e Ordenamento do Território
UNIVERSIDADE DE LISBOA

FACULDADE DE ARQUITETURA
UNIVERSIDADE DE LISBOA

Authors: José Antunes Ferreira; José Manuel Simões; Sofia Morgado; Eduarda Marques da Costa; João Cabral; Isabel Loupa Ramos; Jorge Batista e Silva; Miguel Baptista-Bastos.

Editorial Support: Carlos Freitas; Inês Fonseca.

Publisher: Lisboa, Universidade de Lisboa

ISBN: 978-989-99801-3-6 (E-Book)

30th annual AESOP 2017 Congress

Lisbon, Portugal

In an uncertain world that is rapidly changing economically, socially and culturally, cities and territories have become the common ground for resilient breakthroughs in the policies and practices of planning and design.

These extreme times urge us to shift towards renewed actions in urban and less urbanised territories. Societal changes, disparities in population growth and incomes and consequential impacts on the sustainability of social services and labour markets, climate change and extreme natural events, complex social-economics trends, challenge us to debate and seek paths that lead to a progressive common future.

The planning and urban minded communities are invited to join efforts under the flag of the next congress topic – SPACES OF DIALOG FOR PLACES OF DIGNITY: Fostering the European Dimension of Planning.

A few of the ideas we may want to provide a platform for discussion include developing people's wellbeing, promoting integrated and flexible planning approaches, encouraging collective engagement in urban and environmental management, inclusiveness and multiculturalism.

From one of the most western cities in Europe we believe that we may address potential European urban futures and the need for opening effective dialogue and cooperation with other corners of the globe.

We look forward to welcoming you in Lisbon and engaging with you in discussing these challenges.

REPRESENTATIVES OF LOCAL ORGANISING COMMITTEE

José Antunes Ferreira | IST-ULisboa
José Manuel Simões | IGOT-ULisboa
Sofia Morgado | FA-ULisboa

LISBON AESOP ANNUAL CONGRESS 2017

LOC – LOCAL ORGANISING COMMITTEE

Representatives of LOC: José Antunes Ferreira (IST-ULisboa); José Manuel Simões (IGOT-ULisboa); Sofia Morgado (FA-ULisboa)

Other Members: Eduarda Marques da Costa (IGOT-ULisboa); Isabel Loupa Ramos (IST-ULisboa); João Cabral (FA-ULisboa); Jorge Batista e Silva (IST-ULisboa); Miguel Baptista-Bastos (FA-ULisboa); Paulo Silva (UAveiro)
Secretariado: Agência ABREU (contact person – Madalena Almeida)

Help Us Supporters

Afonso Amaral (IST-ULisboa); Carlos Freitas (IGOT-ULisboa); Natasha Nazarali (IST-ULisboa); Rosário Cavaleiro (IST-ULisboa); Inês Fonseca (FA-ULisboa)

INSTITUTIONAL ORGANISERS

The IST (or just Técnico) is part of the Universidade de Lisboa, and was founded in 1911. Actually, Técnico is the largest school of Engineering, Science and Technology and Architecture, in Portugal, involving a community of over 12,000 people. Innovation, Knowledge and Technology are the guiding principles, which promote excellence and fit the requirements. Técnico offers Bachelor, Master and PhD programmes, lifelong training and develops Research, Development and Innovation (RD&I) activities, which are essential to provide an education based on the top international standards. <https://tecnico.ulisboa.pt>

The Institute of Geography and Spatial Planning (IGOT) is part of the Universidade de Lisboa and is the largest school and a reference in the field of Geography and Planning in Portugal. IGOT comprises the Centre for Geographical Studies (CEG), rated internationally as a centre of excellence. CEG is a reference in research and in the dissemination of geographical knowledge, namely in: Regional and Urban Planning, Evaluation of Public Policy, Regional and Local Development, Migration Studies; GIS and information Technologies, Human and Regional Geography, Physical Geography, Risks and Environmental Impacts and Regional, Tourism, and Historical Geography. <http://www.igot.ulisboa.pt/>

The Faculty of Architecture (FAUL) is part of the Universidade de Lisboa. As a school of architecture, it is the oldest Portuguese institution, its origins going back to the “Paços da Ribeira” Civil Architecture, established in 1594. The FAUL provides degrees at the three different cycles – Bachelor, Masters and PhD in Architecture, Urbanism and Design, besides specialisation and postgraduate programmes. Research, Dissemination and Innovation is also a main focus at the FAUL, hosted by CIAUD – Research Centre in Architecture, Urbanism and Design, a research centre rated “Excellent” in 2008 by the national research institution, the Foundation for Science and Technology (FCT). <http://www.fa.ulisboa.pt>

TABLE OF CONTENTS

TRACKS	29
T01 PLANNING THEORY: CONCEPTUAL CHALLENGES AND PLANNING EVALUATION	37
ID 117 FROM DIVERSITY AND HYBRIDITY TO EQUALITY AND UNIFORMITY IN IMPLEMENTATION OF REGIONAL PLANNING STRATEGIES, RPS, IN NORWAY	39
ID 1016 THE RETURN OF PUBLIC PLANNING IN A POST-POST-POLITICAL MEMPHIS	51
ID 1356 'DECISION NOT TO DECIDE': A NEW CHALLENGE FOR PLANNING	59
ID 1365 'SOCIAL INNOVATION' AND CONTENTIOUS URBAN POLITICS: QUESTIONING THE INNOVATIVE POTENTIAL OF CONTESTED URBAN DEVELOPMENTS IN BERLIN	74
ID 1415 PLANNING THEORY IN THE GLOBAL SOUTH: CIRCULATING TRAVELLING MODELS FROM THE NORTH OR HYBRID ARRANGEMENTS?	87
ID 1419 DEVELOPING AN ANALYSIS FRAMEWORK OF URBAN MORPHOLOGY STUDY	96
ID 1458 CONFORMANCE VS PERFORMANCE: ZONING OF THE URBAN AGRICULTURAL ZONES IN TAIWAN	105
ID 1464 ANTHROPOPHAGY IN PLANNING: BUILDING A THEORY FROM THE SOUTH THROUGH AN ASSOCIATION OF ACTOR- NETWORK THEORY AND HISTORICAL MATERIALISM	113
ID 1465 THE PRAXIS OF CREATING LEITBILDER (GUIDING VISIONS) FOR SPATIAL PLANNING PROJECTS IN METROPOLITAN ZURICH	124
ID 1480 PLANNING FOR CREATING A PEACE PARK; PEACE PARK BETWEEN TURKEY AND GEORGIA AS CASE STUDY	134
ID 1483 URBAN REGENERATION AND ITS ROLE ON MARKET SUSTAINABILITY: A CASE STUDY OF MANCHESTER	145
ID 1490 CRITICAL DISTANCE IN URBAN PLANNING. WILL SMART, SUSTAINABLE AND RESILIENT NARRATIVES SAVE OUR CITIES? INSIGHTS FROM DELHI METROPOLITAN AREA	156
ID 1494 DECIPHERING PLANNING CONCEPTS FROM A PERSPECTIVE OF LACAN'S FOUR DISCOURSES - A CASE STUDY OF URBAN VILLAGE IN BRITISH PLANNING POLICY	166
ID 1512 ESSEX SCHOOL OF DISCOURSE ANALYSIS: A LOGIC-BASED APPROACH TO ONTOLOGICAL INVESTIGATION OF PLANNING	177
ID 1513 EXPLORING THE ZONING AND LAND USE MISMATCH – AN EX-POST EVALUATION OF A DETAILED PLAN IN A LAND READJUSTMENT AREA IN TAINAN	187
ID 1540 ON WHAT GROUND STANDS STRATEGIC PLANNING?	195
ID 1543 SHAPING SPACES OF INTERACTION FOR SUSTAINABILITY TRANSITIONS	202
ID 1565 CRITITQUE OF EVERYDAY LIFE AND POST-POSITIVIST PLANNING	209
ID 1571 SYSTEMATIC SHARING OF EXPERIENCES AND KNOWLEDGE OBTAINED IN PILOT PROJECTS	219
ID 1598 PLANNING ETHICS IN MAJOR TRANSPORT SCHEMES: REFRAMING THE CHALLENGE	226
ID 1600 IF NEOLIBERALISM IS EVERYTHING, MAYBE IS IT NOTHING? QUESTIONING NEOLIBERAL IDEOLOGY IN SPATIAL POLICIES AND PROJECTS	234
ID 1612 WHEN ACTIVISM MEETS RADICAL POLITICS - LANDSCAPE PLANNING AS A CATALYST FOR TRANSFORMATIVE CHANGE	241
ID 1613 SUBVERTING THE PRESENT, PLANNING THE FUTURE: PROPOSING A COUNTER- PLANNING	256

ID 1623 ROLE AND GOALS OF ONTOLOGICAL ANALYSIS IN UNDERSTANDING SPACE AND PLACES	264
ID 1637 TERRITORIAL OPPORTUNITIES FOR URBAN REQUALIFICATION PRACTICES	271
ID 1650 LOCAL IDENTITIES ON CHANGE- URBAN WATERFRONT REGENERATION WITHIN THE GLOBAL CITY ISTANBUL SERIN GEAMBAZU	279
ID 1659 FLANDERS' SPATIAL (POLICY) PLANNING IN THE MAKING: POTENTIAL AND LIMITS TO COLLABORATION AS COLLECTIVE LEARNING	285
ID 1660 CHALLENGES AND TRICKY WORDS. A STRONGER ROLE FOR PLANNERS	296
ID 1668 LEARNING FROM EUROPE?	301
ID 1691 PLANNING AS A RHIZOMIC PROCESS OF EXPERIMENTATION. NOTES FROM BRAZILIAN PLANNING EXPERIENCE	308
ID 1694 CITY-MARKETING POLICY AS GENERATOR OF URBAN DISCONTENT	320
ID 1696 - PROTOTYPES AS OPEN-ENDED ARTEFACTS IN URBAN DESIGN	330
ID 1721 GLOBAL SOUTH PLANNING: FROM WAR TO WARS	338
ID 1738 PLANNING THEORY, A 'DECONSTRUCTIONIST-TURN': ARE WE THERE YET?	345

T02 | PLANNING EDUCATION: BUILDING UP SPACES OF DIALOGUE FOR PLACES OF DIGNITY..351

ID 1350 DEALING WITH OPPOSITION IN PARTNERSHIP DEVELOPMENT PROCESSES	353
ID 1372 THE DEVELOPMENT OF CHINESE PLANNING THEORY SINCE THE 1978: A THEMATIC PERSPECTIVE.....	365
ID 1407 LEARNING THROUGH SOCIAL ACADEMIC GROUPS: UNDERSTANDING, SHARING AND CONTRIBUTING. THE FAU SOCIAL CASE	370
ID 1436 PLANNING EDUCATION IN THE CASE STUDY OF THE COURSE OF METROPOLITAN PLANNING IN ISTANBUL.....	381
ID 1449 PROCESS-ORIENTATED LEARNING AS KEY ASPECT IN HANDLING UNCERTAINTY. EXPERIMENTAL TEACHING METHODS IN CONTINUING EDUCATION IN SPATIAL PLANNING	390

T01 | PLANNING THEORY: CONCEPTUAL CHALLENGES AND PLANNING EVALUATION

CO-CHAIRS: TORE SAGER; ALESSANDRO BALDUCCI; JOÃO CABRAL

When the goal is to create and design places of dignity, this should be reflected both in planning processes and in the substantive content of plans. Is there a process-product gap in planning that makes comprehensive evaluation difficult? Or do planners have instruments to align physical changes with the values strived for in the participative and dialogical planning process? Planning theorists need to analyse whether it is possible to design processes with space for dialogue as well as agonism. Can a European dimension of planning be carved out from the borderland of the two concepts?

Neoliberalism shifts the border between public and private space. In doing so, it tends to expand consumer space and narrow citizen space. However, dignity is not found in consumerism, but in a society whose institutions do not humiliate or repress people. How can planning theory contribute? The austerity policies and the increased inequalities associated with neoliberalism also shift the border between spaces of dialogue and agonism. How does this affect the creation of places of dignity? Can planning theory help to counteract the idea of second-class citizens in the political turmoil of Europe of today?

Several central concepts in the planning disciplines are notoriously hard to define (such as the public interest). The notion of a particular European dimension of planning is likely to pose new conceptual challenges. Is there a planning theory of the Global South? If yes, how does it contrast with ideas of what is typically European? It is an aim to get the masses out of poverty. Is it also everywhere an aim to let the masses live in democracy? Is there a trade-off to be made between the two ends? Does neoliberalism make things worse on both accounts? Nearly everything written on neoliberalism in planning theory is on the negative side, even if neoliberal ideas have been embraced by social-democratic governments as well as right-wing regimes. Does this mean that planning theorists are producing ideology? Should they?

The challenges for planning theory are also associated with the competence for integrating alternative and activist planning approaches. How can the concepts of common good and spatial justice be applied for understanding geographical variations and the role of space and place in planning processes? How can comparative planning theory contribute for an understanding of the role of a state increasingly engaged with the extended reproduction of capital through 'productive' consumption?

ID 117 | FROM DIVERSITY AND HYBRIDITY TO EQUALITY AND UNIFORMITY IN IMPLEMENTATION OF REGIONAL PLANNING STRATEGIES, RPS, IN NORWAY

Ulla Higdem¹; Aksel Hagen¹

¹Inland Norway University of Applied Sciences

ulla.higdem@inn.no ; aksel.hagen@inn.no

ABSTRACT: This paper is built on institutional theory and strategic planning theory, in order to grasp the two main questions: (1) How is the Regional Planning Strategy (RPS) as a new tool in the Planning and Building Act (PBA) understood and implemented in practice, and consequently how is this implementation to be understood as an institutional change of the regional planning system? (2) How is the strategic orientation understood and implemented? Strategic regional planning is institutionalized into the Norwegian planning system in a new two-step model: (a) regional planning strategy (RPS) and (b) various types of regional (strategic) planning tailored to each individual regional challenge. The basis for our analysis is a study of the implementation of the RPS in all Norwegian counties. We find that the translation, contextualization and re-contextualization of the PBA regarding how to implement the RPS is clearly diverse in 2011/12, the first time they make such documents. Even a hierarchical mode of implementation of a new element in the PBA seems to enjoy great freedom in terms of translation and re-contextualization between tiers. The implementation praxis of both central and regional government level contributes to the hybridity of the planning system by (a) the already established side-by side logics of negotiated policy development in a networked governance system and a planning authority and government logic of decision-making, and (b) by the main re-contextualization of the RPS from a planning strategy to a plan. However, the second time, in the beginning of the next election period, the variation has disappeared. The professional and political ambition or competence to oppose, to choose their own way to make RPS, seems to have disappeared.

1 INTRODUCTION

The main goals for, and the intentions behind, inserting a new tool, the Regional Planning Strategies (RPS) into the regional planning system was to make the political priorities for regional planning more targeted, and increase regional planning's efficiency and flexibility (Miljøverndepartementet, 2007–2008). These were heavily debated issues within the former PBA and its practices (cf. Falleth and Johnsen, 1996; Higdem, 2001; Asmervik and Hagen, 2001; Vike, 1995; Røsnes, 2001). Additionally it was important to establish the principle that regional elected bodies must have responsibility for the development of the region. In short, "the planning strategy shall give an account of important regional development trends and challenges, assess long-term development potentials and determine which issues are to be addressed through further regional planning" (PBA 2008). Finally, the RPSs were understood as a better instrument for implementing the central state's policies and a tool for coordination between the major planning actors of the region (Miljøverndepartementet, 2004). The inspiration for the RPS came from Denmark, Norway's neighbor country – ref Ot prop nr. 32 2007–2008. However, the Norwegian system departs from the Danish by introducing planning strategy also on the regional level, and in a somewhat different manner than the municipal planning strategies in both countries. We have not been able to find literature that provides evidence that a similar tool at the regional level is provided for in a planning-law. Therefore, we may regard the Norwegian Regional Planning Strategy and the consequences for regional planning, as unique in an international context.

Figure 1 describes the new regional planning system from 2008. The RPS is a tool defined as a strategy of the planning activities, not a plan, and now the only mandatory element in the regional planning-system. The adoption box in the top right corner is now removed; the county council now finally adopts the RPS. The mandatory comprehensive county plan has been removed and replaced by deliberate regional planning related to vital challenges defined in the RPS. The idea is to give priority to planning by necessity rather than planning by duty. The RPS shall also contain an overview of how the prioritized planning challenges will be followed up. The RPS is to be prepared in close cooperation with the municipalities, the county governor, regional state and other state bodies. The county council may also invite other

organizations and institutions to participate in the preparations of the RPS. The King's approval implies a commitment from the central government to regional planning, which influences the aim of increased efficiency of regional planning. When the approval is given, the Ministry of Local Government and Modernization (MLGM), in cooperation with the other ministries, has assessed that the RPS does not counteract the central Government's goals. Moreover, equally as important, the approval commits the central and the regional state bodies to the coming planning activities. This approval was removed before the second round, but all state bodies still have to participate in and be obliged to the RPS.

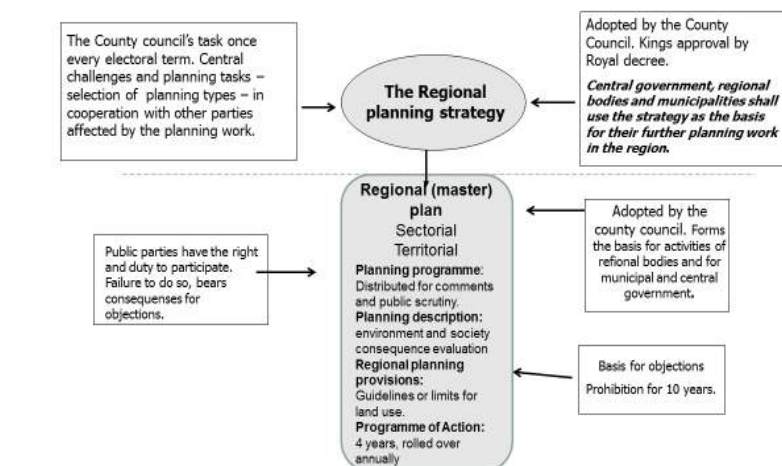

Figure 1: The Regional Planning System of Norway (Higdem, 2012).

The data is based on the study of these documents: (1) the PBA of 2008 with changes, preparatory work to the act and the guidance material to the RPS; (2) the all RPSs developed in 2011/12 and 2015/16, and the case papers following the discussion and the adoption of the RPS; (3) the "National Expectations of Local and Regional Planning" and the central state's letters of final approval to each RPS. We have also done some interviews with planners. In order to classify the RPSs, we have developed a criteria-list. A completed list for the RPSs in all counties are enclosed.

2 IMPLEMENTATION BY CONTEXTUALIZATION AND TRANSLATION

Our analyze is built on institutional theory and strategic planning theory, in order to grasp the two main questions: (1) how is the RPS as a new tool understood and implemented in practice, and (2) how is the strategic orientation understood and implemented? As a point of departure, we use the concept of regional planning doctrine (Friedman & Weaver, 1979), where planning systems are composed of a certain type of procedural praxis as well as a certain type of substantial orientation. The PBA is overall attributed to sustainable development as a main ideological or value assumption – as to the regional substantial orientation of planning. The result of planning is consequently supposed to make societal development more sustainable. Secondly, the procedural orientation in the PBA is (a) oriented towards the regional (and local) elected councils as the planning authority and actors; and (b) the RPS is institutionalized in the PBA as a new procedural praxis where the focus is on the strategic perspective, in order to develop a more flexible and political focused regional planning. Since the RPS is to be co-developed between public actors at different tiers and levels, there clearly are situations of multi-level governance and networks in the RPS. It is also possible to include civil actors and interests in the development of the RPS, as a networked multi-actor system, addressed by both planning and institutional scholars (cf. Healey, 1998; Sagalyn, 2007; Bevir et al., 2003; Rhodes, 1991; Sørensen and Torfing, 2007). As such, we initially argue that the planning-system is a hybrid system comprising different, but side-by-side logics of steering and directing (Mahony and Thelen, 2010).

Institutionalizing a new regional planning model in the PBA as a new praxis of the regional and local planning authorities, is clearly a top-down hierarchical process. In Norway, the first interpretation stage is derived from the Danish model of municipal planning strategies by reforming it to the concept of RPS, as a "master version" (Røvik, 1998). In this top-down chain of translation within a hierarchical structure, there is

presumably limited freedom of translation. There will be room for local adjustments, according to Røvik, but the central government (in this case) may develop mechanisms to control the implementation. The chain of interpretation will develop sequentially as a stimulus-response situation, where the contextualization of a model will proceed in steps from one hierarchical level to another. The possible translators are multiple even in a hierarchical public order (Røvik, 1998; Hardy et al., 1998). Hence, ideas and discourses about how this new element of RPS is to be understood and handled in praxis will presumably take many forms, will be contextualized, and even re-contextualized (Røvik, 1998) into a new framework at several stages. The room for regional contextualization and interpretation will not least depend on the central government's management and control mechanisms, as the "National Expectations of Local and Regional Planning", and the final approval. In addition, the RPS does influence how the regional planning system is perceived and how it works in practice as a further regional institutionalization of a certain regional planning practice. This implies that we may find diverse forms of RPSs and hence forms that may add to the hybridity of the regional planning system of Norway.

3 STRETIC PLANNING (STP) – RETURNED IN A NEW VERSION, OR ALWAYS BEEN THERE?

The RPS itself is not a strategic plan, but we would argue that it is expedient to regard RPS as a partial strategic plan, STP. There is an increasing European interest in strategic spatial planning (cf. Faludi, 2000; Albrechts, 2004, 2012; Friedmann, 2004; Healey, 2007, 2009; Balducci et al. 2011; Gallent and Morphet, 2010; Albrechts and Balducci, 2013; Gunn and Hillier, 2013; Mäntysalo et al., 2015; Schmidt and Well [eds.], 2016; Van den Broeck, 2013). The STP has to some extent had a subordinate and fuzzy position, both as practice and in relation to other planning theories. A typical presentation of the praxis situation of STP in the EU countries is:

"Revival of Strategic Planning – In a number of western European countries strategic spatial planning evolved in the 1960s and 1970s towards a system of comprehensive planning—the integration of nearly everything—at different administrative levels. In the eighties when the neo-liberal paradigm replaced the Keynesian-Fordist one, and when public intervention retrenched in all domains (Martinelli, 2005), Europe witnessed a retreat from strategic spatial planning fueled not only by the neo-conservative disdain for planning, but also by postmodern skepticism, both of which tend to view progress as something which, if it happens, cannot be planned (Healey, 1997). Instead, the focus of urban and regional planning practices shifted to projects (Secchi, 1986; Motte, 1994; Rodriguez & Martinez, 2003), especially for the revival of rundown parts of cities and regions, and on land use regulations. (Albrechts, 2009)."

The same picture is confirmed when we turn to planning theory. Most of the classical books and journal articles, from the '70s up to the 2000s deal with strategic planning to a rather small extent (Hudson, 1979; Allmendinger, 2009). One striking example is that the planning theory "Bible" from 1996, Explorations in Planning Theory (Mandelbaum [ed.], 1996), consisting of over 500 pages with 25 different contributions of planning theory, has hardly given strategic planning any attention at all. Another example is that STP is not mentioned at all in the frequently used SITAR-model (Hudson, 1979). By the turn of the '90s, STP got a renaissance in practical planning. The EU launched many STP processes, such as the ESDP – European Spatial Development Perspective – document in 1999, a legally non-binding document forming a policy framework for all tiers of public administration with a planning responsibility. Now in the 2000s, the EU has developed, adopted and implemented a number of other strategic documents. There seems to be a general perception in planning research that we are about to see a new style of strategic planning; i.e. a combination of traditional and new approaches to planning of sustainable development, regional development and "new" regional politics based on the contemporary development of critical thinking and practical experiences in Europe (cf. Newmann, 2008; Albrechts, 2006a, 2006b; Healey, 2006a, 2006b, 2007; Albrechts and Mandelbaum, 2001; Tewdwr-Jones, 2012; Xu & Yeh, 2011).

In Norway, however, the STP has been present without any interruption, both in the field of practice (Kommunal- og regionaldepartementet, 2001; Kommunal- og arbeidsdepartementet, 1997) and in the theory debates (Amdam and Veggeland, 1998, 2011). By 2015, the central government defined the counties' paramount task as the strategic and direction-setting function related to regional planning (Kommunal- og moderniseringsdepartementet, 2015). STP has since the '70s increasingly been used

synonymously with long term societal planning locally and regionally. In this sense, the Norwegian STP situation seems to be more similar to that of the United States, cf. Kaufman and Jacob's classic journal article from 1987 (Kaufman & Jacobs, 1987) where they claim that STP had been a part of planning education for decades, and that most practitioners trained as planners view the approach as "old wine in new bottles".

Even though strategic planning has not been given that much attention in the mainstream practice and theory debate, it is a concept that over the years has attracted many different definitions and interpretations. Strategic planning has, to a varying degree, been widely used in the business sector, and therefore continuously influenced the public sector (cf. Albrechts, 2001; Dimitrou and Thompson [eds.], 2007; Vasilevska and Vasic, 2009; Bryson, 1988). Luigi Mazza has therefore concluded, with the following sigh of the heart "If strategic planning is everything, maybe it is nothing" (Mazza, 2013). In our opinion, Patsy Healey's definition from 1997 assimilates in a good manner many of the definitions that abound in planning theory (Healey, 1997:): "A social process through which a range of people in diverse institutional relations and positions come together to design plan-making processes and develop contents and strategies for the management of spatial change." An opportunity for "... building new ideas ... and about building processes that can carry them forward." Vasilevska and Vasic (2009) underlines that a new strategic planning will not represent a return to comprehensive planning, since the STP must contain priorities and strategic choices. This understanding of STP coincides with the Norwegian RPS concept. It expresses an ambition to renew the well-meaning comprehensive planning model to models more characterized by flexibility and ability to think and act politically and strategically in collaboration with others.

4 THREE ANALYTICAL ELEMENTS FOR ASSESSING RPS – FRAMING, STORYTELLING AND CO-PRODUCTION

When we in this paper use strategic planning theories in our RPS analysis, we do this by picking out two main elements of STP, namely framing and storytelling. These two elements contribute to different STP focuses, but also overlap; storytelling is not least an effective framing activity. The RPS is a tool of political direction setting within a networked governance perspective. It is therefore appropriate to link the concept of meta-governance (Sørensen and Torfing, 2005, 2007) to the understanding. The RPS and concept of strategic planning may add to the understanding of storytelling. Framing is also linked to the degree of the central government's ability or wish to direct the counties' limits of translation in the implementation process of the RPS, as described by Røvik (1998). When a problem is framed in such a way that a particular planning activity becomes the logical solution, this framing is a strategic activity. It draws up the mental map for planning, and enables particular policy issues to be managed (Dewulf et al., 2009).

We are facing many different framing processes within RPS. One main framing process is PBA, both the relevant sections and the guidance booklet on the RPS (Miljøverndepartementet, 2012). Another is the "National Expectations to Local and Regional Planning" (Miljøverndepartementet, 2011). The regional planning authorities also conduct their own framing processes by adding their own professional and political assessments and priorities into the RPS about what should be considered as the main regional development trends and vital challenges, long-term development potentials and goals, which issues are to be addressed through further regional planning and implementation. Thus, both national and regional planning authorities have explicit framing ambitions (Rein and Schön, 1993). This fact that planning practice reflects the context of power relations, as well as carrying power itself, is termed by Healey "embedded framing" (Healey, 1997). RPS, like strategy planning in general, revolves around inviting stakeholders to rewarding and stimulating dialogues about the present and the future of the region. Framing performs a narrative function, which is crucial for planning and policy (Jensen et al., 2013; Laws and Rein, 2003; Healey, 1997; Mäntysalo et al., 2015). All participants in the RPS-processes participate actively, though not always intentionally, in construction of specific frames. It is a goal for regional planning authorities through sense making, to draw up mental maps for planning, and enable particular policy issues to be managed (Dewulf et al., 2009). In this sense, framing can also have a mediating role, as it can build bridges between the numerous regional planning actors and their preferred actions (Laws and Rein, 2003). However, framing may also trigger conflicts; both RPS and STP are fundamentally political processes.

Throgmorton (1992:17) emphasizes that good planning is “... persuasive storytelling about the future, and that planners are future-oriented storytellers who write persuasive texts that other people read (construct and interpret) in diverse and often conflicting ways.” Storytelling is both a model of the way planning is done, and a model for the way planning could or should be done. Storytelling is an important aspect of everyday planning practice (Van Hulst 2012), whether intentional or not (Asmervik and Hagen, 2001). We choose to understand and analyze RPSs as storytelling – about the past, the present and the future, about vital challenges, who should participate in the planning process, and in what manner. Storytelling is a planning method that needs to be developed in praxis, through praxis (cf. Flyvbjerg, 1991; Hillier, 2002; Healey, 2009; Throgmorton 1992). Planning fundamentally revolves around the successful use of language – the oral, the written, the maps and images (Hellspong, 1992, 1995; Ramirez, 1995a, 1995b; Asmervik and Hagen, 2001).

Storytelling is closely linked to key planning concepts like dialogical planning, collaborative planning, and communicative planning (Healey, 1997; Forester, 1999; Sager, 2013; Harper and Stein, 2012). These concepts and related theories are obviously also relevant in the analysis of RPS. Patsy Healey (2006b:542) has introduced the concept relational complexity to focus on how complex and demanding dialogue and cooperation in strategic planning can be: “‘Relational complexity’ is therefore decidedly not ‘comprehensive’ in its approach. It needs to be highly selective, focusing on the distinctive histories and geographies of the relational dynamics of a particular place. It may recognize borders and cohesions, but also the tensions, exclusions and conflicts which these generate.” As long as RPS is a new procedural praxis characterized by multi-level governance and networked multi-actor system (Bevir et al., 2003; Veggeland, 2003; Higdén, 2015; Higdén and Sandkjær Hanssen, 2014), relational complexity appears to be a useful analytical concept, both for the storytelling, and hence also for RPS.

Another appropriate concept introduced into the strategic planning by (Albrechts, 2012) is coproduction. The term has been used for many years in different contexts and in different intellectual traditions, from coproduction in the delivery of services to coproduction as a political strategy (Mitlin, 2008). It underlines the importance of inviting citizens and grassroots organizations for a more substantive engagement (Le Galés, 2002; Higdén, 2014). It goes right to the core of both RPS that all public bodies and all community organizations both should and must participate and contribute to more innovative and transformative practices (Albrechts, 2006a).

5 RPS DOCUMENTS FIRST AND SECOND ROUND

The two main dimensions of how the counties have implemented the RPSs are (1) whether, or to what degree, the counties have complied with the PBA's provisions of the RPS, and (2) whether, or to what degree, the counties have addressed, answered and complied with the National Expectations of the RPS. Table 1 shows the implementation status for the first round with RPS. The two dimensions (axes) constitute (1) the “master model” of how a RPS is to be understood and implemented – the procedural and model side, and (2) the substantial side, meaning the central governments expectations’ of what policy themes the RPS shall encompass and assess. In the scheme below, the two dimensions are the two axes that form the four-field table below (Table 1). Accordingly, the two axes make four possible adaptations when implementing the RPS. Complying with the law's provisions are the law-abiding counties, whereas the disobedient deviate, or have vital shortcomings, from these. On the “National Expectation” axis, the loyal are counties that address, answer to, comply with national policy, and are loyal to it. The independent are those that contextualize the national policy expectations within their own regional context and frame of interpretation and translation. Consequently, four different types of adaptations occur. We have denoted the four types as follows: the challengers, the loyal, the heretical and the translators. There are different degrees and sorts of adaptations within each main type, since there is a continuum along both axes. Consequently, the four types are ideal types. There are RPSs in each group, which illustrate the vast diversity of implementation practices in this first round in 2011/12. The combination loyal/disobedient we have denoted as the challengers; they challenge what the RPS is meant to be according to the PBA and the guidance booklet, even though they are loyal to the national framing when it comes to the National Expectations. In this category, we find four counties. The loyal are the counties that comply both with the law and with the National Expectations. We have classified six counties as loyal. These RPSs are executed “straightforwardly” without, for different reasons, challenging national state policy or national framing. However, we find that there are many forms of loyalty. For instance, a county may be loyal to the

National Expectations but simultaneously raise critical questions to these and demand a closer dialogue with the central government.

Planning and building act (PBA) National expectations	The disobedient	The law-abiding
The loyal	The challengers: 4 counties	The Loyal: 6 counties
The independent	The heretical: 2 counties	The translators: 6 counties

Table 1: RPS first round 2011/2012. The counties four types of adaptations to implementation

The translators are the independent/law-abiding ones, meaning that the execution of the RPS is according to the PBA-framing, but they are independent from the National Expectations. Their picture of the actual challenges for the county are more influenced by their own analyses and understandings, by their own framing, rather than the National Expectations. An example from two counties in the middle of Norway may illustrates that translation is the dominant view regarding the National Expectations. By way of introduction to this view in the RPSs, they refer to the Government Cabinet's own directive stating: The Government Cabinet has in earlier directives on regional planning, stated that the goals and directions the central state points at will not be equally important in all counties and municipalities. Therefore, the main issues for the county and municipal planning are the counties and the municipalities own policy. Thereafter the counties interpret the power of direction of the National Expectations, and the counties' own legitimate execution of discretion as follows: The Government Cabinet therefore expects that those who participate in the planning processes develop good comprehensive solutions in a regional and local perspective. Consequently, the Cabinet paves the way for local and regional competence represented by the local and regional political bodies and the elected representatives to practice the necessary discretion, and provide for local and regional added value.

The independent also tend to offer the central government policy advice or demands based on their assessment of the regional development challenges ahead. The policy recommendations come on issues where the central state holds the authority, such as policy means and measure for agriculture, fishery or employment.

The heretical, which comprise only two counties, comply neither with the PBA's provisions of a regional planning strategy nor with the National Expectations. They define their own political and planning methodological reality. The challengers and the heretical share a characteristic, which is to develop a strategic plan (STP), rather than a strategy of the regional planning to come (RPS). Six of 18 counties continue a planning praxis where the county council develops a regional policy for central areas (or themes). We also experience examples where central actors such as the county politicians, the county as an organization, the municipalities and the regional partnerships utilize the goals and strategies of the RPS as a planning document in their own planning (Bråtå et al., 2014; Higdén and Hagen, 2015). The two types separate on a central provision of the PBA; the challengers have also worked out an overview of which plans are to be made during the four-year period to come, which is a planning strategy.

Our research gives us a completely different implementation picture for the second RPS round, four years later. It seems that all counties choose to be loyal to both the law and the national expectations. Most of the counties have made well written and well-designed documents which do not oppose to anything at all; not when it comes to political content, not when it comes to planning and governance processes. The most eye casting is a professional and political cleverness, a sort of streamlining. There is no visible resistance in the RPS-documents against laws and national expectations. There are few examples of bold and surprising analyzes and political goals. At the same time, both legislative texts and National expectations are basic vague; it is not difficult to write texts that not are provocative. The counties seem to choose an adaptive non-confronting strategy where they use those parts of the national texts that politically suit them best? One exception is Oppland County that use one RPS page to formulate counter-exceptions to the government.

6 THE RPS PROCESSES FIRST AND SECOND ROUND

We find, both in the first RPS round and the second, that all counties overall comply with the PBA regarding how the RPSs are worked out, meaning the processes of developing the RPS. However, our data show that the counties strive to meet the expectations of parallelism, as the guidance booklet recommends. Parallelism implies that the county and the municipalities develop their planning strategies simultaneously in an open and reciprocal cooperation. Our findings, in short, indicate that there is a reasonably good level of communication and interaction between the county, the regional state bodies and the local municipalities regarding the development of the RPS. As we have pointed out earlier, the central government frames the RPS in terms of the PBA and the National Expectations. From then on, the national state bodies take no part in the RPS development. As Langset and Nilsen (2013) have also found, developing the RPS simultaneously and interacting with the municipal planning strategies is a task that few, if any of the counties are able to execute. In this matter, the coherence between county and municipal levels is weak.

When analyzing the letters of final approval from the first RPS round, we find that the dialogue between county and the central level is missing in the process, even in cases where the county's RPS either challenges national policy or criticizes lack of national coherence between goals. In addition, our data suggest that dialogue is missing between the different ministries in the process. At the central government's level, the letter of final approval seems to be constructed as a relay without inter-ministry coordination, which could have made the approval more coherent. As a by-product, the ministries might achieve coordination on some issues. It is too early to catch up in our research the consequences of replacing final approval with mandatory dialogue.

The RPSs are storytelling documents that essentially are political texts and to a limited extent juridical texts. The legal aspect was severely weakened in the first round in that the central government approved all RPSs, also the RPSs from the heretical counties. When the Central Government chooses not to use the policy instrument to invalidate a RPS, their remaining possibility is to convince all RPS participants through different storytelling methods that they should obey the national government signals? Our research question is, have the PBA, the guidance material to the RPS and the National Expectations functioned as persuasive storytelling (Throgmorton, 1992)? The loyal and the translators might probably answer yes, the challengers and the heretical no. This indicates that if the central government wants greater impact, it must improve its storytelling skills, its rhetorical competence (Hellspong, 1992, 1995; Ramirez, 1995a and 1995b; Pålshaugen, 1995). Therefore, it seems unwise for the national state to reject dialogue in the RPS process? However, it might be wise to replace final governmental approval with mandatory dialogue for the regional state agencies.

The storytelling recognition is equally important for regional planning authorities and all those who participate in the RPS work in each county. It is all about convincing through dialogue about what the key trends and challenges are, what the long-term development potentials are, how these should be addressed through further regional planning, and finally the choice of planning process. Obviously, the PBA, the National Expectations and the dominant planning theories and models are concerned with dialogue, co-development, co-production, et cetera. We have so far not studied this closely. However, we notice that many counties have had broad, inclusive RPS-processes, characterized by an aim to take collaborative responsibility for their own regional development. At the same time, the regional planning authorities and the regional societies challenge the national state authorities to participate with more commitment. We have discovered many good attempts to independent storytelling in many RPSs in the first RPS round. Not at least among the translators, the challengers and the heretical. The second round RPSs are characterized, as mentioned earlier, with pedagogical documents and broad dialogical processes. The ambitions is clearly that many ought to read, understand, be convinced and join the follow-up processes.

7 THE MODEL OF STP – THE MODEL OF RPS

When comparing the RPS and the STP, we rely on the following 7-stage model (Sorkin, Ferris, and Hudak; 1984): 1. Scan the environment. 2. Select key issues. 3. Set mission statements or broad goals. 4. Undertake external and internal analyses. 5. Develop goals, objectives, and strategies with respect. 6. Develop and implement plan to carry out strategies. 7. Monitor, update, and scan. The RPS has a 3-stage

model, cf. PBA § 7-1: (1) Give an account of important regional development trends and challenges. (2) Assess long-term development potentials and goals and determine which issues are to be addressed through further regional planning. (3) Construct an overview of how the prioritised planning functions shall be followed up and the arrangements for public participation in planning work. Figure 2 shows the similarities and differences between a STP-process and a RPS-process. Stages 1 and 2 are identical for the RPS- and STP-model, and then they separate. Where the STP- process continues through setting goals – undertaking analysis – developing strategies – implementation, the RPS adds a stage Plan for Planning.

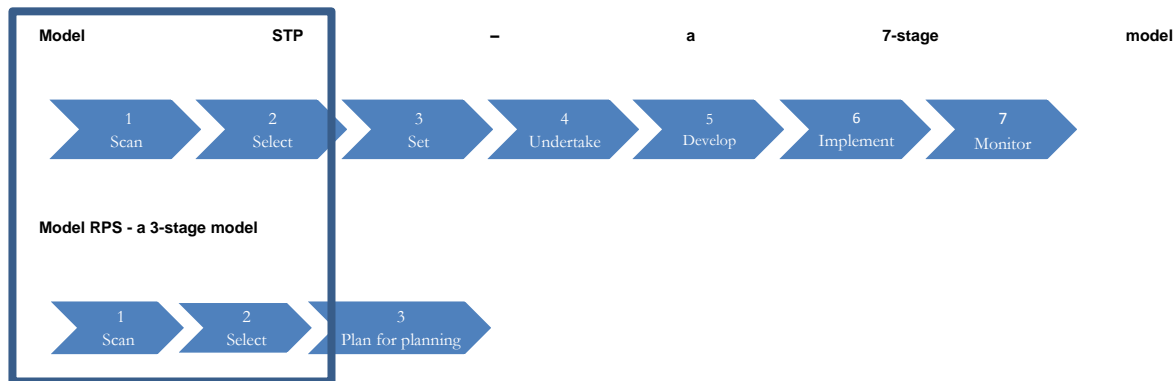

Figure 2: The RPS- and STP-model. Differences and similarities. Based on Sorkin, Ferris, and Hudak (1984) and PBA § 7-1

Our findings, both from first and second round, are unequivocal regarding that all RPSs are strategic processes and documents. Many different actors have participated, and the regional planning authorities have confirmed priorities and conclusions regarding vital challenges and planning needs. This supports what we argued in the introduction that it is expedient to regard RPS as a STP. Both in the first and second round the counties chose to address the challenges - long-term development potentials – goals in different ways. The county can choose to act without planning, or with planning either as a non-PBA plan (strategies) or a PBA plan. There are three main types of such PBA plans - inter-municipal plan, regional plan for a specific theme, sector or geographical area and the former mandatory comprehensive regional plan the county plan.

In the first RPS round the two heretical counties have developed a STP/a county plan, rather than a RPS. The 16 other counties have implemented the RPS in accordance with PBA. In the second round all the counties have made a RPS, but five have chosen to stick to a comprehensive county plan. In addition, many of the RPS documents have a length and a thematic with that reminds of a planning document. One county clearly underline that they regard the RPS to be the comprehensive, long-term planning document in their county. There are more use of non-PBA plans /strategies in the second round than in the first round. Regional plans are tempting to avoid because of the demanding participations regulations. We consider all this to be within the scope of action the counties have got from government.

8 DISCUSSION - CONCLUSION

There were vital differences in how the counties in Norway have implemented the RPS in the first round 2011/12, while it seems almost no differences in the second round. Regarding the two national state framing parameters – complying with the RPS and complying with the National Expectations to the regional and local planning, we find RPSs in all four of our ideal types: The loyal, the translators, the challengers and the heretical in the first round. All acted loyal in the second round.

What does this variety in the first round tell us? First, the variety confirms the already vast evidence in the literature of the challenges concerning top-down implementation (cf. Hill, 2013; Røvik, 1998). Since this hierarchy consists of regional publicly elected bodies with a certain degree of autonomy from the central government (the counties and the municipalities), the counties feel free to translate the PBA into their own

regional context. In the case of RPSs, the translations and contextualization is to be assessed along the two axes. Firstly, the degree of regional adjustment is given by law, which should imply a relatively narrow degree of regional freedom in how to implement the RPS as a planning strategy. As we have seen, this fact does not hamper a third of the counties' regional contextualization and translation. For most of these, we understand the translation as path-dependency (Scharpf, 1997), since these RPSs mostly continue the county planning tradition, as the RPS is contextualized and formed as a long-term plan. Of course, such adaptation also illustrates a need for comprehensive regional planning, which is downplayed in today's PBA. These counties have made a short cut by using the RPS as the overall and comprehensive strategic plan, and translated the PBA to make it useful for their own needs or demands. Therefore, we argue that the new regional planning system in its realization may not fulfil the intended consistency between strategies for planning and the planning itself, and hence contribute to a hybridization. Now, the central government also advances such hybridization by the latest amendments in the PBA, from 2014. Now the PBA also instructs that long-term development goals be stated in the RPS for the future.

Complying along the other axis, the National Expectations of Planning is quite another story. The counties of Norway have since the late 1990's been expected to develop a regional policy based on the region's own challenges and resources, what is called the regime shift from a national allocation or re-distribution of resources for regional development, to a more endogenous and regional resource-based approach (Amdam and Bukve, 2004), in collaboration with both public and private actors. This is continuously underlined in several white-papers (Kommunal- og Regionaldepartementet, 2001, 2002, 2013); and by 2015, the counties' paramount task is the strategic and direction-setting function related to regional planning – to comprehensively assess and contextualize the many central state priorities in the actual regional challenges (Kommunal- og moderniseringsdepartementet, 2015). Therefore, the counties' re-contextualization of the National Expectations was anticipated. The interesting findings here lie in the government's response. We find that the letters of final approval miss contextualization, meaning they show a narrow interpretation of the regional freedom (and expectation) to assess the national goals into the actual regional situation. The central government is torn between the notion of (and need for) flexibility in planning and the need for control or direction setting in policy- and strategy making. The control however was not stricter than that all the RPSs were approved.

This is the first round, the findings correspond with our chosen theories, the findings confirm that the regional political level is about to reinforce their own role as a regional development actor. Many counties evade the national framing and storytelling processes. They use regional co-production to make own plans, to tell own regional stories, to create their own regional political frames for regional development. None of the RPSs is disapproved by the government, which means that this seems to function both for the regional and national authorities.

Why is the second round picture so different? We have to go more deeply in to the RPS – processes, not least to interview participants in these co-production processes. One possible explanation is that the cause of diversity in the first round is due to lack of understanding of what the new tool RPS is supposed to be. There was lack of knowledge and incompetence more than the academic and political independence we met in the RPS from the first round. Now in the second round the planners, politicians and other process participants have learned their RPS lesson¹.

Another possible explanation is that both the PBA and the National expectations are that invite to a broad room for different interpretations. The linguistic formulations are vague; the political priorities are few and weak. The framing is open and broad. It is easy for the counties to be loyal, if they choose to be loyal. It is obvious that in the second round almost all counties are loyal; they have no need to highlight disagreement. This is a possible third explanation. Norway is characterized by a professional and politically united storytelling about which challenges and development trend are valid and important. All ongoing governance processes, all plan making on national – regional – local level, all this co-production leads to a basic united dominant view of the present and the desired future. Disagreement comes later, in the follow up and implementation process.

¹ Still at least five of the counties do not use updated Plan and Building (PBA) law paragraphs in their RPS

9 FOOD FOR THOUGHT

The main goals for, and the intentions behind, inserting a new tool, the Regional Planning Strategies (RPS) into the regional planning system was to make the political priorities for regional planning more targeted by focusing on important regional development trends and challenges, assess long-term development potentials and goals and determine which issues are to be addressed through further regional planning.

What we experience in the second round, however, is that the RPSs represent an almost identical story about the present and the future as we find in National Expectation, in the PBA (Planning and Building Act). We read about the same challenges, the same development goals. Few counties make clear thematic and political priorities. It is not in the RPSs most of the counties signal their own political priorities, as the intention with RPS is.

Alternatively, maybe this is a correct expression for that Norwegian government and the counties are largely unanimous, about the present situation, and about the years to come.

ID 1016 | THE RETURN OF PUBLIC PLANNING IN A POST-POST-POLITICAL MEMPHIS

Laura Saija¹

¹University of Memphis, City and Regional Planning Department

lsaija@memphis.edu

ABSTRACT: In the US Old South, a context that is characterized by major social and racial gaps and the worship of individual freedoms, planning has always faced significant challenges. Especially in the last couple of decades, the growth of electoral consensus in favor of a political establishment that is clearly against the very existence of any form of public spatial planning – perceived as an unbearable interference with the freedom to dispose of private property by legitimate owners – has favored the establishment of neoliberal planning methods and contents. This is true also for the southern city of Memphis, west Tennessee, the ‘northern capital’ of the Delta region, whose history has been shaped by king Cotton. However, in Memphis, that in many ways represents the full accomplishment of what in the literature is defined as a post-political city, i. e. the substantial death of a political debate able to reflect social conflicts together with basic forms of public welfares, few signs of interest in traditional forms of planning, i. e. an effort by public institutions to govern spatial dynamics in the name of the ‘public interest,’ are appearing. Surprisingly, the very actors that have played a major role on the post-political stage, are today taking a

stand against the lack of rules and boundaries for individual and corporate freedom in the real estate sector. This paper discusses the nature of this emerging paradox, presenting the very first outcomes of a case-study research project, carried out by the Department of City and Regional Planning (CRP) at the University of Memphis, TN, with the purpose of contributing to the planning theory debate on possibilities of planning resistance and/or renaissance in the face of neoliberal challenges.

1 INTRODUCTION

In the famous US TV series named *Parks & Recreation*, where the vice-director of the Parks and Recreation Department of an imaginary US town, the good will and optimism of the leading character, committed to the provision of the best possible service to citizens, clashes against her boss' believe that public government is a waste of tax-payers money and his dream to have the entire public parks system privatized and managed for profit. One might believe that the paradox of having a vegan managing a butcher shop is just a comical trick suited for TV; on the contrary, every American knows that reality has surpassed fiction. Almost half of US citizenry, which – especially after the 2016 Presidential election – is gaining a significant portion of the country's political power, that believes in a governmental model that is almost negation of itself, and is based on the substantial idea of dismantling every form of public planning, in the European sense of it (Trapenberg Frick, 2013).

In this perspective, the city of Memphis, the only democratic Hub in the republic state of Tennessee –a State that in 2011 has abolished the State Planning Department, which for many years had been the only professional support for most of TN towns totally lacking planning capacity – is starting to show some countertrends. As a matter of fact, the local debate is displaying a growing interest in a form of 'public planning' inspired by the value of social justice to overcome the historic dominance of total individual and corporate freedom of action (especially on the real estate sector).

This paper discusses the nature of this emerging interest in public planning, presenting the very first outcomes of a research project, carried out by the Department of City and Regional Planning (CRP) at the University of Memphis, TN that has focused on the motivations that led to it as well as the difficulties and contradictions faced by public planning within a traditional anti-planning context. The research has been conducted through a hybrid methodological approach which mixes:

- The case-study approach (Yin 2013), developed through a variety of qualitative methods (demographic and spatial analysis, in-depth interviews with key informants, archival research, GIS mapping, participant observation of planning-related events);
- An engaged-scholarship approach (Boyer, 1990; Ashley & Vos, 2015), based on which long-term community-university partnerships carry out research that is meant to advance disciplinary knowledge while addressing the most oppressing local planning issues.

