area. According to Arexpo SpA plans, the former Expo 2015 site will live 24 hours a day thanks to a variety of facilities. The goals of subjects that are planned to be located in the Milan science and technology park serve the promotion of healthy and liveable city.

Interventions in infrastructure, suprastructure and ecostructure that are realised in the pre-exhibition period, directly or indirectly related to the event, contribute to the promotion of a healthy and liveable environment and improvement of the overall quality of life.

Social events organised during the exhibition are carriers of attention and audience not only from the host city and the region, but also the entire world. The exhibition period is characterized by organisation of numerous events that give the host city special liveliness and recognisability.

Along with this, carefully thought-out programs and projects in the function of the event have important roles, but also have their deeper significance for humanity (The Milan Charter) and remain as a lasting exhibition legacy.

It can be concluded that organisation of world exhibition Expo 2015 Milano can be considered as a tool for the promotion of healthy and liveable city not only on local level but also globally.

ID 1678 | AN EVALUATION OF THE ACCESS TO NEIGHBOURHOOD PARKS BASED ON THE “NEED-BASED EQUITY”: A CASE STUDY IN IZMIR (TURKEY)

Fatma Şenol¹; S. Pelin Ozkan¹; İlgi Atay Kaya²

¹Izmir Institute of Technology, Dept. of City & Regional Planning; ²Dokuz Eylül University, Dept. of City & Regional Planning

fatmasenol@iyte.edu.tr; pelinozkan@iyte.edu.tr; ilgiatay@gmail.com

ABSTRACT: This study aims at contributing to the studies about how spatial distribution of neighbourhood parks in existing cities shape the opportunities for equitable access to “healthy environments” of the “need-groups”—here, low income groups, women, children, and elderly. Based on the “need-based equity,” it evaluates such need-groups’ “access” to neighbourhood parks in the central districts of Izmir, the third biggest metropolitan city in Turkey. It deploys “equity mapping” with the help of geographic information system to analyse and interrelate the basic data about the characteristics of neighbourhood parks and the population that is available in Turkey’s context but relatively limited compared to European context. It comparatively identifies and evaluates the objective characteristics of the built and social environment at the city scale and relates the findings to the discussions of the relations between built environment, health and urban justice.

1 INTRODUCTION

Neighbourhood parks are ideally green open spaces in residential areas that can provide various opportunities to its users for socializing, improving physical and mental health and expressing own identities. Getting access to such opportunities is especially important for those whose life conditions may lead them to live close to their home and neighbourhood space—such as low income people, women with children, children and elderly. This study calls these significant and potential users of parks as “need-groups.” Yet in reality, these need-groups do and may not have “perfect” access to neighbourhood parks, due to characteristics of the built environment that can be shaped by urban planning decisions or/ and social characteristics of these groups that can be easily ignored again by planning decisions.

This study argues that we need to examine the existing cities to analyse whether green public spaces (such as neighbourhood parks) are within walking distance especially to and in those neighbourhoods with high percentages of low income groups, women with children, children and elderly, which has been an ideal in urban planning and design traditions. Relying on an understanding of “need-based equity,” we underline that examining the allocation of neighbourhood parks through the existing cities in relation to the questions of who gets what and why is necessary both to improve the purposes for healthy environments and also our ethical standing as urban planners (Talen 2010). Also, such analysis can improve our decisions about re-allocation of public resources through cities and about “efficient” urban planning and design of open and green public space (Boone et al., 2009).

Briefly, the idea of “need-based equity” suggests that in the redistribution of public resources, the groups that are traditionally disadvantaged due to their class, gender, race/ethnicity, age and so on should have the priority (Lucy, 1981). These are the need-groups for these public services, such as open and green public spaces. Based on this idea, we deploy “equity mapping” (Talen 2010) with the help of geographic information system to analyse and interrelate the basic data about the characteristics of neighbourhood parks and of population. We evaluate such need-groups’ “access” to neighbourhood parks in the central districts of Izmir, the third biggest metropolitan city in Turkey. We use basic data that is available in Turkey’s context but relatively limited compared to those in European context. It comparatively identifies and evaluates the objective characteristics of the built and social environment at the city scale and relates the findings to the discussions of the relations between built environment, health and urban justice.

2 LITERATURE REVIEW

This study considers neighbourhood parks as important for two major reasons. They are public open spaces and public service areas. Related to that, access to neighbourhood parks is necessary especially for those whose daily lives are bounded to neighbourhood and home space, such as housewives, children, seniors, and low income people. At its discussion about the importance of neighbourhood parks, this paper relates to both the researches examining social groups' access to public service areas as an issue of urban and environmental and also those investigating built environment's impact on individuals' physical and mental health (for a review, see Kent & Thompson 2014).

When interrelating these researches, this study situates the issues of built environment and health at the centre of the debates about urban justice, similar to an argument in urban geography, urban planning and politics (e.g., Boone et al. 2009; Byrne & Wolch 2009; Heynen et al. 2006; Pulido 2000). At this argument, urban parks appear as part of "environmental amenities" due to their characteristics providing various benefits and opportunities for improving health, environment, economy, and public life (Boone et al., 2009; Sister et al., 2011). Similar to a distant proximity to environmental disamenities, closeness or a short proximity to environmental amenities (such as public parks) is necessary to improve individuals' and communities' health and quality of daily life. Moreover, created by using public resources, the allocation of public service areas (such as parks) in the city must be taken as the spatial distribution of public resources. So individuals' access to these parks affect their and also public welfare (Byrne & Wolch, 2009; Talen & Anselin, 2001; Talen, 2001; Wolch et al., 2005).

Yet in reality, the opportunities of benefiting from such amenities and public service areas are not equitable distributed among each urban area, community and dweller. This body of work overall criticizes that the existing conditions for people's access to public services, healthy living conditions, local democratic representation and similar public resources are unjust and getting worse especially for disadvantaged groups, such as the poor and low income population, elderly and children. Moreover, it argues for the necessity of an "equitable" spatial distribution (e.g., Harvey, 1973; Boone et al., 2009; Heynen et al., 2006; Marsh & Schilling, 1994; Talen 2010; Wolch et al., 2005) and planning and design (e.g., Loukaitou-Sideris 1995; Low et al., 2005) of public (service) areas built by public resources. Given that human health and also spatial distribution of public resources are criteria at issues of environmental and urban justice, so does the accessibility to urban public parks (Boone et al., 2009; Sister et al., 2010; Heynen, 2006; Heynen et al., 2006; Swyngedouw & Heynen, 2003).

2.1 HOW TO ALLOCATE (NEIGHBORHOOD) PARKS

When examining the accessibility to urban parks, studies emphasize to investigate either individual or structural factors or sometimes both. The former investigates majorly the users' socio-economic and park use characteristics, but rarely relate these to structural factors (e.g. Day 2008; Koskela & Pain 2000; Low et al. 2005; Loukaitou-Sideris 1995). The latter considers basically political, administrative, planning and design decisions affecting the allocation of parks, various characteristics of social and built environment and also interactions among these factors. Works in this group develop studies at city and neighbourhood scale, while only some is based on a perspective for equitable accessibility to parks (e.g., Heynen, 2006; Heynen et al., 2006; Sister et al., 2010; Wolch et al., 2005; Talen & Anselin, 1998; Talen, 2001).

Within the perspective underlining equitable accessibility to parks, some of these few studies underline the "procedural" (i.e., historical, political, administrative and socio-cultural) processes of park provision and allocation and perceptions about open green spaces and their use. Others or "outcome" oriented studies (Nichols, 2001) consider the current characteristics of built and social environment and investigates these usually at a spatial scale (namely, neighbourhood, park and park surrounding) yet with varying kind of collectible data and perceptions of "equitability."

Focusing on the distribution of parks as green public spaces at the city scale, the literature uses quantitative data about the geographical distribution of green public spaces and also of socio-economic characteristics of the city population as potential users. Accessibility is considered as individuals' easy reaching to and benefiting from these green public spaces for various purposes. Also, the ways of how to measure accessibility is considered significant in the consideration of equitable allocation of these spaces (e.g., Nicholls 2001; Talen 2010).

Moreover, these measurements can vary depending on four perspectives about “equitable accessibility” (see Crompton & Wicks, 1988; Lucy, 1981; Nichols, 2001). The works within “equality-based equity” can consider “accessibility” by counting number of public service areas in a specific region and equitable distribution as the equal distribution of costs and benefits among individuals or groups. In the case of urban parks, accessibility and equity is measured as the square meter of green space per capita or the budget spent for open green spaces in that region. This approach is criticized for considering city space as a simple geometry and also ignoring socio-economic differences among social groups and districts in the city and even discriminating against those whose needs, characteristics and choices are different from the dominant groups. Alternatively, considering potential users’ socio-economic and demographic characteristics, the “demand-based equity” can argue for the distribution of green spaces in the city according to dwellers’ demand for their neighbourhood. Yet this usually is determined by these groups’ capacity to get access to political power and mechanisms, which is not distributed equally and favours political “perspectives” (Talen, 1998; 2010). Similarly, “market-based equity” (or “those with money can get services”) favours a portion of the society.