2 HIDEOUS PLANNING

In general, in the history of US public institutions the very concept of what is 'public' is significantly different from its European counterpart, with evident effects on the functional, social, and aesthetic aspects of cities as well as on the ability for public bodies to impacts them (Fairfield, 2010).

Since the first days of colonization, the US socio-political system was established on the worship of every form of individual freedom connected with the dream that individual talents can lead toward social upward mobility in a land of great opportunities –, in open contrast with the ancient system of the British colonizer, which was based on a system of birth-related privileges (Warner, 1995). From the perspective of this paper, this premise is strongly related with a planning tradition that is strongly influenced by the need of protecting the individual freedom of not just owning as much property as one can afford but also disposing it with plain autonomy (Kayden, 2009). This does not mean that US Planning has not been able to generate examples of "public city," i. e. portions of the built environment that embodies a 'public' meaning and/or pay a 'public' function, being owned or not by a 'public' agency; nor it means that there are not examples of planning regulations over private property owners. It does mean, though, that all these examples are both qualitatively and quantitatively very different from the European cousins.

Memphis can certainly be taken as an example: the city was founded at the beginning of the XIX century by freemasons and real estate investors, with the hope of making profit out of the creation of a fluvial commercial hub along the Mississippi River, half way from New Orleans and St Louis (Sigafoos 1979). Thanks to the capital connected to the commercialization of 'king cotton,' grown in large quantities in the entire Mid-South Region, the City has successfully and continuously expanded over the centuries, with the result that Memphis is today one of the less dense US metro area (just to have a European comparison: 4 times larger than Milan, with less than a half of the population).

Since the 1947 Comprehensive Plan inspired by the City Beautiful Movement (Memphis City Beautiful Commission, 1947) until the last officially adopted Comprehensive one (Memphis & Shelby County Office of Planning & Development, 1981), Memphis planning history is full of tools and strategies meant to stimulate new developments, with a focus on the construction of public infrastructures that they need to be fully functional, with a lack of expectation that local government might provide public goods, spaces and services. In Memphis, 'Public' planning, i. e. the act of public agencies to govern urban spatial dynamics, has been challenged on many fronts.

First, within the normative framework that characterizes most of the Old South, unlike what happens along the two coasts, urban planning is not one of the compulsory activities of local governments and there a general lack of public planning culture. For the most part, public bodies engage in the preparation or in the update of building codes without the kind of general vision of development that comes with genuine comprehensive planning. Moreover, there is a substantial lack of norms through which real estate developers are forced to pay for the infrastructural, environmental, and social costs associated with the new developments they are profiting from. Very much like it worked in Italy before the Ministerial Decree n°1444 in 1968, Public bodies are expected to cover the costs associated to the provision of services such as parking, public spaces, transit, etc. thanks to increases of property taxes associated to the new development (except for public schools that are funded through a direct fee on residents). From a European perspective, this system seems to be conceived to favor private and corporate interests in the real estate sector but has a very limited capacity to shape vibrant, layered, and well 'served' neighborhoods and cities. On the contrary, from the perspective of the average mid-southern resident, whose maximum living aspiration is the maximization of privacy and quality of their individual housing unit (Putnam, 1995), this is a hideous system that forces households to pay taxes for their properties that are higher in Memphis than on unincorporated land (land that belongs to a county but is not included in a municipal boundary). For this reason, since the '60, many middle and middle-upper urban residents, mostly with white skin, in the search for 'more fiscal freedom' and willing to put more distance between themselves and the inner-city black communities, have continuously moved immediately out of the City boundary. The City government, in an effort not to lose its precious tax base (and therefore its ability to perform a basic level of services), has responded with a strategy that has encouraged and certainly not discouraged urban sprawl: periodic forced annexation of developed land to the city boundary with the consequent imposition of city taxes on residents that lacks any sense of belonging to the urban community (more data can be found at <https://www.shelbycountyttn.gov/2954/Annexations>). The outcome of such a strategy is a highly sprawled and racially segregated city, that often lacks basic city services (public spaces, transit, security services, etc.) and even the basic qualities of a functional and pleasant urban environment (sidewalks, parks, street appliances, etc.); a city with a dying 'hearth,' i. e. with most the inner-city neighborhoods in extreme social, physical and economic decline.

3 BACK TO A POST-POLITICAL CITY

When the last Comprehensive Plan was officially adopted by the City in 1981, there was still not a clear strategy against urban sprawl: the plan contains a general development vision that still considers urban development occurring in non-developed land as a positive economic engine. It indicates priority governmental actions but does not contains clear and effective land use restrictions. The plan identifies the revitalization of the urban core – mostly Downtown – as an absolute priority but does not identify the connection between downtown decline and urban sprawl and does not indicate local government's responsibilities for revitalization. In the 1977, following the example of many other US Cities facing sprawl and internal decline, the City helped establishing what then has become a completely independent revitalization non-governmental agency called Center City Commission (today Downtown Memphis Commission, DMC) in charge of carrying out direct physical improvements and, mostly, of attracting private investments to Downtown through incentives. In its strategic plan from 2013, the DMC explains

how the agency “is funded with an additional fee on Downtown commercial properties and with direct contributions of Downtown real estate investors; DMC is not funded by any city or county taxes” (DMC 2013, p. II). The necessity is to reassure city and county residents that they are not paying for what in a European perspective can be described as an important public effort: resuscitate a portion of the city that holds enormous historic and cultural values for the entire city and region.

Downtown investors have received significant incentives with almost no land use constrictions. In particular, the City has offered a red-carpet treatment to private investors that have developed hot real estate spots along the river (both north and south of Downtown), which are today sites for luxury houses with a direct view on Mississippi sunsets. The consequence is the growth of urban spaces with a public appearance but owned and managed by private hands seeking to raise (or keep) the value of their real estate investments.

In addition to all of this, the City has also managed to redevelop all the public housing complexes that were built during the New Deal era all around Downtown. Due to decades of disinvestment and lack of maintenance, public housing all around the US had become the symbol of ‘concentrated poverty,’ to be considered the main cause of inner city decay. To address such an issue, the US federal government created special funding programs, HOPE VI and, later, Choice Neighborhood, to replace public housing with privately owned and managed ‘mixed-income’ developments. Since 1995, the City of Memphis has used both federal programs to redevelop all its public housing complexes, replacing two thirds of public housing residents with middle-class ones and transferring most of the affordable housing business – through the federally funded section 8 voucher program – from public to private hands (Saija 2017).

Looking at all these strategies together, the overall effort of central city revitalization is perfectly aligned with the global neoliberal trend according to which local governments progressively should resign their responsibilities to produce or shape the ‘public city’ to focus on provisions and services that guarantee the flourishing of entrepreneurial freedoms and profits (Harvey 2007), especially order and security (Tulumello 2017). One of the main occupations of the local government in the shaping the of Urban environment in the last thirty years still reflects the model opposed by planners in Cleveland in the 70s (Krumholz 1982): the use, in a more or less direct way, of tax-payers’ money to attract and keep private corporations under the idea that they are going to provide jobs for the local workforce. Too bad that fiscal incentives or other kinds of support (such as various kind of urban improvements) are often provided without any formal agreement on the way jobs created (salaries & benefits, residency and socio-economic status of the employees, etc.) or any other guarantees of a ‘public’ redistribution of the corporate profit made through such a public support. In other words, Memphis public bodies have intensively used governmental power for “creating the sorts of physical conditions which can best serve industrial growth, also attempt to maintain the kind of “business climate” that attracts industry: for example, favorable taxation, vocational training, law enforcement, and “good” labor relations.” (Molotch 1976, p. 312).

From a European perspective, in such a context, the lack of public planning is counterbalanced by the extraordinary planning capacity of non-public players. Since the 80s, decision-making, investments, service provision, and urban revitalization efforts have been in the hands of a complex socio-economic system made by:

1. The philanthropic community, which captures a significant amount of private money before it goes into the public budget as tax-dollars. Private foundations, considered more financially reliable and transparent than public bodies, receive private donations that are eligible for tax breaks and manage them with full independence from the public decision-making system;
2. The private development sector, made of private developers as well as professional design, engineering, and planning firms, that sees the growing financial investments in inner-city neighborhood as an additional area of profit;
3. The non-profit community, made of organizations that receive and manage funds coming from different sources for the implementation of projects that are in line with their specific mission. In all the US cities, the non-profit sector plays a very significant economic role, and not only because it carries the responsibility of providing many services that in most European countries would be provided by public agencies (health care, education, social services, etc.). There is a specific type of no-profit that plays a special role in inner-city revitalization, the Community Development Corporation (CDC), a community-based “legally incorporated, non-profit agency empowered to purchase, develop and manage residential

and commercial property, or to provide loans and technical assistance to other organizations doing these same things" (Robinson 1996, p. 1652).

Many scholars have studied the type of alliance that is frequently established between the first two types of actors as well as local politicians and the media, describing it as a 'growth-machine coalition' pursuing "a constantly rising urban-area population – a symptom of a pattern ordinarily comprising an initial expansion of basic industries followed by an expanded labor force, a rising scale of retail and wholesale commerce, more far-flung and increasingly intensive land development, higher population density, and increased levels of financial activity" (Molotch 1976, p. 310). Other uses the expression "Urban Regime" to indicate the fact that informal partnerships between City Hall and the business elite in Urban Context are the mechanism through which decisions are made effectively even in the face of the many limits of US governmental powers (Stone 1989). More recently, scholars have introduced the concept of Post-political City, to indicate the ability of the development coalition, encompassing both economic and political powers, to kill every real social conflicts while erasing the very political essence of urban debates (MacLeod, 2011; Swyngedouw, 2010).

Within the Growth Machine and the Urban Regime frameworks, CDCs are frequently described as the only type of urban development actor that can play a counteracting role, with the potential (and sometime the ability) to break the monopoly of urban 'growth machines' and 'regimes' in the urban development business (Berndt 1977, Bratt 1989, Medoff & Sklar 1994, Robinson 1996) while advancing the interests of low-income inner-city residents. In the transition toward the Post-Political city, scholars have questioned the ability of CDCs to play a real counterbalancing role in the game of urban development in the absence of a real social conflict and clear political debate, it is difficult to have CDC (Stoeker 1997).

Memphis, very much like many other American cities, for decades has been characterized by a level of interplay between these three types of development actors and local officials that remind of these characterizing Molotch's Growth Machine (1976), Stone's Urban Regime, and, since 1991, a post-political city. In 1991, Memphis citizens, 55% of them were blacks (today they are 63%), elected the first black Mayor of Memphis, defeating an opponent who had been Mayor for 10 years and campaigned as an administrator who could attract business. The new Mayor and, even more, his appointed head of the Housing and Community Development Division (HCD) were both successful black leaders embodying the American myth of self-made men able to make their way out of poverty to a full commitment toward black empowerment. They both promised a new season of policies focused less on tourism and business and more on social programs, on city's public schools, and, most importantly, on inner-city revitalization. Public declarations seemed to imply a break into the 'Urban Regime' that had ruled the City for decades, but initial research outcomes show that it might have really meant a change in the [color of the skin of the] actors involved in informal relationships without really changing the nature of the decision-making method. For instance, the intensive use of HOPE VI funds by HCD – in partnership with the local Housing Authority – to redevelop public housing complexes can be interpreted as a neoliberal use of governmental powers (and money) to advance entrepreneurial 'freedom' (and profit) while generating 'post-political consensus' (MacLeod, 2011; Swyngedouw, 2010) pursued by a strong populist leader advocating for relocation, redevelopment, and privatization policies that are 'good for everybody.' The same leader that has proactively used tax payers money to attract in Memphis a number of private corporations such as Electrolux, BassPro, and others. For decades, almost the totality of planning-related decisions made by the City were led by HCD and its director, in the absence of an updated Comprehensive Plan, in the face of a very weak Land Use and Planning Department, and with City Council acting as an uncritical enabler. Moreover, the 2007-08 recession, related to the housing bubble associated with urban sprawl, has further weaken Memphis' public planning: at that time, most of the salaries of the City of Memphis Planning Department's employees were being paid by the fees collected through the development process (mostly related to subdivision requests and new constructions). The collapse of the development sector then caused the failure of the Planning Department's budget and the consequent reduction of its workforce by almost 50% (from 250 to 130 units) in only one year.

What is even more indicative of the post-political nature of city planning in Memphis, is the big role played by the private foundations in the Community Development field; an interest that has always been carried out with a high level of independence from the public sector, especially after the 2007-08 recession. Based on the data, it is evident that the endowments of the private foundations involved in the community development field have not been impacted by the recession as much as the private development sector and the City Planning Department, as further sign that most of the weight of the recession has been

carried out by the shoulders of the public sector and the low- or middle-income sections of the population, without really impacting the richer strata, who are usually in the position of making donation to the philanthropies. These were, however, forced to rethink on how to make their investments in community development and inner-city revitalization more strategic, in the face of a significant increase of poverty rates, housing vacancies, fiscal delinquency, and street crime within the inner-city loop (source: US Census 2001-2010). The immediate outcome of the recession was not only the significant increase of the classic symptoms of urban blight but also the reduction of the capacity of the extremely large number of Memphis CDCs of counteracting those symptoms.

To enhance of level of efficacy in the Community Development sector, between 2007 and 2009 foundations have come together forming what they called the Greater Memphis Partnership, hired a Planning Firm from St. Louis – EDAW Inc. –, and led to the finalization of a Strategic Plan for the Memphis Metro Area named Greater Memphis Neighborhood: A Blueprint for Revitalization (Greater Memphis Partnership, 2009). The Plan identifies priority areas and priority actions to be undertaken. Despite the fact that the document mentions the involvement of the main public agencies, “the city contributed to the process with a symbolic token, just to be able to say that had a horse in the race.” (key informant interview carried out by the author) The whole plan was funded by philanthropic foundations with the purpose of prioritizing Community Development investments, allowing the philanthropic community to act in full coordination and synergy. Three inner-city neighborhood were selected as investments areas and foundations were led to prioritize their funding toward CDCs and organizations operating there. Today, these three neighborhoods have received the most investments for revitalization amongst the totality of inner-city neighborhoods.

In synthesis, Memphis urban dynamics of the past decades are characterized by the complete lack of rules for new developments, the absence of any meaningful attempt to limit sprawl, the privatization of what was left of public services’ provision (public housing, public spaces, etc.), and a process of inner-city revitalization led by a non-public system based on a solid dependence of CDCs from philanthropy. Successes in the inner-city revitalization process, in particular, might lead neoliberal supporters to argue that planning without a public power – where major decisions do not engage, not even within a regimental framework, elected officials – is possible and might even look successful. Is that really the case?

3 MEMPHIS 3.0: CHANGE OF DIRECTION?

Some of the most recent events in Memphis might start to provide a partially negative answer to such a question.

Paradoxically, the very system of actors that have de facto replaced the lack of public planning over the past decades, are today showing clear signs of interest in restoring the planning functions of the main public bodies, while asking public officials to take more responsibility toward spatial governance: private foundations and the major CDCs have clearly expressed, over the past couple of years, the importance to have a strong and well-functioning public sector if the persistent city decline is to be really faced. Despite the sign of revitalization of few inner-city neighborhoods, city leaders agree on the fact that none of their efforts neither HCD aggressive approach to development has really changed the fact that the city is in a lagging status that seems to be impossible to overthrow. In their new discourses in support of a stronger public sector, the issue of social justice makes a recurrent appearance, in a city where 26.2% of residents live in poverty (a % that is almost twice the US average and one and a half higher than the average of the Metro Area; source Delavega 2016). We do not know whether this means that the richer residents are progressively realizing that they cannot live their entire life in their luxury homes out east or along the river and they want a city to live in where they can feel safe and comfortable. What we know is that the very philanthropy managing the wealth that does not get through the public treasury, after the Blueprint planning experience, has decided to significantly invest planning process that, unlike the Blueprint one, are have the capacity of strengthening the capacity of the two main local public bodies: Shelby County and the City of Memphis.

They started with supporting the preparation of the Mid-South Regional Greenprint and Sustainability Plan, “designed to enhance regional sustainability by establishing a unified vision for a region-wide network of green space areas, or Greenprint, which serves to address long-term housing and land use, resource conservation, environmental protection, accessibility, community health and wellness, transportation

alternatives, economic development, neighborhood engagement, and social equity in the Greater Memphis Area” (Memphis-Shelby County Office of Sustainability, 2014, p. 9). For the preparation of the plan, Shelby County Government was awarded a \$2,619,999 Sustainable 61 Communities Regional Planning Grant from the United States Department of Housing and Urban Development (HUD). The philanthropic community was instrumental in funding the preliminary steps that had allowed the County to be successful in such a high competitive federal program. Moreover, despite the official focus was supposed to be on green infrastructure, the plan clearly tries to address their connections with all the other areas of intervention that usually characterize a Comprehensive Plan. Its main contributors admit that in an ideal world Greenprint planning should have followed a Comprehensive planning process. However, they think that in many ways the very Greenprint, with its high ambitions, has played the role of forerunner: it has, for the first time, shown to the ‘public’ and, in particular, to many important local players the legitimacy and the importance of a well-run public planning process.

The Greenprint, published in 2014 after a long process and the engagement of more than 50 stakeholders, is in the process of being successfully implemented, thanks to the immediate financial engagement of the philanthropic community: the main local foundations have been proactive in supporting the physical execution of the most important sections of the new green infrastructures: in some cases they have directly bought the land and led the construction works to then donate the final result to the City – this is the case of the Memphis greenline, for instance – or to ad hoc non-profit – this is the case of the Wolf-River Greenway, donate to the Wolf-River Conservancy –. The tangible successes of the Greenprint and the general enthusiasm generated in the public opinion, has played a key role in the will of the City of Memphis to create a position for a Bikeway/Pedestrian Coordinator, which has helped generating more than 71 miles of new bike lanes since 2010, more than doubling the previous 63 miles already existent (Smiley et al. 2016).

Most of all, the Greenprint has reached its declared goal of triggering a new Comprehensive Planning process of the City of Memphis, the first one in more than 40 years. In this process, the main private foundations have, again, played a major role; they have funded with almost 2 million the first three years of the process called Memphis 3.0. This amount has covered, amongst other things, the totality of the salaries of 5 new planners hired by the Planning and Department of the City of Memphis to run the process, under the promise of future stabilization of their salaries with public funds.

Scholars that are familiar with the literature on planning in a neoliberal era, the idea that public planners are, de facto, on private foundations’ paychecks could be interpreted as a clear sign that public bodies are under the complete influence of the local business elite. This interpretation could be confirmed by the fact that, one year into the process, the founders have explicitly requested to be part of a Memphis 3.0 Advisory Board, a committee of ‘wise’ individuals that can suggest and lead the process through the ‘right’ steps. Moreover, there are very few doubts on the expectations that the Memphis’ commercial elite has from the process; expectations that are summarized by the title of a public seminar organized by the Memphis Chamber of Commerce on February 2017: Why Comprehensive Planning is Good for Business: 10 years after the recession and decades of incentives and actions in favor of a good business climate (total freedom of action of the private sector, especially in the real estate sector), Memphis is still a city that grows physically but not in terms of tax base. What is gain by the suburbs is lost by the inner-city neighborhood and viceversa, in a zero-sum game; a game that is unsustainable not only for low-income residents but also for the commercial elite, which is seeking a drastic change of direction. In this scenario, Memphis situation could be labeled as a paradox (Rushing 2009): in a context where the public hand still lacks of resources and spatial governance capacity and where the broad socio-cultural system is indifferent, if not clearly hostile, to the very concept of Planning, here is the business elite that is strongly contributing, at least in this phase, to a change of mindset. From all our interview with stakeholders, it appears that they all genuinely hope in a real “inner-city revitalization,” referring not just to the physical structures but also communities: it is almost like the private sector is advancing the hypothesis that financial growth is not possible without a certain amount of socio-cultural fairness, which can only be systematically addressed by a strong and affective public sector. One could advance the hypothesis that, after trying to act independently through the Blueprint, they are all realizing of the necessity to have capable public actors, which are “not kept hostages by private corporations and able to pursue courageous choice.”

Whether this is a temporary phase or the appearance of a new paradigm of possibilities for public planning in the reign of neoliberal culture the future can only tell.

ID 1356 | 'DECISION NOT TO DECIDE': A NEW CHALLENGE FOR PLANNING

Flint Ashery Shlomit¹

¹CASA, UCL

shlomit.flint@ucl.ac.uk

1 INTRODUCTION

Urban planning developed during the twentieth century under conditions of strong national welfare states and relatively weak civil societies (Davies, 2001). The need to protect the public interest and guarantee its rights led to the establishment of hierarchical planning systems throughout the developed world. Planning mechanisms were designed to guarantee equal allocation of resources and appropriate infrastructure for various sectors (Dean, 2011, Piketty, 2014). In the urban realm in recent years, the unprecedented scale of urban transformation and the weakening of the social, economic, and political frameworks that constitute the background for planning, has meant that the impact and the pressure of direct cooperation of interest groups on urban space has considerably increased (Alexander, 2002; Kolossov, 2005). Planners and politicians have to cope with interest groups characterised by diverse institutional structures, access to resources, and inconsistent territorial interests; a particular challenge to the planning system is posed by groups committed to non-liberal values and concepts.

Indirect cooperation reflects similarities in the way people 'read' and interpret urban space, direct cooperation reflects economic interests and social organisation, and both can evoke planning policy issues (Fischer, 1982, Alexander, 2002; Kolossov, 2005). While many of these issues, such as the buying of land by purchasing groups or Gated communities, are addressed by an authoritative pronouncement and clear-cut decisions to create an official groundwork of action, there are many others that planning policy makers avoid or refrain from addressing. Both adopting a stance and choosing to abstain from doing so have far-reaching ramifications for society. The difficulties of liberal planning when faced with implementing what is defined as "the politics of accommodation" (Lijphart, 1968; Davies, 2001), and in resolving spatial conflicts between groups and individuals in diverse democratic societies, will be discussed in this paper. In order to explain the ways individuals incline towards and cooperate with groups to claim space, the research will use the themes of social relations and control mechanisms to examine the effects of organisation in housing. The themes of group behaviour in urban space and the policy of non-decision will elaborate the way different groups adopt different strategies to claim space. Hence, the research will examine the ramifications of 'Non-decision making' (NDM) for autonomous individuals and groups who organise neighbourhood change.

The case studies that have been selected are interesting because they function somewhat as 'limit cases' that demonstrate the ramifications of NDM for neighbourhoods changed by different levels of cooperation. They are therefore very different: The type of state in which planners operate, the relationship between civil society organisation to the state or municipality and the role of religious activists (Imams in Whitechapel and Rabbis in Zangwill Street) are very different in both locales. On one hand there is the

ideological power of Imams in relatively secular multi-cultural London. On the other, the city of Jerusalem, Israel's capital and its largest municipality, is subject to fundamental social and political conflicts. Jerusalem is ethno-nationally divided and contested. However, both Whitechapel Road in East London and Zangwill Street of Kiryat-Ha'Yovel, Jerusalem, make interesting case studies for examination of the ability of cohesive communities to operate local housing markets in order to wrest control of space from other groups, thereby creating a 'contiguous' community space. Capturing the value of development relies on housing provision that is mostly built and marketed to attract new types of resident to areas of renewal, and to change an area's homogeneous composition. The need to absorb growing populations creates pressures in particular parts of the city, and on existing local populations. While the hierarchy of London property values remains firmly in place, with inner areas of West London at the peak, it is East London that has seen the most accelerated price rises since 2000. As an effect of serial displacements, middle-income buyers out-compete lower-income groups in both the home owner and rental sectors in London's cheaper housing markets (Hamnett, 2004). Similar to this process and based on the British Mandate system, Israeli planning is characterized by a centralized and hierarchal structure. In West Jerusalem urban planning preserved the liberal trend to unite various population groups for the creation of a common Israeli culture. According to this view, the Haredi community had not been considered as a singular entity that required a special urban space, but instead as part of the wider Israeli melting pot. Consequently, Haredi territory has been restricted by land uses which contradict its nature, and every contact bears the seeds of a territorial struggle with neighbouring populations over living space (Shilhav & Friedman, 1985). High population density and increased prices for flats in Haredi enclaves has stimulated a constant migration of population from the Haredi enclaves. The "Haredification" of Jerusalem [a process whereby non-Haredi populations are replaced by Haredi] can be linked to every aspect of life and decision-making in the city (Hasson, 1996). The influx of Haredi into secular neighbourhoods has caused friction and bitter struggles over the city's character.

Most empirical research overlooks the contribution of policy makers to such processes as NDM and argues that where there are no planning decisions, there are no planning events to investigate---or so it would seem. The analysis of NDM seems to oblige the analyst to provide an explanation for things that do not happen, and researchers have argued that there is simply no reasoned and reliable way to construct such explanations (Crenson, 1971; Sturzaker, 2009; Palmer, 2014). The present study attempts to find a way to do so, contending that in order to examine these processes, one must refer to the social system that drives the local process and the set of values from which it draws its strength. This paper thus examines how groups holding different values adopt strategies to claim territory, identifying the collective features of the referred groups and their urban expression, while also considering the role of planning in the process.

2 THEORETICAL BACKGROUND

'Non-decision making' (NDM) is defined as 'the practice of limiting the scope of actual decision-making to 'state' issues by manipulating the dominant community values, myths, and political institutions and procedures' (Bachrach & Baratz, 1963; Kamuzora, 2006), a result of a lack of public policy or, alternatively, a clear choice of public policy (Dye, 1999; Akindele and Olaopa, 2004). A complete view of power must include, according to Lukes' 'second face of power', a consideration of action as well as inaction, and covert and latent, as well as overt, conflict (Lukes, 1974, 1977; Groarke, 1993; Béland, 2016). Following Dye's definition of public policy as including not only what governments choose to do, but also what they choose not to do, it is common to distinguish between (1) the absence of a decision in a situation of clear opposition to a proposed policy even though the alternative does not have a large coalition of supporters; (2) an auditing body's criticism of the authorities for neglecting their responsibilities, and for refraining from providing optional actions through NDM; (3) inaction arising from a desire to protect interests by preventing changes in existing policies. Although these classifications cannot be absolute in today's complex realities, NDM is, in fact, a specific form of decision on the part of policy-makers - "The decision to avoid addressing the issue" - and its outcome is identical with that of the decision not to decide. Frequently, the desire of a population to live together leads to a refraining from the making of a decision. In disputes of principle, the moral and political legitimacy of NDM policy stems from its ability to allow the preservation of a democratic system, rather than from its ability to bring about willingness to make mutual compromises. Likewise, an issue which is not relevant to most of the population, not germane to the character of the state, or whose economic aspect is of negligible weight relative to the other aspects, has decreased chances of being

decided upon. These characteristics also affect the level of resources dedicated to accumulating knowledge and consequently reduce the chances for the making of a decision in the long term. Hence, this research will examine the ramifications of NDM for neighbourhoods changed by different levels of cooperation.

The effect of cooperation on urban structure was considered by Du Bois (1899) in *The Philadelphia Negro*, which examines the demographics of black Americans, and later by the Chicago School (Park, 1936). The School examined spatial competition between groups as an ecological process and developed an invasion–succession model to describe collective behaviour. According to this view, spontaneous social gathering is a means by which individuals improve their ability to cope with the challenges of urban life (Hawley, 1950; Back 1996). Alongside the creation of cultural dominance within the defined enclave, the isolated territories serve as a protective niche enabling conservation of lifestyles and cultures (Boal, 2008; Mehlhorn, 1998). Purposive and relatively structured forms of collective behaviour are social movements. The distinctly political character of these groups of individuals gathered together with the common legitimate purpose of expressing subjectively felt discontent in a public way, makes these social movements modern (Haferkamp and Smelser, 1992). These urban residential dynamics are often explained by referring to economic factors (Kasarda, 1972; Speare, 1974) or to a mixture of economic and non-economic factors (Borjas, 1998; Clark and Withers, 1999; Fossett 2006). In the case of the latter, ethnic relationships, family lifestyle or life-cycle features are usually added to the basic set of economic factors (Feitelson, 2011; Johnston et al., 2007); the economic factors blur the impact of the non-economic factors, especially of self-identity, on spatial organization.

As opposed to indirect collaboration, a collective that has gathered in a given place and time creates direct cooperation, something that is defined as group behaviour (Anderson & O'Dowd, 1999; Saegert & Winkel, 1990). Clear authority reaches consensus, defines rules and creates an organised segregated pattern. As characterised by purchasing organisation and gated communities, this organised behaviour reinforces traditional communities where religion is a social cement (Bankston & Zhou, 1995). Many of these communities attempt to revive old traditional lifestyles by using modern mechanisms that reinforce compliance due to identification, rather than out of fear or under explicit threat (Castells, 1997). An individual's needs become congruent with the group's interests, and individuals are expected to concede their free will and to subordinate their interests to those of the group, even in cases where they are indifferent or even harmed by them (Riesebrodt, 2002). In terms of leadership, territorial concentration facilitates its control of the members' daily lives, so preserving the community's identity and maintaining its cohesion. When the group members realise they are more likely to achieve their goal when acting in a co-ordinated way rather than individually, they may use the territory as a base for offensive actions against "others" (Taylor & Moghaddam, 1994; Boal, 2008) and expand their enclave's borders through group action (Granovetter, 1978; Lalonde and Cameron, 1994). The borders thus created, whether they are weak or strong (Paasi, 1996), rigid or flexible, gateways or barriers (Altvater, 1998, Newman, 2003), represent economic, political, cultural or social asymmetries between communities (Giddens, 1984). Planning, in this respect, lies on the seam between charting national policy and the pressures of diversified urban politics; it therefore seeks to weaken the spatial pattern of segregation as well as the boundaries between groups (Healey, 1997).

3 METHODOLOGY

The research is based on "real data" information provided anonymously by the people themselves in Kiryat-Ha'Yovel (2009) and Whitechapel (2011-12) at the level of individual families and flats, sections, and buildings. As the author speaks Bengali and Hebrew, she was able recruit assistance from local interviewers and gather rich and sometimes controversial data by this means.

The Whitechapel neighbourhood's collected data are part of a more in-depth survey. Together with a local interviewer, a young male from the Bangladeshi community (who has requested anonymity), the author conducted a door-to-door survey and interviewed 4656 families living in 3186 flats. Whitechapel's households were asked to identify themselves as well as the flat's former dwellers, going back to at least 1995. Several researchers stress that the identity of previous residents is important for traditional families (Waterman and Kosmin, 1988), a conclusion confirmed by this research. Identification of past and present residents of Whitechapel Road allowed the study to identify the flats' dwellers between 1995 and 2012 and

recognise the Bangladeshi Sylheti as the dominant group. The research area of Whitechapel Road contain 642 families living in 63 buildings.

In Kiryat-Ha'Yovel, all 653 buildings were surveyed. In each building/section, representatives of the building committee or the long-standing residents were asked about the identity of the residents of the building, and whether they rented or owned their flat. From the data collected in this manner, a map of the population distribution was created, from which a secondary map was derived for each discrete population group. The population distribution of the Kol-Torah community was particularly marked because it was prominently congregated in the large residential buildings on Zangwill Street. In consequence, the dynamics of residence on the street were then examined at the individual flat level. Although co-operation was limited, most of the new residents indicated that they belonged to Kol-Torah community, based in the adjoining neighbourhood of Bayit-Ve'Gan, and gave their date of entry into the new flat. Zangwill Street contains 347 flats in nine residential buildings with 46 separate entrances.

All other questions asked - both in Whitechapel Road and Zangwill Street - are related to the present occupants in order to reconstruct the dynamics of population replacement. 268 veteran residents of Whitechapel Road (who sold their flats between 2004 and 2012) and 246 veteran residents of Zangwill Street (who sold their flats between 2002 and 2010) were identified and interviewed. They provided information about the price and the month/year of the sale. In addition, they were asked about the approximate number of families of "others" (e.g., not Bangladeshi in Whitechapel Road, and not from Kol-Torah in Zangwill Street) still residing in the building at the moment of a sale. 84% of the ex-owners of Whitechapel Road, and 76% of the ex-owners of Zangwill Street were willing to reply to these questions. Cross-checks with data supplied by real-estate agencies and websites increased the percentage of cases for which the price and the number of secular tenants are both available to 98% (Whitechapel Road) and 88% (Zangwill Street). The market price of a flat at the moment of the sale was estimated on the basis of cross-referenced data provided by local realtors, Zoopla and Rightmove for Whitechapel, and three of the main realtors working in Kiryat-Ha'Yovel. They produced information on population exchanges and explained dynamic processes, making it possible to estimate residential markets in the research areas.

The characteristics of all flats and households were organised as a high-resolution layer for each case study, in which every record is related to its corresponding building. GIS layers for Whitechapel Road were provided by the ordnancesurvey.co.uk/opendatadownload/products.html and updated to 2016. The Zangwill Street data was integrated into the area's GIS layers pertaining to topography, roads, land parcels and buildings, as provided by Jerusalem Municipality and updated to 2004. This spatial-temporal GIS facilitated investigation of the residential micro-dynamics of the case studies, while referring to residents' identities and the turnover of flats, also spotlighting group organisation and leadership rules behind these processes.

In addition, 41 interviews in Whitechapel and 30 in Kiryat-Ha'Yovel were conducted with key figures from various fields. Those involved with the communities were interviewed about spatial relations between the individual and the community, and the economic aspect of the institutions (Jamme Masjid, East London Mosque and Kol-Torah yeshiva) in regard to housing. Functionaries in Tower Hamlets Council and Jerusalem Municipality were interviewed regarding the capabilities and limitations of the planning system in the encounter between population groups. Residents from various "other" population groups were interviewed about activities in public and private spaces. The information was cross-checked with blogs, articles, and internet sites, which offered a range of different types of knowledge and perspectives on the communities. Observing these conflicts in Whitechapel Road and Zangwill Street will enable us to explain the idea of "Terrain of Inaction".

4 THE CASE STUDIES

London's East End developed gradually from medieval times, and from around 1890 became associated with poverty, overcrowding, disease and criminality (Palmer, 1989). Despite a massive gentrification process, some parts of the East End continue to contain some of the most deprived areas in Britain (Kintrea et al, 2008; Dustmann and Theodoropoulos, 2010). Today, the large number of 61 religious institutions in the study area reflects diversity within the population: the area is populated by Muslims, Hindus and Christians of African, British, South-Asian, East-Asian and European origin.

Whitechapel Road (Figure 1) is a part of the historic Roman Road from London to Colchester. Now, there are notable numbers of office buildings and several institutions along the road, such as the Whitechapel Art Gallery, the East London Mosque and the established street market next to Whitechapel tube station selling a range of authentic Asian food and clothes. Towards the end of the 20th century, the street, along with the nearby Brick Lane, became the centre of the British Bangladeshi community. Most of the residents along the road live in and above shops in houses divided as flats, both in private ownership and renting.

Figure 1: (a) Map of Central London with Whitechapel Road marked. (b) The research area of Whitechapel Road

Kiryat-Ha'Yovel is a Jewish neighbourhood in south-west Jerusalem (Figure 2a), populated by secular Jewish along with National-Religious and Haredi populations, including members of the Sephardic sects, the Chabad-Hassidic community, and Lithuanian sub-sects classified by national origin: Israeli, American, French and Sephardi-Lithuanian. In recent years, Israeli-

Lithuanian Haredi of Kol-Torah have been purchasing flats on Zangwill Street, the north-eastern boundary of Kiryat-Ha'Yovel (Figure 2b). Zangwill Street is composed of nine large housing complexes. Originally, most of the flats in the street were about the same size – 48-55 sq. m. (2.5 rooms), though some of them have been enlarged. Kol-Torah Yeshiva was founded in 1939 by German immigrants who arrived in Israel following the 'Kristallnacht' pogrom, and although its scholarly trend was not initially militantly ultra-orthodox, it changed over the years. Today Kol-Torah is considered one of the most important yeshivas of the Torah world, and the secular and the national-religious residents of Kiryat-Ha'Yovel are concerned about its impact on public spaces, and its possible ramifications.

Figure 2: (a) Map of Jerusalem with the Haredi enclaves, Zangwill Street marked. (b) Zangwill Street on the border with the adjoining Haredi neighbourhood of Bayit-Ve'Gan

Both Whitechapel Road and Zangwill Street were established and populated over a long period as a result of many individual decisions. Whitechapel Road and Zangwill Street provide empirical evidence that different population groups, practicing different lifestyles, values and levels of organisation, can create and sustain the same residential patterns within opposite market-price situations. The differences between spontaneous enclaves, represented by Whitechapel Road, and organized enclaves, represented by Zangwill Street, give rise to two fundamental questions. First, what kind of day-to-day residential mechanism sustains the initial structure of these enclaves? Secondly, in respect of the housing market, what is the rule of the market price in maintaining the enclaves? The next section of this article deals with these questions and reveals the social apparatus that drives the observed orders.

5 TERRAIN OF INACTION

5.1 THE RELATIONSHIP BETWEEN CIVIL-SOCIETY ORGANISATIONS AND THE MUNICIPALITY

BANGLADESHI-MUSLIM COMMUNITY – SYLHETIS

While untrained eyes might see the Bangladeshi-Muslims as a homogeneous Sunni population, a closer look reveals a complex communal structure, run by precise rules and conventions. Clans play a central role in the Bangladeshi community, politics and identity formation, providing both a system of rights and social support (Eade and Garbin, 2001). Desai (2011) explains that a Bangladeshi community from Sylhet, a district in north-east Bangladesh, can form a largely homogeneous community. Despite identification with the clan being intense and overt, and a tendency to marry inside the community, Sylheti are highly integrated within general society.

In addition to their spiritual role, Imams (religious leaders) have a central position in the organization of communal daily life. In terms of leadership, social dependencies are a means for preserving the community's structure (Forman, 1989). Interviewees indicate that encouragements from the local Imam in respect of socialization and deep solidarity with the community's values and needs have motivated collective behaviour. Mamun Rahman explained: "our Imam emphasizes the individualism of the community members creates a society that is ever richer in capacities for communication for preserving the community's coherence" (June 15, 2014). Belonging and residing in the group's territory is a source of "social capital", mutual assistance and support for individuals. The individuals' intense awareness of identity motivates them to cooperate in order to maintain their community identity and congregate in a voluntary territorial separation of clans into an enclave of sorts in a free market (Glynn, 2006).

Bangladeshi rates of unemployment are typically high and many live on means-tested benefits. In 2011, nearly half (48%) of British Bangladeshis between the ages of 16 to 64 were reported to be employed, and there is overcrowding in housing (Garbin, 2005). JRF (2015) indicates that British Bangladeshis have the highest overall relative poverty rate of any ethnic group in the UK with 65% of Bangladeshis living in low-income households. Although the older generation is employed mainly in the distribution, hotel and restaurant industries (ONS, 2008), the newer generation is making significant progress at schools compared with other ethnic minority groups and many aspire to professional careers (Rezaul, 2007).

The London Borough of Tower Hamlets houses 18% of the UK's Bangladeshi population (32% of the borough population), most of them Bangladeshi-Muslims, who are the area's older and best-established ethnic minority. The majority of the councillors in Tower Hamlets are of Bangladeshi descent and part of the Labour Party. As of 2009, 32 of the total 51 councillors were Bangladeshi (63%), 18 were White (35%) and 1 Somali (2%). The first Bangladeshi mayor in Tower Hamlets was Ghulam Murtuza, and the first directly elected mayor was the Bangladesh-born British former solicitor and politician, Lutfur Rahman. In addition, large numbers of people from the Bangladeshi community have been increasingly involved with local government, through consultation, participation and engagement.

THE HAREDI COMMUNITY OF KOL-TORAH

The Haredi population is distinguished by internal, nuanced distinctions among its sub-groups, expressed in different values and normative behaviour. Common to all is the great importance given to holy studies, which is expressed in an individual's social status: a "scholar" who refrains from general education but invests and succeeds in his holy studies gains a high social status (Gonen, 2006). The community's leaders regulate a system of control and supervision, prevailing mainly in the Israeli-Lithuanian Haredi community, making the individual dependent on the community (Friedman, 1991). The Israeli government provides stipends to the study institutions directly, but these funds are fully regulated and distributed by the Rabbis exclusively: small living stipends are given to each Torah student family (Gonen, 2006). This phenomenon reinforces an individual's solidarity with the community's values, limiting their economic development (Friedman, 1991). An increase in the strength of the Haredi communities has become highly important when socio-economic issues, such as marrying young and having high fertility rates – some 6% annually – (Berman and Klinov, 1997), exacerbate the growing pressure of the Haredi population on urban space. Despite the state's allocation of land for constructing Haredi neighbourhoods, official solutions were inadequate to meet demand, and Haredi pressure on the enclaves increased. Nowadays, when housing enhancers and young families have difficulties realising their preferences to live within their own communities, the importance of group behaviour has increased. This is particularly relevant to the Israeli-Lithuanian Haredi community of Kol-Torah, which is interested in creating territorial continuity in Kiryat-Ha'Yovel neighbourhood in Jerusalem.

In recent years the number of Haredi related to the Kol-Torah community in key positions on Jerusalem's City Council has increased. Thus, Rabbi Lapolianski served as Mayor of Jerusalem (2003-2008), and his deputies were Rabbi Maklev, who held the Construction and Planning Portfolio since 1993, and Rabbi Pollak, who was chairman of the Construction and Planning Committee (2003-2008). The current Deputy Mayor is Rabbi Pindrus. Characterized by a well-coordinated institutional structure, organized funding and members' strong commitment, Kol-Torah turns to group action and mobilises dedicated manpower and significant resources to create processes of cultural and social introversion and territorial spread, accompanied by the exclusion of the existing local population.

Despite differences in relationships between civil-society organisations (including religious ones) and the state or municipality in both locales and the role of religious activists - Imams in multi-cultural London and Rabbis in the ethno-nationally divided city of Jerusalem - there is a deep resemblance in the social and cultural roots behind urban segregation in both cities. In both communities, individuals are usually born, raised, married and live within their community. They are largely young populations, characterized by high birth rates. An individual's life is centred on the institutions of higher religious studies that also provide social services, including children's education and basic welfare. Despite the economic status of most of the individual members tending to be very low, the economic power of each community as a whole is considerable: many communities maintain financial resources and services composed of donations and taxpayer money through state support for religious institutions (Hasson, 1996; DCLG, 2010).

Another resemblance arises from the outcomes of demographic, social, and economic pressures that have limited the involvement of leadership in the communities' daily lives. In recent years, the 'leftovers' of both communities are driven to establish residences far from the original group enclave, and the geographic separation that is created between the generations threatens community continuity. In the case of the Bangladeshi community, significant numbers of British Bangladeshis move out from Whitechapel to Birmingham, Oldham, Luton, Burnley and Bradford. The population living in the original enclave is aging, and elsewhere, the lifestyle in the new communities tends to adapt itself to the new conditions of life. An individual's identification with community and the desire to raise children in a homogeneous cultural and religious environment evokes conscious moral recruitment. For the Kol-Torah community, the ability of the leadership to enforce group discipline for continued residence within the community has been weakened, and thus motivated Rabbis Elyashiv and Auerbach to organise top-down group action to expand the original living space of the group. The expressive incentive for the group's members is that they would help out in the process of trying to attain the group's goals. Clear-cut monitory mechanisms ensure compliant behaviour, allowing the leadership to impose discipline and organise matters in accordance with its preferences.

5.2 THE EFFECTS OF ORGANISATION IN HOUSING

COLLECTIVE BEHAVIOUR OF THE SYLHETI COMMUNITY

Although a Bangladeshi Sylheti community has lived in the Whitechapel neighbourhood for decades, only the recent experience of gentrification and 21st-century migration - first from Ireland, Greece and Austria, and since May 2004 also from Eastern Europe - followed by significant socio-economic change and physical renewal, motivated a collective behaviour process along Whitechapel Road. Examining the occupation process of Whitechapel Road by Bangladeshi Sylheti people between 1995 and 2012 (Figure 3a-b) can indicate the abilities and limitations of a non-organised community in the creation of a defined enclave within a free market.

Figure 3a-b: Spatial intervention of Sylheti community to Whitechapel Road 1995 and 2012

Despite the area already being occupied by group members, a clear behavioural code enabled a non-organised bottom-up process that created high confidence among residents regarding the group identities of newcomers and veteran residents. The intensive daily contacts between members of the same group resulted in enhanced information flows between individuals. The intra-group information flow freezes established residential patterns: a high percentage of families reside in flats vacated by householders of their own group (Tables 1 and 2). The probability of replacing a family belonging to a different group is calculated as $D_{\text{Replacing_NOT_D}} / \text{NOT_D}_{\text{Left}}$, where $D_{\text{Replacing_NOT_D}}$ denotes the families of a group D that replaced families of other groups, and $\text{NOT_D}_{\text{Left}}$ denotes the overall number of families of other sects that left their flats. The probability of leaving a flat is calculated as $D_{\text{Left}} / D_{\text{Occupied}}$, where D_{Left} is the number of flats occupied by families belonging to a group D in the beginning of the year. Tables 1 and 2 present these probabilities by groups for ownership and renting. The replacement of a tenant of the same group is a strong candidate mechanism for gaining cultural dominance in time.

The transfer of flats to Bangladeshi newcomers, both owned and rented, is significantly higher than with other groups. It seems that other groups (mainly Eastern European) also apply this mechanism, which can be viewed as a powerful generative order, organizing residential patterns through the long term. This practice creates a residential continuum in respective buildings. Bangladeshi families can thus be assured that the level of community members in their building will not decrease following some instance of non-standard residential behaviour by one of them.

Period (Ownership)	Bangladesh	East-European	India, Pakistan, Sri Lanka	East Asian Pacific
1995-2012	0.99	0.27	0.38	0.18

Tables 1: Averaged probability to replace the family of the other sect in a flat, Whitechapel Road

Period (Renting)	Bangladesh	East-European	India, Pakistan, Sri Lanka	East Asian Pacific
1995-2012	0.66	0.48	0.31	0.19

Tables 2: Averaged probability to replace the family of the other sect in a flat, Whitechapel Road

Data obtained from local estate agents (Claremont, Lourdes (since 2005), Chase Evans, Falcon (since 2010)) and former residents enabled reconstruction of the gradient of prices and an examination of the market dynamic as of 1995 (Figure 4):

1. Intensify: two flats purchased randomly by Sylhetis above market price (1st significantly above the market price, 2nd slightly over)
2. Sustain: after the purchase of flats 3, as the number of Sylheti inhabitants increased, prices fell far below market level and stabilised around 75% of the market price. An internal-market had emerged, and Whitechapel Road became identified with the Sylheti population. Prices inside the community territory decline, creating a property line along the road.

Figure 4: Average selling price to market price ratio as dependent on the sequential number of flats among those sold by the veteran Sylheti community.

Twenty-one interviewees explained the need to preserve the identification of the road with the Sylheti community as a reaction to the gentrification process: Saba (53), preoccupied with a possible loss of individual cultural identity and the uprootedness of a society that is more and more similar to a market in which nothing prevents the stronger from dominating the weaker: "I am worried about an oncoming blending of local culture, as other multinational chains follow Starbucks into the area and attempt to gentrify it with their bland corporate décor and homogenous facades. We must defend our area and culture from taking over". Puja (34) adds: "I see Shoreditch, about a mile from here, that every venue have the same hipster formula applied. There's no place for identity anymore". Abida (26) claims: "It feels that the East-End becomes a playground for the rich and Japanese. We are worried that property prices soar pushing us, the original residents, out. We'd better sell inside.". As of 2002, indirect collaborations had succeeded in strengthening the Sylheti presence on Whitechapel Road. Collective behaviour thus attracted Sylheti newcomers. The area designated as Sylheti territory was marked by its own market prices, increasing the community members' sense of place, and improving their ability to cope with local challenges.

GROUP ACTION OF THE "KOL-TORAH" COMMUNITY

In order to understand how group action works, this research examined the rapid occupation of Zangwill Street by the Kol-Torah community between 2002 and 2009. The rapid process indicated the abilities of an organised community when it competes with non-organized individuals. Figure 5a,b illustrate the two stages in the group's penetration:

1. Lone pioneers identify flats for sale and enter them gradually (2002–2004).
2. Massive penetration turns a 'non-hostile' into a 'friendly' area (2005–2007).

The rapid movement patterns were well planned. The designated area was marked by the leaders of the community. In 2002, three Kol-Torah families purchased flats in different housing projects. By 2004 a few Kol-Torah families were living in Zangwill Street.

Figure 5a,b: Spatial intervention of Kol-Torah to Zangwill Street 2002 and 2008

Data obtained from local estate agents (Bunin, E. May 14, 2009; Stern, S. May 14, 2009; Sternberg, C. May 17, 2009) and former residents enabled reconstruction of the gradient of prices and an examination of the market dynamic as of 2002:

1. Penetration: two flats purchased by Kol-Torah above market price.
2. Before "tie-break": flats 3 and 4 purchased below market price.
3. Emergence of an internal-market: Zangwill Street becomes identified with Kol-Torah community. Flats switch hands rapidly, from secular population to Kol-Torah. Prices inside the community territory rise again, creating a property line around/within its boundaries. According to realtors, the community organisation provided financial support to the Kol-Torah "spearhead". The first secular residents to sell their flats received approximately 20% more than the market price.

Until 2005, some 35% of the purchased flats were randomly distributed between the buildings. As the number of Kol-Torah inhabitants increased, prices declined and even fell below market level, but when the street became more popularly accepted, prices rose again (Figure 6).

As of 2006, Haredi direct collaborations had succeeded in strengthening the Haredi presence on Zangwill Street. Group actions motivated by ideological practices expanded the group's territory while segregating the group from other Haredi and the veteran population of the neighbourhood.