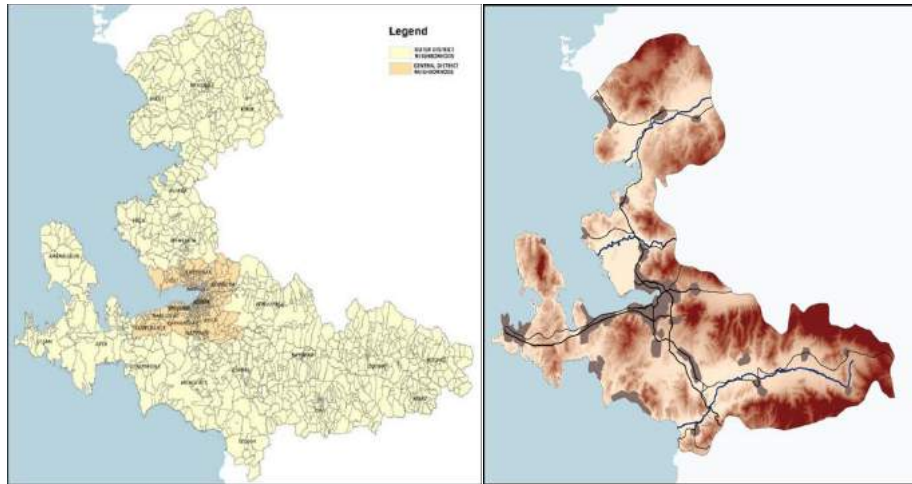

Another perspective argues for “compensation” (Crompton & Wicks, 1988) or “need-based equity” (Lucy, 1981). This considers some groups have been already disadvantaged in getting access to urban resources. However, the main problem is not these groups’ inequitable access to public service areas but their continuous experiences of socio-economic and spatial inequities because of their socio-economic characteristics based on class, race/ethnicity, age, gender and others (Byrne & Wolch 2009; Sister et al. 2010; Heynen 2006; Talen 2010). Thus, this perspective argues for the allocation of public resources and service areas to fulfil the needs of these disadvantaged groups. These groups are basically the poor and low income groups, racially/ethnically marginalized groups, children, seniors and those without cars and so on.

3 STUDY METHODOLOGY AND SITE

Based on the perspective of “need-based equity,” the studies that measure and investigate accessibility to (neighbourhood) parks deploy majorly with quantitative data about the spatial distribution of primarily population characteristics of the disadvantaged groups and also of characteristics (e.g., size and amenities) of green public spaces. Through the tools of geographic information systems (GIS) and using other multiple variables, they compare the relationships majorly between these two spatial distributions at the city scale and ultimately, aim at measuring the disadvantaged groups’ accessibility to green public spaces. Relating their findings to issues of urban justice, these analysis are called as “spatial equity” (Talen & Anselin, 1998) or “equity mapping” (Talen 2010).

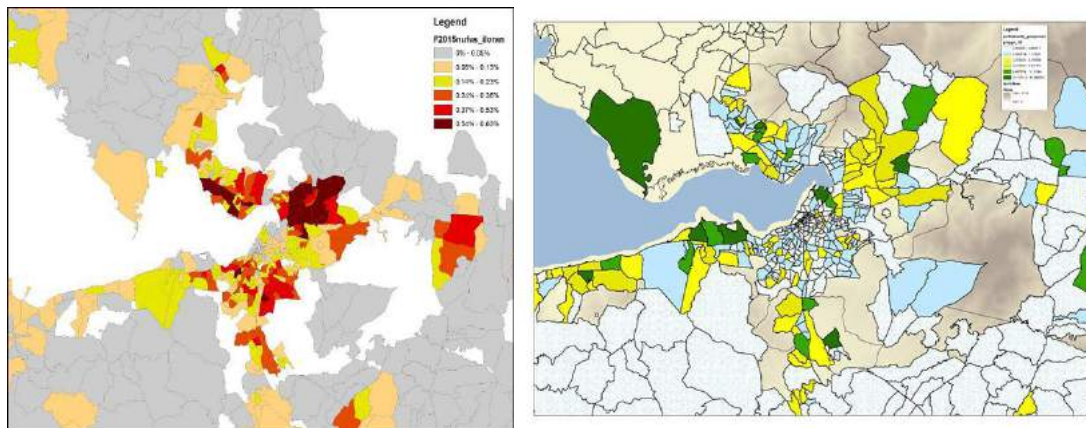

Deploying various kind of equity mapping, the literature focuses majorly on the cases at the city scale in the United States. These works deal majorly with quantitative data driven from “census tracts.” However, given the different forms and availability of data at city scale across the countries, there is a need to re-deploy this approach and method in different contexts with own available data. We aim at fulfilling this need through our case study with the data about Izmir Metropolitan Area and also central city of Izmir. In Turkey, the data about socio-economic characteristics is limited about sex, age, education level and so on at neighbourhood level, but lacks any information about income, wealth, race/ethnicity or political choices or so on. Also, if it exists and assuming that it is reliable, the data about green spaces is available by the municipalities but only about location and size. Also, when working as a unit of analysis, we must consider that boundaries of neighbourhoods are non-homogeneous.

Izmir is the third biggest metropolitan area of Turkey with a population near 5 million at its central and rural districts (Map 1 & 2). The central city with its 11 districts (out of total 30 of metropolitan area) extends along its bay area to the west and immediately on the hills to the east.

Map 1 and 2: Izmir districts and settlements.

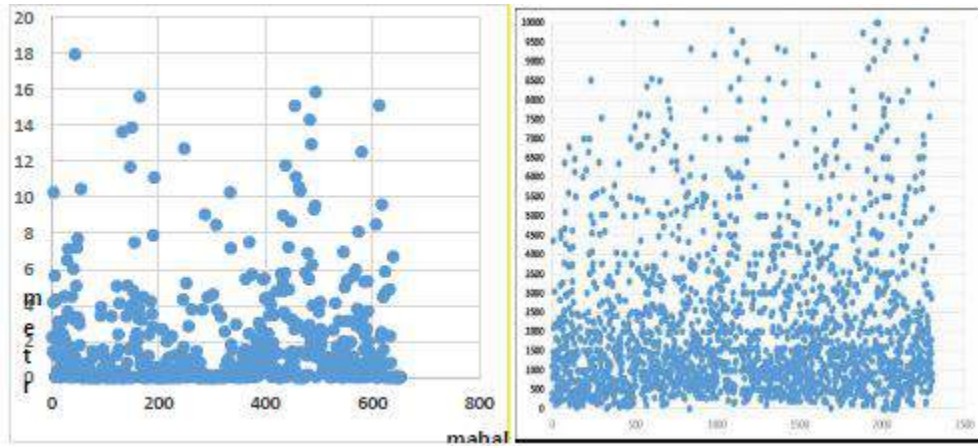

With one of Turkey's densest urban population at its central districts, the city of Izmir has its major commercial areas at coastal neighbourhoods. With an education level higher than Turkey's average, the city gets high level migration especially from its hinterland cities with agriculture base and also south-eastern cities with high concentration of Kurdish people.

Map 3: Distribution of neighbourhood populations

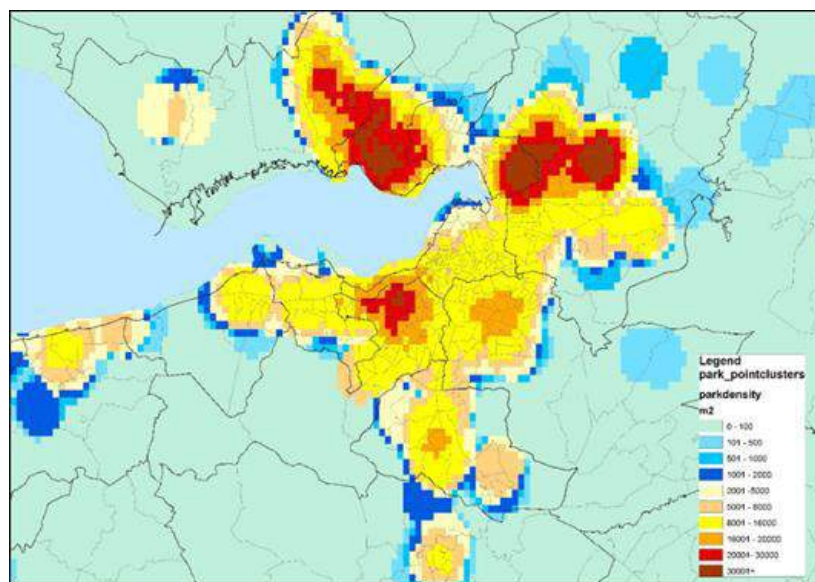

Map 4: Distribution of size of neighbourhood park areas per capita across neighbourhoods

While the central districts are the most populated areas of the metropolitan area of Izmir, the shares of neighbourhoods in these districts from provincial population (Map 3) and also the size of neighbourhood park areas per capita (Map 4) vary and tend to increase to the north and then to southeast. Yet still across total 657 neighbourhoods, the average neighbourhood park area per capita is around 2 square meter (Graph 1).

Graph 1: Size of park area per capita Graph 2: Distribution of neighbourhood park size

In central districts, the sizes of neighbourhood parks vary tremendously yet with a high concentration under 2.000 m2 and then under 500 m2 (Graph 2). Again the northern districts (Bornova and Karşıyaka) are richer with their major urban parks. When we examine the “impact area” or “clusters of the neighbourhood park areas through “point-density” analysis at GIS, the results again show certain districts with higher level than the others (map 5).

Map 5: “Clusters”/ “impact areas” of neighbourhood park areas according to “point density” analysis.