Figure 6: Average selling price to market price ratio as dependent on the sequential number of flats among those sold by the veteran to Kol-Torah, for each section.

Thus, in both areas the communities were able to create and maintain a homogenous segregated pattern. The realtor Andy Masey described how processes within the Sylheti community affected prices: "Sylhetis want to live together, and Whitechapel Road is the living room of the community. Everything is happening there and it is highly important to keep the road as Sylheti. People live there mainly in ownership and transfer flat[s] within the family. Other people described the area as 'dodgy' and avoid it. Actually, if the prices are much lower than the area, people avoid even viewing a flat there". While this process in Whitechapel Road happened in more than a decade, inner pressure inside the Sylheti community expedited this process. Today, the Sylheti community has succeeded in dominating Whitechapel Road, and almost all the 642 families living there belong to the Sylheti community.

Similarly, almost all the 347 families living in Zangwill Street belong to the Kol-Torah community. Single flats that still belong to secular residents are either publicly owned or business locations (i.e., a dental clinic). The realtor Shlomo Stern described the inner-communities market within the Kol-Torah community: "When an area is designated as Haredi, demand increases. People fear that flats will be 'snapped up', and that they will lose the opportunity to live among friends, so that they must wait for another area to be "kosher", perhaps farther away. This causes housing prices to rise. The market which drives the price rise here is not secular or mixed, but within the Kol-Torah community itself. So ultimately the buyer is the one who receives more from the community's funds."

Analysing the 'substantive micro-politics' of planning (Flyvbjerg and Richardson, 2002: 53) behind the unfolding of societal events shows that while the borders created from the Sylheti's collective behaviour (Figure 3a-b) are weak and flexible with other communities living nearby, the borders resulting from Kol-Torah's group action is clear and defined (Figure 5a,b).

5.3 POTENTIAL FOR NDM

WHITECHAPEL ROAD: NATURAL DYNAMIC FOR INACTION

Sylheti individuals, holding a more or less generally accepted set of shared beliefs, including common discontents over both the gentrification process and the recent arrival of Dhaka Bangladeshis into the area, gathered around their common purpose of preserving identification of the road with the community. An important insight from Bachrach and Baratz's work is that in order to explore the role of power (1963) it is important to understand that the deliberation of issues within the formal decision making chamber is only part of the process. This has considerable methodological implications with respect to the creation of relatively structured forms of collective behaviour.

As a sociocultural movement, the Sylheti community developed strategic views to deal with conflict, and made use of legitimate and accepted forms of collective action, such as public demonstrations, recruitment and bloc voting in attempts to increase their numbers along Whitechapel Road. As part of this effort, Lutfur Rahman was elected as a Labour Councillor for the Spitalfields and Banglatown ward from 2002 to 2014. He was re-elected at the 2014 mayoral election, but reported by his agents as being personally guilty of diverting over £3.6 million of grants to charities run by Bangladeshis and Somalis in a way that constituted electoral bribery, spiritual intimidation of voters, postal vote fraud, fraudulent registration of voters, illegal payment of canvassers (BBC, 23 April 2015) and of establishing a "culture of cronyism" at the council. John Biggs, elected on 2015 as the Executive Mayor of Tower Hamlets, said that "too many people have been squeezed out of the borough by the unaffordability of housing".

Although Tower Hamlets politics may operate its own special eco-system (The Guardian, 10 June 2015), the driving force of the succession process in Whitechapel Road is competition for housing between newcomers and the local Sylheti population. This process, moderated by the exchanging of flats inside the community, involves a chain reaction, with each preceding immigrant wave moving outwards and being succeeded by more recent, poorer immigrants. Since the final pattern of segregation along the road is seen as a natural equilibrium, the desire to live together leads to refraining from making a decision. Martin Ling, the Interim Housing Strategy & Partnerships Manager of the London Borough of Tower Hamlets explained: "Sylheti segregation along Whitechapel Road is natural. It is not relevant to most of the population and its economic aspect is close to zero compared to the other major planning aspects, such as affordable housing and further improving the quality of the environment". (Ling, M. 24 June 2014). Thus, the moral and political legitimacy of NDM regarding Sylheti segregation along Whitechapel Road stems

from an ability to allow the preservation of a democratic planning system rather from an ability to bring about willingness to make mutual compromises.

ZANGWILL STREET: A DELIBERATE DECISION FOR NDM

Beyond the analysis of conflicts and the study of hidden forces that constrain the agenda, Lukes (1974: 24) argues that Bachrach and Baratz's conceptualisation of non-issues within a conflict focus misses the potential power of actors, in particular the state, to shape people's perceptions and interests through the operation of an ideological hegemony (1974: 18-20). In the context of Haredi opposition to a proposed policy, as the number of the Kol-Torah's representatives and their influence on the legislature increases, their ability to state NDM and claim resources increases accordingly. Since public resources are limited, the uncompromising need of the Haredi sub-sects for segregation institutes and encourages activism in contravention of planning permission regulations. Rabbi Elyashiv's instruction "Don't give in even if you break the law" encouraged the group's members to achieve their sectorial goals through construction in violation of a permit/without a permit and anomalous use/change of designation (Katz, 2009). Although the municipality's Department of Licensing and Supervision was aware of the illegal activity taking place, it was powerless to enforce planning laws in the Zangwill Street area (T. Katz, May 29, 2008) .

Organized non-Haredi efforts began in August 2008, when the haredification process in Zangwill Street was at its height, and the non-Haredi population saw other parts of the neighbourhood as under threat. The direct cooperation of the Haredi with their community created pressure on the residents, who were exposed to limitations such as restrictions on traffic on the Sabbath and holidays. Some non-Haredi residents decided to establish a voluntary group named 'Action Committee to Preserve the Character of Kiryat-Ha'Yovel' (Nahum-Halevi, 2009). The committee criticised the authorities for neglecting their responsibilities by stating NDM, and refused to accept the renunciation of the authorities from what they saw as their role. The secular presence in public space was intended to influence residents to refrain from selling their flats to Haredi and to present a united front to influence the municipal decision-makers to defend "their rights" and stop sectarian allocations of public resources. In collaboration with the community council, the legal adviser to the municipality, and municipal planning institutions, the committee demanded that planners intervene in the development of the neighbourhood and promoted legal action to prevent the unlawful allocation of public resources to the Haredi.

In practice, a broad coalition of various Haredi sectors of the city's population has limited the mayor's ability to influence local processes; the office avoided issuing policy interventions in the conflict. Bin-Noon, head of the Municipality's public building division, explained: "We have no full understanding and no ethical value to cope with conflicts between diverse population groups. We are powerless to enforce planning laws in the neighbourhood and avoid intervening in this process". Despite the municipality's support in the initiation of an outline plan that provided a comprehensive planning framework for the neighbourhood and the inclusion of issues of sectarian allocations and illegal activity on the public agenda, the veteran population was unable to protect their living space from being taken over. The haredification process continues to occupy space, claim resources, and affect lifestyle.

To conclude, deep social and cultural roots lay behind Tower Hamlets's and Jerusalem's authority's decisions for refraining from decision making. East End politics have often been complex and fiercely fought outside the political mainstream amid poverty, marginalisation and change, and overlapped with religious issues. Similarly, Israeli society is characterized by substantive rifts and controversies that touch upon the character of the nation, the economic policy, and the "Jewish" identity of the state. The connection between cultural roots and planning is pertinent to policy scholars who wish to study policy issues and debates across countries and policy areas, in terms of both explanatory research and prescriptive policy analysis inspired by culture and policy (Akerlof and Kranton 2010; Béland 2016). In both cases, the desire to cooperate in circumstances riven with a proliferation of rifts is what leads to refraining from making a decision in disputes of principle. While Sylheti segregation along Whitechapel Road was conceived as a natural population dynamic and thus did not require planning intervention, Kol-Torah influenced planning decisions, deploying them for sectoral goals. Unlike the Kol-Torah community, Sylhetis do not intend by these actions to make these practices binding on the general population. The impotence of Jerusalem's system to regulate resources and enforce planning laws weakens the individual's ability to withstand the pressure of the organised group, and the fear of being a minority and the daily restrictions motivated individuals to leave.

6 SUMMARY AND CONCLUSIONS

This paper has examined how the policy maker's 'decision not to decide' affects different levels of internal organization and is reflected in the residential patterns of different population groups in Zangwill Street, Jerusalem, and in Whitechapel Road in East London. Jerusalem is ethno-nationally divided and contested. Particular groups can 'break the law' with some impunity while claiming to 'uphold the law' - this is a feature of contested states. It weakens the autonomy of the state (including planners) vis a vis pro-state grassroots activism, whether that stems from settlers, paramilitaries or ethno-religious groups. Although the situation in London is very different, current planning processes and institutions appear to be unable to balance the competing interests of familial and tribal groups living in western and democratic societies.

This research aims to address the conspicuous dearth of micro-resolution studies that identify the complex residential dynamics of groups, contending that in order to examine residential processes one must refer to the fundamental social structures and values from which affected communities draw their strength. This research is therefore aiming to shed light on the ways in which spatial and cultural logics intersect in the urban realm, to open up the possibility of an integrated understanding of the development of the city. Moreover, it represents a real breakthrough in state-of-the-art analysis of residential dynamics in dense inner-city neighbourhoods with wide-ranging implications for informing planning policy. The motivation of policy makers to adopt the policy of NDM regarding residential behaviour should be combined with theories that underestimate the role of different levels of cooperation in governing segregation processes. Under NDM conditions, housing prices serve the process of creating and maintaining enclaves. A combination of limited range of application, which also affects the economic aspect, as well as the desire to avoid controversy about issues that pertain to state and religion, are what motivate policy makers to refrain from making a decision. By applying temporary and local arrangements in Whitechapel, this option allows policy makers to refrain from making unequivocal decisions regarding potentially inflammatory issues, to avoid institutional discord, and to be at liberty to deal with other issues which are ranked higher on the list of priorities of the city and of the media. In light of the relatively low number of people that would be affected and other pressing issues requiring the attention of politicians, the lack of a decision has not been shown to create any loss. Despite some resemblances, the organised entry into Zangwill Street differs from the classic invasion-succession model, according to which relatively free individuals move spontaneously into areas of higher-status populations, using private capital, and also from racial blockbusting in US cities, which involved planned invasions even if the newcomers were not the planners. In Zangwill Street, the group action was supported by community capital and organised implementation. Direct collaboration of individuals with their leadership has inserted the language of Kol-Torah into Zangwill Street, re-shaped the boundary between acceptable and unacceptable uses.

In-depth door-to-door surveys have indicated the way how, under NDM conditions, housing prices serve the process of creating and maintaining enclaves. The housing prices along the Sylheti enclave of Whitechapel Road are significantly lower than those of similar flats on the road, and are drawn by flexible boundaries. The gradient of prices on Whitechapel Road shows a steep drop in prices, and after that a moderate drop in the wake of the formation of an internal market. Unlike the Whitechapel case, the housing prices in the Haredi enclaves are significantly higher than similar housing in the area, which has drawn the boundaries between identities and provided a particular usefulness to the larger mission of the haredification of Kiryat-Ha'Yovel. The gradient of prices on Zangwill Street shows a moderate drop and after that a rise, in the wake of the formation of an internal market. When the veteran population left, there was a sharp decline in prices. Individual cooperation with the group's action is evident in the dramatic increase in housing prices after the "tie-break". Thus, the creation of an inner community housing market, different from its surroundings, improves individuals' ability to cope with the urban challenges within a defined community space.

Along with the advantages of opting for a NDM policy regarding residential dynamics, there are also significant disadvantages. In the narrow sense, preferring this type of policy concerning residential behaviour and applying an attitude of "natural dynamic" to cases that are not specifically designated as collective behaviour, but also to group action, limits the individual's ability to safeguard their spatial rights and maintain their social practices. In the broader sense, the absence of support from a specific agency responsible for collecting and analysing data about residential behaviour to represent the veteran individual residents, their inherent lack of collaboration and cohesion, weakens their ability - as well as the ability of the authority/council - to identify and cope with group behaviour. This paper accepts that such a state of affairs may be temporary. As stated, the impact and pressure of cooperation - both the range of

application and the economic aspects - emerging between relatively free individuals on neighbourhood structures is rising, evoking planning policy issues that current planning systems cannot address. Thus, the ability of the policy makers to ignore them and avoid making a decision is limited. Because its dimensions are projected to keep growing worldwide, the issue will become more intense and may override the ability of decision makers to employ the benefits of refraining from making a decision.

This study contributes two new ideas to the knowledge base of planning policy. The first is the detailed construction of an explanation for the contribution of policy makers to such processes of NDM, and the second is 'terrain of inaction'; an idea describing day-to-day residential mechanisms that sustain the initial structure of enclaves in respect of the housing market rule in maintaining the enclaves. As Lukes' framework suggests, providing a framework which accounts for all three levels of power (observable conflict, non-decision making and the shaping of actors' preferences) while integration is still in its early stages, enables us to understand these constraints of power and opens up the potential to debate alternative processes and models of integration. In the absence of a shared civil society, this process can also be seen as a bottom-up reaction to the changing role of public policies in developing cities. The increasing involvement of groups trying to undermining the institutionalised logic of economics, identities, governance and cultural norms could be relevant to many other situations.

1. 'SOCIAL INNOVATION': DEFINING / SITUATING THE CONCEPT

1.1 SOCIAL INNOVATION AS EMERGING CONCEPT IN URBAN STUDIES

The concept of 'social innovation' has gained increasing popularity over the last ten years, both in academia – where it has emerged as a key term in urban studies literature – and in the policy field. The term, which can be inscribed within debate about social change and social transformations (Moulaert et al. 2005: 1969), has been conceptualized according to different scholarly frames, following heterogeneous

disciplinary perspectives. This diversity has fostered a broad application of the term in different domains, but has also led to difficulties in identifying the conceptual boundaries associated with its meaning, which is increasingly perceived as vague and neutral (Grimm et al., 2013; Busacca, 2013).

Discourses about social innovation have been framed in different (not necessarily mutually-exclusive) terms also in urban studies, varying with respect to the object of change, the meaning of innovation, the importance attributed to the social dimension of transformation processes, and its possible fields of application. In this paper, we will focus in particular on the frame that concerns social innovation in (local) territorial development.

Following the 'territorial' approach, emerged in the 1990s, social innovation in and for local development is primarily conceived as a response to social exclusion dynamics and to the difficulties traditional public systems (including welfare ones) face in dealing with changing societal needs and in addressing 'wicked' challenges (Caulier-Griece et al., 2013: 5; Borzaga and Bodini, 2012). It is conceptualized as both the (positive) outcome of social transformation processes and the means through which social improvement can occur. This only takes place "when the mobilization of social and institutional practices succeeds in bringing about the satisfaction of previously alienated human needs, the relative empowerment of previously silent or excluded social groups through the creation of new 'capabilities', and, ultimately, the changes in existing social – and power – relations towards a more inclusive and democratic governance system" (Gonzalez et al., 2010: 54). These conditions refer to what Moulaert et al. (2005: 1976 2010) define as the three main dimensions of social innovation. The product dimension focuses on "innovation in the conceptualization, design, and production of goods and services that address social and environmental needs and market failures" (Nicholls and Murdock, 2012). The process dimension focuses on the redefinition of organizational arrangement and on restructuring of social relations in more socially inclusive terms. This is related to governance innovation, but it also encompasses the reconfiguration of social practices (Howaldt and Schwarz, 2010). The third dimension is more directly related to the empowerment of the actors involved, and it is based on the (progressive) assumption that "individuals and communities can muster the passion and have the capacity to self-organize and self-manage in equitable and inclusive manners" (Swyngedouw and Moulaert, 2010: 221).

Elaboration of this multidimensional understanding of the concept in relation to urban and local development has led to the definition of a broad, comprehensive framework ('Alternative Models for Local Innovation' -ALMOLIN, see Moulaert et al., 2005; Gonzalez et al., 2010), which is conceived both an analytical device, i.e. "a descriptor for a set of practices" and an interpretative-normative framework for fostering transformation.

This addresses social innovation as "an emerging phenomenon, a theoretical construct and an ongoing field of research within a world of social transformation" (Moulaert et al., 2013: 2). In this context, reference to 'social innovation' is explicitly intended to counterbalance narrow technology-centered approaches to innovation policies, by proposing a more open view about human development, empowerment and local mobilization capable of overcoming technocratic approaches to urban planning (Moulaert et al. 2005). At a conceptual level, social innovation emerges from a "progressive vision" (Swyngedouw and Moulaert, 2010: 221) based on solidarity and reciprocity values (Moulaert and Nussbaumer, 2008) that assumes that individuals and communities affected by marginalization and exclusion and suffering from the effects of uneven power allocation in existing political configuration can redefine their position through self-and re-organization. Social innovation therefore takes place through the involvement of new constellations of actors, including representative of civil society associations, institutional actors at different scales, as well as private stakeholders (Cattacin and Zimmer 2016: 23), it develops through the creation of new governance arrangements and it spreads within "networks of co-operation between community agents" (Moulaert et al., 2005: 1977).

While potentially supporting democracy and citizens' empowerment, the broadening of the political arena and the definition of new governance arrangements also present some contradictory tendencies (Swyngedouw 2005: 1992 ff., see next paragraph). On the one hand the inclusion of different actors could contribute to re-define the city as "a terrain of spatially-informed politics" (Dikec, 2002: 94, see also Swyngedouw, 2009), by supporting the co-creation of shared and livable space, and by providing (disadvantaged) citizens with "the freedom to make and remake our city and ourselves" (Harvey 2008: 23). On the other hand, the "gradual blurring, if not erasure, of the lines of demarcation between state, civil society and market" (Swyngedouw and Moulaert, 2010: 224) potentially embedded in bottom-up practices is exposed to the fallacies related to the so-called 'democratic deficit' of governance arrangements, e.g. in terms of representation, accountability and legitimacy (see van den Dool et al., 2015: 18 ff.; Swyngedouw, 2005: 1999 ff.). This blurring can also lead to the strengthening of "neo-communitarian local regimes within a global neo-liberal turn" (Gerometta et al., 2005: 2010), while the increasing relevance of private actors may (further) support neo-liberal urban development models (see Swyngedouw et al., 2002; Fainstein, 2014), which aim to convert civil society in a "flanking, compensatory mechanism for the inadequacies of market mechanisms" (Jessop, 2002: 455).

The understanding of social innovation advanced in this framework poses big emphasis on path-dependency and contextual dynamics, thus attempting to go beyond uncritical and ahistorical conceptualizations. Localized contextualization plays a relevant role in defining its critical-realist attitude. More specifically, social innovation is conceived as bearing potential to trigger “the transformation of societal relation in space, the reproduction of place-bound and spatially-exchanged identities and cultures, and the establishment of place-based and scale-related governance models.” (Moulaert, 2009: 12).

The local scale is maintained to be the privileged focus for the development of social innovation practices (Moulaert 2009: 16), which develop within constantly ongoing processes of social and political re-structuring. In order to avoid ‘uncritical localism’ and the local trap (Purcell 2006), the local scale is conceived as an ‘entry point’ for action which is embedded in a broader trans-scalar framework of relationships (Gonzalez et al., 2010: 50). In particular, urban neighborhoods are considered as “pivotal sites for initiating and implementing social change that may ripple through the city” (Moulaert, 2010: 5), whereby locally based initiatives are the ones that “can galvanize a range of publics to engage in initiatives that have city-wide impacts on the dynamics of urban cohesion and social development” (ibid.). Social innovation therefore takes place starting from the action of “spatialized urban communities [...that have] a powerful, area-based political and analytical meaning as the real life setting where needs resulting from exclusion can be satisfied, where initiatives grow and are established and which serve as springboard for multi-party, multi-governance dynamics” (Moulaert et al. 2010: 7).

The framework highlights the centrality of (local) public and institutional actors along the development of social innovative processes. Unlike other approaches, the local development perspective of ALMOLIN considers forms of grassroots collective action as complementary to the action of the local state, and both “public and private agencies seeking to overcome situations of exclusion” (Moulaert et al. 2005: 1986) as required. Specific attention is provided to interactions among actors and to the ‘governance’ dimension of social innovation, which “includes the interaction with and the embedding into the political-administrative system of the democratic state of the country where the communities belong”, implying that social innovation also “means innovation in representative democracy and governance state institutions” (Moulaert et al., 2005: 1973).

The dimension of governance innovation appears takes a key position in terms of both necessary means and outcome of social innovation processes. As a mediating and empowering factor of social innovation, governance practices are assumed likewise to foster reflexivity as a means for social transformation and to become a reflexive outcome of social transformation.

1.2 CRITICAL ELEMENTS: QUESTIONING THE NORMATIVE ASSUMPTIONS OF ‘SOCIAL INNOVATION’

Several points of critique have been raised to ‘social innovation’ and its use. The concept is often perceived as “poorly defined and demarcated” (Brandsen et al., 2016: 4), and as “stretched in so many directions that it is at a breaking point” (Grimm et al., 2013: 236). As a discourse, it is seen as articulated in ahistorical and uncritical terms (Busacca, 2013), and perceived as deceptively neutral. Accordingly, it is seen as supporting neo-liberal processes and promoting an increasing centrality of private and entrepreneurial actors in public policies.

Any critique of ‘social innovation’ as a concept and as a discourse, however, is relative and must be critically related to the area of scholarship and of policy to which it refers. For our purposes, it is important to keep a focus on the features it takes in the area of urban and local development studies.

Reflecting on the general articulation of innovation discourse in the urban domain, Shearmur (2012: 9) argues that “the term, laden with positive normative associations, hides not only a multitude of processes that all lay claim to being innovative, but also gives little indication of why innovation is necessary, whether it is also a good thing, and, if it is a good thing, who benefits from it”. This is a good starting point for our discussion. While some of these issues are explicitly addressed in currently prominent models of ‘social innovation’, questions concerning the intrinsically positive normative value associated to social innovation appear to be justified on the basis of a critical scrutiny of both its analytical and normative assumptions (see Larsson and Brandsen, 2016: 294; Phillis, 2008; Mulgan, 2006).

Considering social innovation as an analytical framework, several critics observe that its comprehensive, holistic character may lend itself to categorizing as ‘socially innovative’ a broad range of heterogeneous phenomena, differing and diverging in terms of, features, scope etc. In this sense, Jenson and Harrison refers to social innovation as a “quasi-concept, [...] making use of empirical analysis and therefore benefitting from the legitimizing aura of scientific methods, but simultaneously characterized by an indeterminate quality that makes it adaptable to a variety of situations and flexible enough to follows the twists and turns in policies” (European Commission, 2013: 16). This, again, entails the risk of an

instrumental use of the 'social innovation' concept, as it may analytically support the legitimization of practices that are not effectively oriented towards socially inclusive change.

Considering social innovation as a normative framework, a set of key normative assumptions can be recognized:

- social innovation involves trust in dialogue and cooperation among parties interacting in a collaborative public sphere. It is premised on an associative understanding of the political arena: the existence of an open public sphere is assumed (cf. Gemerotta et al., 2005) where the re-articulation of interests is possible. Within this collaborative space, "socially innovative experiences can develop, interact and penetrate into urban governance relations" (ibid.: 2008). The right and the capacity to access to the public sphere are seen as requisite;
- social innovation focusses on social needs that have been ignored, neglected, or not effectively addressed by public action;
- social innovation expresses an explicit ethical position of social justice, recognizing social inclusion as a main goal of public action (Swyngedouw and Moulaert, 2010: 222; Gonzalez and Healey, 2005: 2055).

As highlighted by Larsson and Brandsen, these "normative assumptions tend to obscure the dark side of the phenomenon such as failure, political conflict and oppression" (2016: 293) that is necessarily part of social change processes and that are intrinsically related to socio-spatial transformation. As also highlighted by Martinelli, forms of social innovation promoted by community, grassroots and neighborhood initiatives at the local level are often "strongly critical to the system, but [with] no intention to overturn the existing order" (Martinelli, 2010: 35). In this respect, for instance, the territorial approach distances itself from more critical and radical positions (defined by Moulaert et al., 2005 as 'another world is possible' approach: 1977 ff.) based on participatory democracy and collective mobilization. It therefore positions itself in a critical-pragmatist and ethical-reformist tradition enriched with a subsidiarity-based, grassroots-oriented social policy.

While legitimate, this position raises questions concerning the conditions for the realization of an open, collaborative and associative public sphere.

A first question concerns in how far a re-articulation of interests aimed at socially inclusive processes is subject to 'power geometries'. This highlights possible contradictions with respects to the recognition of social initiatives. On the one hand, the relevance of spontaneity, self-organization, grassroots experimentation is recognized in the process, and creative and spontaneous practices are held to have a higher innovative potential. On the other hand, the role of third parties is always conceived as complementary to public action. This contrast with critique of the idea of 'governance innovation' as articulated e.g. by Swyngedouw (2005), when he points out features of 'selective inclusion' of innovative models of governance and their tendency to support non-representational forms of autocratic technocracy and the consolidation of beyond-the-state arenas of power intermediaries. A second question concerns not only understandings of 'social justice' and of 'needs' and 'rights' for and by whom, but also how (ant)agonism is considered and what role it can possible play in their (re-)articulation.

As it apparently skips and/or elides social antagonism as a relevant dimension of analysis, and as it defines itself according to a set of normative principles concerning social and political agency, social innovation discourse incurs the risk of becoming self-referential and self-serving, and the case-studies chosen to make its point of being little more than deductive illustrations of its principles. That carefully chosen case-studies may fit the self-representation of social innovation, however, does not per se redeem it from possibly being counterfactual.

No question that the local-territorial approach to social innovation moves from a critical-progressive tradition which pursues a socially emancipatory project. In order to express its critical potential, however, discourse on social innovation would require to be corroborated, to be exposed to systematic falsification by contrasting its (normative) principles with (analytical) observation of the conditions under which claims for social transformation are raised and social innovation may (or may not) successfully emerge and develop. In order to do so, in other words, the (perfectly legitimate) normativity of social innovation would require to be backed by an adequate critical analytics.

2. SCOPE AND METHODOLOGY OF THE PAPER

In order to position discourse on 'social innovation' in a domain of critical urban research that addresses key challenges of contemporary urban policy, we need, first, to discern reference to the concept within its broader and somehow contradictory scholarly field and, second, to articulate a critical position on the concept within this domain. This means, in particular, addressing in how far the concept of 'social

innovation' is a viable analytical-interpretive contribution to understandings directions of evolution and change in public policy and governance practices and its contradictions and challenges.

Our critical position is therefore based on an attempt at constructing a framework for critical reflection on issues raised by the concept of 'social innovation'. In order to make this possible, we argue that there is need:

- for serious empirical grounding and assessment of discourse on 'social innovation', based on analyses open to recognizing its implications;
- for recognizing contradictions between the analytics and the normativity of 'social innovation' discourse.

We raise these issues also in view of their relevance for empirical research designs: firstly, in the sense that most the empirical case-study material produced by literature on 'social innovation' is framed deductively in a way which tends to sideline issues of domination and hegemony in the framing of policy and governance practices; and, secondly, in the sense that precisely highlighting these aspects is critical to recognizing the potential for rhetoric and manipulation involved in the adoption of 'social innovation' as a policy concept.

The paper accordingly adopts a tentative methodology which does not direct analysis – in somehow deductive ways – towards challenges, conditions and degrees of fulfillment of a normatively predefined understanding of 'social innovation', but frames analysis according to a methodological distinction between the analytical and normative dimensions of the concept:

- firstly, by analytically and interpretively addressing the nature of 'social innovation' – in process and outcomes – in the empirical cases at hand;
- secondly, by assessing in how far this either fits or contradicts – in process and outcomes – normative pre-assumptions of 'social innovation' discourse.

Our approach is therefore tantamount to inserting for heuristic purposes a 'critical wedge' in the contradictions between the analytics and the normativity of 'social innovation'. While it is obvious that normative understandings of the object of 'social innovation' frame action in significant and possibly even progressive ways, we are interested in analyzing the way they are defined and positioned in an arena which is potentially (ant-)agonistic and in which they interact with other understandings. The ensuing question is therefore in how far the outcomes of such interactions are to be understood as 'innovation' and in which sense.

The cases chosen reflect a variety of situations raising the issue of 'social innovation'. Their choice is exploratory and does not aim at a most-similar comparative design. In this respect, our approach is not primarily driven by a logic of comparison, but by a critical interests in the dynamics of innovation and in its contradictions. After a brief introduction to the features of the case, the cases-studies address three main analytical dimensions:

- a) the nature of the policy issue, as defined and/or acknowledged within the framework of institutional policy settings and governance practices which define the policy: this entails an analysis of the way specific social needs are selectively defined, recognized and included to become part of the definition of the policy issue, as conveyed by (dominant/hegemonic) narratives and frames;
- b) the nature of the policy issue, as re-defined through the emergence and evolution of forms of political contention and (ant-)agonistic social mobilization which articulate, challenge, and possibly contradict the framework of institutional policy settings and governance practices which define the policy: this entails an analysis of the way social claims are defined in a process of contestation and critical re-articulation of the definition of the policy issue, as expressed by (alternative/counterhegemonic) narratives and frames;
- c) the nature of actors and of their strategic-relational practices as they develop in the course of the re-articulation of the policy through the emergence of (ant-)agonistic claims.

3. 'SOCIAL INNOVATION' AND CONTENTIOUS URBAN POLITICS IN BERLIN: THREE CASE-STUDIES

In light of our critical discussion, we now explore its application to the analysis of selected case studies currently taking place in Berlin. Our aim is to understand in how far the social innovation framework fits a critical analysis of the way 'needs' and 'claims' emerge and are articulated in socio-spatial transformation processes characterised by different levels of contention and antagonism. The case studies have been

selected – among a broader range of cases analysed¹ – and discussed according to their relevance to the purposes of the paper, in terms of raising questions which challenge both the analytical and the normative dimension of the ‘social innovation’ framework.

The case-studies are structured as follows. After a brief description of the case and of its evolution, the ‘needs’ that trigger the development of the transformative dynamics under study are identified and defined, possibly identifying diverging perspectives. Secondly, the object is redefined in terms of ‘claims’, with peculiar attention to the demands raised by different actors and by forms of mobilisation emerged along the process. Third, strategic and relational patterns developed by involved actors are considered. Finally, some preliminary critical reflections (to be further developed in the next paragraph) are presented.

3.1 DRAGONER AREAL

The Dragoner Areal is a 4.7 ha area located in Kreuzberg, a central neighborhood increasingly interested by gentrification dynamics. The area is owned by the Bundesanstalt für Immobilienaufgaben (BImA, the federal agency in charge for the administration of state-owned property) and hosts a former military barrack (about 82,000 sqm, 10,000 of which listed as heritage site), currently partially vacant and partially rented to small commercial enterprises. The area is one of the last public spaces with a potential for transformation in a neighborhood where – as in whole city – housing demand is constantly increasing and available building

Space is getting scarce. It is therefore particularly valuable for private investors, who tried to purchase it as soon as it was acquired and then auctioned by the BImA in an open highest-bidding procedure. In 2012, an investor bought the area with a plan foreseeing luxury property apartments, but also due to the refusal of local government to change the land use plan – which allowed only commercial uses on the area – it soon withdrew from the contract. In the ensuing months, a growing opposition to the privatization of the area arose, leading to the foundation of Bündnis Stadt von Unten (SvU, literary ‘Bottom-up City’), an alliance of local tenants, activists, professionals and citizens opposing the allocation procedure and any form of speculation on the area and demanding its designation for social housing. Nevertheless, BImA started a new bidding procedure, resulting in sale of the area to another investor at double the price. Despite opposition by local government and the campaigns carried out by SvU and other initiatives, the Federal Parliament (Bundestag) approved the sale in 2015. This decision was followed by a further intensification of the initiatives launched by SvU that, in collaboration with other (anti-gentrification) grassroots groups, tried to exert pressure on the Bundesrat (the Federal Council representing German federal states), the vote of which was required in order to legitimize the decision of the Federal Parliament. Thanks also to City of Berlin’s influence and to local district’s opposition, the Federal Council ultimately voted against sale of the area. Despite initial resistance of the Parliament, in 2015 BImA cancelled the contract with the investors. In the following months, Dragoner Areal was declared a ‘redevelopment area’ by the Berlin Senate. In 2016 the new red-red-green government of Berlin integrated some of the instances of SvU in the coalition contract, which foresees the implementation of affordable living and working spaces as well as participatory processes including local associations. At the beginning of 2017, following recent political pressures, BImA announced that there is no intention to sell the area in the near future.

As its evolution shows, the Dragoner Areal case bears features of a dispute developing along different dimensions. On the one hand, there is a substantial dispute (cf. Dziedzicki, 2014) over the (future) use of space, which assumes a peculiar symbolic character given that the area is one of the last free spaces with a transformation potential in a neighborhood that has been strongly affected by gentrification dynamics and by privatization processes over the last decade (see, among the others, Holm, 2013). This can be located within a wider discourse about the unequal distribution of citizen rights which takes central place in the contestation of several transformation processes taking place in Berlin. On the other hand, there is a procedural dispute (ibidem) over the way decisions are taken – e.g. about the political value of the allocation procedure – as well as over the legitimacy of different public bodies responsible at different levels for the future development of the area. In order to disentangle these aspects, we consider the objects of dispute from different perspectives, considering claims emerging from different actors during its evolution.

A crucial position is played by the Federal State, the owner of the area, and by BImA, the agency responsible for the administration of federal state properties. The Federal State’s interest in selling the area can be referred to a general debt-reduction strategy based on selling state-owned properties to the

¹ The cases presented here are part of an analysis conducted in the framework of a studio held in the B.Sc. in Urban and Regional Planning at TU Berlin in 2016-17, titled ‘Facing Urban Conflicts: A Chance for Experimentation? Grassroots Responses to Contested Urban Transformations in Berlin’ and further discussed at the joint student workshop Grassroot Innovation and Contested Urban Politics in Milan and Berlin held at Politecnico di Milano in May 2017. We acknowledge the contribution of students involved in collecting data and in analysing the case studies.

highest-bidding investors. The latter have a specific interest in acquiring and developing the area in the most profitable way, and therefore propose plans foreseeing luxury apartments and speculative uses. The highest-bidding allocation procedure is the key mechanism through which these interests are satisfied. When the most profitable conditions cannot be met, as in this case following local authority's refusal to change the building plan, investors loose interest in the area.

In this sense, a relevant role is played by Berlin's state government, the Berlin Senate, and by the District Administration of Friedrichshain-Kreuzberg. Local government faces growing housing demand due to the steadily increase of Berlin population, and has a political interest in providing livable and affordable living and working places in cooperation with district administrative units, as stated by both the Strategy 2030 (Berlin Senatsverwaltung für Stadtentwicklung und Umwelt, 2015) and the coalition contract (Berlin Senatskanzlei, 2016). The Berlin Senate opposed privatization in this case using different strategies. First, it negotiated with BlmA and gained pre-emptive right to buy the area to a moderate price. Although this did not impede the second bidding procedure in 2014, this pre-emptive right may play a crucial role in the future resolution of the dispute. Second, opposition to privatization is exerted through planning tools. In a first phase (2013–2014), the refusal to change the building plan forced the investor to withdraw from the contract. In a second phase (2016), designation as Sanierungsgebiet ('redevelopment area') opened the way to an alternative development of the area, including affordable and social housing, cultural projects and small businesses. Finally, Berlin's Finance Senator brought the instance to the Federal Council, which ultimately put a veto on the sale of the Dragoner Areal.

Finally, need for affordable housing is a key claim of grassroots initiatives involved in the process, which frame it in more critical terms as a claim to the 'right to inhabit', intended as the right to the re-appropriation of the city as a common good, implying inhabitants' collective right to use, produce and occupy urban space in a just, inclusive and sustainable way (cf. Purcell, 2013). This claim works as the focal point around which local initiatives such as Wem gehört Kreuzberg, Recht auf Wohnen and SvU organize their actions. Beside fair access to livable places, these civic initiatives also claim defense of diversity of the urban population and support for low-income and marginalized social groups.

SvU's claims, in particular, cover both the substantial and the procedural dimension of the conflict, insofar as they ask for 100% public property, 100% affordable and social housing to be 100% long-term secured, as well as socially-minded and self-determined administration of the area, proposing a direct involvement of people from the neighborhood. On the one hand, they criticize the allocation procedure established by the law and demand a more inclusive and decision-making process. On the other hand, the initiative and its network are proposing a pilot project for an alternative development of the area capable of including claims by different local stakeholders, including traders currently working on the area, neighbors, and other citizens groups. In pursuing their objectives, SvU used a variety of methods and a broad protest repertoire (neighbourhood activities, demonstrations, gatherings, events and network activities).

Although the conflict has not yet come to an end, it is possible to identify some elements characterizing it which are relevant for the purposes of this paper.

First, the dispute involved public administrations at different scales and led to a confrontation between national and local institutions. This led to a re-articulation of governance relations and to a growing centrality of local actors (both institutional and non-institutional). For the first time, the Bundesrat stopped a planned sale of state-owned property. Multi-level disputes over the decision-making process took place within representative political arenas, but were also strongly influenced by initiatives and campaigns proposed by activist groups. Furthermore, at least in the initial phase of the conflict, actions and initiatives aiming at social innovation were not launched by public actors, but promoted and strongly supported by grassroots movements through the use of a whole repertoire of collective action techniques which pertain more to direct and agonistic democratic action – relegated by territorial social innovation models into the 'another world is possible' tradition (cf. Moulaert et al., 2005: 1977).

Second, contradictions emerged in the way 'needs' are framed and defined at the local scale. The need for 'affordable and social housing', acknowledged by local government as a priority, can be certainly considered as one of the basic alienated needs not currently satisfied by public policies. However, this is strictly intertwined with more radical claims referring to the 'right to inhabit' and the right to accessible living and working place, as well as with structural critique which does not simply propose a redefinition of the role of local communities within the process, but challenge both the political legitimacy of representative institutions and the way decisions are made.

Third, the potentially innovative dynamics developed after failure of the first area sale, in terms of both process and outcome, is strictly related to the contested nature of the process and to initiatives taken outside representative arenas. This allows questioning some of the assumptions previously discussed, and call for recognition of the contribution that (ant-)agonistic practices can bring to the 'social innovation' debate.

3.2 SCHWARZER KANAL

Schwarzer Kanal is a 'radical queer wagon place' (see <https://kanal.squat.net/>) located on a city-administered lot in the District of Neukölln. The area has been occupied since 2009 by an association formed mostly by non-German activists belonging to discriminated minority groups (including lesbians, trans*persons, people of color, and migrants or refugees with different legal statuses). Currently, it is undergoing major change, since planning foresees a conversion of the area and the installation of the so-called Modulare Flüchtlingsunterkunft (MFU, 'modular refugee housing'). Conflicts emerging on the area raise relevant questions from a social innovation perspective. On the one hand, there is a strongly symbolic political conflict over the right of marginalized people occupying the area to exist and live in the city. On the other hand, this identity-based conflict is strongly intertwined with a conflict over the use of space, which has been designated as a MFU and is at the same time reclaimed by the groups currently living there.

The Kanal project has been existing in Berlin for 30 years, and it exist in its actual form, as Schwarzer Kanal, since 2003. After having relocated several times, the wagon place was evicted from its last location in 2009. Following a large campaign aimed at gaining public support for a permanent location, they were offered by the Berlin Senate a three year contract for an undeveloped land parcel in Neukölln. When the contract expired in 2012, they started to negotiate over the future of the site with the Berlin Senate and in particular with the Berliner Immobilienmanagement GmbH (BIM, a 100% city-owned company in charge of managing public land). This resulted in an agreement proposal which involved an increase in rent prices and which was considered as 'racist' by activists, since it stated that the contract would be terminated immediately should shelter be given to refugees on the rental space (Scharzer Kanal Activist, interview, January 2017). Since their refusal to sign this agreement, the association has been occupying the space without a contract. The existence of the wagon place was finally put in question in 2015 when, as part of the political response to the massive influx of refugees into Germany, the Scharzer Kanal's site was first considered as a location for a MFU. In 2016 this planning decision was confirmed by the Landesamt für Gesundheit und Soziales (Berlin State Office for Health and Social Affairs, LaGeSo) and by the Berlin Senate. The proposed blueprints called for the entire plot to be cleared for construction but the Schwarzer Kanal, with support from the Neukölln District, was able to negotiate a modified plan allowing the group to retain half of their plot. Construction of the MFU has begun in January 2017.

Actors' needs and claims emerging along the evolution of the conflicts are articulated within heterogeneous and strongly divergent frames.

The Schwarzer Kanal group (officially registered as 'Schwarzer Kanal e.V.') adopts a radical perspective and is primarily concerned with a political struggle for the right of marginalized groups to live in the city. Their focus is on strife for overcoming dominant discrimination patterns, and the space they occupy constitutes the physical site for their resistance practices. They conceive themselves as an experimental, utopian project (Scharzer Kanal Activist, interview, January 2017) based on solidarity and aimed at supporting bottom-up activism, empowerment and self-determination among people who are marginalized in political discourses as people of color, women, lesbian and transgenders. The Schwarzer Kanal activists therefore aim to oppose to both structural racisms and its spatial consequences. From this perspective, the occupation of the space is aimed at counteracting gentrification dynamics, but also at guaranteeing an alternative and safe space for minorities which are excluded by the housing market because of their economic or legal status, or which are de facto marginalized because of their sexual, gender or ethnic-cultural identity. By looking at the conflict about the future use of the area, the Schwarzer Kanal group initially aimed at securing a fair rental agreement, but they were unwilling to accept the conditions posed by the BIM GmbH with respect to the legal status of the occupiers. Currently their main goal is to remain autonomous from the MFU.

A different position is held by the Berlin Senate, whose priority is to manage the refugee crisis and to guarantee access to shelter to those who gained legal refugee status. In this sense, the Senate's aim is to satisfy the needs of incoming refugees, which find their definition and legitimation within a juridical-institutional framework. With respect to the conflict, both left and center-right parties agreed about the need to find a compromise solution with the Schwarzer Kanal. While the conservative party (CDU) saw the refusal of the Kanal to sign the agreement as an opposition to the policy of the Senate, left-wing parties (die Linke, Bündnis 90/die Grünen) tried to define possible synergies between the Schwarzer Kanal and the MFU.

Yet another articulation of interests is defined by BIM GmbH, whose objective is to administer public grounds in the most profitable way. Given that the contested area is part of its portfolio, BIM is responsible for monitoring and executing the construction of the MFU. In line with its role, it does not assume political responsibility over the contested dimension of the area's transformation, and maintains that any aspect regarding refugee housing should be negotiated with the LaGeSo, as provided by a resolution of the Land Berlin.

Finally, the District of Neukölln, responsible as local planning authority, aims at finding a compromise solution and, despite conflicting views among District representatives about the Schwarzer Kanal project, at playing a mediation role in the conflict.

Looking at the position of different actors, it is possible to formulate some preliminary reflections about the social innovation potential of the Schwarzer Kanal initiative. In classical 'social innovation' terms, the project constitutes an attempt to satisfy – through self-organized living and community practices – needs that are "not satisfied by public policy and by the welfare system" (see Moulaert et. al 2005, 2010) and to foster social inclusion of discriminated and marginalized groups. People living in the space would not be indeed able to have access to resources and services (e.g. housing) within a market system, while some of them would be excluded from welfare provisions because of their legal status. Despite its inclusive goals and experimental character, however, the Schwarzer Kanal experience can hardly be seen as an example of social innovation, given the eminently antagonistic character of its claims and of its relationships with institutional actors.

The dispute highlights a conflict between two diverging perspectives on social inclusion and marginalization: on the one hand, the radical call for solidarity by the Schwarzer Kanal; on the other hand, the official refugee housing policy promoted by the Land Berlin. These perspectives develop within incompatible frames and narratives. The frame of the Schwarzer Kanal is defined in radical, antagonistic term. Not only the rights to live, exist and inhabit are fought for through strife and resistance, but the hegemonic status quo is challenged as such, and the 'inclusive' solutions proposed by Berlin's institutions are contested as part of it. The practices carried out by the Schwarzer Kanal take place outside of the political-institutional arena, and institutional arrangements aiming at supporting social inclusion are strongly criticized as discriminatory.

The divergence between these perspectives also leads to divergent claims over legitimacy, which result in radically questioning the legitimacy of the counterpart. On the Schwarzer Kanal's side, the key claim could be formulated as follows: who has the right to define priorities between different legitimate rights and needs? On the Berlin Senate's side, viceversa, the key claim concerns precisely the legitimacy of institutions to define priorities among rights and needs and the lack of legitimacy of activists' actions as they are meant to satisfy differently defined rights and needs.

3.3 HOLZMARKT

The Holzmarkt is a site on the Spree river waterfront on which a mixed-used project promoted by a coalition of local entrepreneurs is currently under development. Unlike the previous cases, the Holzmarkt project does not directly represent an 'conflict'; however, its meaning and features must be understood against the background of one of Berlin's most contested urban developments, the so-called MediaSpree project (cf. Dohnke, 2013; Gualini, 2015; Scharenberg and Baden, 2009). 'MediaSpree' is the 'brand' for a large 180 ha area along the eastern Spree waterfront, designated since the early 1990s to become one of Berlin's key economic development areas, with mainly high density office development and a vocation to host media-and creative industries. Strongly criticized since the mid-2000s for its speculative character, plans for the area have sparked a broad mobilization led by dedicated local opposition groups, culminating in 2008 in a local consultative referendum calling for revision of the plan and the safeguard of open space access and diversity of uses along the waterfront. Despite massive popular support, the referendum could not significantly hinder its implementation, which has continued since 2010 on a site-by-site basis.

The Holzmarkt project is an attempt at realising some of the movement's claims through an alternative development of a portion of the area. It was initiated in the wake of anti-MediaSpree protests by local entrepreneurs, mostly active in the local club scene developed over years on land leased for 'temporary uses', forced to move their activities following plan implementation in the early 2010s. In 2012, a coalition funded the Holzmarkt Plus e.G. with the aim of proposing an alternative way of living and of creating a community village in Berlin (Holzmarkt 2013). The area was assigned to the Holzmarkt cooperative by a 75-years building lease by its owner, Stiftung Abendrot, a Swiss pension fund investing in sustainable real estate projects, winner of the open bidding procedure held that year. The ambitious plan presented by the cooperative provides for the realization of an alternative 'urban village', including affordable housing and working spaces, areas dedicated to artists and young creatives, a club, a hotel, a restaurant, a commercial village, and the Eckwert technology center hosting start-ups and student accommodations. It also provides for the realization of a 6,000 sqm public park, to be managed by the civic association Mörchenpark. This will connect the different parts of the village, host public urban gardens, and guarantee open access to the Spree waterfront, in line with the claims of the anti-MediaSpree movement. Since 2013, Holzmarkt organizes art events and festivals hosted in temporary structures and outdoor spaces, constantly changing according to the phases of construction (2015-2017).

The Holzmarkt project is explicitly creative and experimental, and includes a number of innovative elements. As for the physical transformation of space, the Holzmarkt masterplan foresees the realization of

a village to be built to the greatest possible extent with the involvement of local community members and using wood and other sustainable building materials. Temporary structures are foreseen in order to guarantee access to the area throughout different construction phases. The functional mix is intended to support interactions with the neighborhood and to promote spontaneous encounters between users. The project aims therefore to strengthen existing social relations at the neighborhood level and to support the building of a new community, to be jointly constituted by local inhabitants and by new users of the space. The Holzmarkt is conceived as a non-speculative project adopting a low-rent housing policy, guaranteeing affordable working spaces, and enabling the participation of groups (e.g. young professionals, creatives, craftsmen) which cannot access to the high-priced lofts and offices foreseen by mainstream MediaSpree developments. Direct involvement of the neighborhood and of local residents is held as crucial, as far as the design and management of open spaces is entrusted to civic associations. The project proponents also state to support experimentation and innovation with respect to project management and the business model adopted.

The Holzmarkt project formally covers most social innovation dimensions previously discussed, promoting social inclusion and establishing a cooperative internal decision-making structure. In order to better understand how the Holzmarkt Plus e.G. aims to achieve its objectives, we now look to the network of different actors involved in the process and to the way they frame their interests.

The Holzmarkt project is organized in a cooperative structure which “reflects the vision of the project” (Genossenschaft für Urbane Kreativität, 2017). The main actor is Holzmarkt Plus e.G., founded by the promoters of the project. It is responsible for the long-term development of the project implemented on the area. The cooperative includes the initiators, but also creatives, citizens and investors, whose acceptance is approved by the general assembly. All the decisions related to the project are taken by the general assembly, which deliberates with respect to project design and implementation, and which will be in charge for creating a special committee responsible for the selection of the tenants of the new living and working spaces. Both the Mörchenpark e.V., in charge of designing and managing the public and green areas in the Holzmarkt, and the sponsor Genossenschaft für Urbane Kreativität (GuK, ‘Cooperative for Urban Creativity’) have the right to vote in the general assembly. The former is a self-financed civic association, which represents the interests of neighbors involved in the project. The latter, which also has a cooperative structure, is the investment organization financing the project activities.

With respect to future tenants, Holzmarkt Plus e.G. has proposed a model based on three categories: ‘village comrades’, who are shareholders of the GuK (i.e. acquired at least a share of the GuK for 25,000 €) and will constitute the permanent core of the project, also having a voice in the decision-making process; ‘creative residents’, who will have medium-term contract (from 5 to 10 years); and ‘experimenters’, e.g. artists who will have temporary access to affordable working spaces. The organizational structure foresees an autonomous management of project facilities (restaurant, hotel, club etc.) which are run by individual firms under the coordination of the cooperative. Holzmarkt Plus also relies on external experts.

From the perspective of interests and definitions of needs of Holzmarkt Plus e.G., it clearly emerges that the promoters, as they were directly affected by MediaSpree plans, have a clear economic interest in re-activating the area. As entrepreneurs, they pursue a profit-oriented strategy based on a business model which combines autonomy of the project with support of an alternative development model for the area. They demonstratively embrace claims by the Spreeufer für Alle campaign concerning open public space, participatory decision-making, and non-speculative and creative urban environments. Looking at their organizational structure and specific goals, however, it is apparent that they do not frame these claims in critical terms, and that the strongly political and conflictual dimension that was driving the anti-MediaSpree mobilization is neutralized within a sustainable urban development frame strongly relying on the role of ‘creative classes’ in fostering urban experimentation and innovation.

Another relevant actor is the landowner, the Stiftung Abendrot, which bought the area in 2012 and is now supporting the project by leasing the area to the Holzmarkt Plus e.G. for the next 75 years (for around 500,000 Euro per year according to media). The pension fund does not intervene in the decision making process, and has convened with Holzmarkt Plus e.G. that they can buy the area to a fixed price at any moment.

It is interesting to highlight that local institutions are not involved in the project. As declared by one of the main promoters of the project, “the municipalities and the local residents of the neighborhood and/or initiatives don’t play a significant role in the Holzmarkt project” (Husten, interview, January 2017). The Holzmarkt project never really openly sought active political collaboration with any party, even if they gained support by Bündnis 90/Die Grünen and the Social-Democratic Party.

With reference to the social innovation framework, some reflections can be advanced. The project aims to satisfy local needs related to access to public (open) spaces, affordable working and housing which are basically neglected by MediaSpree plans. With respect to the process dimension, the Holzmarkt proposes

an alternative financing model based on the close involvement of financial operators, local entrepreneurs and members of the local community, as well as on a cooperative organizational structure based on shared responsibilities along the decision-making processes. The project represents the initiative of what we could call a local 'coalition for innovation', and is widely perceived as such.

The frame adopted by the project proponents, however, contains also contradictory aspects. On the one hand, they refer to claims emerged from mobilizations against gentrification, privatization and finance-driven speculation in the area. On the other hand, the project conceives itself as "a group of users [that] formed a cooperative society to be able to plan and develop the area themselves" (Catalyst Studio, 2017), thus recalling an imaginary related to the self-made city and referring to the German tradition of *Baugemeinschaften* (literary 'building communities': cf. Ring and AA Projects, 2013). In so doing, the business and management model devised for the latter aim appears to dilute the political and contentious dimension of the former.

Furthermore, despite their declared objective not to maximize profits but to support creativity and promote alternative forms of living, their strategies and choices reveal a strong entrepreneurial imprinting, which might significantly constrain the socially inclusive dimension of the project. According to the typologies of tenants foreseen, it is for instance possible to have access to a permanent contract only by acquiring a 25,000 Euro share of the GuK. The short-term, temporary nature of other forms of contracts opens a potential for instrumental uses of the alternative uses of space to which they are dedicated, which might ultimately foster gentrification dynamics already taking place in the neighborhood.

4. DISCUSSION AND CONCLUSIONS

The cases presented do not neatly fit a 'social innovation' paradigm in urban development. This does not mean, in our view, that they are not relevant to a critical engagement with 'social innovation' as scholarly discourse and as social phenomenon. We rather think that – even if ideosyncratically chosen – they stress aspects which may let models of social innovation appear counterfactual and, ultimately, heuristically inadequate.

We have indicated a reason for this in a discrepancy between its analytical and normative frameworks. In order to discuss this, we have chosen three distinctive cases – among a plurality of relevant cases analysed – from a context which presents a distinctive sensibility for social justice and inclusion, a diffuse capacity for civic initiatives, and policy issues demanding proactive change, but which also shows that the subject matter of 'social innovation' is contested, and that actors of 'social innovation' define their subjectivity largely in a process of contestation.

In the case of Dragoner Areal, (potential) elements of innovation are eminently developed through contestation of dominant policy frames. The case does not only show the evident discrepancy of urban policy agendas across different levels of governance, but also the importance of multi-scalar forms of engagement in their contestation. First and almost, however, it highlights the centrality of contentious politics and social mobilization in the process of generating (potential) elements of innovation. It is through the capacity of civic initiatives and social activism to overtly express dissensus and to develop alternative conceptions of policy issues that new alliances are built – which may integrate local government institutions as well as local civic groups – and may result in viable support for 'innovative' solutions. The contentious mobilization of actors is crucial for translating virtual social claims into an effective capacity for collective action.

In the case of Holzmarkt, (potential) elements of innovation result from the strategic-relational capacity of certain actors to build alliances around a selective interpretation of social claims emerged in a process of contentious mobilization. The self-representation of the project relies significantly on its claim to be innovative, and this claim in turn draws its legitimation from reference to claims raised by social mobilization against mainstream development plans in the eastern Spree river area. This however should not blind us to the fact that what characterizes the Holzmarkt project is the outcome of a process of strategic selection and retention from the repertoire of these claims. This means that claims raised by contentious civic groups are selectively retained and 'translated' in a way which makes them viable and system-compatible – not surprisingly, in the form of a (unconventional and 'innovative') business model which rather fits than challenge the overall logic of development. The 'allies' won in the process of translation are defined by the way the 'innovative' character of the project appeals to this system of compatibilities. It is within these hegemonic confines that the project is 'innovative'.

Schwarzer Kanal, finally, can be seen as a case of 'defeat' of social innovation, in as far as divergences in understandings of needs and rights lead to incompatible claims, conveyed by incommensurable frames, and with no instance of mediation being capable, so far, to realize a viable, 'socially innovative' translation. Here, again, the emergence of (potential) elements of innovation is premised on contestation of the existing order. It is only through radical claims that a paternalistic institutional hierarchisation of rights and

needs is challenged and a broader horizon of inclusion is addressed. However, the radicality of these claims vi-a-vis current policy agendas results in unmediated resistance. Notwithstanding the future possibility of negotiated arrangements to settle the issue, the case reminds us blatantly of the struggles over hegemonic understandings of the social order that are involved in phenomena of social change.

In a perspective of taking 'social innovation' discourse seriously, such observations are just a beginning. They hint of relevant areas of social theory and critical thinking which appear to be sidelined in 'social innovation' models. Addressing them, however, is crucial to understanding how far 'social innovation' can contribute to critical research of current challenges and contradictions of urban development or how far it is a normative policy concept premised on a discursive rationalization of such challenges and contradiction.

ID 1415 | PLANNING THEORY IN THE GLOBAL SOUTH: CIRCULATING TRAVELLING MODELS FROM THE NORTH OR HYBRID ARRANGEMENTS?

Wolfgang Scholz¹

¹TU Dortmund University, School of Spatial Planning, Department International Planning Studies
wolfgang.scholz@tu-dortmund.de

1 INTRODUCTION

The influence of inherited “Western” urban planning models and paradigm for African cities is not yet fully covered in discussions on planning theory. Research has mainly focussed so far on the colonial legacies in Africa, including housing policies and infrastructure systems. The “improvement in sanitary conditions for the white population” (Mabogunje, 1992) and the “segregation according to race” were key elements of colonial planning (Alexander, 1983) and were translated into colonial urban planning laws and urban planning instruments. These are still visible today in post-colonial legislations. For example, the zoning model and separated land uses categories are still the foundation of most planning legislation of the former British colonies (Watson, 2009). Furthermore, “planning education in Africa is firmly ensconced in the traditions and models of Europe” reflecting planning approaches as “colonial-type master planning systems” (AAPS, 2010). These approaches seem to have failed since African cities mainly develop outside formal planning procedures and statutory land use regulations (cf. Watson, 2003; Harrison, 2006).

Some studies have emphasised that in the cities of the global South a new “logic for resource allocation, accumulation and authority” (Roy, 2009) has emerged out of “Western” planning paradigms into the specific socio-spatial constellations of African cities; be it an “unintended outcome” of planning and policy interventions (Watson, 2009) or, on the contrary, a “calculated informality” (cf. Roy, 2009). However, it has to be acknowledged that African cities are shaped both by inherited urban planning ideals and urban planning concepts as well as by the current socio-economic reality.

Dar es Salaam in Tanzania serves as case study for this starting point with currently around 70-80% of informal urbanisation. In this city, the development and shortcomings of the inherited urban planning system will be traced. Based on a review of the historical development of the urban planning system, the first hypothesis is the existence of a continuum of colonial and post-colonial urban planning paradigms and models until today. This is, so the second hypothesis, one main reason for informal urban development as a result of shortcomings of these approaches. Third hypothesis is that although planning approaches have been transferred from the Western world to Africa, the common planning theories are not applicable due to different power relations of the involved actors and the prevailing informal urbanisation outside the statutory planning machinery.

The article is based on two research projects in Dar es Salaam (2010-2013): Regulating Informality – the Influence of Planning Standards on long term Suitability of urban Settlements – the Cases of Dar es Salaam/Tanzania and Durban/South Africa conducted by the author and 2013-2014: Translating Urban Infrastructure Ideals and Planning Models: Adaptation and Creativity in Water and Sanitation Systems in African Cities, conducted by the author together with Dr. Shahadat Hossain, both funded by DFG and under supervision of Prof. Dr. Sabine Baumgart. Another, if not the most important foundation for this paper, is a two years term as senior lecturer at the school of Urban And Regional Planning at Ardhi University in Dar es Salaam (2007-2009).

2 URBAN DEVELOPMENT IN DAR ES SALAAM

Dar es Salaam in Tanzania is one of the fastest growing urban areas in Africa. The population has increased from 100,000 in 1952 to 2.5 million in 2002 and to more than 4.4 million in 2016. In the same way, urban spatial expansion took place. From independence in 1961 when the built-up area had a radius of only 6 km to the 1990s it increases in a finger like shape up to 40 km along the trunk roads into the hinterland. Most of the urbanisation took place informally outside the legal planning framework. Fig. 1 displays the urban area and distribution of planned settlements as well as informal settlements and transformed former villages today to underline the dominance of informal urbanisation. Starting point of this article is the question why informal urban development is the dominant mode of urbanisation despite of detailed urban planning and land use legislation in place. Reasons can be traced in the statutory planning system and its colonial roots. The first level of analysis is the current urbanisation and its urban planning system followed by a deeper analysis of the historical development of the urban planning system in Tanzania. Therefore, to understand the current situation, there is need to analyse the historical development of urban planning, its legislation and the land tenure system. This will provide a sound base to draw conclusions for a discussion on planning theory.

CURRENT URBAN DEVELOPMENT PROBLEMS

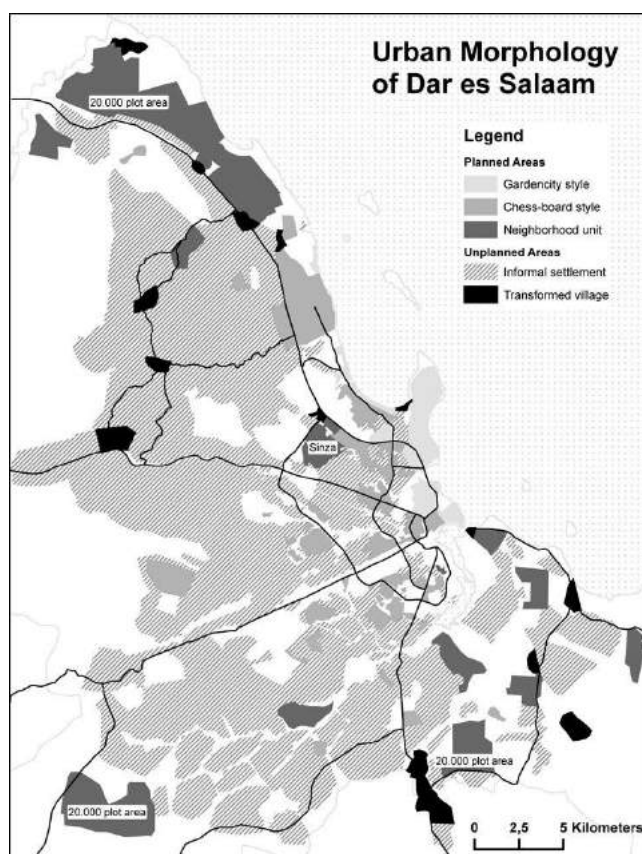

The research revealed three major problems of current urban development: the plot size standards, the shortage of building land and the land tenure system. In the last decades, only a few areas were planned for low income residents, the so called high density areas with plot sizes of 400-800 sqm. However, they could not reach the target group because poor settlers could not afford the land prices requested by the Government or were bypassed in the allocation process due to intransparent processes. In some cases, rising land prices on the market even attracted residents to sell their allocated plots since the market value is higher than the governmental fixed price (Scholz et al., 2013). The formal urban planning plot size standards can be seen as one cause for this development. Current formal urban land use planning standards with their large plot sizes based on colonial standards almost hundred years ago are too expensive for the Government to develop and unaffordable for the urban poor. Besides the price for land, costs for infrastructure services are another hindering factor. The large plots reduce the ability of the Government to fulfil its self-given obligation of infrastructure service delivery without user contribution. Kombe (2011) outlined the costs for different infrastructure standards in relation to the plot sizes. He stated that for the formal plot sizes, infrastructure costs are prohibitive for urban poor settlers. The cost of infrastructure services from small plots of 100 sqm to larger plots according to the official land use planning standards (min. 400 sqm), increases by more than three times. This is mainly due to the increased total length of infrastructure service lines such as roads, water pipes, storm water drains, in relation to the number of households being served. It can be concluded that due to high costs for services, the Government cannot afford to issue new building land. Therefore, these planning standards contribute to the shortage of building land. (Scholz et.al, 2015)

The high urban growth rate at about 5% in combination with the low rate of new statutory planned housing areas leads to a serious shortage of building land. Today, the unmet demand for affordable building land is largely covered by the informal land market and most urban inhabitants have to buy plots on the informal land market. There, they can find a place for living in smaller plots with average plot sizes of about 100–200 sqm. However, these areas are not serviced. In exchange they will have to cope with higher costs for services and utilities like urban transport (if located at the periphery) and water from street vendors (if not serviced) or even with higher risks (if located in flood prone areas). (Scholz et al., 2015)

Another factor causing the urban development problems is the land tenure system. During the socialist period of independent Tanzania, land became public in 1967. Actually, it can be said land became under the control of the Government respectively the ruling party in the then one party system (Kironde 1995). When land is needed for public purposes, including new planned residential areas, it can be acquired by the President. If an agreement to acquire the land from the current land holder fails, then compulsory acquisition should take place. Originally, the compensation was made on unexhausted improvements on land only, but since 1995 land has officially a value (Kironde, 2006). However, the value of land is often

under dispute between land holders' expectation and actual compensation paid by the state. Land holders expect compensation based on future land value after being developed while the Government pays only a compensation based on the current value as e.g. agricultural land. The expectation of the higher price is fuelled by the option of the land holder to sell the land on the informal land market for residential purposes to individuals. Also often valuation surveyors estimate total different prices for similar neighbouring plots which leads to mistrust of the compensation model (Molle and Lugoe, 2007). In the informal land market, land under customary land tenure (former village farm land at the then periphery of the town) is subdivided by the land lord and sold to potential dwellers at market prices which are higher than the official compensation rate. This system works well for both sides because it meets the expectation of a higher price for the land holders and provides access to land for residents what the formal system cannot provide sufficiently. Security of tenure is provided by local officials and witnesses during the selling process undermining the power of statutory urban planning. (Kironde, 1995)

All these three fields, the planning legislation, the planning plot size standards and the land tenure system support the loss of urban development control of the statutory planning system. Three interconnected reasons can be observed. The first is the current high urban growth rate with increasing number of residents which is beyond the capacity of the planning authority to produce new building land due to legal and administrative shortcomings in the planning machinery. Second, the inherited urban plot size planning standards require large plot sizes for housing (the official minimum plot size is 400-800 sqm for high density areas). These standards are today too expensive for the government to acquire land and to service the areas with infrastructure and unaffordable by most social groups (Scholz et al., 2013). And thirdly, loopholes in the customary land tenure system of agricultural land which open the door for land holders to subdivide and sell land on the informal market with illegal land use changes towards residential by bypassing the official procedure to acquire land for planned areas by the Government. This factor leads to a hybrid system of urban development in which statutory urban planning plays a minor role and market forces dominate.

While this analysis provides an explanation of the current problems of the statutory planning system and the dominance of informal urban development, still the underlying causes are open. Therefore, the following questions will be discussed based on an historical analysis of urban development plans for Dar es Salaam.

To which extend is the inherited urban planning system responsible for the current situation?

How can these findings help to develop a planning theory for cities in the Global South like Dar es Salaam?

Figure 1 - Urban Development in Dar es Salaam displaying formal and informal areas, Source: Wolfgang Scholz. Cartography: Ines Standfuss

3 HISTORICAL DEVELOPMENT OF THE PLANNING SYSTEM IN TANZANIA

In order to address these questions, there is a need for a deeper study of the historical development of the urban area and its planning system (planning legislation and underlying planning models). Hypothesis is

that the weakness of the current planning system is rooted in its still dominating colonial past (see hypothesis one and two).

Despite independence in 1961, the planning system with its planning approaches and its urban planning legislation were never changed and adjusted for post-colonial conditions and still reflect imported planning ideals. The Tanzanian Town and Country Planning Act of 1956, CAP 378, which is based on the British Town and Country Planning Act of 1947, is the basis for the comprehensive urban planning legislation until today. (Scholz et.al, 2013)

The planning regulations deal with the use of land and buildings, the intensity of use of land, the size, and form and construction materials of buildings. For public land uses it manages e.g. roads reserves and the protection of natural resources. The land use plans assign separate land uses (i.e. residential, commercial, educational, etc.) for an ordered physical development, as perceived by the statutory planning. The land use categories create distinguished land use pattern by the separation of activities following the principle of an orderly developed town.

COLONIAL AND POST-COLONIAL MASTER PLANS

Germany was the first colonial power in Tanganyika (the continental part of the present United Republic of Tanzania) for about three decades. The Germans laid the foundations of today's urban fabric and the urban planning legislation with the first Building Ordinance in 1891. It organised Dar es Salaam in different areas, along the ocean for Europeans, followed by an area for Arabs and areas for Africans separated from them in the then outskirts. This was the starting point to use planning regulations for racial segregation. In 1914, the German colonial government revised the legislation into a three-zone ordinance: Zone 1 for European style buildings with more costly constructions on large plots, Zone 2 for mixed construction using only permanent materials designated for Asians, and Zone 3 for African style constructions without regulations on small plots. However, the ethnic groups were not mentioned in the Ordinance. The intended segregation by ethnic groups was rather achieved by setting different levels of building standards and plot sizes. So automatically the zones targeted different income groups and thus indirect ethnic groups. The German colonial planning created, therefore, with the three zone model a racial and spatial segregation by building and plot size standards. (Kironde, 2007). The simple plans from this period and the low level of planning intervention goes in line with adaption planning according to Albers (1993) in terms of planning theory.

When the British took over in 1916, the British Colonial Government kept the three zone based segregation practices until 1961. Despite migration restrictions, the British Colonial Government experienced rapid urban growth of the African population increasing between 1938 and 1944 from 26,000 to 40,000. Already at this time, urban growth led to informal settlements with poor living conditions, overcrowding and lack of infrastructures. Informal settlements are, therefore, not a phenomenon of post-colonial times only (Brennan et al., 2007). The emergence of informal settlements, however, is not covered by planning theories.

These first colonial periods clearly display the import of Western planning models and concepts to Africa to achieve the goal of racial segregation by applying different plot sizes, construction and infrastructure standards. The Ordinance and the three zones model was able to hide the political goal behind technical parameters. The hiding of racial segregation by using three zones was successful and therefore deep-rooted in the planning system that it is still undisputed in place in post-colonial Tanzania. The three still existing different colonial plot size standards in Tanzania (named today low, medium and high density areas) for residential areas thus resonate the former colonial principle of racial segregation by zones and even use the same plot size parameters (Scholz et al., 2015). The former racial segregation continues today as a guiding principle along different income groups in the three zones.

PLANNING APPROACHES

A similar process of continuation of colonial principles can be observed in the planning approaches. They still follow mainly the standardised top down master plan approach aiming at a determined controlled urban development over a long fixed period to solve identified urban development problems. This approach is similar to the blue print planning or containment planning period according to Albers (1993) in Europe.

When looking at the master plans for Dar es Salaam from 1949, 1968, 1979 and 1998, again not only an import of Western planning ideals and paradigm can be observed but also the long lasting impact of the planning paradigms, especially of the three zone model.

In the master plan from 1949 by Sir Alexander Gibb and Partners, London the influence of Western planning ideas can be traced. The role of the planner was seen as an objective technician who is aiming at controlled urban development (cf. Alexander, 1983).

"The underlying virtually environmental determinist philosophy was translated into a characteristically physical planning approach, exemplified by its application of somewhat mechanistic Garden City principles, an overriding concern with layout and visual appearance, and its devotion to the arithmetic of prescribed standards and densities" (Armstrong, 1986).

The at this time dominant concern for health called 'sanitation syndrome' led to the planning of open spaces as response to the misery conditions in colonial cities. According to Doherty, plans in Tanzania "were not primarily motivated by a desire to house the growing African population, but rather fear of the possible consequences of an outbreak of contagious disease in severely overcrowded and inadequately serviced slum settlements." (Doherty, 1976). Therefore, the population in the congested African areas should be reduced and the strict segregation between racial groups guaranteed by open spaces called 'breeze lanes.' The physical segregation of different racial groups, already introduced by German authorities by plot sizes and building standards, remained unchanged. (cf. Armstrong, 1986) Armstrong (1986) concludes that "The importation of fashionable contemporary western planning ideas, served to further enforce this elite bias. For example, no modification was proposed to the rigorous building code in operation which, by insisting on relatively high standards of space, materials and service provision, continued actively to discourage the extension of African owner-occupation."

The introduction of the neighbourhood unit, actually a planning concept developed in the 1930's for North American cities, promised a more small scale and community oriented planning approach. Neighbourhood units should be rather self-contained communities with own identity and services in the middle of the unit to cover around 5000 residents. Even today, the neighbourhood concept is the fundamental concept in planning practise and planning education in Tanzania which supports the above formulated hypothesis. The 1949 plan displays clearly the process of importing Western planning models and paradigms to maintain colonial power by urban planning.

With independence in 1961 the population grew to 275,000 from 99,140 in 1952 which is 1/3 higher than the forecast of the plan. Reasons can be seen in the decline in rural areas during and after the Ujamaa period (socialist self-reliance period). Another fuelling factor was the availability of major services exclusively in urban areas, a factor which remained largely until today. Already one third of the population lived in informal settlements at this time (Armstrong, 1986).

After independence in 1961, the colonial planning standards were modified slightly but not fully adjusted to post-colonial socio-economic realities, options and needs. The 1956 Town and Country Planning Law remained in place (amended in 1961) and has been only recently reviewed as Urban Planning Act 2007 but by large the contents have remained the same again (Kombe and Kreibich, 2006). The plot size standards are still far beyond what urban poor dwellers can afford and it does not support an optimal use of scarce resources.

The first plan after independence in 1968 followed officially the ideas of the socialist Arusha Declaration in 1967. It is based on a comprehensive planning approach with a long range scenario plan up to the year 2000 with an estimated population of 2 million (Rondinelli, 1986). The idea was the creation of new centres beyond the existing relatively small urban boundaries to reduce population pressure on Dar es Salaam. This was clearly in accordance with European planning models of sub centres of this time and therefore again an import of Western ideas. Interestingly, the former colonial concept of breeze lanes remained as landscape corridors from the hinterland to the ocean now called 'open space fingers'.

Since the Arusha Declaration features rather anti-urban aspects in favour of rural development, the colonial policy of limited urban growth continued and the existing housing problem should be solved with the use of police and bulldozers in the independent Tanzania (Armstrong, 1986). The 1956 British Colonial Town and Country Planning Ordinance remained in place. The 1968 plan is an example of the evolution of planning as a technical discipline with clear and rigid concepts and again an example of the import of Western planning concepts without adjustments to local conditions. It clearly follows the idea of development planning.

The following 1979 plan was designed during a period of economic decline as result of the 1967 Arusha Declaration and the war with Uganda. Dar es Salaam experienced a growing population with migration from the rural areas, the growth of informal housing areas and stagnation of the economy. Another negative impact for Dar es Salaam was the transfer of the capital to Dodoma in 1973 including the transfer of funds from Dar es Salaam to the new capital and the abolishment of municipalities. Due to this circumstances, "the 1979 Plan is a more down-to-earth document, compared with its ambitious predecessor, lacking many of that plan's grand planning concepts and intended as a professional working document, determinedly pragmatic and flexible, concentrating on the more pressing and detailed concerns

of urban management" (Armstrong, 1986). It also reflects the crisis in urban planning in the 1970's with the shift from long range comprehensive technical planning towards a more pragmatic project based approach. However, the main idea of a master plan as long term development plan remained, while in Europe the planning approaches after the collapse of the rational synoptic planning models have changed more dramatically towards incremental planning. The 1979 plan is therefore still a top-down master plan with some project based approaches for its implementation.

The plan recognised informal settlements and allowed commercial activities even in residential areas. It opened the door for mushrooming informal businesses in the settlements and to cater for the demand of the costumers and to create income generating activities, however it also caused land use conflicts. These developments are still not guided by the formal planning since appropriate planning instruments and procedures are missing to guide commercial activities. (Scholz et al., 2013)

Slum clearance and demolition was given up in favour of regularisation and gradual upgrading. Overall, the plan displays again Western planning ideals following the shift of planning towards more pragmatism and less interventions. However, it could not response to informal urban development and the shortage of housing. Needless to say that the 1956 British Colonial Town and Country Planning Ordinance and its related plot size standards and land use categories were still in place.

In the 1990s when a new master plan was needed, the master plan approach was not seen as suitable anymore. Therefore, UN-Habitat offered financial and technical support to prepare a new approach, the strategic development plan for Dar es Salaam. It should be within Habitats newly launched Sustainable Cities Project using Dar es Salaam as pilot study (Dar es Salaam Sustainable Project, SDP 1992-2003). The strategic urban development plan (SUDP) was considered as a suitable alternative to the master planning approach. UN-Habitat has been promoting it with financial and technical experts, again a huge import of Western planning ideals.

The SDP aimed at strengthening municipal planning and management and improving stakeholders' participation by a collaborative planning approach. However, the SDP acted parallel to the formal planning system since the procedures of the top-down designed Town and Country Ordinance were still in place. Therefore, the SDP did not produce a statutory physical development plan for the city but rather a document with interrelated strategies. Instead of a top-down master plan for a specific period of time, the SDP approach offered development options based on environmental consideration that were prepared by involving experts from academia, local and central government ministries and members of the civil society. A draft SUDP report was prepared in the early 1998.

While the SDP as a planning process can be seen as a success story (despite its dependency of donor funds for the extensive stakeholder involvement), its planning output has not been approved by the Ministry for Land, Housing and Human Settlement Development (MLHHSD). Main critic was the absence of a comprehensive future land use plan since it was not a document with still open final decisions on future land uses. The Ministry was clearly in favour of the old master plan approach and not of planning as a process. Here we can see that the continuing import of Western planning approaches is not fully linked to the political discussion in the country. The top-down master plan approach was still the preferred one by the Ministry while international organisations opt for the new approach and implemented it with the help of financial assistance.

The conflict between process orientated flexible planning and the demand of the authorities for a final land use plan led to the development of new General Planning Schemes (GPS): "combining the advantages of both" (Lupala, 2013). This new planning instrument, the strategic master planning which should combine the advantages of master planning concepts and strategic planning concept like SUDP. Today in Tanzania, urban development plans and detailed planning schemes have to follow documented stakeholder meetings on the one hand and produce planning documents with defined future land uses on the other hand. The statutory planning regulation (Urban Planning Act 2007), allows such hybridisation of planning concepts. The GPS can be understood as the first locally developed planning approach although it is actually a hybrid of imported ones. However for the SDP, the new law came too late, its funding phased out in 2003 and therefore Dar es Salaam was still in need of a new urban development plan.

With the financial support of the World Bank, the Ministry assigned the planning task to an Italian company (Dodi Moss, 2012). While the idea of the strategic master planning is to promote wider participation, the current master planning process continued its earlier tradition and thus limited the planning process only to a few planning experts. Lack of stakeholders' participation is one of the critics of the draft report of the on-going master plan. It did not achieve the desired level of participation process from SUDP and is therefore rather an old fashioned master plan again.

Fig. 2 displays as conclusion the existing continuum of planning approaches from early colonial times up to today. The top-down approach is the dominant way of planning in Tanzania, despite of a short period of the unapproved SDP. The three zone model survived from German colonial times up to today and is still

the undisputed mode of land use planning despite of the changing political and socio-economic environment in Tanzania. Only the racial notion is replaced by segregation by income. In all periods, informal settlements were part of urban development reality and are clearly not a phenomenon of recent rapid urbanisation only.

Fig. 2: Overview on Planning Approaches, Instruments and Urban Models in Dar Es Salaam, Source: Wolfgang Scholz

The figure also clearly displays that despite of an urbanisation period of more than hundred years in Tanzania, a locally based planning system and comprehensive model has not been developed with exception of the hybrid approach of GPS. All approaches are imported and run in a parallel way. This is very much in line with the idea of planning approach layers by Selle (1995), however, all layers and planning periods have been developed in Europe locally and in line with the socio-economic conditions and the political development. In Tanzania, all approaches and plans were imported and all of them share the ignorance to deal with the increasing degree of informal urbanisation. The urban area influenced by statutory land use planning is now below one quarter and is not under control of urban planning institutions.

Therefore, Tanzania needs to develop a locally based planning model which reflects the high degree of informal urban development, the dual land tenure system and the relationship of Government and citizens which differ much from Europe where the planning models actually come from.

4 PLANNING THEORY FOR THE GLOBAL SOUTH

The evolution of Western planning theory and planning approaches can be traced by its transfer to Tanzania. During colonial times, planning instruments, methods and paradigms were imported from Europe: Starting from the German "Bauordnung", which became the basis of urban planning in Tanzania (Kironde 2007) followed by the master plan approach, neighbourhood units and participatory elements.

According to Armstrong (1986), it was the respective "application of fashionable western urban planning ideas" that influenced the plans of Dar es Salaam from 1949 to 1979. This can be stated even up to the 1990s SDP and the current master plan. Obviously, there have been some changes in the urban planning system during the last two decades. The planning system was changing from a rather technocratic to a more participatory and strategic planning approach. Planning has changed from strict master planning to a more flexible strategic planning approach. However, the current master plan seems to fall back into the old approach.

Nevertheless, Dar es Salaam still faces problems with the application of outdated planning legislation which are based on colonial rules for segregation and still reflect a totally different understanding of the size, function and role of the cities. Land use planning standards including land use zoning were based on the model of a small low density, green city with large plots reflecting the ideals of a colonial version of the Garden City. It was combined with ideologies of sanitation and health issues which also asked for low population densities. This model may have been adequate for colonial towns with modest growth that were physically and socially limited through restrictions of migration. However, it cannot cope with the high urban growth rates since independence and, above all, it cannot be implemented by weak public administrations with limited resources (cf. Njoh, 1999 and Payne, 2001). Furthermore, it is hardly suitable for the current process of urbanisation under poverty where the majority of settlers can only afford small plots and where large plots in planned areas lead to high costs for infrastructure supply (Kombe, 2011).

The current informal urbanisation in Dar es Salaam can be seen therefore rather as a result of inappropriate and not applicable planning legislation than as a phenomenon of the African city per se.

However, urban planning is not irrelevant as Berrisford (2013) stated “As competition for land intensifies in Africa’s rapidly growing towns and cities, planning laws assume a fundamental importance. They determine how urban growth is managed and directed. In most countries outdated, inappropriate and unintegrated laws are exacerbating urban dysfunction.”

Berrisford (2013) therefore stresses “The promotion of “one-size-fits-all” and “model planning laws from outside the continent has not served Africa well.” He argues that “more progressive, realistic urban planning in Africa will require a radically different approach to planning law reform. This is essential for sustainable and equitable urban development in Africa.”

Watson and Agbola (2013) add

“The plans assumed an orderly and law-abiding population that was willing to comply with zoning and building laws and formally employed families. For most inhabitants of African cities, outdated planning laws are an irrelevance – until deployed against them by the vindictive or opportunistic. Most urban development in Sub-Saharan Africa is occurring in a completely non-planned and non-transparent manner – despite the existence of master plans the need for reform can be identified.”

However, current approaches towards a reform of planning tend to focus on the establishment of a parallel system outside the current legal framework (e.g. Sustainable Cities Programmes from UN Habitat, various donor driven small scale case based projects on settlement upgrading, urban management projects) instead of starting from zero to create a new and appropriate planning system which reflects African urban realities, capacities and traditions. Another issue to address is the parallel system of governmental legal procedures, including the planning legislation on the one hand and leaders of the ruling party or neighbourhood committees on the other hand. Both are also dealing with planning-related topics including land management. This parallel system can benefit from loopholes in and failure of the legal planning system and receives, in many cases, a higher degree of trust from local residents due to tradition (Scholz et al., 2015). A new planning system should therefore reflect these political power relations and make use of traditional local leaders by involving them into planning procedures. There is the need to involve all stakeholders including civil society and non-governmental organizations in the development process. If the Western approach of incremental planning is a suitable one is questionable due to the unbalanced power relations of the actors.

Robinson proposes therefore a fundamental shift of the planning legislation. It

“should be guided by the legal principle of intra vires (within the legal power) which means you are permitted to do anything except what’s specified as not allowed. The prevailing principle of ultra vires (beyond the legal powers) means you can only do what is specifically permitted. A new system of planning law to manage land use in existing and new urban areas (planned and unplanned) should be tailor-made for each country so as to be understood, relevant and enforceable given the decision-making processes and capacities of key role players. Emphasis should be on identification of the absolute minimum of what is NOT permitted in terms of uses and changes of use.” (Scholz et al., 2015)

In order to achieve these goals, there is a need to revise the academic urban planning education as well. In many African countries including Tanzania, the urban planning course design and the underlying urban models including text books have been imported from Europe in the 1970s and 1980s and have not been updated to today’s reality. “The education of these future planners requires thorough reappraisal of existing teaching methods, the introduction of new ones, and remodelled curricula” (Watson and Agbola, 2013).

The Association of African Planning Schools (AAPS) has started a process to revise the current planning education at African planning schools. Topics should be informality, access to land, collaboration between planners and communities (Watson and Agbola, 2013).

However, the authors from AAPS are aware that

“On graduation, they (planning practitioners) might be expected to implement outdated planning legislation, or design golf courses or gated communities for the wealthy. But unless planning students are exposed to the prevailing conditions and trends in African cities, and encouraged to consult and interact with local communities to assess how

planning might best address these, they will merely advance the marginalisation of the planning profession – and of the poor – in Sub-Saharan Africa.”

These facts show the need for re-thinking central elements of the statutory land use planning system. The Urban Planning Act in Tanzania is currently under review to take key socio-economic changes into account, particularly the large unplanned parts of cities which could not be governed by the existing instruments and management practices that are in force. However, it is not expected to change the general underlying concepts of colonial legislation and urban models quickly since they are deeply rooted in the legal and institutional set-up of the post-colonial state.

Therefore it is necessary to address the issue from a planning theory prospective as well. The current planning theory approaches are mainly based on European and North American planning situations. Here the planner acts in changing roles as a caretaker of public goods and public interests in an environment of private land ownership and a statutory democratic political system which guarantees the rule of law. The example of Dar es Salaam above, however, displays a different picture. The planner is still part of the formal governmental system; however the relationship between the Government and the citizens is different. From colonial to post-colonial times, the state is a powerful actor who does not depend on the support of the citizens e.g. as taxpayers but rather relies on donors, international organisations, influential persons and groups. Bratton and Logan, (2009) claim that claim that democracy is supposed to mean “power to the people” and not just “a vote to the people”. Democracy in Africa remains largely unclaimed. For urban planning it means, participation plays a minor role and the dual land ownership system with public land under the control of the government or the president and customary land tenure under the control of local leaders also changes totally the role and the position of planning in the urban development. Titus Musungu, Physical Planning Dept. Ministry of Lands, Housing and Physical Planning, Nairobi, Kenya, summarised the situation of urban planning in African cities: “The perception of (urban planning) laws is that they only apply to the former colonial core city and not to the recent post-colonial expansions. Land-use regulations are perceived to be only applicable in the colonial city since they are a colonial construct.” (own fieldwork of the author, 2013).

Under these conditions, new planning theories compromising the power relations and the land ownership still have to be developed. The long lasting import of planning approaches will not help to overcome the above mentioned urban development problems.

ID 1419 | DEVELOPING AN ANALYSIS FRAMEWORK OF URBAN MORPHOLOGY STUDY

Wei Xuanzi¹

¹TU Delft

x.wei-3@tudelft.nl

1 INTRODUCTION

Urban morphology is the study of the city as human habitat (Whitehand, 2007). Its study is characterized by diverse perspectives. The primary concern of urban morphology is urban form. The spatial layout is the realistic dimension of urban form, and is the tangible results of the social and economic transformation. To understand how the urban form overlap and fit into each other is of crucial importance (Whitehand, 2007). Thus how to deconstruct the urban form into the elements and to explore the relationships between the elements will serve to understand the mosaic of urban form.

Kropf (2005) deemed that generic structure of urban form is a hierarchy of levels related part to whole, which means the urban form has different levels. As Mudon (1997) has pointed out: urban form can be understood at different levels of resolution, commonly corresponding to the building/lot, the street/block, the city and the region. Whitehand (2007) also think the resolution is one of the three components that

constitute urban morphology. Wang and Zhou (2014) divided the urban space into 5 levels of resolution: building, the street, the block, the city and the region, and reckoned that the conception of urban morphology itself contains the relevance and unity of different spatial scales.

The realistic built environment has offered a direct image to reflect the transformations of urban morphology of different levels. At finer levels, large squares, the high-rise buildings has replaced flat houses and courtyards; at relatively high resolution, the newly built-up areas began to emerge, the wider road network for the vehicles has replaced the pedestrian-friendly network; the overpasses and highways which function as a conjunction across the areas or even municipalities can be seen as an intuitive symbol of the integration of the areas into a region, though the overpasses and highways are not necessarily built to help the definite formation of the region. Thus when different scales are concerned, different kinds of transformation in terms of urban morphology should be concerned, as Kropf (2005) pointed out, individual buildings, at one level of scale, do not have the same handling characteristics as a street, at another, or a town as a whole. However, an analytical framework at different levels of urban morphology has not been established yet.

Therefore, this article will commit to develop an analytical framework for the urban morphological study. This framework is established on 3 levels: neighbourhood level, town level and metropolitan region level. The building level is avoided since the building mainly focuses on the architectural characteristic if it is regarded as an individual level, while this framework is an analytical framework for the urban morphology, in which the building could only be regarded as an element at neighbourhood level. The street and block levels are substituted by the neighbourhood level since the block layout is mainly decided by the street network, which means these two are essentially the same, and within one neighbourhood, the block, street usually have certain unitary characteristics, thus should be categorised into one level.

This article is going to answer the questions: how the analytical framework could be established at the neighbourhood, town and metropolitan region level? What are the different focuses at different levels? what are the elements of the different levels, and what are the relationships between the elements? How could the different elements been synthesised into a unified framework?

2 NEIGHBOURHOOD LEVEL

2.1 CONZEN'S THOUGHT

Conzen tried to interpret the development of the urban form from a historical perspective. He thought the city emerged as a result of complex processes - primarily economic, social and political, while the rules and regularities between these processes and the form of a city can be noted in the development of its physical structure (Niković et al., 2014). He has developed a tripartite division of the townscape: the town plan, the building fabric and land utilization (three form complex), they have overlapped, integrated and evolved into the current form.

The land use pattern is the order or spatial development of land use, the elements of this pattern are the individual units of land utilization reflected on discrete plots, the elements of the building fabric is defined as the individual buildings. The town plan is subdivided into three components: the street system, plot pattern and building pattern. The constituent element of the street-system is the street; the element of the plot pattern is the plot and the element of the building pattern is the block-plan of buildings (Kropf, 2009). The plan unit is defined by distinguishing it from its surroundings in terms of its streets, plots and buildings. And the morphological region (landscape unit) is further defined as a region that has a unity characteristic in respect of urban form (characterised by three form complexes). The morphological region serves as the basic unit to illuminate the historical development of an urban area in urban morphology.

The layout of the street system dictates the block system, and the street-block is an aggregate of plots, is a plot or group of contiguous plots bonded partly or wholly by street-lines and forming a discrete part of plot pattern of the town (Comert, 2013). The plot is identified as a unit of land utilization and the building is individual units of land utilization occupying discrete plots. Therefore, the elements of this method is not independent, one does not make sense without another.

2.2 CANIGGIA'S THOUGHT

The Italian thought of urban morphology is developed by Muratori in 1940s, subsequently developed by Caniggia, they also think the city could only be understood from a historical perspective, but they deem that the building typology should be the starting point of the study of urban morphology.

This method analysed the urban morphology as a complex entity split into a hierarchy of different components: elements, structures of elements, systems of structures, and organisms of systems. There is

an interdependent relationship within the hierarchy system. For instance, the individual buildings are related with each other, so do they with their lots. Caniggia applies this to both individual buildings and to the town. When considering the town, the buildings are elements. The structure of elements is an association of buildings or an aggregate which referred to as a tissue. The system of structures is then a combination of tissues forming districts and neighbourhoods. When these are taken together, they formed the settlement of towns. Then all of these get unified and formed as the organism of the town and cities. Urban morphological process could be understood through a typological process, namely, the process of continuous evolution of type over time in an area (Chen, 2010).

With this method, an object of a scale is all objects with a relation of whole to part to objects of the scale immediately smaller (Comert, 2013), which means the urban morphology of a town could only be explained from the buildings. The aggregation of the buildings is urban tissue, Caniggia defined it as the coexistence of several buildings existing in the minds of builders before the act of buildings. Thus, the construction of the architecture and the town reflect the relationship between the different entities in a certain cultural era. In the urban tissue, the lot, route, block could be identified, all characterised with a type nature, and is related to its surroundings at equal/upper/lower scale. The system of structures is then a combination of tissues forming regions or districts, which taken together form the organism of the town (Kropf, 2009).

2.3 PEREIRA'S THOUGHT

Unlike the former two methods focusing on the traditional historical cities, Pereira's focus is on the newly-built urban space. New urban space production features new urban areas being built from scratch and urban regeneration. This urban development process may lead to a careful formalisation of urban space in the building area, creating a vacuum in the borders between buildings, abandoning continuous and subsequent spaces during multiple interventions (Pereira, n.d.). The newly-built area has reduced the town into an urban area which is a juxtaposition of architectural objects, lacking an urban expression to form an urban style.

The form of the town is established in the relation between the outdoors space and buildings, which exist in a given landscape/soil (Pereira, n.d.). Pereira identified the elements of urban form into landscape/soil network, outdoors space network and buildings network, and each network is not independent, instead it is the interaction of the networks that shapes the urban form and dictates the expression of the city.

The landscape/soil set the context of the newly-built. The influence of landscape/soil in morphologic terms mainly concerns location, topography, sun and wind exposure, and soil and subsoil quality and aptitude and landscape composition. When prepare for the new development, the context need to be taken into consideration in terms of building the new order, the context could have already set the limits of the building activity, and identifying the transformations would help to build the compatibility between the future form and the current form.

The outdoor space was analysed into two categories: circulation space and outdoors meeting space. Circulation space is the moving space for the vehicles and pedestrians, it is the network that connects the settlements and other urban areas. It is constituted of a hierarchy system with different access opportunity to the people and other urban spaces connected. It points towards a relationship between the road network, outdoors meeting spaces and buildings in terms of formal and functional integration and spatial distribution of use or omits it, which indicates how this relationship is viewed and defines the dimensions and geometry of the building network (Pereira, n.d.); The outdoors meeting space morphology is delimited by the cultural and functional aspects, and is related to the definition of urban space production in a certain society. The morphological nature of the outdoor meeting space is usually omitted and narrowed into some green space and built outside the urban settlement, which, gradually swallowed by the growing of the settlement. Thus the outdoors meeting space is usually fragmented, cannot comprise a network, do not take the role as a regulator for the building outlines, hence the vertical urban form (Pereira, n.d.).

The buildings are the main element in the outdoors space's vertical component (Pereira, n.d.). The buildings are established as a consequence of the formal definition of the urban outdoors space, or its inducer (Pereira, n.d.). If the buildings act as the inducer of the outdoor space (a prevailing point), the outdoor space is the dependent variable of the buildings, which means the buildings will have more intervention to the outdoor space. While on the contrary, the exterior form of the buildings corresponds to the interpretation of the already established urban outdoors space's form on a planning level and is interpreted by designers when drawing building façades for the decided activities by the programmes (Pereira, n.d.).

3 TOWN LEVEL

3.1 LYNCH'S THOUGHT

Lynch's research on the city is based on a pragmatic psychological perspective, he focuses on how the city's image is cognised by people, namely the imageability of a city. He defines imageability as the quality of physical object which offers the observer a high probability of evoking a strong image, and aims to see how the urban physical environment could be manipulated to the imageability's advantage.

An environmental image could be analysed into three components: identity, structure, and meaning (Lynch, 1960). Identity means the individuality or oneness of the object, by which it could be recognized as a separable entity. Then the structure means the spatial or pattern relation of the object to the observer and to other objects, the object should have some practical or emotional meaning for the observer (Lynch, 1960). The three characteristics make the image workable. Considering the inconsistency and diversity of the meaning for different minds, it is wiser to focus on the physical clarity of the image (identity and structure) and to neglect the meaning respect. Based on the mental maps from different individuals of three main cities, he found the imageability of a physical urban form highly depends on the five elements: paths, edges, districts, nodes and landmarks.

The type of the elements of a certain physical entity is not set in stone. For instance, a road could be regarded as a path or an edge in different circumstances, a train station could be a node or a landmark. The elements need to be patterned together to supply an urban form. In reality, it is not the sole element that offers the way of organizing the image of the city, but the total patterns. Most observers seem to group their elements into intermediate organizations, which might be called complex (Lynch, 1960). The observer senses the complex as a whole, and in the whole, its parts are interdependent and are relatively fixed in relation to each other. The elements in the whole may reinforce each other, resonate so that they enhance each other's power; or they may conflict and destroy themselves, and thus the whole (Lynch, 1960).

3.2 SPATIAL DEVELOPMENT CONCEPT'S THOUGHT

The spatial development concept is based on a system of interrelated and integrated spatial elements which together make up the desired spatial development form for the municipal area (South Africa, Municipality of Mogale City/Municipality of Mogale City).

The essence of the spatial development could be abstracted as: the functional relationships between different spatial locations induces the movement of people, goods and services. The solid, durable movement give rise to specific routes that describe a network of interaction, where the function aggregate offer the people, goods and services to interact intensely gives rise to activity nodes, the intensity of the activity of the nodes gives rise to the development of a hierarchy of nodes of different sizes and importance depending on the level of interaction taking place in a node (South Africa, Municipality of Mogale City, n.d.). In the development of the network and the nodes, some related land use inside the networks and between the nodes are developed and act as the surfaces that tie the system of networks and nodes together.

The elements of a town is strongly related with the type of the society. In agriculture society, the movement network are mostly for the pedestrians, and the nodes are mainly characterised by the residential nodes, agricultural production nodes, several commercial nodes, and the surface are related to the network and the nodes. While in the modern society, the network must accommodate the modern transportation manners, and be capable to deal with the needs of movement produced by the people, goods and services. The activity nodes tend to be diverse, intensified and specialised, including a hierarchy of the residential, industrial, commercial and recreational activity nodes. And hence the modernisation and expansion of the surface. The network of activity nodes is reinforced by a system of activity spines which connect with these nodes. Activity spines can be defined as concentrated urban development along movement routes which are typically also major public transport routes (South Africa, Municipality of Mogale City, n.d.).

3.3 THEORIES OF URBAN STRUCRURE

3.3.1 BURGESS'S CONCENTRIC ZONE THEORY

The model was created in 1925 by E.W. Burgess, Robert Park, and Roderick McKenzie. As a result of examining a number of cities, especially Chicago, Burgess suggested the division of cities into a number of concetric zones which is the competence result of different social groups searching for the best area for their futher development. He pointed out that the typical processes of the expansion of the city can best be illustrated by a series of concentric circles, and as the city grows, each zone must spread and move

outward, encroaching the next one, creating miniature “zones of transition” and setting into motion various land-use successions. Thus it is essentially a growth model concerned with radial expansion as a concomitant process of urban growth (Klaaff and Schnore, 1971)

3.3.2 SECTOR THEORY

The Concentric theory of Burgess was based on the conditions of American cities in 1920. Since then, picture of cities had changed and therefore, Homer Hoyt proposed the sector theory in 1939. In this model, Hoyt took “the accessibility caused by transportation routes” into consideration, and concluded urban land use pattern was not in concentric circles, but rather sectors. Thus, the effect of direction and time was added to the effect of distance. Transport corridors, such as rail lines, public transit and major roads, are mainly responsible for the creation of sectors (Sector and Nuclei Urban Land Use Representations, n.d.).

Hoyt's sector model assumes a shape much like that of a pie from which pieces are cut at random. Each of the types of land use is orientated to an important factor in its growth and development, i.e. industry is drawn to railroads and waterways, commercial establishments are drawn to main traffic arteries; while residential areas tend to be situated around the other areas (the low class residential sectors are located around the various manufacturing and functional elements as a matter of convenience to the worker rather than being drawn to the CBD) (Riley, 1958). The model suggests that, over time, high quality housing tends to expand outward from an urban centre along the fastest travel routes (Torrens, 2000).

3.3.3 MULTIPLE NUCLEI THEORY

Following Hoyt's development of a sectorial city, Harris and Ullman introduced a more effective generalization of urban land uses. It was brought forward that many towns and nearly all large cities do not grow around one CBD, but are formed by the progressive integration of a number of separate nuclei in the urban spatial structure.