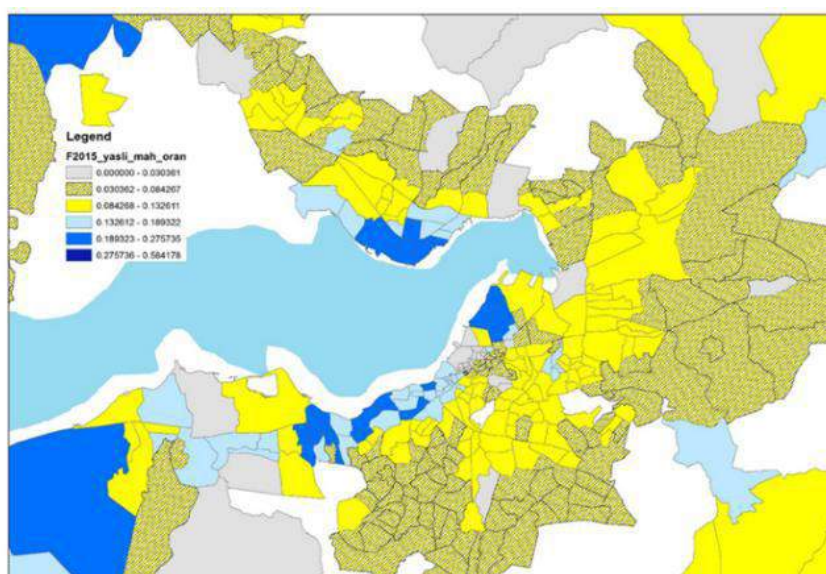

3. 1. DISTRIBUTION OF “NEED-BASED” GROUPS IN CENTRAL IZMIR

We can that the neighbourhood shares of total number of children (age 3—13) (map 6) and seniors (age 65+) at provincial level vary across the neighbourhoods but in opposite direction and between those along coastal line and on the hills. The former has higher shares of seniors (map 7).

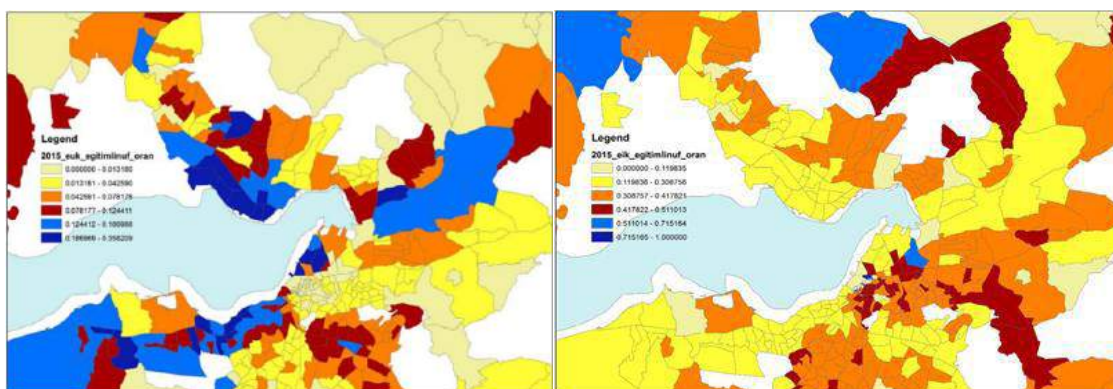

Map 6: Neighbourhood shares of total number of children at province

Also, determined by the number of students, big schools with children (preschools, elementary and secondary schools) and with teenagers (high schools) are located usually at the northern central districts of Izmir (maps to add).

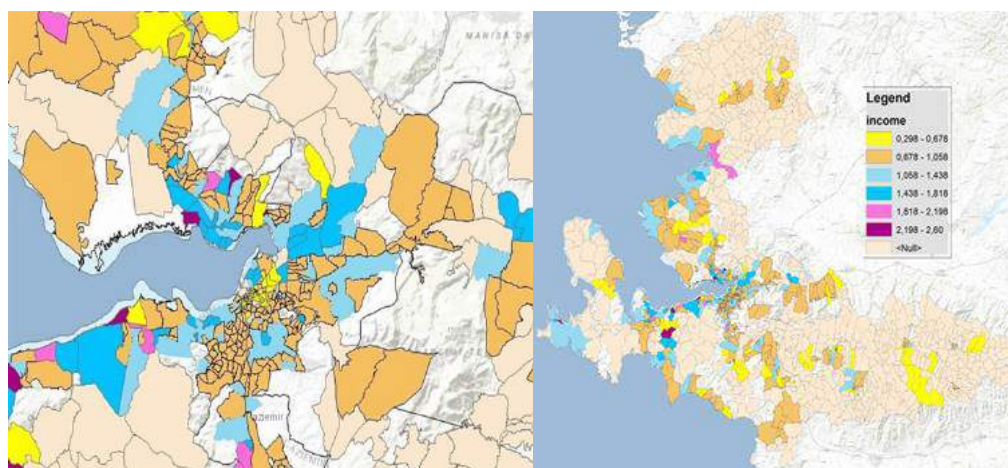

Map 7: Neighbourhood shares of total number of seniors at province

Another group of spatial distribution of population characteristics we examined as part of “need-based” groups is the education level. Similarly, the differences are apparent between the coastal and hilly neighbourhoods but also to the north with a high share of “women with high education level.”