This model is amongst the most innovative descriptive or analytical urban models (Torrens, 2000). The city's CBD was losing its importance in relation to the rest of the city, it is innovative in its recognition of the city as multi-centered. The novelty in multiple-nuclei theory also lies in its acknowledgement of several factors that strongly influence the spatial distribution of urban activity: factors such as topography, historical influences, and special accessibility (Torrens, 2000).

4 METROPOLITAN REGION LEVEL

The metropolitan region includes the built-up urban area and the economically connected territory to the outside (Definition of Urban Terms, n.d.). It reflects the economic expanse of an urban area and is generally defined by the commuting hinterland of an urban area, and is the product of the industrial society which enables such efficiency of commuting.

There is not a unified theory discussing urban morphology at this level, since at this level, either explanation of the formation or sensing from a physiological perspective is tough. At this macro level, structure is the main focus in terms of urban morphology, thus the elements on this level should be the ones that could influence the changes of metropolitan region structure, the centre and subcentre, the dominant transit and the large-scale projects are those ones.

4.1 CENTRE AND SUBCENTRES

It is undeniable the main driver of the formation of the metropolitan region is the centralisation benefits of a larger modern economy and the decentralisation enabled by the new transportation technology to avoid the disadvantages of over-centralisation from the economy-geography perspective. As urban spatial structure is the spatial miniature of urban economic and social structure, the new spatial structures emerging to facilitate new forms of production (Smith, 2011).

Deconcentration is more difficult to trace in urbanized space, while the concentration of the urbanized space reflect as the urban centres and subcentres. Though the reality is more complex, a simplified picture of metropolitan regions shows a core centre city that is surrounded by its hinterland and is characterised by a clear hierarchical relationship between the core and periphery (Smith, 2011). In this simplified model, the core city is supplemented by the additional centres of various sizes, however, the core city usually are substituted by a city network of several cities with at least two equal or at least comparable cities (Germany, GIZ, 2014), for instance Rotterdam–Den Haag metropolitan region.

The dominant centre(s) of a metropolitan region is(are) characterised by the large amount of producer services, the contradiction between the demand and supply of central offices has prompted the

development of other tertiary centres. Besides, the high-tech industry centres, secondary-industrial centre, political and institutional centre, residential centre, retail centres distributed across around the metropolitan areas, some constituted the subcentres, while some others could also act as a dominant centre. Holly (1993) has concluded four metropolitan forms: monocentered, multinodal, noncentered, multicentered model. And he found the multinodal model has general support in reality. The centers of the metropolitan region are the main concern of his study (even can be seen from the names of the models). Since the layout of the centres and the relations between the (sub)centres constitute the main structure of the metropolitan regions.

The centre of a metropolitan region has experienced significant change in terms of the landscape, the producer industry which is the main industry of the central area is characterised with the skyscrapers in high density and may have more landmarks. While the subcentres would have a totally different built environment either from the centre or between themselves because of the functional differences and the inherent nature of the specialisation. Thus, the urban morphology is absolutely different at the neighbourhood level or urban level because of the spatial structure difference.

4.2 DOMINANT TRANSIT

One of the main purposes of the city is to supply its residents with accessibility. Before the industrial revolution, in which era walking is the only travel mode, cities are all monocentric with a walking accessibility. The modern travel mode enables much longer daily travel distance, promoting the decentralisation of the city, which is a necessary condition for the cities to reach a metropolitan region. Accessibility is the main reason for the transportation to transform a particular site's form, since higher accessibility would attract more development chance for that area, which will change the land use pattern of that area, hence the whole morphology. For instance, the improved accessibility may induce a new shopping mall which will affect the flow of people and the surrounding morphology, and this will in turn enhance the improvement of accessibility of that area. Some of the central areas is developed with certain transportation's development. The term "edge cities" describes the process whereby new commercial centres were created in post WWII USA at the urban fringe, typically near major highway intersections (Smith, 2011). The development of those newly built attractions will change the flow of the people and hence the structure of the metropolitan region.

The modern transportation could act as an impetus of decentralisation. However, since the development of the transportation could not only induce the people to move outwards, but also enhance the accessibility of the traditional centre for the people living in outer fringe, it could also act as a centripetal force for the spatial structure. The dominant mode of the transportation displays its particular network logistics to its affiliated area, thus introduces complementary built-environment forms they encourage, pulling urban development towards certain spatial structures (Smith, 2011).

Thomson proposed urban archetypes that fully embrace the complementary spatial structure for particular transport modes. For rail dominated cities, the complementary spatial structure is the monocentric form which provide the high accessibility to the centre, whilst orbital accessibility is poor; while the full motorisation archetype provides high accessibility across the whole city, which encourages a low density dispersed pattern (Smith, 2011). Though the mode is to some extent extreme, some similar examples in the real world could be found. Tokyo metropolitan area, which is underpinned by its rail system, retain its strong centre in the inner city; Copenhagen, with a finger plan supported by the rail system, still shows a more monocentric structure than its European cousins; while Los Angeles, the car-dominant area, is famous for its non-dominant centre structure and the notorious urban sprawl.

Urban transportation networks have the characteristic of path dependence. Since the development of urban transportation system calls for a great deal of investment, the demolition and reconstruction of the system may more than double the investment, which is almost impossible. Once the dominant transportation system has formed, the development of the other system may have little effect on the whole, the built environment of the area tend to enhance the original dominant system. Therefore, once constructed, the dominant transportation system of a metropolitan region tend to last for a fairly long period, and will structure the metropolitan region in its own way.

4.3 LARGE-SCALE PROJECT

Large-scale project, which is always on the planning agenda of many metropolitan regions, seeks to attract the flows of international investments in the globalization context. These large-scale projects could range from the revitalisation of the traditional city centres (used to be the dominant form in around 1950s) to the focus on the periphery of the city (dominant form of the contemporary world).

The change has displayed the transformation of the backdrop of the integration against which the largescale projects involved themselves in, which could also help to explain the formation of the

metropolitan region. With regard to globalisation, the location preference's change could reflect the changes as how the cities are willing to connect themselves with the global market; With regard to the transport aspect, the preference's change shows the technical advances and the increase of car ownership in the last few decades; with respect to the economic development, the preference's change offers a clue of the transformation of the secondary industry based economy to a tertiary industry based economy and the choice change of those prime offices; with regard to the spatial pattern, the preference's change illustrates the construction of the infrastructure and the government's focus change. All of these changes could all contribute to the location choice changes of the large-scale projects. Those large-scale projects could be regarded as the physical entity that serves to connect the metropolitan region, and promote metropolitan urbanisation, since these large-scale projects are symbols that the city no longer behaves locally limited, and could also act as the combination joint of the metropolitan region, such as an airport.

Though there are extremely changes in terms of the location choice and related built environment, some invariable ingredients could still be found in the large-scale projects. The symbol function which mainly manifests in the architectural excellence is a significant one, another one could be summarised as the expected associated spatial outcome. An airport could be a typical example in explanation, since the airport could act as the anchor in increasing volumes of business travellers, tourists and goods flow through airports, and may lead the hinterland to expand into employment, residential hubs. London has utilised the 2012 Olympic games to "create" its east as a new prosperous hub with the related office, real estate, commercial, tunnel development.

These projects could not only change the morphology of its own area, but also the structure of its own city or even the metropolitan region. The influence of the large-scale projects could be long-term, the prospects of the development could attract subsequent investment, such an area may probably become a subcentre of its situated city and also enhance the role of its situated city in the metropolitan region, thus transform the structure of the metropolitan region.

5 SYNTHESIS AND DEVELOPMENT OF THE FRAMEWORK

5.1 FOCUSES ON VARIOUS LEVELS

After discussing the thoughts at different levels, a synthesis is essential to identify the similarities and differences and helpful to develop a framework in terms of urban morphology (Table 1). At the neighbourhood level, the focus is mainly on the micro level, though Pereira's thought used the terminology urban form, urban style, her focus is still on how could the newly-built pattern be designed into tissue thereby fitting into the existent landscape and form an urban style altogether, thus the terminology used to cut into the urban morphology at this level is pattern; the elements examined by Conzen and Caniggia are building, plot (lot), street (route), block, land use, they see how those elements patterned together, formed different types, then identify the process of morphological changes. In Pereira's thought, buildings and the street system still exist, but she has also emphasized the landscape/soil and the word network, which means that in the newly developed environment, the original landscape of that city and the natural environment should be considered while developing; and the word "network" also reflect the integration focus between the newly-built and the existent entity. The terminology and the elements examined reflect the focus of the this level are the small part landscape of a city and its pattern, type, the formation process of it and the compatible ability with the original part.

At the town level, from the perspective of the terminologies that cut in the urban morphology, the angle of this level is more macro than the neighbourhood level. Though in Lynch's thought, pattern still retains, the meaning has changed, pattern is mainly used to build the identity of the entities so that it could be structured to form the complex, and the whole, thereby developing the whole image of the city. In the spatial development, the focus is on the essence of the spatial development of the town, from a relatively physical and abstract perspective. In Burgess, Hoyt, Harris and Ullman's thoughts, the urban structure has become the focus, which is different from Lynch's thought, although the two structures both means relationship: Lynch's thought's structure mostly focuses on the physical relationship, while the structure of Burgess, Hoyt, Harris and Ullman's thoughts focus on the functional aspect, the physical structure serves as the spatial reflection of the functional structure, this is why the function is the element they examined. In Lynch's thought, paths, edges, districts, nodes and landmarks are the elements which serves to develop the imageability, the elements could also be used to explain the urban morphology, for instance, the landmark could be a drive of the development of the surrounding area, the edge could be seen as an obstacle that block the continuous development, two kinds of urban morphology developed in both sides of the edges. At this level, the mainly focus has developed from the part to the whole, how could the whole been developed and how could the whole run and reflect in spatial dimension.

The metropolitan region, which is a product of the post-industrial society, does not have a unified thought in exploring its morphology. Its focus is so macro that the pattern cannot fit in analysing its morphology,

whereas structure which focus on how the metropolitan region run and the relationships between different parts has been the focus at this level, thus urban structure is the terminology cutting into morphology at this level. The elements examined are the ones that could influence the whole structure of the metropolitan area. At this level, the main focus is absolutely on the whole, how the spatial structure was and evolved into the current one.

Scale	Terminology	Method	Elements examined	Typology
Neighbourhood	Pattern	Conzen	Building, plot, street, block, land	
	Urban tissue	Caniggia	Building, lot, route, block, land use	
	Urban form, urban style	Luz Valente-Pereira	Landscape/soil, the outdoors space(circulation space network and outdoors meeting space network) and buildings	
Town	Pattern, urban structure	Lynch	Paths, edges, districts, nodes and landmarks	
	Spatial development		Nodes, networks, and surfaces	
	Urban structure	Burgess, Hoyt, Harris and Ullman	Urban function	Concentric, sector, multiple-nuclei
Metropolitan region	Structure		Centre, subcentres, dominant transit, large-scale projects	Monocentered, multinodal, noncentered, multicentered

Table 1 - Synthesis of the different thoughts

5.2 SYNTHESIS AND DEVELOPMENT OF THE FRAMEWORK

After discussing the different focus of urban morphology at different levels. Offering a definition of urban morphology is suitable at this stage, based on the analysis above, urban morphology could be defined as the research to explore the change of physical urban form as the time flows, with different focus of urban form at different levels: at the neighbourhood level, urban form means the patterns and their integration to form a landscape, at the town level, urban form means the formation of the whole and the structure of the whole, at the metropolitan level, urban form means the organisation and structure of different wholes to form a metropolitan region.

Scale	Elements Examined (original)	Elements Transplantability								Element Examined (improved)
Neighbourhood	building, plot, street, block, land use, open space, landscape/soil	building	plot	block	street	land use	open space	\	landscape/soil	building, plot, street, block, land use, open space, landscape/soil
Town	network (path), edges, districts, nodes, landmarks, urban function	landmark	node	district	network (path)	function	\	edge	natural condition, original urban form	network (path), edges, districts, nodes and landmarks, urban function, natural condition, original urban form
Metropolitan region	centre, subcentre, dominant transit, large-scale projects	large-scale projects	sub-centre/centre	sub-centre/centre	dominant transit	function	\	dominant transit	natural condition, original structure	centre, subcentre, dominant transit, large-scale projects, natural condition, original structure

Table 2 - Elements Transplantability and Analytical Framework

In order to get a systematic framework for the urban morphology analysis, some minor difference of the difference should be neglected, for instance the plot and lot in Conzen and Cannaggian's thought respectively, which means some of the elements could be substituted by one element due to the similarities. Besides, we could observe the transplantability of certain elements at the different levels, such as the street – path/network—dominant transit, such transplantability ability at different levels could reflect the continuity of the urban form at different levels, and could also act as the complements of the elements of different levels. The transplantability of the elements and the improved analytical framework is shown in table 2.

The elements at a level is not set in stone, for instance, the large-scale projects could also be the nodes at the town level and building at neighbourhood level, the transplantability pattern listed in the diagram is just the one that meets the contrast at each scale. In reality, there could also be some confuse in the identification of the elements, for instance a train station which could be identified as a node at the town level could also be regarded as an edge, since the urban form behind and in front of the train station could be very different; the train station could also be a landmark at the town level, could also be a large-scale projects at the metropolitan level as long as the train station is big enough and has aroused certain developments, could also be a building at the neighbourhood level. Therefore, the framework offer an analytical framework for the urban morphology, and also supply some flexibility for the analysis, the entity could be identified according to the level it stayed in and the function it act in the analysis.

5.3 UTILISATION OF THE FRAMEWORK AND THE SUBSEQUENT RESEARCH

The analytical framework is helpful to detect what kind of elements is the key in studying urban morphology at different levels, though the different focuses of urban morphology has already been identified, with the analytical framework, a clear clue about how could the different focus at different levels be realised in the study of urban morphology could be acquired, and get to know the different elements that is going to research at different levels. For instance, if urban morphology at the neighbourhood level is the research target, the building's pattern should be a key point, which would include the buildings' façade, while at the town or the metropolitan region level, the façade of the buildings cannot be the research focus.

In the following research, the policy will be introduced, and the relationship between the polices and the urban morphology at different levels in China is going to become the research focus. Although the research on the policies and the urban or metropolitan region structure has already had some outcome, such research on neighbourhood level is still absent and is worth researching. And China, as the emerging country in the last few decades, the speed of its urbanisation has dwarfed its counterparts. The urbanisation process also has its own characteristics. But according to the characteristics of the Chinese jurisdictional boundaries, the analytical framework which is based on the western thoughts need to be adapted to the Chinese reality, and then used into the research on policy and morphology.

1 INTRODUCTION

1.1 TWO TYPES OF PLANNING

Urban planning is the result of political decision-making, but planning methods or tools cannot act as a panacea for problems in the city of globalisation and urbanisation. In general spatial planning theory, there is two type of planning, conformance-based planning, and performance-based planning. According to Umberto (2008), these two planning models relate to respective cultural assumptions and technical procedures finally producing, in virtue of their juridical effects, different operational consequences on spatial development and on territorial governance. In conforming planning, a normative prescription or standard will be established, end up generating project plans that focus on the adoption of the project. Although material effects of the plan easily to be evaluated, the initial plans may be misread or interpreted in unexpected ways and result in otherwise outcomes. In performing planning, the planner will propose a vision of future spatial development and make future open, then strategic plans produced in the dynamic negotiation of decision making. That make the objectives of the plans remain flexibility but the effects hard to be evaluated (Faludi, 2000; Umberto, 2008). The former was widespread in almost all European countries and the United States, and the latter can be seen in Dutch and United Kingdom, now being increasingly practised across Europe.

1.2 FROM TRADITIONAL ZONING TO PERFORMANCE ZONING

In planning practice, the conformance-based planning is usually implemented as traditional zoning to achieve the planned objectives. Traditional Euclidean zoning separates land uses in a hierarchy based on land use type, dividing residential, commercial, and industrial land uses in prescriptive zones. Under the traditional zoning tools, planners delineate the scope of different land type, establish the category of land

using, and control the intensity of development in an urban area. However, traditional zoning has been actively criticised for its inflexible, narrow focus and blunt approach to land use. After that, the reflection on the use of traditional zoning gradually led to the further development of the various types of land use controls, resulting in the need for zoning to develop in the direction of flexibility, diversity, and localisation.

Because of the rigidity of Euclidean zoning, an alternative to land use control arises from the perspectives of performance-based planning. Performance zoning, a flexible land development method, trying to improve decision making in land use control, building regulation, and natural resource management. In Douglas C., Neil G., and Brendan J.'s view (2006), performance-based approaches are composed of two components: first, criteria that describe the desired end result, and second, methods to define standards used to measure the acceptable limits of impact to ensure the desired end result. Since the early 1950s, performance standards have been employed in land use planning.

To control adverse impacts of industry, the United States adopted industrial zoning through the control of noise, vibration, air pollution, radioactive radiation, glare, humidity, fire, and explosive hazards. Performance standards based on carrying capacity, the threshold of safety, and environmental quality are proposed as a means to replace prescriptive (and permissive) zoning. Then, it has been employed in industrial standards, building codes, design standards, zoning, and entire planning systems (Douglas C. et al., 2006). Industrial performance standards tend to be commonplace in many zoning ordinances today, but the translation of performance-based approaches to other land uses less frequent. Hence, it is required to plan other types land likes the agriculture land in urban development through such practices.

The purpose of this paper is to discuss the phenomenon of the gap between the plan intents and the actual results. With this intention, we conduct a thorough literature study on conformance-based and performance-based planning theories first, present a tendency from traditional zoning to performance zoning. An attempt of conceptualization of the role and functions of the agricultural land in urban areas, useful to frame the discussion, will follow. The article will then focus on the current planning issues of urban agricultural zones in Tainan City, Taiwan. By proposing performance-based land-use control tools on urban farmlands, we believe it could avoid inappropriate land-use damaging the farmland and negative externalities. Finally, a concluding section will sum up the main findings of the article.

2 CONTEXT

2.1 THE URBAN LAND USE PLANNING SYSTEM IN TAIWAN

For the sake of effective land resource management and to pursue sustainable development, land use and development of all land in Taiwan are managed through a varied land use planning and control system (Lin, 2010). The framework of a planning system in Taiwan was first established by the Urban Planning Act of 1939 and its implementation byelaw. After the Amendment of Urban Planning Law in 1973, new regulation for the enforcement was introduced and published as the Regulation for Enforcement (of Urban

Planning Law) for Taiwan Province in 1976 (Chen and Chih, 2010). From then on, Taiwan's land use planning system is indeed established (see Figure 1). According to the Urban Planning Law in Taiwan, land use in urban areas is controlled by zoning regulations. By law, any urban land can be planned for any of ten land use zones, which follow: residential zone, commercial zone, industrial zone, administrative zone, cultural and educational zone, landscape zone, reservation zone, conservation zone, agricultural zone, and others. The use zones can also be broken down into sub-zones on the basis of intensity.

Figure 1 - The land use planning system in Taiwan
Source: Lin, J. C.-Y. (2010). Planning and development of industrial land in Taiwan.)

However, there are many defects in implementations. First is the poor administration leads to the low land-use efficiency. Second, the strict and rigid regulations limit the flexibility and potential of future land development. Thirdly, the disregard of the environmental carrying capacity in the zoning plan.

2.2 THE IMPORTANCE OF URBAN AGRICULTURE

Urban agriculture (UA) is considered as an important source of food, fuel, and income in developing countries. The concept of urban agriculture arises from the strategy of sustaining Sub-Saharan African (SSA) cities, based on the pursuing of food security. In Smit, Ratta, and Bernstein's point of view (1996), UA refers to an industry that produces, processes and markets food and fuel, largely in response to the daily demand of consumers within a town, city or metropolis, on land and water dispersed throughout the urban and peri-urban area. As practised around the world, urban agricultural activities include horticulture, aquaculture, livestock production, and forestry.

It must be recognised that urban agriculture plays a significant role in the urban ecology system. A rapidly increasing urban population has implications for demand for food, potable water, shelter, transportation and health and recreation services, and will pose additional stress on natural and cultural resources (Quon, 1999). Therefore, in the process of urban planning to consider the principles and location of urban agriculture to ensure that the functions provided by the effectiveness.

The importance of urban agriculture is increasingly being recognised by international organisations like UN-Habitat, OECD (Organization for Economic Co-operation and Development), EU (European Union), and FAO (World Food and Agriculture Organization). According to a global partnership organisation RUAF Foundation (Resource Centres on Urban Agriculture and Food Security), there are several benefits of urban agriculture. The contribution of urban agriculture to food security and healthy nutrition is probably its most valuable asset, also complements rural agriculture and increases the efficiency of the national food system. Through economic impacts, urban agriculture may function as an important strategy for poverty alleviation and social integration. Not to mention the contributions to urban ecology, be a crucial part of the urban environmental management system. In the discussion about the multi-functionality of agricultural, the farm function can be said in three main dimensions. First are the food and economic function, second for the ecological and environmental functions, and third for the social and cultural functions (Lee et al., 2009).

2.3 URBAN AGRICULTURE DEVELOPMENT VS. URBAN AGRICULTURAL LAND DEVELOPMENT

Portugal may be known as an agricultural country, but the intense urbanisation process changed the focus on agriculture since the middle of the XX century. According to the results of the European Union (EU) Farm structure survey (FSS) 2010, the utilised agricultural area (UAA) represents 40 % of the Portuguese territory. From 2000 to 2010, the UAA decreased by 5 %. With the actual reduction of agricultural activity, most shantytowns already transformed in planned urban areas, being the work of the immigrants from former Portuguese-speaking countries in marginal areas.

In Portugal, urban agriculture is seen as green infrastructure. The Portuguese law ("Decreto Regulamentar" nº 11/2009, 29 of May), recognises agriculture as a compatible activity within the green infrastructure mentioning that "green spaces are areas with functions of ecological balance, open air recreation, leisure, sports and culture, agriculture or forestry" (Cancela, 2009).

Different from urban agricultural development in Portugal, the agricultural zone is delineated in urban planning areas in Taiwan. According to Urban Planning Law in Taiwan, urban planning areas can set agricultural zone and conservation zone, to limit their use of building, depending on the topography, using status, or the needs of military security. The meaning is that it does not regulate the necessity of painting the agricultural zone at urban planning area, and does not take into account the local demand for farmland. As shown in Figure 2, we make a thorough inquiry about the growth of Taiwan's urban agriculture zones. In the past sixteen years, the urban planning areas in Taiwan gradually increased, as for the urban agricultural zones continuously decreased then slightly climbed in nearly three years. The proportion of urban planning areas in Taiwan has fallen 21.73% to 20.89% by 0.84% from 2001 to 2016. This situation is known for that the demand and necessity of agricultural land recently reduced, but it still quite extensive in urban planning areas. In Figure 3, at the end of 2016, there were 435 urban planning areas in Taiwan, with a total area of 482,692 hectares, accounting for 13.33% of the total national lands. The urban planning area contains non-urban development areas and urban development areas, the agricultural zones are part of non-urban development areas, reached 100,780 hectares, account for one-fifth of the Taiwan urban planning area. It is crucial that the role and function of rural zones should be clearly defined when establishing the regulation of land use and the strategy of land development.

Figure 2 - The growth of Taiwan's urban agriculture zones
 (Source: Construction and Planning Agency, Ministry of the Interior, Taiwan.)

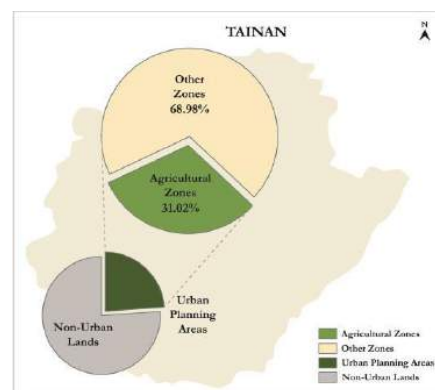

Figure 3 - The proportion of Taiwan's urban agriculture zones in 2016
 (Source: Construction and Planning Agency, Ministry of the Interior, Taiwan.)

Owing to the general thinking on sustainable development, planning theory in Taiwan's national development goals have a conversion from economic growth to resource conservation. The National Land Planning Law in Taiwan published in 2016, involving the concept of growth management and emphasising the rehabilitation of land resources. Thus making Taiwan urban planning system has been a significant change towards the performance-based planning. However, nowadays land use control tend to squeeze natural resources areas because of the needs of urban development. This condition may arise many problems of the current land use, results in the gap between the plan intents and the actual results.

Agriculture zones are an important part of the land in Taiwan territory, but it seems that the urban planners have not fully take into consideration for that land use to develop in the past. In the urban context, due to the lack of real guidance of master plan and appropriate management, regulatory ineffectiveness, as a result, the actual use of farmlands usually deviate from the purpose of agriculture. From property market perspective, since the farmland has set to be as reserved land for future urban developments. The expected value of such under-used lands has been increasing. On the other hand, the violation of the zoning ordinance is the most frequent problem encountered that converted farmland into factories or housing illegally. As a result, the poor environmental quality is an inevitable consequence in addition to challenging the land-use regulations.

3 MATERIAL & METHODS

Tainan City is one of the municipalities located in the southern region of Taiwan. The study area of this article is the master plan of Tainan City, which contains the original Tainan City, as shown in Figure 4. After the administrative upgrade of the five cities in 2010, the original Tainan County merged into Tainan City. Since that, the role of original urban agricultural zones become fuzzy. Under the goal of food security and territory use sustainability, this study is to explore the problem of urban development and resource utilisation. It refers to the problem about how to protect the prime farmland and the significant agricultural resources through the location planning and overall development guidance program of the agricultural zone in Tainan's master plan, so as to make the best use of the land.

In the analysis data, this case study used the 2016 Tainan City Fifth Overall Review of Master Plan as the basis for zoning control, with the 2006 National Land-Use Inventory as the basis for the current use of land. In the process of analysis, we first review the history of urban planning and development in Tainan City, understand the position and function of the agricultural zone in Tainan City. Then the GIS overlay analysis is conducted to compare the Tainan City urban agricultural zone with the farmland in National Land-Use Inventory, to find out differences in the area and distribution of land use. Through the case study, the current issue of the agricultural zone in Tainan City urban planning area is discussed, also the lack of planning process. At last, this article is trying to clarify the role of agricultural zone relationship between urban planning and urban development.

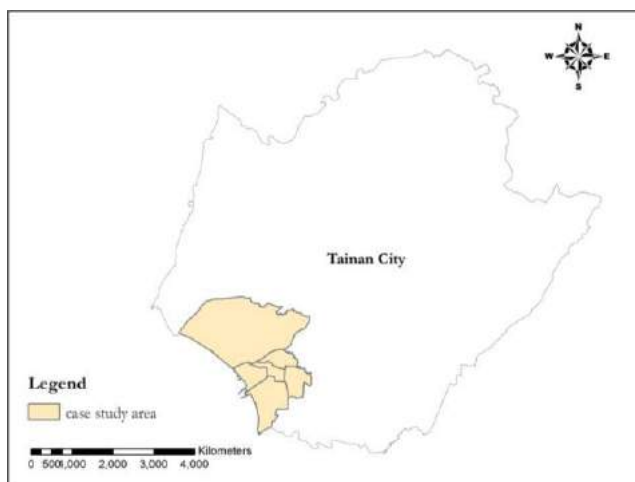

Figure 4 - The scope of study area

4 CASE STUDY

4.1 THE URBAN AGRICULTURAL ZONES IN TAINAN

In the past sixteen years, the percentage of urban agriculture zones in Tainan's urban planning areas gradually decreased, as shown in Figure 5. The trend of development is the same as Taiwan nowadays situation seems that the demand and necessity of agricultural land recently reduced. At the end of 2016, there are 16,285 hectares urban agricultural zones be delineated, accounting for 31.02% of the urban planning areas, as shown in Figure 6. In Tainan, primary industry is mainly distributed in the original Tainan County and the original Tainan City where this paper study for basically see the secondary and tertiary industry as the main function of positioning. By demand prediction for agricultural resources place planning, overall agricultural land needs in Tainan City will reduce in the next ten years. So the existing urban agricultural zones and the newly planned should be defined clear to make sure the farmland function is indeed played.

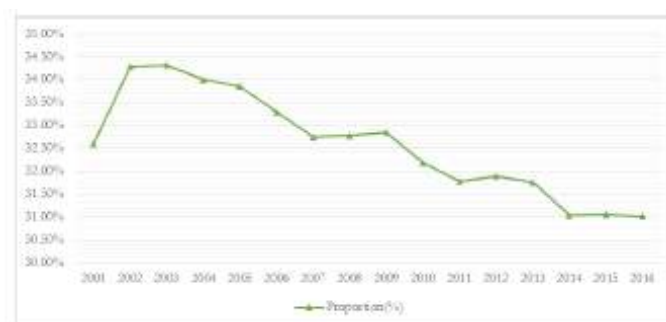

Figure 5 - The growth of Tainan's urban agriculture zones
(Source: Construction and Planning Agency, Ministry of the Interior, Taiwan.)

Figure 6 - The proportion of Tainan's urban agriculture zones in 2016
(Source: Construction and Planning Agency, Ministry of the Interior, Taiwan.)

4.2 ZONING IN MASTER PLAN OF TAINAN URBAN PLANNING

In Tainan City, the place for primary industry such as agricultural use mainly locates at the edge of urban areas. According to the 2003 Tainan City Fourth Overall Review of Master Plan, the agricultural zone and conservation zone can be altered after review, if there are needs for overall development in government major public works plan. Comply with this principle, the agricultural region gradually subject to aggression and marginalisation with Tainan city development needs.

According to the 2016 Tainan City Fifth Overall Review of Master Plan, the administrative area of land use project contains North District, Eastern District, Annan District, Southern District, West Central District and part of Anping District in Tainan City, 17,524.94 hectares. In concert with the planning period of Taiwan regional plan, regarding 2026 as the target year. The planned population is set at 1.1 million. After overall review, the land use project delimits 33 categories of zone, and the public facilities land project set 48 kinds of land. The subtotal area of former is 14,183.25 hectares, accounting for 80.93% of the total urban planning area; the latter is 3341.69 hectares, accounting for 19.07%. In Land use zoning map of Tainan (Figure 7) shows the distribution of each zone and the public facilities land. As shown in Table 1, in the urban planning area, Tainan City's zoning includes 4542.61 hectares of the residential zone, 439.34 hectares of commercial zone and 1037.46 hectares of the industrial zone. Among this, the area of the agricultural zone is 5212.92 hectares, accounting for 29.75% of the total planned area.

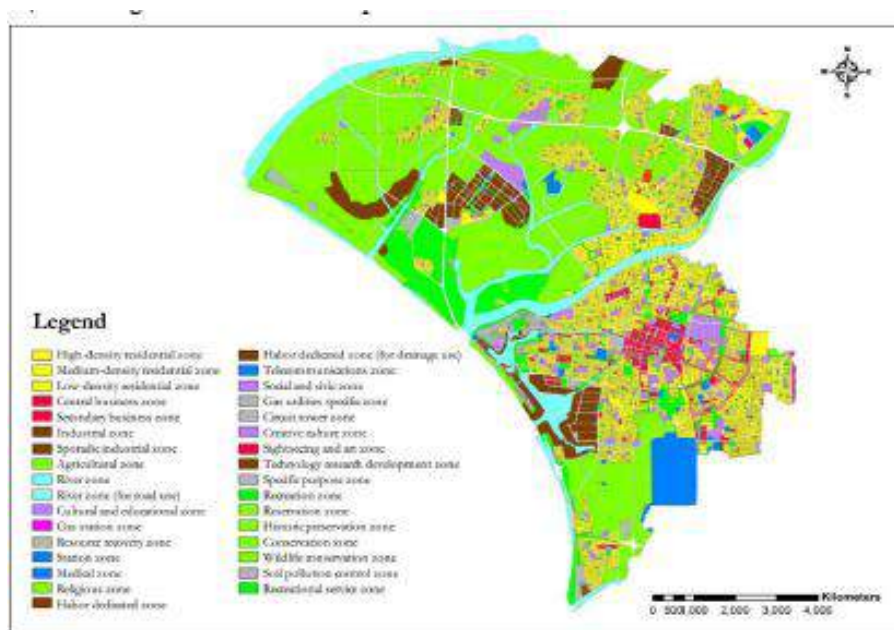

Figure 7 - Land use zoning map of Tainan
(Source: Tainan City major plan 2016)

Land use item	Area (ha)	Proportion (%)	Land use item	Area (ha)	Proportion (%)
High-density residential zone	128.25	0.904	Habor dedicated zone (for drainage use)	0.48	0.003
Medium-density residential zone	1526.29	10.761	Telecommunications zone	7.66	0.054
Low-density residential zone	2888.07	20.363	Social and civic zone	0.08	0.001
Central business zone	220.17	1.552	Gas utilities specific zone	2.32	0.016
Secondary business zone	219.17	1.545	Circuit tower zone	0.02	0.000
Industrial zone	1036.78	7.310	Creative culture zone	30.77	0.217
Sporadic industrial zone	0.68	0.005	Sightseeing and art zone	2.34	0.016
Agricultural zone	5212.92	36.754	Technology research development zone	2.78	0.020
River zone	1170.62	8.254	Specific purpose zone	10.74	0.076
River zone (for road use)	10.78	0.076	Recreation zone	486.00	3.427
Cultural and educational zone	95.54	0.674	Reservation zone	2.71	0.019
Gas station zone	6.12	0.043	Historic preservation zone	26.24	0.185
Resource recovery zone	0.48	0.003	Conservation zone	483.46	3.409
Station zone	3.58	0.025	Wildlife conservation zone	529.19	3.731
Medical zone	0.47	0.003	Soil pollution control zone	35.56	0.251
Religious zone	30.75	0.217	Recreational service zone	3.16	0.022
Habor dedicated zone	9.06	0.064	Total of land use zoning	14183.25	100%

Table 1 - The land use project in 2016 reviewed Tainan master plan
(Source: Tainan City major plan 2016)

Following the Regulation for Enforcement of Urban Planning Law for Tainan City, the agricultural zone delineated to maintain agricultural production. In addition to normative use purpose of food security, agricultural zone only applies for the following use:

- Farmhouse building
- Agricultural output and marketing necessary facilities
- Leisure agricultural facilities
- Rural revitalization related public facilities

However, if the Tainan city government censor approved, may have the following facilities:

- Utility infrastructure
- Earthwork stacking treatment
- Wasted resources recovery
- Storage site
- Parking for motor transportation
- Passenger and cargo terminal and subsidiary facilities
- Car driving training ground
- Social welfare facilities
- Kindergarten
- Gas station
- Outdoor stadiums and sports training facilities with an area under 0.3 hectares
- Temporary facilities for government major public works plan

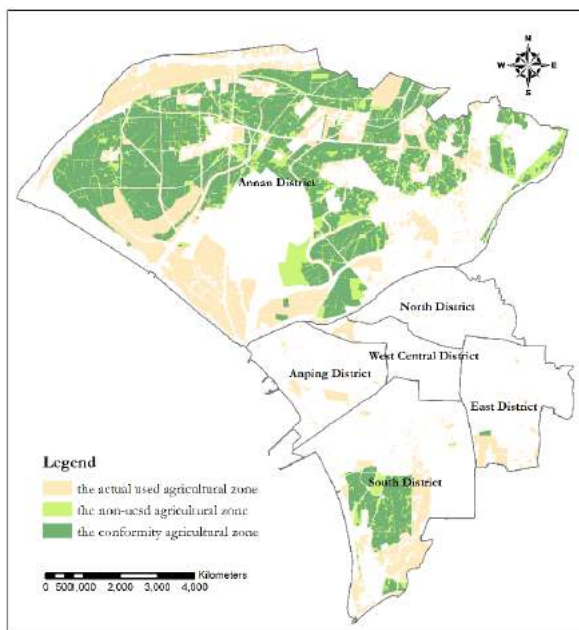

Moreover, before urban plan published, where the land in the agricultural zone is scheduled to be the construction land or has been built for residential use in a legal building base, the building and usage could continue under the relevant regulation.

4.3 EVALUATION THE OUTCOMES OF AGRICULTURAL ZONE IN TAINAN MASTER PLAN

After the merger and administrative upgrade in 2010, the original Tainan Country and Tainan City border facing land consolidation. Initially, the boundary agriculture zones are often used as the isolation areas with other zones and retained as the hinterland of urban development and expansion. However, the principles and objectives of nowadays agricultural zones are not clear enough to make the land resources ineffective.

According to the overlay analysis above the land use zoning control of Tainan master plan and the current use of National Land-Use Inventory, there is a difference between the exact area and the location distribution, as shown in Figure 8. In urban agricultural zones of Tainan City major plan, the current use of agricultural lands is 4058.55 hectares, account 79.02% of the total urban agricultural zones; the current use of non-agricultural lands is 1077.42 hectares, accounting for 20.98% of the total urban agricultural zones. On the other hand, the region not in urban agricultural zones but for farmland use with an area of 2861.56 hectares

To further explore the agricultural location and spatial planning issues, the compliance of urban agricultural zone in Tainan can involve two conditions. One is the plan guide urban agricultural zones through

regular overall review of master plan³ that propose the developmental principle. In this condition, former agricultural zones may transfer into another zone legally. Moreover, the continuous agricultural zones should use for the contained item to achieve conformity. The other is urban agricultural zones that do not be transferred but become non-agricultural lands or the current use of farmland not located in urban agricultural zones. That means modern farming using have a violation or illegal phenomenon, indicating that the planned agricultural zones do not meet the needs of the actual use of agriculture land.

Figure 8 - The conformity of urban agricultural zone in Tainan

According to the Urban Planning Law in Taiwan; the government should overall review the urban plan at least once in three or five years.

By evaluating the conformity of the urban agricultural zone, several questions results from the plan intents and the real results do not meet being noted here. First of all, urban expansion erodes the production function of the agricultural area. When major public works were developing and traffic transportation constructing, the accessibility of outside agricultural area, therefore, be improved. Then originate the needs for contained using item and functional transformation. Second, the contained using item under the Regulation for Enforcement of Urban Planning Law tend to departure from the intent of agricultural purposes. Take Tainan City, for example; the existing contained using items are so loose that do not match agricultural purposes. There is no guidance to improve the necessary, location and size control of land use, leading to the status of agricultural using become fragmented and scattered. The third is the trend of illegal use of farmland to illegal factories. To avoid the violation of land use, department of urban planning should strengthen the statute and strictly banned.

In summary, the phenomenon of current use in urban planning agricultural zones do not meet the original plan will have an adverse impact on the agricultural production environment, green landscape, and living environment also be severely damaged.

5 CONCLUSION

Facing the change of planning thinking in Taiwan, the setting of whole development guiding principles and the proposal of urban plan vision should be taken into consideration seriously. From then till now, Taiwan's urban development and land use control are all conformance-based planning, arise many problems of the current land use, which result in the gap between the plan intents and the actual results.

Given the nowadays urban agricultural zone, take Tainan master plan for a case study, it seems that urban planners in the past have regarded the urban agricultural zone as a preparatory land for urban development. At that point, the performance of urban planning areas tends to violate or alter the ground use due to the weak contained using item. Therefore, in the future urban planning, the role and multi-functionality of urban agricultural should be redefined to maintain the quality of urban living space. The urgent priority is to confirm the value and necessity of existing urban agricultural zone, make sure to protect the vital and sustainable agricultural land resources. Through taking a look at the origin of urban agricultural zone delineating, we wonder that why and where that zone exists in current land use system. The debate tries to seek for the plan intents in the regulation of zoning, as formerly discussed. All of the urban agricultural zones should correspond with the needs and position in future urban agricultural development.

In response to environmental and socioeconomic conditions change, the substantive urban development does not need such amount of agricultural zone that existed. What urban planner can do is to manage the land resource effectively through kinds of control tools. Essentially, performance zoning mechanisms should be established to ensure the multi-functionality of urban agricultural in the development of land use control tools. At the meanwhile, the coordinated sets of measures should be purposed in planning and management of urban agricultural zone to provide government reference.

From the perspective of sustainable development, taking agricultural land resources as green infrastructure, the reduction of energy consumption in urban could be accomplished by a low carbon approach to urban planning. The valuable but not needed agricultural zones in urban planning areas can be used as green space to promote the sustainable use of land resources in Taiwan.

1 INTRODUCTION

The tacit understanding of a singular path to development still permeates the practice of urban planning in both Global South and North, ignoring “the world epistemological diversity [and] the conflictual plurality of the knowledges that inform social practices” (Santos et al., 2004, p. 19). Even when the interest to situate the local within a globalised world is identified, there is little research that investigates local networks, reflecting what Souza (2011) describes as ‘knocking on the doors, but not entering the houses’, as researchers do not delve into the everyday. Even still, when research does investigate the everyday, the natural step is to appropriate EuroAmerican (that is, central) theoretical frameworks to deal with peripheries, disregarding particular socio-spatial features of local practices. So, the tooling is usually inadequate and out of context reflecting a hegemonic ‘central’ process that packs places full of singularities in the category ‘the periphery’.

As a result, short-sighted strategies are not able to encompass micro-scale alternatives that might be brought about from specific socio-spatial practices, thus not challenging the socio-spatial inequalities and inequities deep-rooted in countries of the global South, such as Brazil. Theory and praxis fail to value local initiatives that may lead to local transformation, reinforcing the hegemonic power relations at play in the everyday. The lack of interest in what we will call bottom-bottom tactics (Melgaço, 2016)—those that will happen at a microlocal scale and in the everyday level of a given socio-spatial group—reinforces the ‘one solution for all’ approach. This phenomenon is even more deleterious in the Global South, where, as already said, EuroAmerican theories are often decontextualised to further explain peripheral phenomena without the due contextualised critical approach.

At LAGEAR (Graphics Laboratory for Architectural Experience) and MOM (Living in Other Ways), two research groups at the School of Architecture at the Universidade Federal de Minas Gerais in Brazil, we have been challenged to deal with urban communities’ everyday socio-spatial practices and we came to understand that the EuroAmerican theoretical framework we always drew from has blurred our view of the communities with preconceived abstract (and prejudiced) universal assumptions of power relations.

This might seem obvious, but is not an easy problem to deal with as socio-spatial postcolonial theories are scarce and come from elite researchers working in EuroAmerican universities (not to mention socio-spatial decolonial theories from Latin American researchers, which barely exist)¹.

In order to cope with such a problem, we started to investigate possible approaches to enlarge our theoretical framework to avoid hegemonic universal assumptions, taking into account microlocal specifics without turning our back to EuroAmerican theories. This has been done in a sort of meta-method, drawing from Oswald de Andrade Anthropophagic Manifesto (1928), which questioned Brazilian cultural dependency.

Andrade (1928) brings the image of the anthropophagic ritual, in which human beings eat others to incorporate their features. In Andrade’s Manifesto (1928) Brazilian culture would stop ignoring its roots (Indigenous and African) and be freshly reinvented, departing from the very roots, “eating” and “digesting” a selection of interesting features from abroad. Anthropophagy as a method assumes the richness of intercultural encounters and at the same time avoids dependency on foreign culture. A well-known jargon from Andrade’s manifesto (1928) is “Tupi, or not Tupi, that is the question”, which acknowledges Shakespeare’s relevance and at the same time replaces ‘To be’ with ‘Tupi’, dislocating the Shakespearean doubt from a universal being in the world to the Native Brazilian tradition. So, at the same time anthropophagy questions universals and draws from them. The main point, we argue, is the need to keep the theoretical framework in context, always under construction, avoiding abstract hegemonic universal theories that tend to become prescribed top-down truths.

Let us introduce a few critiques raised by decolonial theories in general and then by postcolonial urbanism² to explain our proposed anthropophagic method. One of the most important decolonial authors is the Argentinian philosopher Enrique Dussel, exiled in Mexico. His politics and philosophy of liberation focus on a collective, which he calls *pueblo* (the people), as the subject of democracy (Dussel, 2012). Democracy needs no adjective but to be aware of its subject, the block of people, which is neither a hegemonic block in power nor a class, but a group of different people (defined with Gramsci as the social block of the oppressed) that are usually powerless and misrepresented in the traditional representative democracy. For Dussel (2012), the decolonising turn indicates a new approach to politics taking into account the contradictions within the “block of people” and its potential historical transformations. So, the decolonial theory proposes a theoretical framework to look at oppressed people without preconceived EuroAmerican universals.

Being more specific, a good example is that of African indigenous feminist standpoint³, claiming that Western gender theories tend “to reduce women and girls’ experience to categories of ‘victim’ and ‘other’”,

¹ For the postcolonial theories of space see for example Ananya Roy (Professor of Urban Planning, Social Welfare and Geography and inaugural Director of The Institute on Inequality and Democracy at UCLA Luskin), AbdouMaliq Simone (Goldsmiths College, University of London), Ash Amin (Director of Research in the Department of Geography at the University of Cambridge), Jamie Peck (Canada Research Chair in Urban and Regional Political Economy and Professor at the Department of Geography at the University of British Columbia in Canada).

² We have no intention to cover decolonial and postcolonial theories but highlight selected aspects that help understanding our proposed method.

³ Dussel is part of the Group *modernidad/colonialidad*, one of the most important collectives of thinkers in the first decade of the 21st century, discussing the power relations established from 1492 with the conquest of what came to be known as America. This group departs from the capitalist mode of production and European modernity (trying to construct a local political view rather than adopting the consolidated economic framework), distinguishing itself from postcolonial thinkers—usually coming from British and French colonies in Asia, Oceania and Middle East, drawing from a culturalist perspective and starting their colonial history 300 years after ours—. It is clear that colonization happened in very different ways in each place. Generally, we might say that the main difference, besides the period, is that the earlier

clouding contradictions experienced by girls and women in the construction of their power “via relational world views of motherhood, family, sisterhood and friendship” (Chilisa and Ntseane, 2010, p. 617).

Chilisa and Ntseane highlight that “Western male hegemony enters the school through subjects such as religion and can be typically reinforced through [...] culture, embodied in language and rituals, generating multiple centres of oppression for girls/women in the education system and the public space” and that there is a need to explore “ethical and transformative ways of approaching this complexity that can account for how girls and women negotiate and resist patriarchal power” (Chilisa and Ntseane, 2010, p. 617). They claim that their work “explore[s] strategies for decolonising Euro-Western archival knowledge and challenging dominant, patriarchal, colonial research methodologies” while also “outlin[ing] the role of the activist feminist researcher as transformative healer, who resists dominant research discourses in order to develop processes of social justice and healing in the community” (Chilisa and Ntseane, 2010, p. 617).

This seems a good pointer for social research, but if we expand our research scope to socio-spatial practices, considering that space is constituted by and is constitutive of a social group, we need to enlarge our decolonial perspective. Marcelo Lopes de Souza (2006, 2012) proposes a socio-spatial approach he calls *estadocritico* (critical of the state) incorporating tactics into strategies. Usually, tactical approaches (the bottombottom) tend to disappear while strategic proposals (top-down or bottom-up) tend to last. The challenge is to incorporate tactics into strategies, bringing bottom-bottom tactics to dialogue with bottom-up strategies, always avoiding the top-down (Gazzola, 2017). For that we might consider different scales (the microlocal and the global) and draw from a postcolonial critique of urbanism formulated by Jamie Peck (2015, p. 166).

[...] Postcolonial urbanism had to entail more than turning conventional treatments upside down, flipping over the ‘time chart of urban theory’ by promoting Southern urbanisms as alternative universals or premonitions of an alt-global norm; instead, the goal was to be one of ‘decentring [rather than inverting] the reference points for international scholarship’ (pp. 169, 91). Along the way, this would have to involve “dislocating” the EuroAmerican centre of theoretical production’, while recognizing that the regions of the ‘centre’ may also be ‘exceptional from a [truly] global perspective’ (ROY, 2009, p. 820; SEEKINGS and KEIL, 2009, p. vi; SHEPPARD, 2014). The project of postcolonial urbanism is consequently marked by an attitude of principled wariness concerning most (if not all) pre-given conceptual or classificatory formulations, especially universals made in the North and masquerading as stylized facts, policy paradigms or conceptual abstractions.

happened in very different ways in each place. Generally, we might say that the main difference, besides the period, is that the earlier colonisation of America ended up being more devastating of the native culture—by mixing cultures— than the later colonisation of British and French in Asia, Oceania and Middle East—and also Africa—which managed to preserve their dialects and cultural traditions (with much less mixture). The main similarity is the imposition of hegemonic power relations from the colonisers. The example of African indigenous approach might seem questionable, as the African decolonial perspective is very different from the Latin American, being the indigenous in Africa acknowledged as a preserved category oppressed by hegemonic discourses and practices of injustice, while in Latin America, specially in Brazil, the cultural mixture prevails, even if a few indigenous groups also exist. Nevertheless, the feminist perspective of the indigenous in African theory is a good example of a means to approach contradictions beyond reproducing abstract EuroAmerican hegemonic universals, moving towards social justice.

However, we also acknowledge the excessive particularism of Postcolonial studies that frustrates attempts to reconcile the global and the local in research (scales that are only growing apart (Peck, 2015)) and to develop common grounds for Southern urbanism and EuroAmerican theories to dialogue (Peck, 2015; Vainer, 2014). The urban field still lacks methodological strategies that address the local while situating it

colonisation of America ended up being more devastating of the native culture—by mixing cultures— than the later colonisation of British and French in Asia, Oceania and Middle East—and also Africa—which managed to preserve their dialects and cultural traditions (with much less mixture). The main similarity is the imposition of hegemonic power relations from the colonisers. The example of African indigenous approach might seem questionable, as the African decolonial perspective is very different from the Latin American, being the indigenous in Africa acknowledged as a preserved category oppressed by hegemonic discourses and practices of injustice, while in Latin America, specially in Brazil, the cultural mixture prevails, even if a few indigenous groups also exist. Nevertheless, the feminist perspective of the indigenous in African theory is a good example of a means to approach contradictions beyond reproducing abstract EuroAmerican hegemonic universals, moving towards social justice.

within a macro-structure as a means to overcome the dichotomy and, instead, foster a dialogue between the planetary and the particular (Peck, 2015). This means considering the 'globalising power' but also highlighting peripheral 'counter-narratives' (McFarlane, 2010).

In our research groups, one first attempt to deal with this through a meta-method drawing from anthropophagy was experimented in Ligia Milagres' PhD research (2016). She did two case studies of selforganisation of people in disputes for urban spaces—one in Brazil and one in Germany—not comparing, but highlighting the main issues raised in each. The method assumed the EuroAmerican basis of our socio-spatial theoretical background¹ and instead of trying to avoid that, incorporated it in building a theoretical lens to look at the cases. The lens brought fundamental concepts from anarchy and Marxian theories dealing with socio-spatial issues and had its focus defined according with the local spatial practices examined. After that, little theoretical pointers were drawn from the encounter with the everyday practices, establishing a deeper dialogue between global and local, EuroAmerican and Brazilian. The result is still incipient, but drafts a decolonial theory of self-organization of socio-spatial groups as an open process, not as a finished product, which would not come up to usual socio-spatial EuroAmerican methods. The main difficulties of Milagres' method were raising data within the time frame of the research; not looking at the cases with the colonial perspective of power relations (Quijano, 2000); not polarizing conflicting relations as antagonistic; and not being extremely subjective in the selection of what to consider or not. So, two main challenges need attention: first, to shorten data raising time and, second, to develop a tool to look more objectively to the local practices in order to voice socio-spatial contradictions without ignoring the theoretical lens.

In order to shorten data raising time we had already tried different approaches, extending from semi-structured interviews with a range of selected experts in the community, to photography workshops with a small group of people registering the spaces they like and dislike and projecting the pictures later for public discussion (Kapp and Baltazar, 2014). Regarding information apprehension, the latter is less timeconsuming.

Even if most people are not willing to take pictures, they are often keen to join the projection session. The discussions raised by different views on the places registered are very inspiring as they provide a quick socio-spatial panorama and reveal consensus and contradictions within the community. Nevertheless, researchers may fall into the trap of analysing the outcome from public discussions with a biased viewpoint, assuming power relations according to their cultural background and colonial universals, and polarizing contradictions as antagonisms. So, we also need a tool to analyse data avoiding the above said.

Actor-Network Theory (ANT) seems the best tool for the job (even being European) because it is a sort of meta-method designed against other tooling that departs from power relations, and proposes to look at the connections between humans and non-humans in an unbiased network. Relations will raise from a careful description of such a network (in our case, the socio-spatial relations) with no imposition of the researchers' EuroAmerican theoretical framework (Latour, 2005). According to John Law (1992) ANT researchers should not neglect the existence of a macro-social system that interacts with the micro-social:

For instance, we might start with interaction and assume that interaction is all that there is. Then we might ask how some kinds of interactions more or less succeed in stabilising and reproducing themselves: how it is that they overcome resistance and seem to become "macrosocial"; how it is that they seem to generate the effects such power, fame, size, scope or organisation with which we are all familiar (Law, 1992, p. 380).

ANT simultaneously wards off social and structural determinism (Latour, 1999), taking agency as something that "happens in the 'intra-actions' of everyone and everything involved, and is not an attribute located in the machine (...) neither an attribute located in people. Agency is not a practice separate from the whole interactive process, it always emerges as a hybrid process" (Baltazar and Kapp, 2010). According to Latour (1996 par. 13), "[t]he notion of network helps us to lift the tyranny of geographers in defining space and offers us a notion which is neither social nor 'real' space, but simply associations". He also explains that ANT "is a theory that says that by following circulations we can get more than by defining entities, essences or provinces. ANT is not a theory of the social, it is a theory of a space in which the social has become a certain type of circulation" (Latour, 1999, par.19). Nevertheless, space in ANT is seen as a background, not as an actant in the network (Farias and Bender, 2012; Murdoch, 1998).

Thus, the benefit for researchers to take ANT as a method to construct a socio-spatial network is the possibility of a temporary withdraw from structural assumptions surrounding the work of social research and take 'space' as an actant together with all other human and non-human actants, as it allows for more attention to the relations found on site that are often neglected from a macro scale approach (specially in urban fragile communities). However, we still have research questions that needs addressing after an

¹ With the exception of Marcelo Lopes de Souza and a few writings of our own group, all the socio-spatial literature we draw from is EuroAmerican.

unbiased understanding of the community as a network, to which ANT alone cannot respond. So, we can still keep the usual theoretical lens to frame research questions and adjust its focus according to the ANT network outcome. For that we draw from Historical Materialism (HM) because Marxian-based theories are usually the grounds of EuroAmerican Critical Urban theories (our known theoretical framework up to now).

It might be argued that constructivist theories such as ANT and Marxian-based theories such as Critical Urban theory are, in the least, antagonistic in nature. That is so, because, generally, while foundations of the latter lie on the existence of macro structures that actively influence the way space is produced, the former utterly negates the existence of such conforming fabric, arguing that reality is socially constructed.

This means that for ANT power lies on asymmetrical interactions between all sorts of actants (both humans and nonhumans) that can be observed in a microscale, while Marxian theories tend to explain the existing power relations on the basis of a macrostructure, such as the capitalist mode of production. Nevertheless, many scholars have already seen the complementarity of these approaches when attempting to bridge macro and micro analysis. For instance, Brenner et al. (2012) discuss the benefits of ANT as a methodological tool to investigate urban issues, as opposed to ANT as an ontology. Thus, while ANT provides an effective tool to quickly map a locality without any pre-judgement of value in the relationships of eventual conflictive parties (but lacks tools to generalise); HM allows for an in-depth critical analysis of co-existing conflicts found on site (despite its difficulty to encompass particular elements essential to understand urban issues at the microlocal scale and its pre-set EuroAmerican perspective of power relations)¹. Given the timely nature of the topic, this paper will present the association of ANT and HM as an anthropophagic method to uncover socio-spatial practices in the so-called rurban communities in an empirical teaching experiment.

2 AN EXPERIMENT USING THE ANTHROPOPHAGIC METHOD

The crossing of ANT and HM was firstly pursued in Melgaço's PhD research, supervised by Baltazar (Melgaço, 2016), and is being experimented in Laguear and MOM since 2012, with positive prospects. The experiment presented here follows the PhD in an undergraduate course taught by the authors in 2016 to test the method. It responded to a general complaint among students that many of the modules that deal with the urban scale are too abstract, not providing critical and practical tools for the fieldwork and subsequent analysis and discussion of data gathered. It is often the case in design and urban design studios, for instance, that students need to propose interventions to the study area, but these are unsuccessful due to the rushed and biased nature of analysis. Trying to address the difficulty of gathering data, since 2012, we have been trying to adjust ANT as a method also for students to empirically approach urban controversies² in different modules at the School of Architecture at UFMG. These modules presented varying degrees of success in problematizing situations—by identifying the issues and naming the main actants involved—and in associating these controversies to the space (and spatial practices) itself. Nevertheless, students still lacked tools for further critical investigation of the issues raised.

To tackle the limitations observed in the previous modules, a 15-hour course 'Spatial practices and the introduction of ICTs in rurban communities' was taught in 2016 to further test and mature our anthropophagic method. The main goal of the course was to allow architecture and urbanism undergraduates to experiment fieldwork by providing them with the necessary tooling to explore empirical research while being able to critically and contextually analyse it. For that, they were given the task to investigate the relationship between existing spatial practices and the way ICTs are being appropriated in rurban communities. The problem was defined enough so that it could be dealt within the timeframe of the course, but it was also open enough so it could generate a varied discussion among the students. The main goal was to look critically to spatial practices but without preconceived ideas of the communities, ergo the suggestion to take ANT as a preliminary approach to the subject (via fieldwork and collection of further information thereafter). ICTs were one of the elements suggested as their recent introduction is bringing important changes to rurban communities. In the case of the two communities investigated during the course, the influence of ICTs can be especially observed among younger generations, who are included in broader socioeconomic-cultural networks that are not geographically bounded.

The introductory class presented the three elements that composed the course: spatial practices, ICTs and the rurban. ANT as a method was also presented to instigate the students to further research this theory.

¹ As in decolonial theories (Dussel, 2012), our anthropophagic method does not ignore the capitalist mode of production but attempts to look not at the economic general aspect of it in a negative critique, but at the political that arises from the block of people and their diverse forms of resistance.

² Approach used, for example, by Albena Yaneva in the module "Mapping Architectural Controversies" at the University of Manchester.

During the session, they formed three groups and were given the task to find a rural community in Minas Gerais as a case study. The aim was to conduct a one-day field work and then understand the spatial elements that compose the rural, the spatial practices that were to be found there and the role of ICTs in the community's everyday¹. After understanding how these relations were built locally, they should focus on how they related to the wider socio-political, socio-spatial and socio-technological conjuncture.

We provided a set of literature divided into four categories: methodology, ICTs, spatial practices and the rural. Every student should read at least one methodology text, choosing among references on qualitative research (Demo, 2013) and ANT as a methodological tool (Law, 1992). In addition, they should ensure that at least one member of the group was responsible for one of the themes, who should read and write a review on the related literature and observe the elements related to the topic during the fieldtrip, using MOM's guide for fieldwork (MOM, n.d.). A google spreadsheet was used for the organisation of the reading schedule, guaranteeing that the groups would have access to all the basic literature given the short timeframe of the course. The literature was discussed during the second and third meetings, with each text presented by those responsible for it and an open discussion that followed. This dynamic allowed all students to get acquainted with the topics of which the others were responsible.

After being exposed to these two sets of bibliography—the first comprised of a theoretical framework based on Marxian authors and the second comprised of ANT as a methodological tool—the students were asked to devise their own plan on how to analyse the case study selected (using either framework or a combination of them). One group decided to visit Noiva do Cordeiro, a matriarchal community, located 100 km from Belo Horizonte, the capital of the state and where our university is located, while two groups chose to visit Arturos, a quilombola² community in the metropolitan region of Belo Horizonte. Each group went to the field trip on their own time before the third week of the course, when they presented their preliminary impressions of the visit, exercise followed by discussion. In the final week, students presented their initial analysis, also followed by discussion and questioning. This analysis was further developed for their final written work, due two weeks after the presentation. In the following section, we will unpack the dynamics of the groups in their field work and the methods they used to further analyse the data collected on the field³.

2.1 A LITTLE ABOUT THE COMMUNITIES CHOSEN FOR RESEARCH

The first group visited Noiva do Cordeiro, a community founded in the 19th century, after newlywed Dona Senhorinha separated from her husband to join Francisco Fernandes. Part of a very traditional catholic society, the couple was excommunicated to the fourth generation and had to settle in the outskirts of Belo Vale, a 7.000 inhabitant city in Brazil in current numbers. Having raised their family isolated from the nearby villages led to very strong bonds amongst themselves. Fifty years later, the marriage between the young Delina with 42 years' older Evangelic pastor Seu Anísio reinforced local prejudice against the community. He instated the Noiva do Cordeiro religion, whose strict rules—daily prayers, fasting and public punishment—led the community to the brink of starvation. In the 1990s, with the minister's death, the community joined to overcome poverty. While men commuted to the capital for work, women organized collectively the reproduction activities in equally collectively owned spaces. This solution freed some women to invest time in productive activities: they run a lingerie factory and a medium scale farm; process some of their feedstock, producing compotes and cheese. The interest in the community raised with the documentary "Noivas do Cordeiro" aired by the Brazilian channel GNT, and since then, they have increasingly received the visit of "social tourists", lay people, researchers and students from all around the country (and the world) interested in their lifestyle. Because of that, they have developed a tourism agenda and no random visits are allowed in the community. The unfolding of social tourism over time led to the creation of a local narrative, told repetitively and edited to please visitors. This means it is hard to obtain spontaneous information.

Group 2 and 3 visited Arturos, located in the outskirts of Contagem, largest industrial complex of the State of Minas Gerais. Similar to Noiva do Cordeiro, Arturos is a familiar community, formed by the descendants of Arthur Camilo Silvério and Carmelinda Maria da Silva. Arthur was the most prosperous sibling of Camilo Silvério da Silva, an African slave from Angola brought to Brazil in the 19th century, and founded the community on the land he acquired in Contagem. After his death, the land was divided into plots for each

¹Everyday is explored here with Henri Lefebvre as a social level, avoiding a possible hierarchization of spatial relations in scales.

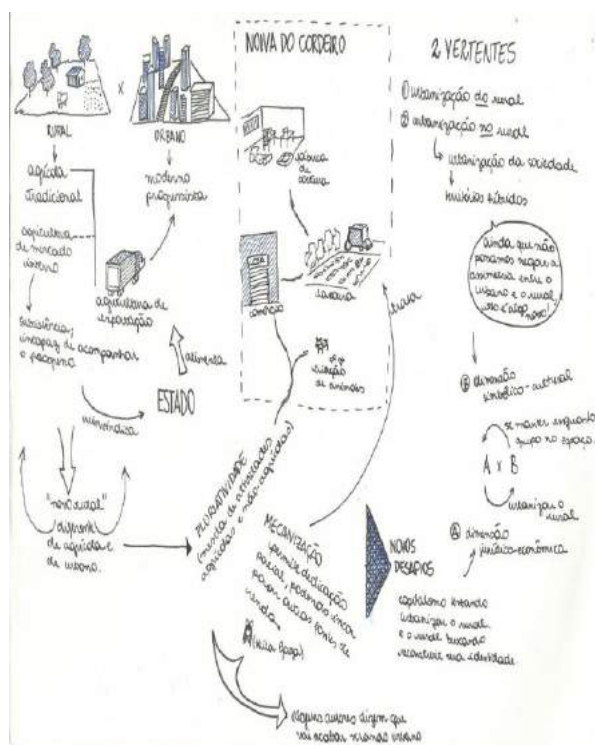

² Quilombola is the designation of slave refugees and their descendants that fled the sugarcane mills, farms and smallholdings where they performed various menial jobs to form small villages called quilombos, today a symbol of resistance of the black culture and fight for equality.

³ It is important to note that the three groups of students showed similar levels of engagement in the course, of exposure to the community and time to produce their final work. They were also encouraged to conduct interviews rather than a photography workshop, as the latter requires prior organisation and at least two visits to the community.

of his siblings, and the community today is formed of eighty families, accounting for more than 500 members (Prefeitura de Contagem, 2011). The older generations value their African heritage, especially through cultural activities such as batuques and congado, local musical traditions, and for their active contribution to the resistance of African culture in Brazil, in 2014, the community was the first recognised as immaterial heritage in the country (IEPHA MG, 2014). The increasing interface of Arturos with the outside, with the younger generations leaving the community to study and work and the introduction of ICTs, are bringing new socio-spatial processes to the community, challenging its traditional form of spatial organisation. Both communities, despite clear distinctions, provide some of the current conflicts faced by the rurban that could be grasped by the student in their research.

2.2 THE DIFFERENT WORK DYNAMICS DEvised BY THE GROUPS

Each group developed different dynamics to visit the community and analyse the data collected. Group 1's

methodology was mainly based on HM. Two main reasons explain such approach: the exposure of students to the community prior to the fieldwork through online material and our own perspective as researchers; and the familiarity of some students with our research methods, as they work as undergraduate researcher assistants at Lagear. Their first impressions were impregnated with preconceived notions of power relations based on socio-economic macrostructures. Fig 1 shows the group's attempt to relate their preliminary perceptions of Noiva do Cordeiro with João Rua's (2006) discussion of urbanities in the rural which was kept in their final work. Although an important exercise of understanding concretely the discussion proposed by the author, it did not allow the group to advance their perception of spatial practices beyond the input from discussions in class and from the literature.

Figure 1 – Group 1's concept and empirical evidence link. Source: Group 1 final essay (unpublished).

Network analysis was introduced later, as a visualisation rather than as a process tool. The hasty attempt to arrive to conclusions by using HM underscored the pre-existence of value judgements and incurred in the group resorting to universals without allowing local actants and their relationships to be revealed by the method. A precarious network resulted, with highlighted elements and connections from previous analysis. Neither the weight of the interactions nor existing power relations that could have projected by a network analysis of the community can be inferred from the graph (Fig. 2).

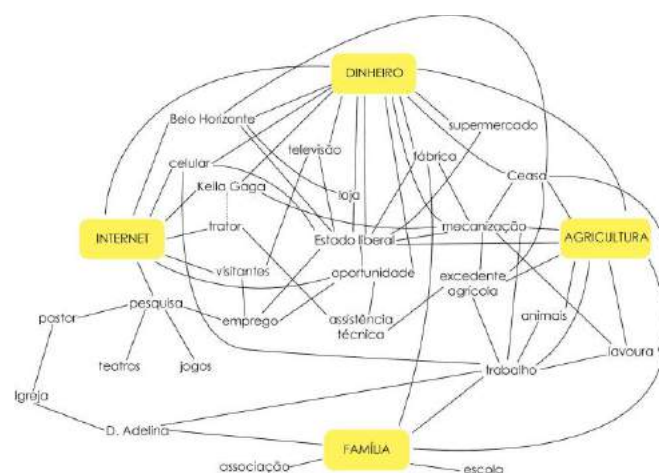

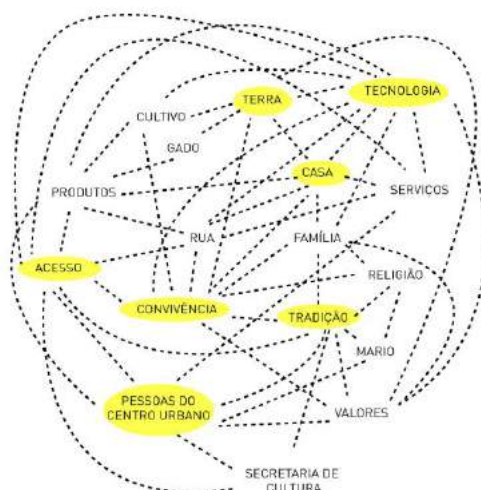

Figure 2 – Group 1 final network. Source: Group 1 final essay (not published).

Groups 2 and 3 departed from a loose attempt to use ANT on the field, but assumed different strategies, especially after the first critique session that followed the fieldtrip. Group 2 did a thorough research online previous to the visit to corroborate their choice of community. According to them, “the analysis of the quantitative data, the history, satellite image and the representativeness of the cultural body were the important information for the final decision to work in Arturos”. Students used observation and interviews and secondary sources to define their actants. Despite the desire to use ANT as a process tooling, the group used it “as a means to represent the existing relationships in Arturos” (excerpt from their final work, unpublished), and was presented only at the end as a final product. After the fieldtrip, they soon adopted an unstructured mix of both ANT and HM to organise and analyse their findings, which concealed singular elements of the community that depict its conflicts as a rurban community in the context of an everurbanising society. For instance, they resorted to general actants—family, field, house, access, conviviality, values, religion, cattle—rather than focus on more specific actants, such as Mario, the patriarch of the community. The lack of the particular elements that compose the network led to a misleading construal of the power relations according to their own cultural and social position.

Their rushed construction of the network can be observed by its lack of structure and confusion of elements to be included, which masked existing but invisible power relations (fig. 3). As with group 1, the

main actants (highlighted in yellow) were defined by the group, with no clear explanations to their choice of prominent actants. Some elements included, such as ‘tradition’, are not observable actants. If an ANT processual approach were fully adopted, tradition could have emerged during the critical analysis, as one of the underlying elements that function as a social glue of Arturos, with the use of an HM theoretical framework, for instance. Even though the exercise might have been an attempt to bridge a theoretical framework and a concrete situation, not only the network, but all the analysis of the group was based on general elements thereby with little advancement in critically addressing the questions posed in the course.

Figure 3 – Group 2 final network. Source: Group 2 final essay (unpublished).

Group 3 also conducted interviews and observation in the community. Differently from group 2, they attempted to use ANT as a tool “to understand the community, [...] not assuming what one wants to explain, as it masks the most interesting questions about the origins of power and organisation” (group 3’s essay excerpt, unpublished), focussing on the collection of primary data. For the first discussion session, the students built a preliminary network by writing the actants on different post-its and trying to arrange them in a large sheet of paper, which proved to be ineffective.

Without an appropriate tool, the students were unable to compute the amount of information collected (actants + relationships), also inferring local socio-spatial practices from their own standpoint. Let us note

3 ANT + HM AS AN AGONISTIC APPROACH TO PLANNING: A PROPER TOOLING FOR THE SOUTH?

So far, we have attempted to provide an anthropophagic method to challenge the shortfalls of our own theoretical production, extensive to the ways we teach future architects and urban planners. This means not only discussing the pedagogical approach but also calling attention to the political implications of the field as we invite students to dwell on the conflicts found on site. As already explained above, ANT enables researchers (and students) to step back from their prejudices to look at the actants and unveil connections and contradictions between them by means of a network. Together with an HM analysis, actants may not be polarised and regarded as antagonists, therefore avoiding the dichotomy friend/enemy (and its antagonism) towards an 'agonistic pluralism', and unveiling that which Chantal Mouffe (2005) discusses regarding political implications. In other words, we should assume the difference between enemy and adversary, being the latter constitutive of a radical democracy. In Mouffe's (2005) words:

Conflict, in order to be accepted as legitimate, needs to take a form that does not destroy the political association. This means that some kind of common bond must exist between the parties in conflict, so that they will not treat their opponents as enemies to be eradicated, seeing their demands as illegitimate, which is precisely what happens with the antagonistic friend/enemy relation. (...) If we want to acknowledge on one side the permanence of the antagonistic dimension of the conflict, while on the other side allowing for the possibility of its 'taming', we need to envisage a third type of relation. This is the type of relation which I have proposed to call 'agonism'. While antagonism is a we/they relation in which the two sides are enemies who do not share any common ground, agonism is a we/they relation where the conflicting parties, although acknowledging that there is no rational solution to their conflict, nevertheless recognize the legitimacy of their opponents. They are 'adversaries' not enemies.

An agonistic (not antagonistic) approach in urban research implies the need to pursue a careful data raising taking into account interactions (conflictual or not) between actants (human and non-humans). This also means a critical perspective that de-naturalizes existing conflicts and questions social relations as contingent constructions of hegemonic practices. If ANT seems a good tool to deal with the first challenge, as it is an attempt to construct an unbiased network of actants, HM still seems a good tool to deal with the second challenge, as it might help dealing with power relations arising from the network (constructing a theoretical lens to be focused according to the network, instead of drawing from universals, as shown by Chilisa and Ntseane (2010). This means to avoid pre-conceived theoretical lenses (those that have also blurred our own critical perspective of the socio-spatial groups we have been working with).

Our anthropophagic method drawing from both ANT and HM is one possible way to approach research agonistically, as it acknowledges the (inevitable) co-existence of conflictive parties without prejudging them before trying to uncover local evidences of the power relations enacted in space. Its preliminary results indicate that it can be a positive asset for undergraduates to grasp local interactions and produce critical socio-spatial analysis that are more context specific and responsible. We use the word responsible here because this method allows them to acknowledge the political dimension of the field while positioning themselves, rather than embodying the universals postulated by EuroAmerican theoretical framework.

This experiment also suggests the positive outcomes for research itself, as it proposes an anthropophagic meta-method to approach a community (mainly a non-organized socio-spatial group) to be able to propose an informed collaboration. This does not mean an imposition from researchers, but a careful first contact to enable the construction of a truly collaborative research relation with the community. A few works state that research might never be pursued by outsiders, the ideal would be that community (indigenous community) undertook their own research, but it would be acceptable a collaboration since the outside researchers respected the indigenous traditions and did not impose their theoretical framework (Smith, 2013, p. 186). Our proposal is not of an outside research, but of a method that only starts with approaching the community with a meta-method to enable further developments. By extending it to undergraduate education, we instigate students to avoid from the onset top-down approaches that often lead to ill-suited responses to local demands, and may continue throughout their professional life.

In order to conclude, we might state that this paper acknowledges the importance (and pervasiveness) of EuroAmerican theories in Southern urban studies, but calls for more context-driven academic production in our countries. For such, it presented an alternative anthropophagic method for studying socio-spatial groups in the context of Brazilian academic production. It draws from ANT to approach a community, systematising it as an agonistic network. It also draws from HM to construct the lens to look at the network adjusting its focus according to the intertwining of unbiased interactions found in the agonistic network and the theoretical framework that sets research questions (which at this stage is still primarily an EuroAmerican framework that needs the anthropophagic approach to purge it of its foreign dominance). It is a work in process that has been furthering, but needs systematisation as it advances (and that is what this paper does).

ID 1465 | THE PRAXIS OF CREATING LEITBILDER (GUIDING VISIONS) FOR SPATIAL PLANNING PROJECTS IN METROPOLITAN ZURICH

Celina Martinez-Cañavate¹

¹University of Liechtenstein, Institute of Architecture and Planning Fürst-Franz-Josef-Strasse

celina.martinez@uni.li

1 INTRODUCTION

When we think about the future, we automatically conjure up images in our minds. These images can and will shape our future actions. Visions of the future are closely linked to the particular ideals held by each individual and must be seen as closely linked to the associated current technological possibilities (Foraita 2013). Visions of the future also arise with respect to the spatial development of regions and cities. Since the 1950s, visions of how cities and regions should further evolve have increasingly been defined by public-sector experts on architecture and spatial planning, and then documented in so-called Leitbilder (Giesel 2007).

1.1 THE CHANGING MEANING AND FUNCTION OF LEITBILDER

The use of the term Leitbild is on the rise. In the German-speaking world, it has in recent decades been increasingly discussed in the context of spatial planning. Even though the debates among professionals about visions of what should constitute a city had already begun as the discipline of urban design was first taking shape in the last quarter of the nineteenth century, the concept of a Leitbild did not achieve currency until later. According to Kuder (2002) and Naegler (2003), there are two generations of Leitbilder: The first generation of Leitbilder was shaped in the 1940s by the post-war era and did not enter the planning profession until later, in the 1950s. At the time, Leitbilder were virtually equated with the dictatorial past and its authoritarian control mechanisms, from which one distanced oneself a few years later. For a long time, what resulted was criticism that Leitbilder have “a faint military tone” (Adorno, 1967, p. 7) and serve to enable strong figures to assert subjective political vested interests in a democratically constituted but repressively structured age. The second generation of Leitbilder arose mainly when faced with the demands for participation made by a large number of actors and the resulting increase in complexity. Initial attempts were then undertaken to use Leitbilder as a strategic planning tool. This so-called renaissance of Leitbilder in the early 1980s can be explained by the shift to open planning processes, in which a problem-oriented and pragmatic approach was sought.

Literature research shows that the constantly recurring discussion about Leitbilder originates from a mixture of global developments and from local options and constraints: At the centre of the disputes are different interpretations and understandings of the term Leitbild, which elicit imprecision and contradictions. First and foremost, a theoretical debate about Leitbilder in spatial planning takes place in Germany (Engelhardt, 1975; Giesel 2007; Knieling 2000; Kuder 2002; Lendi 1995; Naegler 2003; Sieverts 1998; Streich). But in Switzerland, too, the Leitbild is a topic of growing interest.

1.2 LEITBILDER IN SWISS PLANNING DISCOURSE

Switzerland has been experiencing rapid development of settlements for decades, and this growth has further accelerated in recent years. Whereas the settlement areas expanded nationally by 13 km² per year in the period 1980–2002, to more than 2000 km², this value doubled to 27 km² per year in the period 2002–2008, yielding a settlement area of more than 2500 km² (Müller-Jentsch, Rühli, 2010, p. 3). Due to its high population density (198 inhabitants per km²) and the extreme topography (half of the country is not amenable to settlement), Switzerland has a special need for effective spatial planning.

In 1979, the first building law on spatial planning was formulated, thus increasing pressure on the cantons and municipalities regarding sustainable development of urban areas and settlement in general. The objectives additionally formulated in May 2014 in Article 1 of the Spatial Planning Act (Raumplanungsgesetz; RPG), namely “to direct settlement development inward, with due regard to an adequate quality of living” and “to create compact settlements” (Bundesrat Schweiz, 2014) poses new challenges in this regard for those responsible. Entire city districts are being newly built, and some neighbourhoods are experiencing perceptible densification. More and more people are increasingly using the public realm more intensively. This can lead to conflicts: Different ideals and utilization demands collide with one another.

Swiss spatial planning entails various procedural steps for spatial development and has diverse instruments to manage it: Leitbilder are among the ‘informal’ regulatory planning tools that are primarily used at the beginning of any spatial development. They are ‘informal’ in the sense that they are not regulated by law in an obligatory, legally binding way – although in most cases, as will be seen later, they possess a certain binding character. They aid in pursuing spatial and urban development policies as network policy, act as a mediator between specialist departments, public authorities, and other actors, and act primarily as the basis for other, more binding planning steps, such as the cantonal structure plan.

An initial investigation of metropolitan Zurich shows that the number of Leitbilder that have been created has increased since Article 4 of the Spatial Planning Act was implemented: The production of Leitbilder has, for example, consistently increased in the last 20 years (1996–2016) (fig. 1). Article 4 requires that “those public authorities who are entrusted with planning tasks [...] [must] instruct the populace about the goals and course of the planning” and ensure that “[the populace] can contribute appropriately to the planning” (Bundesrat Schweiz, 1979).

Figure 1: Development in the creation of Leitbilder in metropolitan Zurich (Quantity/Year)

In Switzerland, the theoretical debate on Leitbilder is limited. As a research topic, the Leitbild praxis was first examined in 1970 by the Institute for Local, Regional, and National Planning at the ETH (Schweizer Nationalfonds, 1970). The focus was on the substantive identification of thematic priorities within the compilation of Leitbilder by means of examining six case studies. Nearly 20 years later, Koch (1988) contributed to the urban development discussion by examining the Swiss Leitbilder of the modernist period from 1918 to 1939. In the following years, no one dealt with Leitbilder within a theoretical context. Instead, in the mid-1990s the first brochures were made with instructions and assistance for compiling Leitbilder (Gerber, Michel, 1995; Amt für Raumentwicklung Kanton Uri, 2012). With a focus on the Leitbild as an instrument of spatial planning, they formulate fundamental principles and measures for the treatment of various topics.

It is only in recent years that the discussion about Leitbilder in Switzerland seems to again be gaining interest: At the Zurich University of Applied Sciences (ZHAW), for instance, a research group has studied the planning method of ‘Leitbilder for urban neighbourhood development’ (Institut für Urban Landscape ZHAW, 2012). On the basis of investigations and case studies, the group developed a planning method that combines interdisciplinary content such as urbanism, planning theory, planning procedures, and participation procedures. The study resulted in a vade mecum, a guide for compiling spatial Leitbilder that is intended to support the authorities and technical planners in their work with Leitbilder (Institut für Urban Landscape ZHAW 2016).

On the terminology of spatial Leitbilder in the Swiss context and their transformation over the last 100 years, Martinez (2015) provides in-depth insight. The investigation shows that the development in the importance of Leitbilder and the process of creating them, which began in the 1990s, continues to have its effects even today. For example, Leitbilder are no longer understood solely as a visual representation of a targeted order. Rather, the process that is meant to lead to consensus in selected topic areas is itself the main focus.

As an instrument for design and communication, Leitbilder have adopted many forms in recent years. However, they almost always consist of three components: (1) the Leitbild process, (2) the Leitbild in words and/or images as the product of this process, and (3) the subsequent concretization (Knieling, 2000, p. 8). This paper is based exclusively on the product – the “Leitbild document”, and on its contents and formats.

2 RESEARCH INTEREST AND RESEARCH DESIGN

The topic of Leitbilder is by no means uncontroversial, and is in fact controversially discussed in debates on planning theory and social science and in praxis-related spatial planning discourses. Advocates point out that, contrary to earlier times, Leitbilder are no longer static or pictorial and have lost their normative character. Others voice the opinion that Leitbilder are empty formulas that hinder the implementation of planning.

The aim of this study is to build a bridge between the theoretical backgrounds of Leitbilder and their concrete applications in praxis. The content analysis of the Leitbild documents, conducted within a theoretical framework, is intended to provide insight into the Leitbild praxis experienced in the Swiss context by considering the following questions:

- a) Function of Leitbilder: What functions are assigned to Leitbilder in today's planning praxis?
- b) Binding character of Leitbilder: What tendencies can be observed in the implementation of Leitbilder?
- c) Contributions to the Leitbild procedures: What levels of participation can be discerned in Leitbild processes?
- d) Pictorial language in Leitbilder: What importance do images have in Leitbild documents? And what are the discernible tendencies regarding the type of images and their application?

The investigation focuses on metropolitan Zurich. Within this geographic boundary, the case studies were selected according to the following parameters: (1) the examples are to be understood as Leitbilder (as processes and concepts that serve to formulate future spatial developments, which are not legally binding, and which are based on the consensus of a group of people), (2) they can be viewed online, and (3) they were developed during the time frame 1996–2016.

The sample contains 50 Leitbild documents. The methodological approach employed here was a summarizing and structuring content analysis as outlined by Mayring (2000): In a first step, evaluation aspects that have been fixed through a reductive process and are theoretically substantiated were applied to the material, in order to ultimately assign, in a second analysis step, the deductively obtained categories in a methodologically sound way. In a third step, the selected Leitbild documents were scrutinized for their suitability with respect to the research question. The case studies that were classified as suitable were recorded using the MAXQDA analysis tool (software for computer-aided qualitative and quantitative data and text analysis) and separated into three time frames (Z1/1996–2002; Z2/2003–2009; Z3/2010–2016). This enables a precise investigation of development trends. In a fourth step, sections of text about a specific topic were assigned to a parent category that serves as the basis for the coding of further differentiations and the structuring of specific groups. Finally, in a fifth and last step these groups were compared within the three time frames (Z1; Z2; Z3) and tendencies were extracted.

3 TENDENCIES IN THE UNDERSTANDING OF LEITBILDER IN PRAXIS

The initial analyses and the findings thus obtained are explained below. The examinations are based on a theoretical framework that serves as an introduction to the individual topics.

3.1 FUNCTIONS OF LEITBILDER

Leitbilder are assigned various functions. The first element that should also be mentioned, which is solely attributed to Leitbilder, is the utopian moment. In Leitbilder, Engelhardt sees “[...] a pioneering and practicable category of utopias geared to positive action” (Engelhardt 1972, p. 169). Streich (1986), by contrast, ascribes normative properties to Leitbilder. He sees their role in the formulation of comprehensive, consolidated, and visually comprehensible target concepts that represent a framework that provides guidance for decisions and evokes sufficiently concrete mental images. He also attributes a kind of quality assurance and control to Leitbilder. After a concrete implementation of planning goals, the Leitbild can, as a superordinate reference system, take over the task of checking the achievement of goals (ibid.). At the end of the 1990s, Becker observed that Leitbilder are based much more on cooperative and consensus-oriented processes, and that they comprise formulated objectives and principles of action (Becker, 1998). Knieling (2000), too, sees Leitbild processes as procedural components that serve as the basis for further planning steps. In a communicative and open planning process that relies on cooperation among the actors, Leitbilder contribute to the coordination of the collective action (ibid., p. 215). The consensus building takes place not only within the planning team but also beyond it, by involving the public. In this sense, the Leitbild is also an indispensable communication tool for dialogue between the world of politics, administrative authorities, and citizens. (Sieverts 1998, p. 21; Gerber 1995, p. 481). In addition to fulfilling the functions of guidance and communication, one of the tasks of Leitbilder is to provide motivation, since they “[...] [are able] to stimulate engagement and motivate to action” (Kahlenborn, 1995, p. 18). Lastly, Knieling (2000) attributes the functions of reflection, innovation, and marketing to Leitbild processes.

On the question of what functions are assigned to Leitbilder in today's Swiss planning practice, an inductive content analysis was conducted on the topics of function, goal (operational, not substantive) and purpose.

In the 50 case studies examined, all but one author assigned functions to the Leitbild: The analysis shows that in the first time frame (Z1/1996–2002), the normative functions of Leitbilder were predominant (fig. 2). Thus all the Leitbilder (100%) from Z1 were assigned the task of providing guidelines (governing parameters): “With these Leitbilder, additional governing parameters are to be created [...]” (Bezirk Einsiedeln, 1996, p. 6). And: “Urban design principles [point] the way for further planning and realization” (Amt für Städtebau Stadt Zürich, 2000, p. 3). Moreover, in three-quarters (75%) of these case studies, the role of serving as the basis (procedural component) for other planning steps is assigned to the Leitbild: “With the goal of maintaining and improving the attractiveness of the old quarter of Wil, the municipal council has [...] commissioned the elaboration of appropriate basic principles and governing parameters” (Stadt Wil, 1998, p. 3). And: “With the Leitbild, the intention is to define general basic principles for planning and building development in the perimeter area [...]” (Bezirk Einsiedeln, 1996, p. 6).

Although these functions were also regarded as important (35–60%) in two other time frames (Z2 and Z3), guidance and direction attained more importance (about 90–100%) as a task of Leitbilder: “These are the values to be striven for. The concepts that one may never reach, but which can give one orientation” (Gemeinde Zollikon, 2008, p. 13). And: “The Leitbild offers guidance and provides evaluation criteria for future construction projects” (Stadt Zürich, 2011, p. 2).

Communication as a function of Leitbilder is only given attention (almost 30%) in the third time frame (Z3): “[The development concept] is, however, also to be understood as a process and thus as a tool for dialogue” (Gemeinde Wetzikon, 2010, p. 4). And: “As used, the Leitbild should serve as a means of communication and as a basis for the planning and construction standards of the resident community of Cham” (Einwohnergemeinde Cham, 2011, p. 2011).

The functions that imply the cooperation of people (coordination, process orientation, cooperation) are only attributed to a small portion of the Leitbilder (around 10–15%). They first appear in the time from 2003 to 2016 and express themselves, inter alia, as follows: “[The Leitbild serves to] find consensual solutions, and to involve citizens in the planning process from the outset” (Stadt Bülach, 2004, p. 4). And: “[The goal of the spatial development concept] is [...] to coordinate and reconcile the main priorities of urban design, open space, and transport” (Gemeinde Wetzikon, 2010, p. 4).

Lastly, the function of promoting identity is attributed to the compilation of Leitbilder in two cases (6%): “[The Leitbild] should create a positive image and become a source of identity” (Amt für Städtebau Stadt Zürich, 2012, p. 3). And: “The participatory process [of creating a Leitbild] supports the culture of togetherness and leads to identification” (Stadt Brugg and Gemeinde Windisch, 2014, p. 10).

Figure 2: Functions of Leitbilder, as share of codings (%) per time period.

3.2 THE BINDING CHARACTER AND IMPLEMENTATION OF LEITBILDER

Leitbilder are often criticized for the growing discrepancy between vision, planning, and implementation (Burckhardt 1980). According to Streich (1988, p. 73), however, Leitbilder serve the implementation of planning, meaning they provide control and guidance for deriving concrete goals in subsequent planning processes. Hence the implementation of Leitbilder is equated with control and guidance. Dierkes et al. (1992), by contrast, shift the main focus of consideration from aiding control and guidance – for the architectural or spatial-structural implementation of the substantive contents of the Leitbild, for example – to the creative development process for the substantive contents of the Leitbild. For them, the implementation of the Leitbild lies in the process itself. Thus the degree of binding force depends in no small way on the goals formulated in the Leitbild. According to Gruber (1995), a binding character is needed more for generally formulated development goals and concepts than for action guidelines. While the former explicitly establishes a target–means relationship (Lendi, 1995, p. 625 and Knieling, 2000, p. 29), the flexibility to act with regard to problems and situations is more important for the latter. Weeber et al. (1985), too, move away from the definition of a Leitbild as a single, generally applicable concept and speak of Leitbilder (in the plural) as scenarios for spatial developments that exist in parallel.

The question of what models can be identified for the practical implementation of Leitbilder was examined on the basis of the codings implementation/measures/basis/binding character (fig. 3).

The investigation showed that a first group (U1) conceives the implementation of Leitbilder by means of concepts and plans that simultaneously serve to verify if the goals have been achieved. In all the time frames (Z1–Z3), this group is represented most frequently (70–100%) and entails comments like these:

“The evaluation of future building permit applications in the area covered by the Leitbild takes place at the municipal level in accordance with the provisions and recommendations in the enacted Leitbilder” (Bezirk Einsiedeln, 1996, p. 66). And: “[...] the Leitbild [serves] as the basis for the pending revision of the regional structure plan and as a basis for evaluating the proposed revision [...]” (Planung Limmattal, 2007, p. 2).

A second group (U2), which conceives implementation as the setting of goals within Leitbild processes, has the lowest representation with approximately 6–7% in the time frames Z2 and Z3. Here, immediate implementation does not seem to be expected. Rather, the process is the focus of the procedure, as attested by the following statements: “In five workshops between April and October 2010, the community of interest [...] has dealt with questions of urban development. The results of the process are visions of the future and sketches dealing with specific subjects and spaces [...]” (G RUV, 2010, p. 1). And: “[...] the group [elaborated on] the goals and subgoals for the most important issues and developed ideas for measures and problem-solving approaches [...]” (Gemeinde Zollikon, 2008, p. 4).

Finally, in a third group (U3), both of the above-mentioned implementation models (U1 + U2) are combined in one procedure: This group mainly gains importance (23%) in the third time frame (Z3). In this case, the Leitbild creation process includes studies and test planning in which the positive aspects of several scenarios are brought together in one Leitbild, as illustrated by the following quotes: “Together, [we have] continued the initiated cooperative planning process [...] and conducted the test plan ‘Leutschenbach-Mitte’, whose synthesis is used as the basis for the new Leitbild. It sets the stage [...]” (Amt für Städtebau der Stadt Zürich, 2012, p. 2). And: “Based on the input from the populace and the spatial planning

analysis, [...] a thesis paper with objectives [...] was developed" (Stadt Brugg and Gemeinde Windisch, 2014, p. 4).

Figure 3: Tendencies in the implementation of Leitbilder, as share of codings (%) per time period

3.3 CONTRIBUTIONS TO THE CREATION OF LEITBILDER

Sieverts (1998) sees the spatial Leitbild as a kind of 'agora' that can engender democratic participation in politics. In the complex undertaking of spatial planning, he thus ascribes a political nature to Leitbilder and sees their task as indispensable in fostering an understanding of correlating actions and objectives (Sieverts, in: Becker, Jessen, Sander, 1998, p. 21).

In Switzerland, Leitbilder are employed at various planning levels: They vary from closed to open procedures. Some are developed by an expert team working without public involvement, whereas others are based on a participatory process where involvement of the populace is at the centre of that process. However, participation can be implemented in different stages: In his multi-stage model, Selle (1996) distinguishes among four levels that build on each other: (1) information for and consultation with those involved (in the process), (2) information for the general public through democratization of the planning, (3) a participation procedure to stimulate motivation and the mobilization of endogenous potential, and (4) cooperation, meaning collective problem handling through synergy effects. Cooperation as the last stage entails a shift of the decision-making process, moving it from within the political-administrative system to the outside, where it is designed by numerous actors.

When considering participation procedures in Swiss planning processes, it is important to remember that the choice of the form and means used to disseminate information and foster participation is at the discretion of the planning authority. The principle anchored in Article 4 of the Spatial Planning Act (1979) – "those public authorities who are entrusted with planning tasks must inform the populace about the goals and course of the planning" and ensure that they "[...] can contribute appropriately to the planning" – is interpreted variously. That is because the term "appropriately" leaves open to a large degree both the practical implementation of participation procedures and the degree of participation.

In order to explore the tendencies of participation procedures in the planning praxis within metropolitan Zurich, a content analysis was undertaken with the following coding: Information/contribution/cooperation/participation/workshop.

The results of the investigation (fig. 4) reveal that a first group of Leitbild documents (25–33%) contain no statements about participation procedures (M1). Time frame Z1 is characterized primarily (50%) by Leitbilder that were developed and concluded with contributions from landowners (M2) and can be recognized by statements like the following: "The affected landowners [...] were informed by the building authority about the process of developing the Leitbild; they had the opportunity to submit proposals for creation of the Leitbild" (Bezirk Einsiedeln, 1996, p. 42). And: "The landowners concerned had the opportunity [...] to submit proposals [...] that [were] taken into account in the pertinent Leitbilder" (Bezirk Einsiedeln, 1996, p. 5).

The landowner-oriented procedures are hardly present (0.03–0.07%) in the following years (Z2 and Z3) and are replaced (29–33%) by self-contained participation procedures conducted among communities of interest (M3): "The work has been supported by a broadly assembled supporting group, in which the parties, the neighbourhood and local associations, and various interest groups were represented" (Stadt Frauenfeld, 2008, p. 5). And: "Around 40 stakeholder representatives participated in [...] the two workshops. Remarks, ideas, and feedback were gathered about development scenarios for Wollishofen [...]" (Amt für Städtebau der Stadt Zürich, 2011, p. 4).

Distinct tendencies are observable in time frames Z2 and Z3, in which Leitbilder are used as a basis for contributory participation (M4) and therefore the notification and the call for participation are announced in the document itself (7–20%): "With this in mind, I invite you to participate in the planning process, to partake in the discussion and in the decision-making. Share with us your wishes and suggestions for urban

development”(Stadt Luzern, 2007, p. 11). And: “Now, as citizens it is your turn: take part and contribute. Identify the things important to you [and] also any objections.” (Gemeinde Beromünster, 2014, p. 7).

On the other hand, a clear trend in Leitbilder can be observed, in which the participation procedures play an important part in the whole process and are therefore already documented in the Leitbild itself or in a supplementary report (M5): “The results of both participation procedures were summarized in two contribution reports [...]” (Stadt Luzern, 2008, p. 7). And: “The team from the ETH led the workshops, prepared them, followed them up, and continually documented the results in this project manual” (ETH Professur für Architektur und Städtebau Christiaanse, 2014, p. 7).

Figure 4: Tendencies of participation procedures in the creation of Leitbilder, as share of codings (%) per time period.

3.4 PICTORIAL LANGUAGE IN LEITBILDER

In the process of designing Leitbilder, textual and visual components interact. Images, as conveyors of knowledge, have the potential to transform information and insights into a form accessible to the senses and thus to present complex topics in a simplified way (Dierkes, Marz, Hofmann 1992; Schuck-Wersig et al. 2014). Yet images also contain codes that are frequently hard for laypeople to decipher, especially when they are abstract and symbolic (Ballstead 1996). When using maps and plans as a means of communication, for example, it can be observed that it is often very difficult for laypeople to decipher (decode) the information, meaning to transfer it to their own world of experience (Rambow 2004; Wissen 2009). Especially when it comes to communicating contributions of spatial planning developments, images are an important means of understanding. These can be fundamentally distinguished as follows: those that portray the existing condition and thus aid the analysis, and those that also portray objectives, strategies, and targeted measures, that is, planning and draft planning.

Part of this final analysis is a consideration of how important images are in the Leitbild documents and what pictorial language is employed for understanding the content.

The investigation of the relationship between text and image reveals that particularly the Leitbilder that were created early-on (Z1) are text-heavy (fig. 5); the documents consist (in terms of graphic space) of about three-quarters text (72%) and roughly one quarter images (28%). In subsequent years the ratio levels out, such that documents from the time frame Z3 already consist of 42% images.

Upon investigation of the types of images and their importance in Leitbild documents, the following can be discerned (fig. 5): Over the entire period of examination (Z1–Z3) and beyond, 2D plans and photographs are the two types of images used most widely. Especially in Z1, they account for the largest share, with 91%. The other types of images (3D visualizations, tables/diagrams, sketched depictions, and photographs that document participation processes in Leitbild developments) first gain importance beginning in Z2 and Z3.

Figure 5: Types of images and graphic share (%) in Leitbild documents

4 CONCLUSION

The integration and function of Leitbilder in the planning structure is largely discussed at the theoretical level. Nevertheless, the praxis involving them is not fully understood because due to their informal character, Leitbilder are used in diverse ways.

The theory-based content analysis aims to extract tendencies in the Leitbild praxis by examining case studies in metropolitan Zurich. The investigation of the functions of Leitbilder shows that the authors primarily assign a normative character to them and view the Leitbilder as guidelines for action that serve as the basis for further planning steps. Leitbilder are also awarded the task of guidance and quality assurance in multi-stage procedures. Statements on the role of the Leitbild as a medium of communication in cooperative processes are rather rare. This is also reflected in the praxis of implementing Leitbilder, where three tendencies (U1/U2/U3) stand out:

U1: In most cases, the planners equate the implementation of Leitbilder with the creation of concepts and plans. This serves to verify if the goals of the formulated fundamental principles have been achieved in the subsequent implementation.

U2: Leitbild procedures that are understood only as a process for setting goals for spatial development are extremely rare. And nevertheless, it can be observed that such procedures are increasingly understood as supplemental to U1.

U3: In this spirit, a new model emerges of a Leitbild consisting of two parts: a normative part and a processual part.

Most Leitbilder are referred characterized as binding for the authorities, which admittedly facilitates their implementation. However, if other legally binding instruments apply – such as a structure plan – Leitbilder lose their distinctive profile vis-à-vis these planning instrument, although theoretically they would clearly be distinguishable. Leitbilder could still be seen much more in a complementary relationship with other planning instruments such as concepts, plans, or programs: While they are increasingly deemed to have a normative content with defined guidelines, the elaboration of scenarios is value neutral, inasmuch as they only portray the various possibilities for future development. Finally, Leitbilder have the potential to create a framework that is comprehensible for all stakeholders, within which a discussion about the future of the built environment can take place. Whether in expert circles or participation procedures: Leitbilder serve as instruments for coordination and communication and can aid in the search for future prospects, ideals, and a high-quality living environment for the consensus of all those involved. Yet this possibility has not yet been fully exploited. The following tendencies can be discerned in the implementation of participation procedures:

M1: About one third of the Leitbilder were developed inside the planning authorities and without public involvement.

M2: Especially in the first years (Z1), Leitbilder are developed with the involvement of the landowners.

M3: Most Leitbilder are developed in the presence of various interest groups, in which, for the most part, members of the local population are represented as a group. These participation procedures commonly take place at the beginning of Leitbild processes and regularly include organized workshops within more or less closed circles. Not until the end of the process is the final Leitbild (document) presented to the public at large and adopted by a legislative consultation process.