Maps 8 & 9: Neighbourhood shares of total number of respectively “women with high education level” and of “women with low education level” of province

Finally, based on a sample data improved for another project, we have the distribution of income level per household. Those areas below the average income level of the sample (in brown and yellow colour) are those neighbourhoods outside the coastal and northern neighbourhoods.

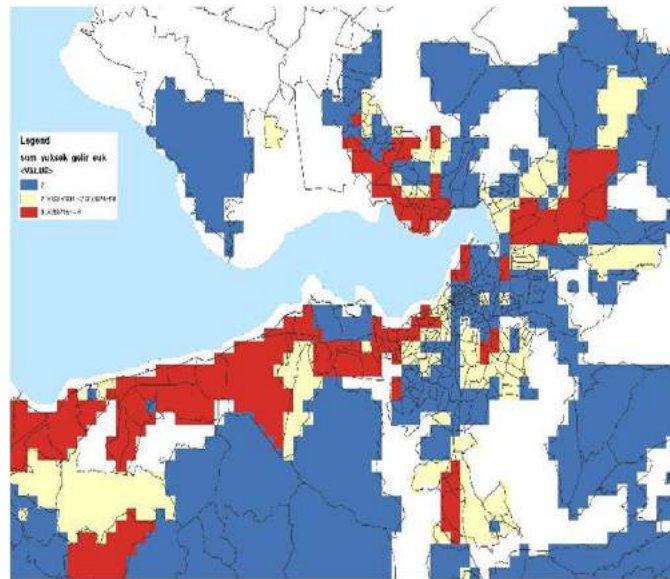

Map 10 & 11: Spatial distribution of household income level at central city and provincial level.

3.2. HOW TO RELATE CHARACTERISTICS OF NEIGHBORHOOD PARKS AND NEED-BASED GROUPS

In order to relate the neighbourhood parks’ and need-based groups’ characteristics, we developed both Pearson correlation and also regression analysis. Accordingly, we see that there is no correlation between education level and age groups, while there is linear correlation between income level and education level but none with age groups. Moreover, our regression analysis underline two major findings: i) Those neighbourhoods with higher household income level, low population density and higher education level by women tend to have more size of neighbourhood park area per capita. ii) at provincial level, at rural level the higher the income level and the size of age groups of 6-13 and 30-55 the higher is the size of neighbourhood park area per capita.

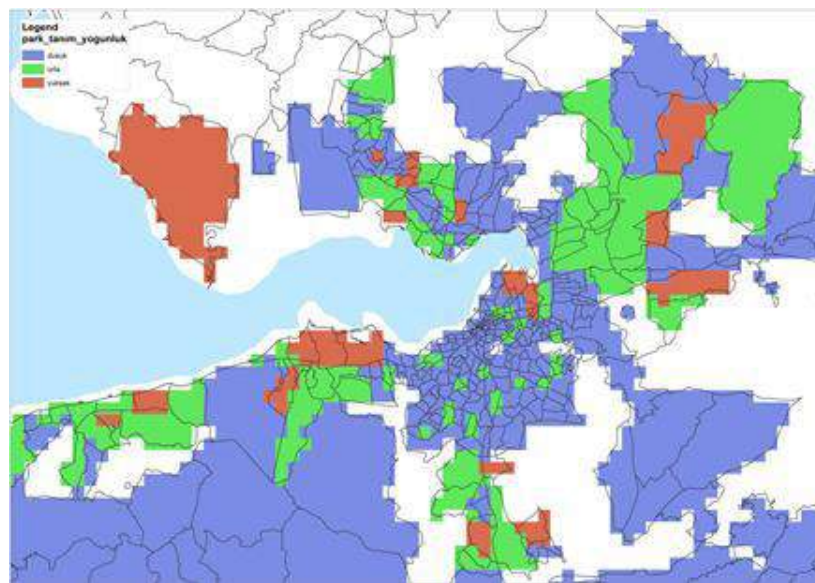

Relating to these findings (especially the first one) pointing to “significant” variables (education level by women, average income level, population density at neighbourhood level, and size of neighbourhood park size per neighbourhood), we deployed “overlay analysis” at GIS in order to “map” the “park rich” and “park poor” areas with need-groups. The results are:

Map 11 shows areas resulted by the juxtaposing of the average income level and education level of women. Accordingly, the areas with “high” values (red) extend along the coastal line especially to the south and again to the north including the hilly areas (Bornova). The areas with “medium” values (yellow) are those next to “red” areas. And the rest is with “low” values (blue).

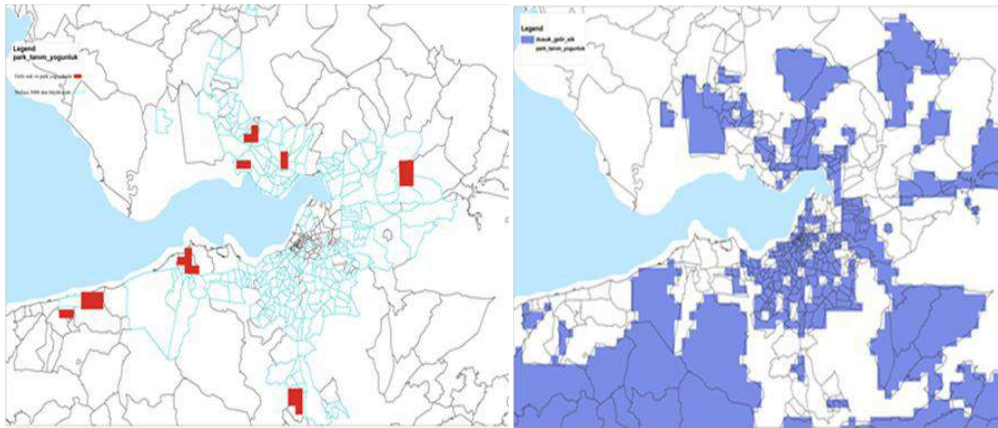

Map 11: Juxtaposing income and education level

Another map developed by “overlay analysis” is the spatial distribution of size of neighbourhood park areas per capita. “Red” shows again the “highest” values, “blue” shows the “lowest” values.

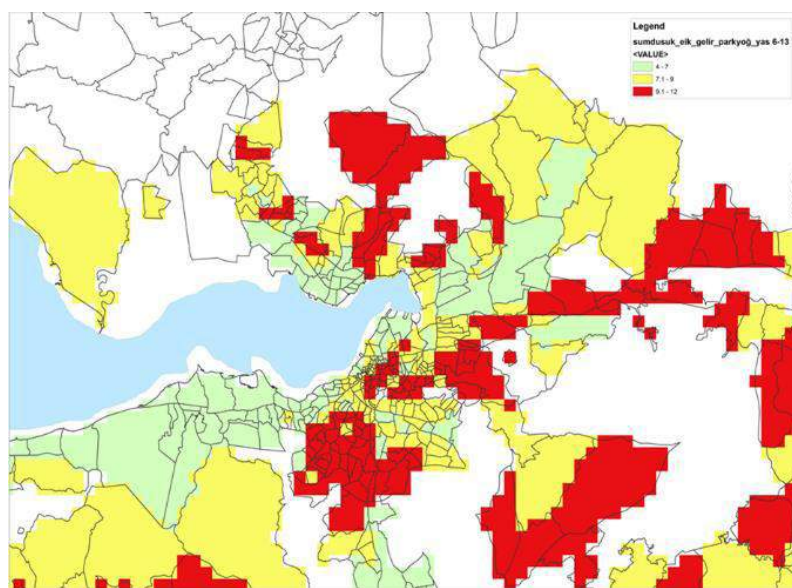

Map 12: Size of neighbourhood park area per capita (by “overlay analysis”)

Then we interrelated respectively “high” values and then “low” values at both of these two maps in order to find out both “park rich” areas and “park poor” areas according to population characteristics.

Map 13 & 14: Respectively “park rich” and “park poor” areas according to population characteristics

Map 15: Juxtaposing “park poor” areas with high level of shares of the age group of 6-13

Finally, we also took the age group of 6-13 (which appeared as significant at regression analysis earlier) into consideration especially for the “park poor” areas. The final map tells that “park poverty” in the hilly areas away from central coastal areas (in “red”) (Map 15) gets more dramatic especially for the children between 6-13 and their families.

4 CONCLUSION

Arguing that neighbourhood parks are important for improving body and mental health especially of those need-groups, this study attempted to map “park rich” and “park poor” areas in the central districts of Izmir especially related to characteristics of the population. Relating to the results of the regression analysis, we underlined the linear relation between income level, education level by women and size of neighbourhood park areas per capita across the neighbourhoods. These results have lead our priorities at the analysis (especially overlay analysis) at GIS. Our final maps point that “park poor areas” are those low income neighbourhoods with low education level by women and away from the coastline. Also, some of these “park poor areas” get worse, given that they have higher level of the share of age group of 6-13, that is children at elementary and secondary school level.