M4: In a few solitary case studies, an intention to involve the public in the planning processes is solely declared. In such cases, the Leitbild document forms the basis for discussion.

M5: And lastly: within Leitbild processes, a tendency can be discerned in which the contributions are at the core of the idea finding. In such cases, the Leitbilder document the participation procedures and outcomes.

Lastly, the investigation of the pictorial language of Leitbilder reveals that the development tends to shift from technical/planning-related portrayals to visual/spatial (3D) depictions and diagrams. This enables laypeople to develop a better understanding of future spatial scenarios and thus creates the basis for communication, on a level playing field, between experts and the public.

Among the conflicting priorities of environment, society, and politics, the Leitbild, as an informal instrument, seems to have assumed an important place in the Swiss planning praxis. Spatial planning is influenced from two sides. On the one side, by overarching legal provisions and planning goals at the federal, cantonal, and regional levels, and on the other side, by the concerns, desires, and ideas of the affected population. Here, the compilation of a Leitbild can enable the establishment of an initial basis for defining common goals.

ID 1480 | PLANNING FOR CREATING A PEACE PARK; PEACE PARK BETWEEN TURKEY AND GEORGIA AS CASE STUDY

Sahar Pouya¹; Basak Demires Ozkul¹

¹Department of Urban and Regional Planning, Faculty of Architecture
pouya@itu.edu.tr

1 INTRODUCTION

There are a whole host of environmental issues for biota along the political borders. Many international borders, not only appear on maps, but are bounded by fences or other obstacles that fragment landscapes and ecosystems. More or less, many international borders have been caused ecological issues including biodiversity reduction; the fragmentation of habitat (particularly for endangered animals which both require wide open spaces to survive and maintain gene pool diversity); habitat destruction through land filling and extensive service roads and invasive vehicular patrolling (Cunningham, 2012).

In these situations removal of border obstacles and creation of designated corridors to facilitate animal movement has sometimes proven to be a worthwhile solution. However, cross border conservation solutions have been used more. Typically solutions like this are called Transboundary Conservation Areas (TBCA's) which is also known as peace park.

Following the World Parks Congress in 2003, a Global Transboundary Protected Area Network was established by International Union for Conservation of Nature (IUCN) and based in South Africa. IUCN defines a Transboundary Protected Area (TBPA) as:

“an area of land and/or sea that straddles one or more borders between states, sub-national units such as provinces and regions, autonomous areas and/or areas beyond the limit of national sovereignty or jurisdiction, whose constituent parts are especially dedicated to the protection and maintenance of biological diversity, and of natural and associated cultural resources, and managed cooperatively through legal or other effective means”.

In addition to TBCA's, two other types of transboundary areas have been classified. Table 1 quantifies all three typologies (Mayoral-Phillips, 2002).

Transboundary Conservation Areas	Areas that span well-defined borders, within precise and linear concepts of international borders (Krukoski, 1998). Aim: conservation of biodiversity, cultural heritage and economic benefits
Trans frontier Conservation Areas	Areas that span regions where boundaries have not been agreed upon (Krukoski, 1998). Aim: as with TBCA's. In addition to ameliorate tensions related to disputed borderlands
International Peace Parks	Areas that have definite political objectives and are largely symbolic in nature. Objectives: confirm, strengthen, or re-establish good relations with a neighboring state(s); prevent escalation of border disputes; safeguard biodiversity.

Table 1- Typologies of Conservation Transboundary Areas (Source: Singh, 1999)

TBPA itself can be developed based on a wide variety of different cross-boundary arrangements including:ational Park in the USA and the Waterton Lakes National Park in Canada (Mayoral-Phillips,

2002). By the late 1990's there were 136 protected areas, adjoining 112 international boundaries in 98 countries (Ali, 2007).

Although peace parks can be found in various ecoregions of the world, they are mostly categorized based on their location in two groups; terrestrial and marine conserved areas. Waterton-Glacier International Peace Park, The Great Limpopo Transfrontier Park, "W" Transborder Parks, Kavango - Zambezi Transfrontier Conservation Area are the terrestrial cases and Binational Red Sea Marine Peace Park, Iona – Skeleton Coast Transfrontier Conservation Area, and Mnazi Bay-Ruvuma Estuary Marine Park are the Marine TBPA.

Peace parks address ecological degradation and demands cooperation across national and other geopolitical boundaries (Cunningham, 2012). These cross border efforts are instrumental in reunifying artificially-divided landscapes and can facilitate development of coordinated conservation practices. Other benefits of peace parks creation over borders include improved political relationships between countries, increased tourism opportunities, and the involvement of local communities in conservation solutions that will provide direct local benefits (Lavery, 2007). This article aims to investigate the cooperation between Turkey and Georgia by a transboundary park. Since early 2000th, World Wild Fund for Nature develops concept for establishing Georgia-Turkey cross- and transboundary cooperation for biodiversity conservation and sustainable resource use in South Colchic region (Ajara Autonomous Republic of Georgia and bordering part of Turkey). From Georgian side, apart of Mtirala NP, Machakhela river valley (Machakhel in Turkish) is considered as the key area for development of transboundary activities.

Machakhela is relatively small transboundary river: upper part locates in Turkey – protected area as Camili Biosphere Reserve and middle and lower streams locate in Georgia. The valley is rich not only in biodiversity, but also from a historical cultural viewpoint. The idea of international cooperation and participation to conserve the areas crossed the political border has been discussed for a few years in Turkey and Georgia. However, no survey and assessment has been performed about the possibility of the idea. This article makes attempt to analyze the management and planning strategies of two counties considered for the valley in order to create an international peace park.

2 METHOD AND MATERIALS

The area which is proposed as Transboundary Peace Park in this research is a huge valley with three main landscapes of forest, mountain, and residents located over the international border of Turkey and Georgia, in the northeast of Turkey and southwest of Georgia (figure1). The Turkish part of the site has been known as Camili (Jamili) and the Georgian part is known as Machakheli.

To analyze the current situation of each part, three main factors including biological assessment, Socio-Economic assessment, and planning approaches are considered. To get the information and data, it uses the secondary reports, and available documents and internal sources. After the situation analyses, necessary planning phases are suggested in order to integrate and define the areas as a whole under one main category of International Peace Park.

Figure 1- Location of the site between Georgia and Turkey

2.1 SITUATION ANALYSES OF CAMILI WATERSHED AREA/TURKEY

The Turkish part of the site is situated 25-30 kilometers from Batumi (Georgia), one of the oldest harbors in the Black Sea. Camili Watershed Area and its surroundings have thus been conquered many times throughout history. Since 1925, Camili is included in the Borçka district of Artvin Province in Turkey. It has six villages having both official Turkish and unofficial Georgian names. In 2005, Camili became Turkey's only UNESCO-recognized biosphere reserve (Figure 2). Because Camili Watershed Area also enters Georgian Borders, the area is defined by open natural borders (7) (Pirselimopglu & et.al, 2008).

Figure 2- Location of the Camili Watershed Area in Turket (Source:UNESCO,2017)

2.1.1 BIOLOGICAL ASSESSMENT OF CAMILI

The Macahel (Camili) river basin (27,000 ha, 400–3415 m) in the province of Artvin borders the state of Georgia on the eastern edge of the Black Sea region. With its Caucasian mixed temperate rain forest and high alpine meadows, the river basin is rich in biodiversity and features many endemic species.

Mount Karçal (3415 m) and neighboring peaks, as high as 2000 m, close off the basin on 3 sides (figure 3). The Karcıl Mountains (3,415 metres high), are in northwestern and there are also three main valleys; the Ugur-Maral, Efeler and Duzenli in the area. The area has a very steep land structure. The altitude varies from 400-500 m high in deep valleys to 3500 m in mountain top. Two important rivers at the arena are Ugur and Efeler stream and they have various supporting branches. The most important water source at the area is Karagol River with an area of 10 ha.

The forest at the area has mostly kept their natural qualities. There are a great numbers of trees which are considered monumental in the forest. The area is also very rich for endemic species (71 endemin species) (Teksoz & et al, 2016).

Figure 3- A vast view of the Karçal Mountains (Teksoz & et al, 2016)

Wildlife at the area is very rich. It includes mammals, 90 bird species. It is highly significant part of the bird migration route within the Black Sea Basin. The Karçal Mountains is one of the important habitats of the endemic Caucasian black grouse (*Tetrao mlokosiewiczi*). It is an important zoo-geographical area for insects-pure Caucasian bee race (8) (Pirselimopglu &et.al, 2008). There also exists a large population of bark beetles that present a threat to the regional forest ecosystems. Important carnivore species in the area include wolf, jackal, red fox, badger, marten and weasel.

2.1.2 SOCIO-ECONOMIC ASESMENT

Villages at elevations of 500–1000 m in this geographically isolated basin are surrounded by natural and artificial barriers on all sides. The area is with the area of 16.000 hectares includes 6 villages named

Camili, Duzenli, Kayalar, Efeler, Maraal and Ugur Villages (population of 1213 people, 268 households). Numerous archaeological sites can be found within Camili, for instance, the Iremi mosque in Maraal village, Tamara's cave and an arched bridge at the entrance of Efeler village. Altogether, six villages are located within Camili, and each of these exhibits notable architectural values (figure 4). Old houses that contain four to six rooms and wooden balconies are typical of this traditional style.

Figure 4- A vast view of Camili Village (Kaymaz, 2012)

Natural condition of the area- climate and land structure and dense plants has limited the economic use of the area. Due to the geographical conditions of the area the roads are blocked by snow for 4-6 months in winter. Local people are dependent on nature in order to perpetuate their living. Human-nature relations are built on traditional knowledge and experiences from the past (UNESCO, 2017)

In addition to these natural conditions, limited transport and communication opportunities do not let economic life to grow (Pirselimopglu &et.al, 2008). Income resources at the area are cattle-dealing, bee-keeping, hazelnut and corn growing, fruit and vegetable growing. Camili has a very traditional rural lifestyle with hazelnut farming and honey production as the main economic activities (figure 5).

Figure 5- Traditional lifestyle of people in Camili (Teksoz &et al, 2016)

Cultural, ethnographic and historical values of the area which the locals have produced for centuries (language, folklor, clothing, hand-craft, songs, cuisine, authentic production systems) are important elements to be considered among the objectives of the regional cultural tourism development.

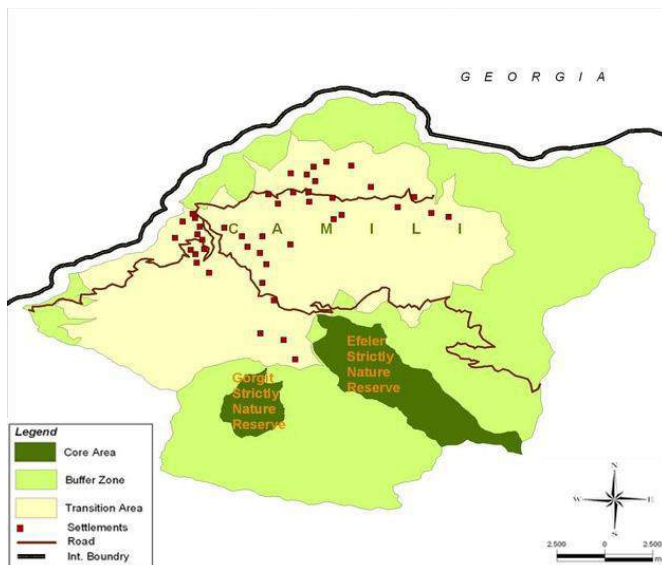

2.1.3 PLANNING APPROACHES IN CAMILI

There are two projects at the area; “Biological Diversity Project (Global Environment Facility supported by World Bank and “Camili and Karagol Forest Ecosystem Protection and Development Opportunities Project” being carried out by The Research Association of Rural Environment and Forestry (RAREF) . In the light of these studies, Decisions were made for protection area and sustainable resources use and Camili-Gorgit (Heba High Plateau) and Camili-Efeler (Findik High Plateau) Nature Conservation Areas (NCA) was established. These Nature Conservation Areas which are connected to the General Directorate of Wild Life do not have borders and Management.

There are two projects at the area; “Biological Diversity Project (Global Environment Facility supported by World Bank and “Camili and Karagol Forest Ecosystem Protection and Development Opportunities Project” being carried out by The Research Association of Rural Environment and Forestry (RAREF) . In the light of these studies, Decisions were made for protection area and sustainable resources use and Camili-Gorgit (Heba High Plateau) and Camili-Efeler (Findik High Plateau) Nature Conservation Areas (NCA) was established. These Nature Conservation Areas which are connected to the General Directorate of Wild Life do not have borders and Management.

- Camili Biosphere Reserve

In 2005, the area (the part in Turkey) was registered as Biosphere Reserve. The biosphere reserve area with a surface area of 25.222 ha is bordered with Georgia. The area between Black Sea and the high mountains beyond it show mild and humid climate features with subtropical oceanic character (İnandık, 1969). World Wide Fund for Nature (WWF) registered this area as one of the 20 Ecologic Regions. There are also two nature reserve areas Camili-Efeler ve Camili-Gorgit) in the biosphere reserve area (figure 6) (Kaymaz & et al, 2012).

Biosphere reserve area where precipitation is observed in each season according to climate characteristics is rich in terms of hydrographic elements. The water in the area is drained by Efeler, Uğur and Düzenli rivers (Koday& Kaymaz, 2013).

Figure 6- Surface area (terrestrial): 27,152 ha , Core area(s): 2,237 ha , Buffer area(s): 13,731 ha , Transition area(s): 11,184 ha (Source:UNESCO,2017)

Biological Diversity and Natural Resource Management Project (BDNRMP) , which is supported by the GEF between 2000 and 2006, is being carried out in the Camili Biosphere Reserve. The organizations responsible for the application of the management plan are the Republic of Turkey, the Ministry of Environment and Forestry, the General Directorate of Nature Conservation and National Parks, and BDNRMP Camili Project Management (UNESCO, 2017). The forest area is under the authority of Directorate of Forestry and the Two Strict Nature Reserves are managed by the Directorate of National Parks (Ministry of Environment and Forestry, 2014).

After the border is set, the area remained in the north east of Turkey, remote, isolated and set apart from its previous Centrum, Batumi, however governance process helped the conservation of ecosystems. After the border between Turkey and Russia (at that period) was set, the number of brown bears living in the border has increased. This is because there is no human entrance, interference in the region. Entering the area was not possible for foreigners. The permit was removed for Turkish citizens in 2004, but remains obligatory for foreign citizens. This requirement for a permit together with the difficulty to reach the area

has helped to keep the ecotourism activities on a modest level that resulted in the ecosystems to remain undestroyed (Ministry of Environment and Forestry, 2014).

2.2 SITUATION ANALYSES OF MACHAKHELA/GEORGIA

Georgia lies in the west of the southern part of the Caucasus region. Georgia holds the major part of the region's biodiversity with almost all Caucasus eco-systems and habitats represented and a high number of globally threatened species (GEF & NUDP, 2016). Machakhela valley is located in the south of Adjara/Georgia on the border with Turkey (figure 7). Machakhela is considered as the Eco regional Conservation Plan for the Caucasus (ECPC) on the border with Turkey and close to the existing Mtirala National Park and Kintrishi Nature Protected Landscape.

Figure 7- Machakhela is located in the south of the Adjara/Georgia

2.2.1 BIOLOGICAL ASSESSMENTS

Machakhela includes two landscapes: secondary fields (orchards, residential areas) and deciduous forest with evergreen sub-forest. There is a river named Machakhela River that is relatively small trans-boundary river between Georgia and Turkey.

Machakhela valley is home of the unique variety of relic and endemic plants (figure 8). 10,868 ha of Machakhela valley is covered by forests, 75 % of the territory is virgin forests. Most of the territory of the valley is occupied by the Colchis forest communities, which include an understory of evergreen shrubs with various endemic species such as Urgern's Rhododendron, and other common species like Cherry laurel or Caucasus box (Ilia University, 2015). Dominant species are beech, chestnut, oak, spruce, maple, persimmon and etc. Around 200 species of vertebrates' mammals, birds, amphibians, reptiles and fish) are found on the proposed territory.

The area is an important bottleneck for migratory birds (Batumi Flyway) in spring and autumn. Among the species that can be observed are: Imperial Eagle, Lesser Spotted Eagle, Steppe Buzzard, Black Kite, Booted Eagle, etc (GEF & NUDP, 2015).

Figure 8- Vegetation in Ajara PA's (GEF & UNDP, 2015)

Anthropogenic landscapes are covered with cultural and invasive vegetation, while forested section is mainly covered with local Colchian species. The areas where mature Colchic forest is well preserved are notable for that pristine wilderness and scenic beauty (GEF&UNDP, 2015). Colchic forests provide an important habitat for large mammals, including brown bear, golden jackal, European lynx, European roe deer, wild boar, and wolf.

2.2.3 SOCIO-ECONOMIC ASSESSMENT

In the area, old traditions are well preserved, and it has good connection with neighboring Protected Area in Turkey. Cultural and historical heritage including the medieval Tskhemlari Bridge, and many other arch bridges, the Gvara Fortress (6th-7th century AD), different churches and monasteries, and other ethnographic attractions such as an old wine press.

Popular festivals and celebrations are also part of the cultural richness of Machakhela region that are worth mentioning, such as the popular Machackhloba Festival held in the second half of September (UNDP & GEF, 2016).

Eight inhabited villages are in the area of influence of the Machakhela National Park with 3.048 inhabitants. The vast majority of local families keeps their own farm and lives from agriculture and development of local products, which opens a possibility for the development of agro-tourism and rural tourism activities that enable visitors to experience the culture and traditions of local communities while generating additional sources of income for the local population.

The area has specific geographic and climatic conditions. Main part is mountainous and is characterized by small lands. Utilization of new lands is practically exhausted. Agricultural production has predominance, infrastructure is also developed. There are tree tea factories, inert material factories, building blocks manufacturing complex. The lack of agricultural lands does not allow development of large-scale farming. Therefore, mostly small farming is presented. Accordingly, production capacity of industrial sector is insignificant (Gamma Consulting, 2011).

Tourism is the most promising and rapidly developing field of Adjara. But unfortunately, Georgia-Russia conflict of 2008 and later world economic crisis has deteriorated situation in Georgia and among them – Adjara. This adversely affected all sectors of economy, including tourism.

2.2.4 PLANNING APPROACHES OF ADJARA/GEORGIA

Georgia holds the major part of the Caucasus region's biodiversity with almost all Caucasus ecosystems and high number of globally threatened species (MoEPNR & KfW, 2011). However, Georgia's biodiversity

is threatened by unsustainable logging of forests, over-grazing of pastures, poaching of wildlife, the cultivation of wetlands, the inappropriate siting of built development, mining and quarrying, and mass tourism. Georgia's main strategy for biodiversity conservation is the development of its network of protected areas (MoEPNR & KfW, 2011).

The Government of Georgia's policies regarding PA development and management are set out in the National Biodiversity Strategy and Action Plan (NBSAP) adopted in 2005. The Eco-regional Conservation Plan for the Caucasus (ECPC) serves as a guiding document for the NBSAP. However, there are weaknesses in the policy framework with regard to the integration of environmental protection goals into national policies, communication between ministries with functions related to natural resources management, and sustainable land management (MoEPNR & KfW, 2011). Since 2008 Georgia has been developing a comprehensive program on protected areas and strong partnerships with international organizations such as World Bank, EU, KfW, IUCN, GEF/UNDP, etc.

Ajara PA's, are part of an important priority conservation area in the Caucasus Eco-Region and have good opportunities for the development of ecotourism. The two project PA's are an important priority conservation area in the Lesser Caucasus including; Mtirala National Park (area of 35 000 hectares; 20 000 hectares covered by forest), and Kintrishi Protected Area (GEF & NUDP, 2015). Machakhela, as recently established National Park is still underdeveloped (GEF & NUDP, 2015). Machakhela National Park which joins on the south with the Camili Biosphere Reserve in Turkey creates an excellent opportunity for transboundary cooperation towards a better protection and integrated management of the involved territories (figure 9). Establishment of Machakhela PA will consolidate the network of PAs in the region and fill an important gap in the representation of the forest biome.

Figure 9- Machakhela Valley crossed the border of Turkey and Georgia and links to the Camili Watershed Area

- Machakhela National Park

The area was first established as a National Park in 2015, becoming part of the system of protected areas of the Autonomous Republic of Adjara. With a total area of 7,359.44 hectares Machakhela National Park is located in the gorge of the Machakhela River in the Adjara Region in Georgia. This park supports contributing of an ecological corridor between the protected areas of south-west Georgia (in particular, Mtirala National Park and Kintrishi state reserve) and protected areas of north-east Turkey in particular, Camili Biospheric Reserve. It is located within the administrative boundaries of the municipalities of Keda and Khelvachauri.

The need for transboundary conservation was indeed recognized as a priority by different experts from the Caucasus region stated by international organizations such as UNDP and IUCN (2013)

Machakhela NP is to establish a transboundary PA as it shares borders with the Turkish PA Camili (figure 10) (UNDP&GEF 2016)

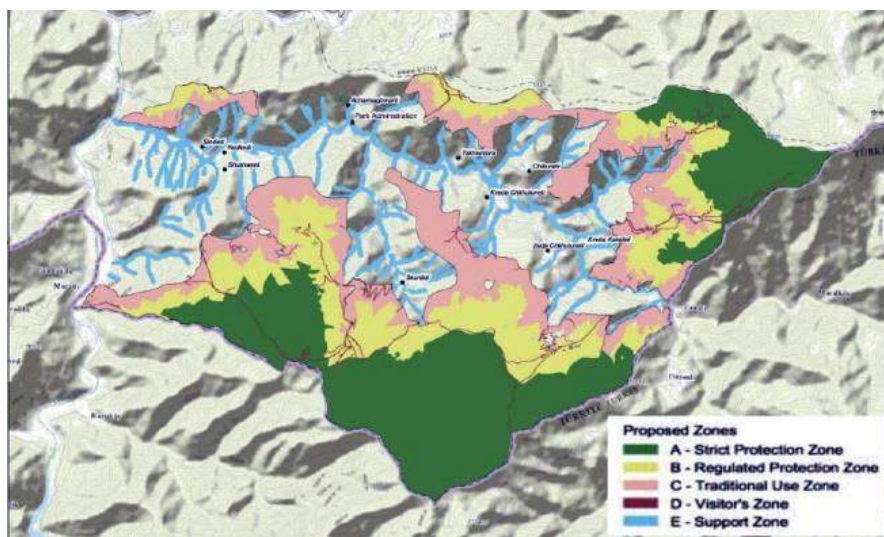

Figure 10- Machakhela NP Zoning Map according to the Law on Protected Areas; Strict protection Zone (Zone A): established to preserve virgin nature and educational activities, Regulated Protection Zone (Zone B): established to protect the living environment, Traditional Use Zone (Zone C): established to conduct economic activities related to the environment protection, Visitor's Zone (Zone D): established to conduct environmental recreational and educational activities (Source: Ilia University, 2016)

Objectives and authorities of in Machakhela National Park in Georgia include:

- Conservation and protection of unique ecosystems;
- Tourism development;
- Creation of an ecological corridor between the protected areas of south-west Georgia and protected areas of north-east Turkey
- Improve socio-economic conditions for local community
- Promoting transboundary cooperation _ linking the Machakhela national park with the adjacent protected areas in Turkey.

Since early 2000th, The World Wide Fund for Nature (WWF) develops concept for establishing Georgia-Turkey cross- and transboundary cooperation for biodiversity conservation and sustainable resource use in South Colchic region (Ajara Autonomous Republic of Georgia and bordering part of Turkey). From Georgian side, apart of Mtskheta NP, Machakhela (Machakhel in Turkish) river valley is considered as the key area for development of transboundary activities. Machakhela is relatively small transboundary river: upper part locates in Turkey – protected area as Camili Biosphere Reserve (established within the framework of Global Environmental Facility) and middle and lower streams locate in Georgia. The valley is rich not only in biodiversity, but also from historical cultural viewpoints (WWF et al, 2006).

In addition, Adjara PA's has a great potential for tourism development that should be addressed some issues like the governance and management structure by facilitating the participation of different administration levels, local communities, private sector, etc. in the PA 'decision-making and a more flexible system of revenue sharing between APA and the PA's. Agreements should be made in order to allow PA's to retain a share of income generated from tourism activities (UNDP & GEF, 2016).

3 RESULTS

Part of Machakhela Valley in Turkish territory is called Camili. It has been defined as biosphere reserve by International Union for Conservation of Nature (IUCN) and includes Efeler and Gorgit Strictly Nature Reserve. While, the main part of Machaekhela Valley in Georgia has been considered as National Park by IUCN. It is one of the three Protected Areas in Ajara region of Georgia. Based on the Table 2, each categories has definite objectives and definition. Biosphere reserve is a unique kind of protected area that differs from a national park with different aims. National parks and other kinds of protected natural areas usually are primarily concerned with conservation; however biosphere reserve aims research and sustainable development

Categories	Definition (IUCN)	Primary Objectives (IUCN)
National park	Large natural areas set aside to protect large-scale ecological processes, along with the complement of species and ecosystems characteristic of the area, which also provide a foundation for environmentally and culturally compatible spiritual, scientific, educational, recreational and visitor opportunities.	<ul style="list-style-type: none"> • To protect natural biodiversity along with its underlying ecological structure ; • To supporting environmental processes, • To promote education and recreation.
Biosphere Reserve	Areas which cover a larger area of land, may cover multiple National Parks, Sanctuaries and reserves. It will also include the entire buffer and tourism zones and offers protection to not only the wildlife and flora but to the indigenous people as well. some controlled economic activities will be permitted in these areas - like mining and farming etc.	<ul style="list-style-type: none"> • To conserve genetic resources, species, and ecosystems; • To do scientific research and monitoring; • To promote sustainable development in communities of the surrounding region.

Table 2- The definitions and aims of Nature Park and Biosphere Reserve in IUCN categories are summarized

The management system of a biosphere reserve needs to be open, not closed, to community concerns; and it needs to be adaptable to changes in local circumstances. While, nation Park allows no human activities inside the buffer or core zone. There may be limited activities (other than tourism) within the tourism zone of a National park. Biosphere reserves are meant to be places where communities can work with the area's land-managing agencies, local governments, schools, and other institutions to design responses to external political, economic, and social pressures that affect the ecological and cultural values of the area.

By considering the Machakhela Valley that covers whole of the areas including villeges, Karcak Mountains, Camili Biosphere Reserve, Machakhela National Park as an international peace park between Turkey and Georgia, the achievements would be:

- to enhance ecosystem integrity and natural ecological processes by harmonizing natural resources management approaches; and facilitate wildlife migration;
- to promote alliances in the management of biological and cultural resources and encourage social, economic and other partnerships among their Governments and stakeholders;
- to foster trans-national collaboration and co-operation in implementing ecosystems and cultural resource management;
- to develop strategies for local communities to benefit from peace parks; benefit from the increased eco-tourism to the area, promote tourism through the loosening of borders; and
- give better knowledge of ecological and socioeconomic dynamics of the area ecological monitoring

4 CONCLUSION

Finally, to create an International Peace Park between two countries of Turkey and Georgia, 6 main phases are suggested in this study.

Phase 1: Analysis of

- Natural environment, climate, topography, ecological systems and natural resource areas (wild life, vegetation, water surfaces) and geology.
- Cultural heritage
- Socio-cultural economic environment, population characteristics, cultural structure, values, human migration, local participation, tourism, economic situation, settlement, infrastructure
- Agriculture/Production systems, capacity building, people-nature relations,

- Demand analysis, residents perception and preferences, Attitudes, stakeholders' interests
- Environmental quality problems
- Institutional structure, existing plan and policies, legal framework, capital, human resources.

Phase 2: To determine the formulation of the plan and planning approaches

- Environment –sustainable development approach carrying capacity.
- Community participation approach- maximum participation of the effected community in the planning process. The determination of choices of policies and plans together with local residents and related civil authorities.
- Constantly overlapping flexible approach –because the planning is an ongoing process .This approach emphasize constant observation and feedback and doing arrangement and corrections

Phase 3: Planning

- Produce plans and suggestions related to planning elements will management plans (including associated programmes) and multi-annual operational business plans for the selected areas in coordination with relevant stakeholders and projects.
- Create geo-referenced base maps for the selected site.
- Carry out baseline surveys (Key Biodiversity Area, land use, socio-economic).
- Delineate the external boundaries of Peace Park.

Phase 4 : Zoning the area that defines: Areas with special potential worth protection (strictly and semi protected), Areas with potential for tourism and recreation like cross border festivals, and multi-purpose protection area will be determined on protection tourism and recreation area.

Phase 5: Integrated Monitoring: After plan prepared according to the suggestions, to witness the application of the plans and the realization.

Phase 6: to observe the situation conflicting with objective, plans produced after plan formulation, policies and suggestions, and doing necessary arrangement and correction and feedback.

ID 1483 | URBAN REGENERATION AND ITS ROLE ON MARKET SUSTAINABILITY: A CASE STUDY OF MANCHESTER

Chien-Ling Lo¹

¹School of Planning, Bartlett, University College London

c.lo.12@ucl.ac.uk

1 INTRODUCTION

The role of planning policies in the property market, particularly in regeneration, has been recognised as to shape, regulate and stimulate the market (Adams et al, 2010 & 2015; Jones, 2014). These scholars pointed out the lack of market indicators to evaluate the outcomes of planning and regeneration policies, which shows that the need for regeneration policies to engage with property market still remains neglected and there was little discussion on whether urban regeneration policies encouraged sustainable property markets as important economic institutions.

This paper intends to explore the impact of regeneration policies on the evolution of property market toward a more sustainable level against the conceptual framework with three evaluation indicators identified in this research including market maturity, competitiveness and resilience by looking at how Manchester has been transformed through its regeneration schemes over the past few decades with the effort of all stakeholders and particularly the Manchester City Council by interviewing the council's leaders and planning officers. Moreover, this paper looks at the feedback and opinions from the developers and planning consultants and the others who have experiences in working with the Manchester City Council for their development proposals to find out what made this city commercially successful and whether it really has profoundly regenerated the city through numerous property developments.

2 WHY MANCHESTER?

The rise of Manchester as the first industrial city in the world, and a successful one, witnessed the prosperity of the United Kingdom with other industrial cities through the industrial revolution. Not only did it claim its success from the industrial revolution; but also Manchester has some unique qualities as a city. Peck and Ward (2002, page 1) describe the special characteristics of Manchester as a city,

“Manchester has always been a city of extremes, a city of hard edges. The City has a gritty vibrancy, even on its (many) rainy days. There is here a spirit of dogged independence, sometimes expressed in the form of arrogant exuberance, sometimes as downright indifference to what the rest of the world thinks. Mancunians will always tell you that it happened in Manchester first, though only rarely will you find them patiently attentive to the counter-arguments. The city has always been on a hurried path to (some kind of) improvement, and has little time for those who would put obstacles in the way or get distracted by temporary setbacks. Always a city on the move, it has been in an almost perpetual state of restructuring, right back to its early stirrings as the crucible of industrial capitalism. Talk of revolution, like the drizzle, is nearly always in the air.”

After the Second World War, the effect of deindustrialisation process on this post-industrial city has been catastrophic. Job losses saw people move out of Manchester and the pace of population decline was alarming. By 2001, Manchester saw its population halve since 1931. From the late 1970s, the disparity between the London and the north opened up dramatically partly because governments ceased trying to spread economic growth more widely among cities (Martin, 1988; Rodriguez-Pose and Gill, 2005; Pike and Tomaney, 2009, page 20; Martin et al, 2015).

In this context, Manchester faced many difficult urban problems, such as high unemployment rate, empty mills and factories and a crisis of losing its residents over time in the 1970s (Young et al.). Manchester looked like a shrinking city with no hope and future at that time. However, since the 1980s Manchester has undergone a shift in governance and has developed a series of selling, marketing and branding strategies to reimage the city (Young et al., 2006). After 70 years of constant decline, the population data of the 2011 Census showed that Manchester has become the third fastest growing city in England and Wales, with an increase of 19% of its population (Manchester City Council, 2016). This impressive figure means that in the last 10 years Manchester has attracted more inhabitants than any other metropolitan area outside London (Ortiz-Moya, 2015). This city seems to have changed its fate and turned its fortune around.

In several literatures, the role of Manchester City Council (MCC) has been suggested to be quite significant and dominant for the transformation of Manchester (Cochrane et al., 1996, page 1327), particularly as an exemplar in physical regeneration from the 1990s (While et al., 2004, page 557). One of the tactics MCC used was to embrace the idea of entrepreneurship. Manchester has become one of the most widely cited examples of entrepreneurial urbanism (Ward, 2003), which includes “urban development as the process of urban entrepreneurialism” (Harvey, 1989) and requires more state intervention most conveniently through regeneration initiatives. The general frame for Harvey’s account is the relation between capitalist development and the social and the physical landscapes of urbanization. Urbanization, Harvey argues, is “both product and condition of ongoing social processes of transformation” (Harvey, 1989a:3). Within this general context Harvey’s specific focus is the reorientation in attitudes to urban governance since 1970s in the advanced capitalist economies. Drawing on a range of diverse sources and observations Harvey argues that, in short, “the ‘managerial’ approach (to urban governance) so typical of the 1960s has steadily given way to initiatory and ‘entrepreneurial’ forms of action in the 1970s and 1980s’ (Harvey, 1989a:4).

The idea behind urban regeneration initiatives is to fix the mismatches between the post-industrial city and the necessities of the new service economy and, accordingly, cities need to improve their general conditions and recover their ‘sense of place’ (Ortiz-Moya, 2015). With this in mind, Manchester has been through several stages by undertaking flagship developments to construct iconic buildings with a high symbolic value that would transform the face of the city and re-brand its image for investment. A number of key events occurred to assist intentionally or unintentionally in this process of city transformation. Firstly, during the era of the Central Manchester Development Corporation (CMDC) between 1988 and 1996, the southern part of Manchester city centre was redeveloped, the public realm improved and office space increased. This coincided with a period of strong economic growth in Manchester during the 1990s.

The IRA Bomb in 1996 formed part of the drive to carry out the physical renewal that had been planned during the 1990s. Manchester Millennium Limited (MML), a public-private partnership (PPP) between the city council and local businesses was set up, to lead the post-bomb regeneration. According to the news report (BBC, 2006), MML attracted £83m of public sector funding, a combination of government and European money and £30m from the Millennium Commission for Urbis, the Exchange Square museum conceived as a showcase for inner-city life as well as a total of £500m of private sector cash was brought in between 1996 and 1999.

Following developments completed during this time, Manchester city centre now offers one of the largest office markets outside London. Swinney and Sivaev (2013) noted that the number of private sector jobs in Manchester city centre increased by 39 per cent between 1998 and 2008. The MCC committee report (2012) on the progress and impact of City Centre Regeneration initiatives on economic growth in the city centre stated that demand for office space was so high that there was a shortage of office space, with prices higher than regional and national averages.

Given many achievements accomplished by the effort of MCC, however, as Ortiz-Moya (2015) observed, Manchester is still suffering the problems derived from its shrinkage process hidden behind its recently achieved population growth. Deas and his colleagues (1999) also questioned that the tactics MCC employed over the years did not pursue more broadly-based goals for regeneration, for example, their strong emphasis on economic growth, almost at the expense of any consideration of wider distributional effects and the single-minded focus on securing property developments.

So far, property developments are deemed as a subject and tool for the delivery of regeneration initiatives promoted by the entrepreneur-like MCC as a means of state intervention. Since the late 1970s, the prevalence of neoliberalism has been evident in the urban policies of the UK governments, which is rooted in the belief of a free-market mechanism. Any state intervention would only be expected when there is evidence of market failure that only could be corrected by the power of the state. However, the movement of entrepreneurial urbanism emphasising on urban governance in the advanced capitalist economies, seems to move away from this belief and provides the governments with a justified ground to intervene in the market at a substantial scale under the name of regeneration. This peculiar phenomenon strikes one to explore the impact of regeneration policy on property market by looking at this interesting case, the city of Manchester.

3 THE CONCEPTUAL FRAMEWORK ON MARKET SUSTAINABILITY

Through reviewing the relevant literature, a conceptual framework is developed to explain the relationships between urban policies, regeneration initiatives, economic sustainable development and sustainable regeneration property markets. There are few essential elements identified to evaluate the level of market sustainability in property, involving the state of market maturity, resilience and competitiveness for long-term investment or economic competitiveness as illustrated in the following diagram. This conceptual framework provides a foundational structure for the research design of this paper. These three factors are discussed closely in relation to the context of economic sustainability in urban policy (Keogh and D'Arcy (1994); Adair et al.(1999); (Jones & Evans 2013); Martin (2012); Rogers (2012); (Adair et al.,

2002; Couch, 2003; Porter, 2005; Hutton, 2008; Tallon, 2010).

Table 1 Conceptual framework on sustainable regeneration property markets

As the concept of sustainability has been emphasised progressively, the UK government has also integrated the goal of sustainability into urban regeneration policies. The UK sustainable development policy in 2005 has called for 'a sustainable, innovative and productive economy that delivers high levels of employment; and a just society that promotes social inclusion, sustainable communities and personal wellbeing' (DETR, 2005, p. 16).

However, how can one dictate whether a market is sustainable or not? Which criteria or benchmark should one utilise? Is there any applicable assessment model or framework for the definition and implications? These are the questions, which this research intends to investigate. Economic aspects of sustainability are crucial for every inhabitant of the country (Zuleeg, 2010). According to Dárcy (2011), he contends that the operation of the real property market will have an inevitable impact on the ability of an urban region to exploit, maintain or create competitive advantage and thus its ability to generate high and sustainable economic growth relative to its competitors. In this context, this paper argues if a property market would

influence the level of competitiveness and sustainable economic growth, then it also could assume if the property market of a city or region which shows sufficient level of competitiveness and sustainable economic growth, would be deemed sustainable. The implications of the market sustainability include a market with capability of coping with property cycles (Jones and Watkins, 1996, p. 1132), which demonstrate a level of economic resilience.

Based on the literature review on market maturity, economic competitiveness and resilience, the definition of market sustainability in the property sector adopted in this paper is a property market that indicates its maturity via well established values and transactions; and a city or region which could prove to obtain sufficient level of economic competitiveness and resilience to deal with the economic cycles over time.

4 MARKET MATURITY

Jones and Watkins (1996) conclude that the establishment of a sustainable market occurs when a market is created which 'evidently' meets the long-term needs and aspirations of consumers by comparing the targeted sub-market to the mature markets recognised by the market participants including the main investors, estate agents and the government registration agents. The market also needs to be viable in its own right to be regarded as being sustainable. As mentioned above, the implications of the market sustainability include a market with capability of coping with property cycles and properties as market products to have achieved such a level of acceptability that there is an active resale market as well as the evidence of institutional investors' involvement in trading properties in such a market (Jones and Watkins, 1996, p. 1132).

A robust investment structure can help create sustainable regeneration property markets, which are less susceptible to short term economic market cycles and which are attractive to private investors with longer-term investment horizons, most notably institutional investors (Parkinson et al. 2010 quoted in Haran et al. 2011). Following the rationale of the essential role played by institutional investors, one of the aims of this paper is to investigate how urban regeneration policies affect the property investment market with a focus upon the factors influencing the behaviour of the institutional investors on their decision-making process.

Research undertaken by Adair et al. (2005) indicates that once a regeneration area becomes established and rental growth is apparent, competition between investors is likely to reduce property yields. The findings of the study show that investment property in regeneration areas can outperform national and local benchmarks, which challenges the perception of lower investment returns in regeneration areas. The analysis also demonstrates that over a long-term period regeneration areas offer significant investment opportunities. Therefore, to collect the opinions on the level of trading activities from leading estate agents and developer are crucial to measure the level of market maturity in the designated areas.

These findings confirm that receiving high levels of public sector support and effective regeneration policies help the regeneration areas mature and create sustainable urban environments capable of meeting private sector investment goals (pp. 164-1645). They provide a logical reasoning to interview the councillors and planning officers of Manchester City Council.

Jones (2009, p. 2370) contends that the concept of market maturity has close parallels with the process of the development of a sustainable market in the context of regeneration where new land uses are introduced to a locality. Jones and Watkins (1996) claim that to achieve the state of market sustainability, a market should be sufficiently mature to overcome the downside effects of the property cycle with an active resale market being able to lock-in longer term institutional investment, which explains the importance of interviewing major institutional investors.

5 ECONOMIC RESILIENCE

After the credit crunch, questions of regional resilience have gained importance when discussing regeneration. Within a conceptual framework of resilience, resilient cities are regarded as places that better cope with the shock of change to the wider economy and environment (Jones & Evans 2013) which indicates the quality of regional economic adaptability to changing circumstances (Hassink 2010). In this sense, not only firms and industries but also local and regional development policy, and in a broader sense the institutional environment of firms and industries, would affect the dynamism and adaptability of regional economies. A resilient region or city would have to keep altering the markets and local political structures to adapt to changing environmental conditions.

Most of the recent uses of the term in regional or urban applications refer to this idea of the ability of a local socio-economic system to recover from a shock or disruption. However, the various literatures suggest that

there are many different ways of interpreting resilience and it is necessary to grasp the essential concepts of resilience in different disciplines.

For example, Martin (2012) introduced a four-dimension model of regional resilience based on mainly three interpretations or uses of the term respectively called Engineering Resilience found in physical sciences; Ecological Resilience found in ecological sciences; Adaptive Resilience found in complex adaptive systems theory. He developed this four-dimension model as an attempt to provide a full meaning to the notion as a description of how regional economies respond to recessionary or other such shocks.

There are four contributors to defining resilience. The first is that of resistance, that is the vulnerability or sensitivity of a regional economy to disturbances and disruptions, such as recessions. The second is that of the speed and extent of recovery from such a disruption. Of interest here is whether the speed and extent of recovery are determined by the degree of resistance to the shock in the first place. The third aspect concerns the extent to which the regional economy undergoes structural re-orientation and what implications such re-orientation has for the region's output, jobs and incomes. The fourth dimension concerns the degree of renewal or resumption of the growth path that characterized the regional economy prior to the shock. In addition, these different aspects or dimensions of regional economic resilience may interact in different ways, to produce different outcomes of the sort illustrated stylistically.

Martin (2012) then argues that the regional performance of economic growth and the competitiveness can be key factors to examining the level of regional resistance to a recessionary downturn. He also emphasises how national policymakers respond to a major recessionary crisis can be quite crucial in influencing the economic resilience of different regions and localities. The specific policies adopted by the central government will condition the scope for and form of firm behaviour differently in different regions, especially according to the economic specialisms of those firms.

Table 2 Four dimensions of regional economic resilience to a recessionary shock (Martin, 2012)

New tensions have been created in the past decades under the prevalence of neo-liberal globalisation because its constant pressure to adopting changes and shifts for being universal is likely likewise rendered unstable (Harvey 1989 quoted in Rogers 2012, p. 101). Within a broader framework of neo-liberal governance reform, the reaction of governing authorities was to address urban regeneration, not only of the public spaces, streets and architectural forms of the physical city, but also to reimage the city and manage the public and corporate perceptions of the city in a post-industrial global marketplace by embracing the strategy of entrepreneurial cities in pursuit of economic growth.

Urban transformations are regarded as the engines of economic growth since cities are the centres of production, consumption, innovation and accumulation of wealth (Musterd 2003 quoted in Rogers, 2012). These cities and towns that demonstrate evidence-based metrics of economic growth are used as case study models of successful regeneration.

In this sense, therefore, the concept of resilience is introduced to seek a solution to ease the tensions created by neo-liberal globalisation in pursuit of economic growth in urban policy.

6 ECONOMIC COMPETITIVENESS

Another issue on market sustainability is economic competitiveness for long-term investment since the social structuring of markets is generally in response to the problems of competition and exchange (Fligstein and Dauter 2007, pp. 117) and cities seeking to stimulate economic growth have competed with one another to attract businesses (Jones and Evans 2011, pp. 68). D'Arcy and Keogh (1999) state that the property market will influence urban competitiveness directly and subsequently will affect the sustainability of its economic growth, through the provision of suitable accommodation for economic activity and indirectly through its cumulative contribution to the built environment (p. 917).

The competitive advantages of progressive cities facilitate capturing opportunities for development and attracting pioneering business while other cities are challenged in a competitive global economy. Regeneration and business strategies related to the property sector are two of the most significant tools that cities have employed to overcome physical, environmental, social and economic challenges and enhance competitive strength (Adair et al., 2002; Couch, 2003; Porter, 2005; Hutton, 2008; Tallon, 2010).

The principal forms, functions, and policy mechanisms of local and regional economic strategy in advanced western capitalist societies have undergone major changes during the last two decades. There have been major shifts in cities' roles as subjects, sites, and stakes in economic restructuring and securing structural competitiveness. These shifts are reflected in increased interest in, and emphasis on the entrepreneurial city at both regional and local levels. The distinctive feature of entrepreneurial cities is their self-image as being proactive in promoting the competitiveness of their respective economic spaces in the face of intensified international and regional competition.

Regeneration projects are commonly associated with gentrification processes, as one of the most significant economic outcomes of regeneration is the increase of real estate prices in the regenerated areas or its surroundings (Berényi and Szabó, 2009; Csanádi et al., 2011).

According to the European experience (Mora and Peña, 2010) two main types of regeneration operations can be distinguished. The first category shows that interventions in central areas such as historic or traditional neighbourhoods and resulting in gentrification processes or new activities and functional specialisation. These cases often involve private and public property developers becoming partners to overcome the economic and legal difficulties that are characteristic of such operations. Transfers of public resources to private operators often occur in these cases, and the ultimate users and owners are the beneficiaries of the operation. These operations frequently entail evictions, rising property values and processes of exclusion of the lowest-income population and of the least competitive activities.

The other type will see the interventions that coordinate various programmes and policies of social and housing improvements in so-called 'vulnerable' or 'deprived' areas. These can be considered as involving a 'standardisation' process, since their objective is to mitigate potential social conflicts and to reduce the distance that separates living conditions in the most deprived neighbourhoods from those of the middle or 'normal' range, especially in terms of housing, public space, education and transport. These operations attract little interest from property developers, and are usually carried out by public authorities. In these cases the demographic and social composition of the areas is usually maintained, contributing to stability and thus to the consolidation of a pre-stratified social space.

It clearly concerns the performance of economies and can at one level be equated with the trajectory of the economy in terms of variables such as value added, employment or incomes of the population. Parkinson and Boddy (2004, p. 1) contended that since the 1990s cities have been viewed as 'dynamos of the UK national economy, vital to the competitiveness of "UK plc"... Cities are now regarded as economic assets rather than urban liabilities reflected in the renewed investment in cities and growing attraction of urban life, both of which are vital to economic competitiveness (ODPM 2004b; 2006a).

Globalisation is one of the principal reasons behind the need for cities to compete, and the impact of globalisation on competitiveness is important in understanding urban change and regeneration strategies. In the age of global capital flows and globalisation, cities at the global level have to become ever more competitive to secure future growth and the regeneration of urban economies. To this end, cities seek to ensure competitive advantage over their regional, national, European and global counterparts.

This has implications for urban regeneration in terms of attracting business, residents and tourists to particular cities. Cities have to fight to secure competitive advantage through attracting international capital (see Hall 2006, pp. 82–84). Place and local context matter in terms of competitive strength, and some cities offer a better mix of attributes for business and business success than others (Begg 1999; 2002a; Boddy and Parkinson 2004; Buck et al. 2005).

Deas and Giordano (2002) put forward the ways in which competitive advantage might be measured. A distinction can be made between competitive assets linked to contextual factors, and competitive outcomes related to economic performance. However, these indicators suggested by Deas and Giordano (2002) do

not account for image factors and their impacts on place. Harvey (1989) further contended that the conditions that are important depend on the market in which a city is attempting to compete. Governance factors are seen as a key condition for enhancing city competitiveness. The 'organising capacity' or 'institutional capacity' of city regions is vital (van den Berg et al. 1997; van den Berg and Braun 1999). Competitive cities have the power to be able to anticipate, respond to and cope with changing intrametropolitan and extrametropolitan relations (van den Berg et al. 1997).

Business and the private sector more generally appear to gain from a competitive city through an advantageous business environment, whereas city authorities benefit from urban and economic regeneration stimulated by business growth. Evaluating the benefits of inter-city competition on local communities is more problematic, particularly if success bypasses excluded communities and neighbourhoods within entrepreneurial and 'competitive' cities.

7 RESEARCH METHOD

The aim of this section is to explain the issues surrounding the interview method used in this research. It is essential to outline the type of interview form deemed suitable and the analytical approach to analyse the interview data.

8 THE TYPE OF INTERVIEW FORM

This research includes the conduct of semi-structured interviews with open-ended questions. In order to find out how the city of Manchester has been transformed through its regeneration schemes over the past few decades, it is essential to look at what primary stakeholders in the city and particularly the Manchester City Council have done to deliver their vision for the city by interviewing the council's leaders and planning officers. It is equally important to know how the key market participants such as the developers, estate agents, institutional investors and planning consultants evaluate the outcomes of these regeneration schemes made to the city by listening to their views on what made this city commercially successful and whether the city really has been profoundly regenerated through numerous regeneration developments as well as its impact on the evolution of property market toward more sustainable level.

Following the rationale mentioned above, there have been nineteen interviews undertaken. These interviewees could be broadly categorized into two groups. The first group aims to focus on the work of the Manchester City Council in the effort to transform and regenerate the city for a better future. Therefore, these interviewees have the representatives including the political leaders and planning officers from the Manchester City Council as well as from other local authorities within Greater Manchester. Another group consists of the primary market players in the property industry such as the developers, estate agents, institutional investors and planning consultants, who offer their views from the standing point of the market forces to assess whether the market in Manchester proved to be regenerated successfully and sustainably after a substantial number of regeneration schemes and funding have been placed in Manchester since the 1980s.