4.1 ACKNOWLEDGEMENT

This study is supported as a research project ("Evaluation of Existing Neighbourhood Parks based on Need-Based Equity") (Project no: 215K239) by the Scientific and Technological Research Council of Turkey.

T12 | TOURISM, LEISURE AND GENUINE URBAN CULTURES

CO-CHAIRS: JARKKO SAARINEN; JOSÉ MANUEL SIMÕES; PIOTR LORENS

In the last 50 years, tourism has had a massified growth at an average annual growth rate of 6.5%. As shown by several authors, this was possible due to a combination of numerous factors, that range from the political, economic and social reasons (consecutive and considerable gains in free time among the general population; increasing purchase power of the population of several economic strata, growing internationalization and globalization of economies) to the technological ones (increase in mobility, generalize use of ICT). Worth mentioning are also factors inherent to the tourist sector (development of tourist offer, increment of competitive production formulae, selling and promotion of tourist real estate developments and services, growing internationalization of a multitude of heritage resources in value chains of tourist products).

Tourism is presently one of the driving activities of the world economy and a key driver and facilitator of globalization. Economically speaking, the tourist sector has a total annual turnover of 1.2 billion international tourists, being responsible for 9% of the world gross product and employment, and 6% of the world exports.

The tourist market is global and characterized by the increase, diversification and innovation of offers and segmentation of demand. The tourist experience tends to gain centrality in the moment of decision making considering the tourist products and destinations. However, cities continue to be the foci of major tourist attractiveness, reinforced by the growth of low-cost airlines. Cities are also the stage of touristification processes with some meeting rehabilitation and enhancement of material and immaterial heritages and local identities, whereas others stress the loss of character of places and repeat the standardizing prescriptions of the global economy.

ID 1318 | TOURISM INVASION? STUDY ON THE FUNCTIONAL TRANSFORMATION OF DWELLINGS AND POPULATION LOSS OF LOCAL RESIDENTS IN VENICE HISTORIC CENTER

1 INTRODUCTION

1.1 THE EXCESSIVE TOURIST POPULATION BROUGHT BY THE UNIQUE SCENERY

Venice is the capital city of the Veneto region of northeastern Italy, with its main island isolated from the Adriatic Sea and surrounded by a vast shallow water area called the lagoon. In 1987, the main island of Venice and its lagoon area as a whole was assessed the world's natural and cultural heritage by UNESCO (the United Nations Educational, Scientific and Cultural Organization). What makes Venice unique is that it is not only a living city built on water with the ancient medieval urban layout, but it also remains plenty of well-preserved gorgeous palaces, brilliant churches as well as a huge number of architecture in different times and different styles.

Unique tourism experience on water has brought high reputation to the historic city of Venice, while problems related to the excessive tourism population have occurred at the same time. With the prosperity of the tourism industry, social problems like the inflation of prices, gentrification, depopulation, high rate of vacant dwellings has greatly threatened the living condition for aboriginals and the conservation of historic dwellings in the main island of Venice. What's worse, these problems could even interact each other to form a vicious circle. During the fifteen years from 1991 to 2005, the industries of Venice were shrinking in all sectors except for construction, hotels, banking and insurance, and academic research, which are all served for the tourism industry more or less_Da Mosto, 2009_. In this context, the employment rate of local residents has been continuously declining and thus their incomes are not enough to support the purchase of dwellings. As of 2011, the number of residents living in the historic center (main island) has been dropped to less than 60,000 people, nearly One-third of the population of the 1950s(Figure 1).

1.2 THE DEPOPULATION OF THE VENICE MAIN ISLAND

Due to the environmental capacity constraints, there are some native residents who left the main island of Venice and chose the modern lifestyle with car preferences on the nearby mainland, which is more convenient and comfortable for them(Good, 2005). Meanwhile, there are also residents who prefer to take the water transportation so they move into the main island of Venice. Under such condition, it can be concluded that the demographic change due to lifestyle preferences almost does no affect to the total population. Objectively speaking, the economic restructuring brought about by the impact of globalization, coupled with the geographical restriction of the lagoon area, eventually lead the decay of Venice's

industry. According to the Venice Report, during the fifteen years of 1991-2005, on the main island of Venice, all the other industries were shrinking except for industries related to tourism services such as construction, hotels, bank, insurance and academic research. (Figure 2) In this context, the employment rate severely declines on the main land, and local residents can hardly support their own housing and lives by only depending on tourism services. What's worse is that the tourism-oriented urban developing goal has decreased the number of every-day services for residents such as the fair-price supermarkets, schools, hospitals, pet shops, barber shops and so on, thus enhancing the living cost for locals. All these factors are forcing local residents to seek for new job opportunities as well as affordable houses outside Venice.