The analytical framework of interview data: Interviews present one of the sensible methods in social science to gain information and understanding of social phenomena and attitudes (Walliman, 2006:131). These interviews are to investigate five sub-topics identified in this research aiming to find out how regeneration policies affect property market in Manchester by understanding the view of interviewees on the relationship between property markets and regeneration policies; how land use regulations influence property market development; implying market maturity, economic resilience and competitiveness on Manchester regeneration property market to assess its level of market sustainability; the role of local government in regeneration; the investment prospect of Manchester regeneration property market.

9 THE ANALYTICAL STRATEGIES

Given the nature of interview data, it seems to be appropriate to use qualitative thematic analysis to forming relevant themes, which reveal the attitudes of the interviewees and the phenomena they observed regarding the issues about regeneration policy and property market in Manchester.

After interviewing a few political leaders and planning officers of the Manchester City Council, several themes have been mentioned and emphasised in the interviews which are summarised as follows.

10 THE RESPONSES ON MARKET MATURITY

After interviewing the developers, estate agents and institutional investors, they seem to provide evidence that shows a healthy and steady volume of trading activities within regeneration property market in the central city of Manchester at the time of interviews undertaken between June 2016 and May 2017.

Several papers have discussed that investment in regeneration areas was believed to have certain disadvantages associated with the negative impression of high risk investment for prospective investors. However, among the interviewees, they claimed that the main concern for developers and investors is not about whether a development for a potential investment opportunity is located inside the regeneration area but the image of that city for its future growth in a long-term prospect.

Also, the reports prepared by the agents (could be local one or one that has local knowledge) will be the key information for institutional investors when they come to investment decisions in cities outside London. They, particularly institutional investors, rely on this information greatly if not entirely because in most cases, they are not familiar with that city and do not have enough knowledge about the local market.

From the feedback of the interviewees, they regard there to be no issue of regeneration stigma for Manchester which could be seen as a sign of market maturity because some of these investors, including several institutional investors, demonstrate the positive impression on the buildings located in regeneration areas of Manchester city centre and had invested in regeneration properties before or still keep the holding.

Another issue of investment in regeneration properties has been debated by some scholars on the greater performance of regeneration properties in terms of the growth of rental and capital values. One of the estate agents said in the interview that the greater growth in rental or capital values of regeneration properties could be down to the low initial prices below the average of the other properties in the area; this is not necessarily because it shows a stronger demand or better performance.

Also, he pointed out that a market to become mature is not definitely linked to the length of the market established. In some cases, a new market could operate and mature within a few years if there is a growing market as a whole and that city is booming and certain sub property markets within regeneration areas in Manchester have proved to be the case.

One developer suggested that the problem with valuing a regeneration property is the difficulty to find good comparative evidence in adjacent areas with similar specifications since there was no market before. He shared how his company came to overcome this problem. He said that before his company launches a development project in a regeneration area, they tend to construct a couple of houses first and then to see whether these houses could be sold quite easily. If they have been sold successfully, it proves that there is a demand for it and at the same time, we established the useful comparable.

11 THE RESPONSES ON ECONOMIC RESILIENCE

With regard to economic resilience, one of the leaders for Manchester City Council assures that they constantly follow up the latest updates on the market and economy. They are clearly aware of the effect of economic cycles on the market and bear this in mind when giving out the planning permissions accordingly. He exclaims that it is important to balance both sides of demand and supply to retain market resilience particularly within the economic downturn or financial crises. He also emphasises the willingness and proactive attitude that MCC holds to assist the companies and facilitate the market conditions when the city starts to experience any economic turmoil.

His statement has been supported by other interviewees with positive opinion towards the city council's endeavour to help the businesses when the economy looks difficult. These tactics include the city council would help with land assembling for any desirable developments and reach out to hear the voices of businesses for better policies and actions.

However, one of the developers points out a different view on the efficiency that city council grants the planning permissions. He believes that the city council could be more confident to reject the development proposals for over-supplied sub-markets for example, buy-to-let apartments. He thinks the go-ahead planning permissions for the city centre apartments show the fear and concern from the council for deterring the further investment if they reject these proposals.

In terms of regeneration property performance during the recession period after the credit crunch in 2008, one of the estate agents remarks that the regeneration properties struggle more than the non-regeneration properties. He thinks this is partly because the regeneration market seems relatively less well-established and demand could disappear faster than others when the economy is looking gloomy.

Moreover, the downward adjustment of property values in regeneration areas during the 2008 recession also proved to be greater than others.

Major events could change the political and economic agenda and stability of a country such as Brexit. Following the result of Brexit vote to leave the EU, the implications and impacts of the Brexit have not been testified but uncertainties have made by some of the interviewees very worried about the future prospective of Manchester, such as the council's leaders, developers and agents. However, even though they are not keen on the leave vote of Brexit, they still retain a certain degree of optimism for the resilient capacity of Manchester to weather this challenging situation.

12 THE RESPONSES ON ECONOMIC COMPETITIVENESS

Firstly, they stressed that the essence of having a clear and well-defined vision is one of the major elements to the success of regenerating Manchester into a modern and thrilling city and regeneration schemes acted as an assistance vehicle which have been used wisely to deliver the objectives of the defined vision rather than being the centre of the strategic framework to transform the city for a better position in the global and regional competition.

The purpose of this vision in a broad sense is about aiming is to turn Manchester into an exciting city where people want to live and visit, which assists making their city image as a brand. This vision also includes a desire for securing a better future of the city by embracing the ideology of entrepreneurship since the 1980s moving away from the left-wing welfare state approach. One of the crucial reasons for the change of mind is to do with funding. Manchester City Council deems acquiring regeneration opportunities to be great chances to obtain public funding from the central government and the European Union. But they did not just stop there. They clearly pulled in private-sector partners to undertake the projects to regenerate the designated areas by offering a lot of assistance to assemble parcels of land and giving prospective developers clear instructions on what kind of developments are desirable in certain areas, which provides greater certainty for obtaining planning permissions.

Another essential element of the success of the city is the endeavour of the council to create an environment where investors feel their money will be safe since they believe Manchester looks promising for long-term economic growth and their investment will produce a good return. To achieve these, the council believes that the population of the city centre should grow; more jobs should be created; they need to attract more visitors and tourists. As a result, they have invested substantial amounts of money in art and cultural sectors such as art galleries, museums and theatres. They also invested heavily in infrastructure, particularly, the Manchester International Airport and Metro Link.

However, having a well-defined vision and strategies is not enough because they rely on long-term plans and consistency. The interviewees from Manchester City Council all believe with no doubt that the success of transforming the city has resulted in a strong leadership and a lengthy time of political stability within the council with dominance of the Labour Party. As one of the political leaders said, "We present ourselves 'Manchester Labour' we present ourselves a political party drawn from Manchester (and) it is all about Manchester... (Mancunians) they are wanting a party (putting) Manchester first".

They measure their success by presenting the figures that show the growth of population, the growth of economy, the growth of property value, the growth of jobs and the growth of inward investment in Manchester over these years. They believe that in general, the exercise of regeneration schemes has helped expand the property market and pushed up the demand and values. By assessing the performance of property market after several financial crises, such as the credit crisis in 2007 and 2008, they consider that the market shows resilience and competitiveness.

They see Manchester as a brand and promote "Manchester Brand" vigorously because they believe that if they could make the city image competitive it would then be able to sell the city brand to the world; people and investment would follow and inward investment is very significant to keep the economy of the city sustainable.

The efficiency of planning system affects the construction cycles in the property market. An inefficient planning system could prevent prospective developers from having new developments in an area with a fear that they would not be granted a planning permission. This factor will influence the competitiveness of the market.

With regard to the planning system, the interviewees who are developers were asked by the question on how efficient it is to obtain a planning permission from Manchester City Council and their experience working with MCC. One developer who is specialized in housing said that it depends on which local authority and their attitude towards the development proposed. In general, working with MCC has

been a good experience. They are quite approachable and it is clear at an early stage whether the development proposal looks favourable to MCC by speaking to them.

Another developer who had several primary regeneration projects in Manchester suggested that even though their experience working with MCC has been a good one because the council is quite efficient to react to a development proposal; but one rising concern is that they wish to attract as much inward investment as possible which comes with pressure not being able to decline or reject development proposals when the market is overheated.

There is one developer who has been constructing several mega developments in Spinningfield who claimed that they have a good relationship with MCC but they never found any major difficulty for obtaining a planning permission with other local authorities because they think if they got the best development proposal for an area, any local authority would love to accept their proposal.

However, a retail developer shared a different view by saying that the relationship with a local authority is the key to obtaining a planning permission successfully. They normally will work with local property firms who got connections with that local authority. However, in general, they consider that our planning system is not very efficient and the reform ideas suggested by the central government seem to be unworkable with the local plans and procedures.

When discussing about their view on the leadership of MCC, most of them agreed that the city council has got a strong leadership but one of them raised a concern about lacking diverse voices from other parties seeming to show one form of dictatorship. And he also doubted the style of entrepreneurship would fulfill the needs to tackle certain social issues such as a sharp increase of homeless people in the city centre.

In another sign of city competitiveness, some of the institutional investors claimed that they would choose Manchester first over other regional cities such as Liverpool or Sheffield because of its attractive city image and its competitive position to draw in businesses and inward investment.

13 CONCLUSIONS

This paper intends to explore the role of urban regeneration policies in establishing sustainable property market by looking at the case study of Manchester since the 1980s. A conceptual framework is constructed by adopting three primary elements relevant to market sustainability established through the literature review, including market maturity, economic resilience and competitiveness. The discussion of this paper mainly focuses on the findings found by the interviews with the political leaders and planning officers of Manchester City Council, developers, estate agents and institutional investors. By interviewing these key stakeholders, one intends to find out any impact of regeneration policies on property market for its economic sustainability measured against the conceptual framework of maturity, resilience and competitiveness.

As discussed before, the evidence of a mature market involves capability of coping with property cycles and properties as market products to have achieved such a level of acceptability that the market shows active buying and letting transaction and evidence of attracting institutional investors into the said area (Jones and Watkins, 1996).

After interviewing the developers, estate agents and institutional investors, they seem to provide evidence that shows a healthy and steady volume of trading activities within regeneration property market in the central city of Manchester at the time of interviews undertaken between June 2016 and May 2017. Several papers have discussed that investment in regeneration areas was believed to have certain disadvantages associated with the negative impression of high risk investment for prospective investors. However, among the interviewees, they claimed that the main concern for developers and investors is not about whether a development for a potential investment opportunity is located inside the regeneration area but the image of that city for its future growth in a long-term prospect.

Another aspect of market maturity discussed in this paper is to investigate how urban regeneration policies affect the property investment market with a focus upon the factors influencing the behaviour of the institutional investors on their decision-making process. From the interviews, there is no direct evidence to show that the overall regeneration policies have influenced the behaviour of institutional investors.

However, the finding of less resilient reaction to the financial crisis in 2007 in regeneration property market shows that the level of market maturity in regeneration areas is still weaker than the non-regeneration market. The reason could be the relatively volatile confidence of investors in the regeneration properties due to its shorter history of the transactions upon which investors will base their analyses.

In general, the finding of the interviews against the level of maturity in Manchester regeneration property market signals a mixed message. On the one hand, the rental and capital values of regeneration properties seem to be in line with the non-regeneration properties, which means it reaches the maturity level. On the other hand, its level of resilience to weather the financial crisis seems to be less robust than the non-regeneration market which makes it less mature. This very same point also is shared when discussing the level of economic resilience in the city.

Although the evidence suggests the regeneration market did worse during the recession period, the approach and effort of Manchester City Council to strengthen the level of economic resilience have received positive feedback. This seems to inject certainty and confidence into the investment environment and helps to stabilise the market.

Further concern on economic resilience is discussed widely among the interviewees coming from the leave vote of Brexit, which could de-stabilise the market due to unexpected and expected uncertainty and risks. As a whole, the finding indicates the multi-layered nature of economic resilience that requires the city and city's stakeholders to act co-operatively.

As discussed before, cities secure their economic competitiveness through attracting business, residents, tourists and inward investment. The findings indicate that Manchester as a city brand has successfully drawn in more business, residents, tourists and inward investment over the years. This could be considered a proof of gaining better economic competitiveness.

The aim of this paper is to explore the impact of regeneration policies on the evolution of property market toward a more sustainable level against the conceptual framework with three evaluation indicators identified in this research including market maturity, competitiveness and resilience in Manchester. To conclude the finding of this research, the three indicators have been useful to identify the features of regeneration property market against the measuring dimensions. The interview data shows that Manchester has reached maturity in terms of its property values but less mature and resilient when enduring the financial crisis.

The majority of interviewees confirm that the MCC plays a positive role to facilitate, assist and stimulate the regeneration market by promoting the entrepreneurial approach to businesses, developments and investment, which reinforces the economic competitiveness of the city.

As a whole, the evidence indicates that the regeneration policies have brought some positive impact on the economic sustainability of regeneration property market in Manchester since the 1980s. However, one should note that the limitations of this research could be found in certain degree of subjectivity in this conceptual framework and opinions shared in the interviews.

ID 1490 | CRITICAL DISTANCE IN URBAN PLANNING. WILL SMART, SUSTAINABLE AND RESILIENT NARRATIVES SAVE OUR CITIES? INSIGHTS FROM DELHI METROPOLITAN AREA

Sebastião Santos¹, Maria de Fátima Ferreiro¹, Cristina Sousa²

¹ISCTE-IUL/DINAMIA'CET; ²Oporto Global University

sebastiao.santos@iscte.pt ; fatima.ferreiro@iscte.pt ; cristinas@upt.pt

ABSTRACT: New Delhi is the second largest megacity in the world with a population of 26 million inhabitants (United Nations, 2016). Its metropolitan area is under severe vulnerabilities due to the lack of control of planning instruments on urban transformations. Needs in housing, resources (water and energy), infrastructures, transports, public services (health and education) among others are definitely going beyond local and regional government response capacities (Kapuria, 2014). Planning efforts, policies and regulations seem to have been instrumentalized under distinct historical moments, namely colonization, state control over land and nowadays capitalism and globalization. This led to the advent of an unplanned urbanism, with its extreme consequences and risks. It is intended to establish this nexus by revisiting the key planning moments in Delhi along with its different socioeconomic, cultural and political frameworks across time. Finally, we draw conclusions on how contemporary urban development models such as 'sustainability', 'resilience', 'participated governance' or 'smart cities' are being framed, perceived and applied under the context of Delhi urban planning instruments, policies and research. It seems that these narratives are serving as means to achieve specific goals by different drivers and actors. The discourse of sustainability is used to sell gated urbanizations for higher income classes, situated in greened areas, far away from slums and pollution. Resilience and horizontal governance is pursued by the state as a mean to make citizens resistant and accountable to deal with city problems withdrawing public institutions from its own responsibility. Smart Cities Agenda is based on a huge investment on technologic

information systems (Delhi is home to many ICT companies) on the hope to end mobility and pollution problems, leaving aside the fact that 77% of Delhi population live under poverty, in precarious housing or without infrastructure (sewage systems, water distribution and services) (Kushwaha, 2016). It is intended to highlight the importance of this reflection for a deep rethinking on concepts and practices in urban planning field, specially in what concerns its normative generalization without taking into account the influences and consequences of distinct political, social,

1 INTRODUCTION

New Delhi is the capital of the Indian state situated in the North of India between the states of Haryana, Uttar Pradesh and Rajasthan. Its designated metropolitan area, Delhi Capital Region (DCR), extends over 1483 km². Three moments seem to have triggered urban transformation in what concerns its population explosion and urbanization rate. A first moment corresponds to the transference of the administrative capital from Calcutta to Delhi during the colonial period that attracted population by the creation of a new institutional and economic dynamism; a second moment corresponds to the Independence of the country in 1947 and to the partition between Pakistan and India that led to a massive transfer of populations between the two states, with countless Hindu refugees moving to Delhi; finally, its affirmation as an important urban center on a global scale and the polarization of urban-regional development that resulted in the rural exodus and a dramatic growth of the metropolis in the last five decades (Sharma and Joshi, 2015).

From 1.4 million inhabitants in 1950 Delhi population increased up to 18.6 million in 2004 and 25 million in 2011 (Mookherjee et al, 2015). These three historical moments of growth and urban expansion also correspond to specific planning policies, plans, regulations and governance frameworks developed under distinct political social and economic settings, namely colonial planning driven by the interests of the British Empire, modernist planning powered by post-independence socialist democracy, and, more recently, what might be defined as a 'neoliberal planning' moved by global economic liberalization. Through consultation of the Delhi Master Plan 2021 (DMP 2021) we found that only 24% of the population lives in considered legal areas, with the remaining 76% of the population living in unauthorized areas. By making a comprehensive reading of planning evolution in Delhi it is possible to establish links between planning options and the proliferation of an informal city (parallel to the planned city) where a network of urban vulnerabilities and 'failures' settled across time (Bhan, 2013). Firstly the paper establishes this nexus by revisiting key urban transformations in Delhi relating them with planning options that have emerged in distinct socioeconomic, cultural and political contexts. Secondly some considerations will be made on how contemporary concepts such as 'sustainability', 'resilience', 'participative governance' or 'smart cities' are being framed, perceived and applied under the current context. Finally, some conclusions will be made on how urban planning practices, policies and regulations can be 'colonized', influenced or distorted by different political, economic, and cultural regimes across time and what is the importance of this reflection nowadays. This preliminary essay resulted from literature review, consultation of planning/policy tools and the analysis of a set of interviews conducted to researchers from several disciplinary fields and to state institutions related to urban planning.

2 A REVIEW OF PLANNING PRACTICE IN DELHI METROPOLITAN AREA

2.1 THE COLONIAL CITY - THE GARDEN CITY OF THE POWERFUL

In its origins, Delhi corresponds to a set of fortified nuclei or 'cities' founded by the Mughal Empire with the capital city in Shahjahanabad (Old Delhi). It was already possible to observe a social hierarchy 'embedded' in its physical structure; in the citadels, at the top, would live the clerics or administrators and in the outskirts, or outside the walls, in densely built areas, the remaining inhabitants (Blake, 2002). British occupation did not invert this tendency to urban stratification, on the contrary, it deepened even more. First established in Old Delhi (1803), the British soon started to develop areas outside the walls, such as the Cantonments (areas with military functions) and the Civil Lines (residential areas) initiating a path of physical and social demarcation from the Indian population (Guerrieri, 2014). A crucial moment in Delhi history was the decision to transfer the colonial capital from Calcutta to Delhi (1912), due to the partition of Bengal and the rise of nationalist attitude against the British occupation in Calcutta. It became necessary to design a new city, able to 'perform as a political symbol' and strategically respond to imperial interests of stabilization, a city that would be able to confirm its importance near the old capital of the Mughal Empire (Ridley, 1998). 'New Delhi' Lutyens plan was the first planning instrument that addressed the new capital, embodying the hierarchies of the colonial system and India's own caste culture, in what appears to be a transference of Ebenezer Howard's city-garden movement into the Indian urban context (Sudjic, 2006). In contrast to the densely-occupied 'Old Delhi', where mixed land use coexisted with a large cultural diversity, New Delhi was planned as its opposite, a low density city with wide avenues to accommodate car traffic,

green areas to combat the extreme climate and a new urban order based on the spatial division of its social structure according to "race, occupational rank, and socio-economic status" (Hall, 1880, p.217 ; Stamp, 2017). Designed as a representation of the colonial power, the plan clearly demarcated three distinct areas: the government complex, the commercial district and the bungalows zone. The first typologies constitute institutional and economic enclaves, the last typology currently called Lutyens Bungalow Zone (LBZ) being a residential area exclusively for white members of the colonial government (Jalil, 2011). Colonies were another important typology introduced by the British. Corresponding to the definition of 'neighbourhoods', first served the purpose of housing English settlers but their model has been replicated over time, filling the interstices between a colonial and a post-colonial era. They are simultaneously a physical aggregator of the metropolis and a way of housing segregation (Guerrieri, 2014). It is important to note how the Garden-City model based on principles of social progress and environmental concerns that emerge under a scenario of precarious working and living conditions in British industrial cities was appropriated and transfigured into a urban model based on social segregation and the representation of colonial power (Choay, 1983, pp. 339). In the 30's (XX Century), the bipolar nature of the city becomes clear, with the imperial, comfortable and planned New Delhi on one side, and the congested Old Delhi on the other side, where informal mixed-use occupations proliferated (dwellings, shops and small industrial units), but also diseases (tuberculosis, malaria) leading to a high infant mortality rate (Mehra, 2013). Over population and urban densification coupled with insufficient sanitation structures end up compromising public health. In 1937, Arthur Parke Hume was made responsible for the first attempt to solve the accelerated city growth through the development of Delhi Improvement Trust (DIT) (Priya, 1993). This instrument was intended to improve road infrastructure, sanitation and waste treatment systems, but above all to eliminate slums by building new neighbourhoods to meet the needs of a homeless population expected to rise up to 200 000 in a fifteen year projection (Mehra, 2013). Hume was influenced by the principles of Patrick Geddes and advocated a technique of 'conservative surgery' - what may be called today 'tactical urbanism' -, defending rehousing before demolition, the controlled removal of degraded housing and the organized extension of informal zones. British Central Government resisted the idea of addressing informal areas through the planning system by opting for an alternative scheme, based on developing new neighbourhoods for high-income classes, in order to finance housing for the poor in a later phase (Legg, 2008). This strategy failed to meet its objectives, not only due to continuous delays, but mainly as a consequence of succeeding events, independence and partition between India and Pakistan (1947), that led to a huge population influx. Overall in the colonial period the urban development model was based on the interests of the British Empire. Indian people had minimum influence in policy or decision making across administration scales, western city models as garden-city movement were used exclusively under aesthetics of power and environmental concerns, aggravating social discrimination processes and generating a bi-polar city, New Delhi (planned for government and administrators) and Old Delhi (not addressed by planning systems).

2.2 THE METROPOLIS OF AN INDEPENDENT STATE - THE 'OFF MODERN' CITY

As the efforts for a unified India failed, extreme violence and an unprecedented migration of Sikh and Hindu refugees from Pakistan to the capital occurred. The jump from a city to a metropolis seems to have started here. Between 1941 and 1951 the population increased from 700 000 inhabitants to 1.4 million inhabitants and the area of the city doubled (Dupont, 2011). The spread of slums and informal areas is paralleled by the lack of multiple infrastructures due to a context of weak regulation and control over the urban form. In response, the first Delhi Master Plan (DMP 1962) was developed as a result of a partnership between Delhi Development Authority (DDA) and the American Ford Foundation that was already supporting the country in the process of institutional modernization and policy development. It is not surprising that the Ford Foundation was concerned about the deep inequalities related to cast, religion and ethnic issues, especially if taken into account the role of Communist rule in China and the conflict between Soviet communism and Western democracies in the 50's (Staples, 1992, p.6). According to Ghosh (2013) the main social policies in the Indian context (including food security, education, job creation, education, health and anti-poverty programs) aimed specific groups with some 'political voice' in order to control possible social conflicts. This did not allow the production of a coherent policy of social and economic development, proving itself susceptible to disputes and disregards of the law (Thynell et al, 2010).

DMP 1962 was therefore influenced by the American school of planning in the 1960s, in domains such as urban regeneration, functional planning or zoning, following also the trends of Indian development policies in the early decades of the independence (1950s and 1960s) based on an interventionist state and social-driven policies able to promote some capital redistribution and economic diversification (Banerjee, 2009). The general trends established by the plan included the development of a green belt and seven satellite towns, called 'Ring-Towns', in order to simultaneously divert and contain urban growth by decentralizing population, housing, commerce and industries to the periphery (Ewing, 1969). Furthermore, a new land policy drove public acquisition of large areas required for houses and other land uses in an attempt to match supply and demand without any private assistance (Srirangan, 1997, p. 37). The plan provided also the resettlement for a part of the population in the so-called resettlement colonies, strategically located near new residential and industrial zones but they lacked infrastructures, quality and appropriate space to accommodate Indian families (Mookherjee, 2015; Thynell et al., 2010). The DDA

purpose, influenced by western modern vision, was to foster 'flow inducing urban forms' capable of reversing the concentration trends which were considered responsible for disease outbreaks alongside with the precarious sanitation network. Within this context, English legislation, known as 'nuisance laws', was perpetuated with the aim of controlling 'Indian behaviour'. Also sanctioning proceedings and regulations were set up in order to control the indigenous form of producing city that was imminently informal, constantly negotiated and where the boundaries between public and private spaces were blurred (Kishore, 2016). Soon the first Master Plan of Delhi became obsolete. In 1971, the growth of the city had already largely surpassed the numbers forecasted. Industries and commercial spaces had spawned and housing needs increased from 150 000 (in the 1960s) to 380 000 (in the 1980s). Approximately 1.5 million people lived in substandard houses or in expanding slums (Priya, 1993). The first master plan, DMP 1962, was the object of multiple criticisms: it was accused of miscalculating the proposed densities (based on American cities), and it was said to idealize a "model city, prosperous, hygienic, and orderly, but failed to recognise that this construction could only be realised by the labours of large numbers of the working poor, for whom no provision had been made in the plans" (Baviskar, 2003, p.91). The American planning team blamed the failure of planning with the overload of bureaucracies, jurisdictions and leadership changes, and also to what they have defined as an Indian 'repulsion to planning'. On the other side, Indian authorities, refer the 'plan maladjustment' to the cultural and social reality of India, its inability to respond to the speed of economic and social transformations that the metropolis was subjected to, including powerful migratory flows (Banerjee, 2009). The monopoly of public control over land led to constraints regarding the proper development of urban land and plan implementation, causing an inflation of urban land prices and resulting in a constant subversion of DMP 1962 (Srirangan, 1997, p. 53). The expansion of informal areas, the eviction of slums during the state of emergency (1975-77), the proliferation of unauthorized private colonies and, more recently, the expulsion of small industries due to court orders, determined the absence of a specific living, economic and industrial centre, giving rise to mobility problems and urban pollution proliferation (Véron, 2006). The second and third planning instruments proposed by the DDA in 1985 (National Capital Region Planning Board Act) and in 2001 (Delhi Master Plan 2001) were mainly acts of revision of the first MPD 1962. Modernist planning based on principles of zoning, urban regeneration and public interest over land was endorsed as a mean to materialize the capital of an Independent India driven by social policies (housing, food security, education, job creation, provision of public services), concerns on capital redistribution in society and the diversification of economy. If modernist views were vastly contested in the west for its homogeneous and simplistic views of society and for not having paid attention to the contexts where they were applied, in Delhi its translation traduced in the general failure of planning. Constraints in the proper development of urban land, maladjustments between the plan and Indian cultural reality, the exclusion of the poorest communities through the displacement of their dwellings, small industries and commerce and the constant subversion of the plan gave rise to an unplanned city parallel to the planned city in response to population needs.

2.3 THE GLOBAL MEGACITY - THE CITY TO ALL AND TO NONE

The shock in oil prices due to the Gulf war forced the country to request for immediate help in 1990 to the International Monetary Fund (IMF). In exchange for its loan, the Indian government was obliged to make structural and macroeconomic adjustments, easing the inflow of foreign capital through a new legislation and police framework. The investment in rural areas fell from 14.5% (before the reforms) to only 6% of GDP in 1998, which, together with the liberalization and mechanization of agricultural market, resulted in a decrease of agricultural employment and rural nutrition problems, triggering a massive migration of population from rural areas to cities in search for employment (Patnaik, 2004). Almost simultaneously deindustrialization occurred in cities like Delhi due to the growing importance of other Asian countries. Millions of immigrants who arrive everyday in Delhi mainly integrate the low-paid informal economy or see their efforts to obtain a job forged (services sector demand is mainly for graduated workers), thereby increasing the number of slums and worsening the already existing social inequality gap (Ahmad, 2013).

As Mike Davis points out in 'Planet of Slums' "the Third World now contains many examples of capital-intensive countryside and labour-intensive deindustrialized cities where urbanization" is driven by the reproduction of poverty, not by the supply of jobs" (Davis, 2007, p.16). The most recent National Capital Region Plan (NCRP 2021) and Delhi Master Plan (DMP 2021) follow the context of economic liberalization and the aim of including the metropolis in the global economic circuit. Since 1985 to 1990 police and legislation changes in India influenced by global institutions as the World Bank and IMF promoted decentralization of urban governance, stimulated multi-sectorial private public partnerships (PPP) in urban management and provided a friendly framework for business (low taxes and relaxed regulations) in order to attract foreign direct investment (FDI) (Dupont, 2011). The most important spatial expression of these changes in Delhi (National Capital Region) was the proliferation of Special Economic Zones (SEZ), business parks, large real-state developments, shopping malls, public space revitalizations and large infrastructures (e.g. tube or highways) financed by private and public budget (Chatterji, 2013). The Asian Games of 1982 and, more recently, the Commonwealth Games of 2010 are paradigmatic examples of a series of World Events that triggered urban large-scale investments and new spatial configurations aiming

to project the city into the global network (Kennedy, 2015). Many of these transformations carried out on the name sustainability, modernization, quality of life or environmental concerns have contributed to the expulsion of a set of urban realities such as informal areas, rural settlements or small polluting industries with enormous social consequences. The small industries considered polluting were relocated or eliminated from the metropolis centre leading to the loss of two million jobs.

Simultaneously 3 million homes were demolished in exchange for resettlement (only for a portion of eligible families) in the city outskirts, far away from employment sources (Ahmed, 2011). Currently 77% of the population in precarious housing or without adequate infrastructure (e.g. sewage system) and only 24% of the population lives in legal areas according to DMP 2021. The rise of economic inequalities are mirrored by increasing social-spatial segregation processes. Public urban investment seems to have been used to attract more investment and to drive new urbanization processes not to solve structural problems. The consideration of cities as 'engines of growth', creating geographic unbalances between urban and rural territories (with associated massive migration fluxes) and intensifying urbanization are leading to disruptive impacts on resources and environment caring capacities. Delhi is considered to be the most polluted city in the world especially regarding PM2.5 particles responsible for the increased incidence of lung cancer, heart disease or bronchitis (Singh, 2016). In what concerns treatment of solid waste, existing landfills are already at their maximum capacity and 'Waste to Energy Plants' do not have technology to control pollutant emissions (Randhawa, 2016). According to Water police for Delhi - Draft (2011) the current need for water supply is roughly similar to the demand and the access to potable water isn't generalized leading to major scarcity events that will be aggravated as population increases. If, on the one hand, overpopulation is often targeted as the main cause of the city's problems, on the other hand, it seems to be what allows the development of large-scale urban investments or mega-projects (e.g. World Events). Migrants labour force was the main builder of the metropolis throughout its history, also providing the necessary services for its operation, namely through the informal sector (the most important in Delhi economy) (Srivastava, 2005).

This is the nexus of the 21st century in urban India, a huge population coming from rural areas, incorporating the informal economy based on low-cost labour and expanding the slums. Simultaneously occurs the spreading of special economic zones, luxurious shopping malls, large real estate developments for the upper and middle class.

3 URBAN PLANNING TODAY: CONCEPTUAL APPROPRIATION(S)

Through a comprehensive reading of the salient features of planning instruments (DMP 2021, NCRP 2021) and from going to the narratives resulted from the interviews we may observe that the structure of planning seems to be transiting from a perspective where the state and the 'plan' are the central actors in urban development and on the assurance of public interest (modern planning) to a 'market-driven' perspective based on territorial competitiveness, economic growth and to a standpoint where urban development results mainly of a negotiation between a range of different actors such as institutions, economic agents, communities and NGO'S has expressed by Awadhendra Sharan (Centre for Study of Developing Societies) in this interview excerpt:

"I do not actually see the plan to be a driving force, this idea of long-term planning, this concept of the plan makes no sense, 'that's gone' (...) Notice who is moving the speech? Certain institutions like TERI (The Energy and Resources Institute), CSE (Centre for Science and Environment), Ngo's that were not present in the 1960s (...) other players that must be taken care of are the economic agents that arrange strategies to raise capital for example from Singapore or elsewhere, the banks, the financial system, these are powerful actors, who decide what projects to bring or not to Delhi. What I am saying is not that planning has disappeared, but the city is much more complex. If we want to look at reality today and try to understand it, the range of agents is much wider and we have to change our analysis in planning."

Following the trend of a broad 'negotiation' in what concerns the city's evolution, new instruments of participative governance have emerged as part of the urban governance reform introduced by 74 Indian Constitutional Amendment. Although this may mean an increased access from population to decision-making processes it's important to analyse the balance of power relations between different actors specially in the Indian context where cast, religion, and class are still determinant factors of social conflict and segregation. Scientific institutions, economic players or political agents may have a higher influence or become 'governmentalizing' than other social groups. This is an important factor in a city that has developed mainly through informal processes, mostly due to social marginalization produced by the exercise of planning itself. Also it seems crucial to question if extreme processes of urban vulnerability and the scope of social segregation can be addressed mainly through bottom-up approaches as expressed by Leon Morenas (School of Planning and Architecture - New Delhi) in this interview excerpt:

"I believed that bottom-up approaches could work but now I think the system is too big for bottom-up approaches to change anything. Having a community to participate does not imply that people accept their ideas. If you have different castes, for example, what will happen? How can we put the poor to participate? In the processes of public participation what is observed is that it has been used for the privatization of services and the transformation of citizens into consumers. If you ask me if I have faith in the decentralization of decision no because the experiences show that the poor in any case have been deceived"

Market-driven instruments as PPP (to reduce public expenditure) and regulatory incentives to attract foreign capital (FDI) are being generalized in development policies across the world and also in Delhi Metropolitan Area. The largest urban development program in India "Jawaharlal Nehru National Urban Renewal Mission" (JNNURM) was based on these procedures. The program mainly included four financing axes; (1) Urban infrastructures and governance (UIG), (2) Urban Infrastructural Development Scheme for Small and Medium Towns (UIDSSMT), (3) Basic Services for Urban Poor (BSUP) and (4) Integrated Housing and Slum Development Programme (IHSDP). The (3) and (4) allowed the financing of rehabilitation or rehousing processes, as well as the development of basic infrastructures (water, sanitation and energy). The main allocation of funding (79%) was mainly done in (2) and (3), the ones responsible for the development of large urban infrastructures (e.g. flyovers, tube, roads) able to trigger intensive urbanization processes and capital allocation (Kapur, 2013). In fact this strategy is confirmed in the plans has demonstrated in this excerpt of DMP 2021

"(...) the basic policy of the Regional Plan - 2021 is aimed at accelerated development of the urban and rural areas. For this, infrastructure has to be substantially upgraded at local and regional level (both by the State and Central Government) in order to induce growth in these areas, specifically in identified settlements / Metro Centres. It is felt that this will make them more attractive for locating economic and allied activities and for attracting private sector investment"

In an eminently informal city with severe lack of basic infrastructures, 'urban regeneration funds' seems to be assisting private investment and economic growth in the form of new urbanization, while existing urban problems lay somehow forgotten. Rehousing programs are resulting recurrently in the furthering of population constraints has expressed by Debolina Kundu (National Institute of Urban Affairs) in this interview excerpt:

"Basic Services for Urban Poor was a government program that ran from December 2005 - March 2015. It constituted mainly a rehousing program for home provision. But if you go to these cities most of the houses are empty because they were built in the outskirts of the city, which resulted in an economic displacement. These areas do not have jobs and are not provided with public transport, the displacement takes 3-6 hours which creates severe constraints. The problem is that in slums the problems continue, there are epidemics, crises related to water scarcity. The supply of drinking water is only made once a week by tankers. In what concerns urgent urban interventions we need to act in the provision of services, basic amenities and controlling unequal growth, because there are people with a lot of money and there are some who have none and this gap is increasing. Measures must be taken because in the future this will lead to a severe economic and social crisis."

If urban investment seems to be used mainly on the development of big infrastructures and the spread of urbanization, it's possible to observe the increasing entanglement of the 'private sphere' in the 'public sphere'. Main services concerning waste, energy, mobility are being privatized and in some urban areas occurs the 'complete privatization of planning itself' where the state simply dismisses its role in urban development or as a public services provider, delivering them to developers.

"By a regulatory quirk, the land around Gurgaon was managed by a single agency, the chief minister's office in the state of Haryana (...) It meant that developers' plans in Gurgaon could be approved in a matter of days, not years. The result? Fast-track approvals for office parks, luxury condominiums, five-star hotels and golf courses. Half of the Fortune 500 companies launched satellite offices in the city's gleaming high-rises (...) If you ask a regular person 'Would you want to live in a city that doesn't have a functioning sewage system or garbage disposal or a good network of roads,' they'd probably say no," says Rajagopalan. So the developers had to convince potential renters to say yes — by filling in the gaps in the city's sparse public services themselves. A patchwork of private services emerges, but only within property lines. (Kedmeý, 2016, media article) Going again through the reading of MPD 2021 and NCRP 2021 it's interesting to note that the concept of 'sustainable development' constitutes a goal, however is not addressed through a systemic perspective appearing mainly associated with environmental issues and the management of resources such as water and energy. Each dimension has its own specific and pragmatic approach whether it's the provision of housing, transportation, industry, trade and commerce, informal

sector among others, but the trade-offs between each one are not deeply explored. More than promoting inclusive development (taking into account that the majority of the population is poor, do not have access to basic services such as house, water, electricity) the plans and practices seem to pursue 'an exportable urban image' (similar to those of the western global cities), where concepts are translated more in 'embellishments' and less in solutions. A paradigmatic example is the Indian Smart Cities program. Its mainly technology-based and linked to automation of services such as waste management and mobility. In the case of Delhi Metropolitan Area, it will be implemented mainly in New Delhi, the part of the city that is better served by services and that is occupied by 2% of the population, namely ambassadors, public administration and an economic elite. Pravin Kushwaha (Centre for the Study of Science Policy, JNU) in this interview excerpt draws attention on the need to reflect upon the origins of the environmental discourse in India and how it has contributed for social unrest pointing out the need for addressing sustainability also from the side of social justice:

"The environmental movements were moved by the middle class, focused more on the preservation of nature, excluding people in this process, the discourse was to remove the slums.... There was a large slum on the banks of the Yamuna. 400 000 people were removed and then they built a park on its banks. Development has two faces, the physical transformation of the city and another part of the expulsion (...). The money for smart cities could be to regenerate other areas of the city, but we continue in the game of symbolic urbanism. The discussion on smart cities, has to do with technologies. The speech is that of automation, sensors, but this is not the way to understand sustainability. We have to think about environmental sustainability and social justice. We have to connect the environment issues with poverty issues without that it is impossible to address the issue of sustainability in South Asia and of course policy, politics is important. We have to question the imagination of sustainability in itself we can not see things on one side (...) It takes morality and ethics. We are doing and selling sustainable buildings but what does that matter?"

In what concerns the 'resilience agenda' and also the transition from centralized policies to decentralized community based policies it is possible to observe a certain 'precaution' in some academic circles related to the challenges that these transition of concepts and practices may pose to research and society; The risks of not addressing communities' real problems by imposing pre-defined research topics or the risk of 'state withdrawing' by the transference of its responsibilities and accountability to communities has pointed out by Suruchi Bhadwal (TERI- The Energy and Resources Institute) and Pravin Kushwaha (Centre for the Study of Science Policy, JNU) respectively:

"There may be some fixed agendas in research and funding. In participatory approaches, when different stakeholders and actors are involved around the topic of resilience, may be the case that researchers have a certain agenda but may not be the same agenda as the community. Therefore, as a researcher or a person who is going to implement a certain project in a certain area, I have the duty to understand how to integrate these problems that are not related to research, these topics can't not be ignored"

"Community-based policies have sprung up against the idea of state domination in the 1970s, questioning central power... but over time we have noticed that this binary idea of the discourse bottom up/top-down in planning was sharpened, and the promoters of the bottom up advocated the disengagement of the state (...). I have to say the role of the state is not irrelevant because communities can not provide its total security, can not plan for more comprehensive social, economic, political and planning aspects."

	Colonialism	Partition and Independence	Globalization
Development model	Colonialist. Moral by British empire interests. Discrimination based on nationality, race, social status or religion.	State interventionism as a way of generating redistribution of capital in society and the diversification of the economy.	Neoliberal adjustment introduced in the 90's by FMR. Cities as engines of growth, imbalance between rural and urban development.
Governance and Public Policies	Colonialist-driven. British had minimal influence in policy or decision making in central or local government. Top-Down.	Social-driven policies (food security, education, job creation, provision of public services) focused on specific groups with some 'political voice'. Top-Down with public consultation.	Market-driven policies in several sectors, transportation, water, waste, housing (PPP). Friendly environment to investment through decentralization and deregulation. Top-Down & Bottom up (State withdrawal from public assistance).
Urban Planning	New Delhi/Lutyens Plan. Planning oriented to the symbolic representation of colonial power. Influence of western city models, 'Garden City Movement' (Ebenezer Howard)-Lutyens Plan for New Delhi.	Master Plan Delhi 1962, National Capital Region Planning Board Act (1984), Master Plan Delhi 2001. Planning oriented through principles of zoning, functionality, urban regeneration and public land ownership. Influence of Ford Foundation, American School of Planning and Indian development policies in the early decades of independence.	Master Plan Delhi 2021. Planning oriented to investment and global projections. Preference is given to infrastructures able to follow intensive urbanization processes on behalf of rehabilitation or enhancing processes. Influence of IMF and World Bank.
Urban Vulnerabilities	Socio-spatial discrimination based on nationality, race, social status or religion. Bipolar City - New Delhi (Planned for government and administration) vs. Old Delhi (not addressed by planning systems). Lack of infrastructures, public services, health issues.	Contradiction in proper development of urban land, Maladjustment between the plan and the Indian reality. Exclusion of the poorest community's livelihoods through the peripheralization of their dwellings, small industries and commerce. Subversive City- Expansion of an unplanned city parallel to the planned city in response to population needs. Plus-pollution, mobility issues.	Socio-spatial segregation based on income, education, caste and religion. Exclusionary city - Poverty enclaves coexist side by side with wealthy exclusionary enclaves. Plus- scarcity of resources and environmental threats.

Figure 1- Synthesis of Delhi urban transformations across time

4 CONCLUDING REMARKS

Plans, policies, legislation, governance models and even knowledge (technical and scientific expertise) in Delhi urban planning practices have been always convened to materialize normative views by different political, socio-economic, and cultural regimes throughout history. The colonial period influenced the polarization between a Mughal-city (Old-Delhi) and colonial capital (New-Delhi) promoting a racial and social hierarchy in urban development. The post-independence period was marked by the discrepancy between the rigid modernist plan based on public control over land and the rise of a 'subversive urbanism' emerged from unattended population needs. Finally, the global financial system determined the unbalance between urban-rural development and the uneven spatiality's of the metropolis, where poverty enclaves coexist side by side with wealthy exclusionary enclaves. Successive planning models were influenced by different 'agents', first through colonization processes, after through knowledge exchange processes (e.g. American Ford Foundation) and finally through global market liberalization promoted by global institutions. Planning practice have been at a certain degree 'colonized' by distinct interests, has addressed mainly a small part of the population and ignored a vast majority of the communities and their livelihoods in the urban development process. This triggered an insurgent city (with an associated network of vulnerabilities) with which 'bridges' have never been truly established. In a globalized world, cities are seen more and more as 'engines of growth' and urban planning is increasingly dependent on territorial competitiveness, capital attraction and market-driven strategies. By this reason vulnerabilities, uneven growth processes or social spatial segregation are not exclusive of distant realities but are rising around global cities and territories (Harvey, 2006). Migration is one of the main consequences of unbalanced territories. People who suddenly are surrounded by deprived conditions such as limited access to housing, employment, 'basic goods' or constraints in the possibility to participate in decisions related to their leaving spaces are forced to move: Rural migrants in India are expelled to cities due to the loss of their livelihood, refugees have no other option than cross oceans to enter Europe and escape war (caused most of the times by political and economic interests), the population of de-industrialized cities (due to industry dislocation for more 'competitive' countries) have no other option than to leave in search of employment, leaving behind 'ghost cities' and 'seeds for the spreading of populist movements' that can threaten democratic systems (e.g. Rust Belt Cities in the U.S). Sassen (2015, p.173) refers to the generalization of "social, economic and biospheric expulsions" and to the importance of looking "at the extremes of a system in order to analyse trends that can be revealed in more moderate ways within the system itself." In a global world, the growth of socio-economic inequalities, migratory phenomena, environmental impacts (e.g. climate change) or scarcity of resources are not bounded to national borders. Delhi as an 'extreme' case reminds us about the urgency of critically analysing the growing territorial vulnerabilities or 'geographies of injustice' by first depicting the influence of the current development model in public policies, institutions, spatial planning systems but also in knowledge production. Recent economic and ecological crises have demonstrated that market mechanisms, influencing policy options, have undermined 'sustainable development' and therefore urban planning practices, increasing inequalities and vulnerabilities in territories and cities (Eraydin, A. and Taşan-Kok, 2013). In this context we assist as pointed out by (Ahern, 2013) to the progressive transition from the concept of sustainability, "a fail-safe perspective" to the concept of resilience, a "save to

failperspective”, which somehow assumes the disturbances of the world and its consequences as a given (Pizzo, 2013). We can question if accepting resilience as a normative concept is not a risk in itself. In what concerns territorial governance attention must be taken in what concerns “informal institutions and opaque nebulous networks of territorial governance” that “may pose a grave challenge to democracy and direct risk to the democratic representation, accountability and transparency of decision processes of fundamental relevance to large groups of citizens” (Metzger et al, 2014, p. 2-3). Concluding there is a need to increase ‘epistemological criticism’, considering planning domain not only solution-driven (or a technical or neutral instrument) but an instrument that also deals with the social construction of urban problems, identifying planning failures and depicting trends within knowledge production in what concerns ‘normative and hegemonic colonization’ of concepts (conceptual normalization) and practices (Public Policies and Planning Instruments) that can lead to increase vulnerabilities (Sandercock, 1998, p. 4-5). Today, more than ever, only by addressing the real impact of the hegemonic and unbalanced ‘flux of capital’ in the physical, social, environmental, economic, institutional, political and scientific domains that ‘build cities and territories’ will be possible to create ‘Spaces of Dialog for Places of Dignity’.

ID 1494 | DECIPHERING PLANNING CONCEPTS FROM A PERSPECTIVE OF LACAN'S FOUR DISCOURSES - A CASE STUDY OF URBAN VILLAGE IN BRITISH PLANNING POLICY

Chuan Wang¹

¹ESALA - University of Edinburgh,
chuan.wang@ed.ac.uk

1 INTRODUCTION

With the explosion of available information in the contemporary age, numerous new planning concepts are being invented in pursuit of better urban environments. When we read books about future cities, listen to the speeches of renowned architects and urbanists, browse edge-cutting urban design projects or audit discussion of urban development, countless new concepts pop up in texts along with models, drawings and videos such as eco-village, smart city and numerous -isms.

Many concepts in planning are notoriously difficult to define. If we are asked to give a definition of smart city, the answers are often curtailed to individual perception. What is the 'smartness' of cities? Optimal transport, efficient energy consumption, data networking, social networking or even all the above-mentioned characteristics? Many planning scholars and practitioners doubt the validity and effectiveness of some planning concepts, such as public interest (Campbell & Marshall, 2002), smart growth (Downs, 2005) and sustainable development (Marcuse, 1998).

It raises a question for this research: how much can contested planning concepts influence urban planning policies and future urban development? This paper tries to open up a new perspective to view this question with the help of Lacan's Four Discourses theory, focusing on a particular planning concept - urban village - in the context of British planning policies.

2 LACAN'S SOCIAL THEORY AND ITS APPLICATIONS

2.1 WHY LACAN'S FOUR DISCOURSES?

The primary reason that this research employs Lacan's Four Discourses theory is that "planning is a form of social action, or a social practice...intervening in the world to protect or change" (Taylor, 1998, p.167). Therefore, the complex social effects behind urban policies and urban development can be decoded with the tangible analytical tools of the Four Discourses schemata (Lacan, 2007). Lacan's theory offers an insight into the process of how ideology shapes social reality (Glynos, 2001), and provides scholars in other fields with "a cautionary portrait of thinking-as-it-happens" (Bowie, 1988, p. 133).

The second reason is the comparability between names of planning concepts and master signifiers. Saussure's semiotics divided signs into two components: the signifiers and the signified (de Saussure, 1983[1916]). The signifier is the form of a sign, while the signified is the concept which the sign aims to denote. In the boom of the planning concepts, the signs and their meanings do not match each other perfectly since the signifiers are always assigned with different interpretations. Therefore, I argue that the names of planning concepts are equivalent to the signifiers in Saussure's theory.

Furthermore, they can be regarded as master signifiers due to their importance in the knowledge building of the planning discipline. Master signifiers, or S1 as Lacan labelled, are the primary points to gather all different kinds of knowledge and organise them with a loose but necessary structure (Lacan, 1993), and "complex aggregates of ordered words constituting diverse narratives of contestable sets of knowledges and beliefs" (Bracher, 1988, p. 45). Master signifiers are values and ideals, playing a crucial

role in the building of knowledge. The names of crucial planning concepts, such as ecocity, sustainable development and smart city, represent new identities of future cities as the primary points in the knowledge network and construct the special order of the knowledge of urban planning.

Therefore, the social effects in the discussion and implementation of planning concepts can be analysed according to four fundamental social effects in the schemata: indoctrinating; governing/rationalising; desiring; analysing/subverting. This helps to find the real motivation, targeted audience and actual production in the discourse of urban planning.

2.2 FOUR DISCOURSES SCHEMATA

In the Four Discourses schemata structure, there are four voids in the diagram namely Agent, Other, Production and Truth (see Figure 1). Four variables are placed in these voids: Master signifier (S1), Knowledge (S2), Divide subject (\$) and the unattainable object of desire (a). The four variables and their interpretations in urban planning are comparable according to Lacan's social theory (see Figure 2). These four variables follow a clockwise loop of S1-S2-\$-a in the schemata structure so that the change of the positions create four different discourses. This means that names of planning concepts can be examined through four different types of social effects behind four types of discourses.

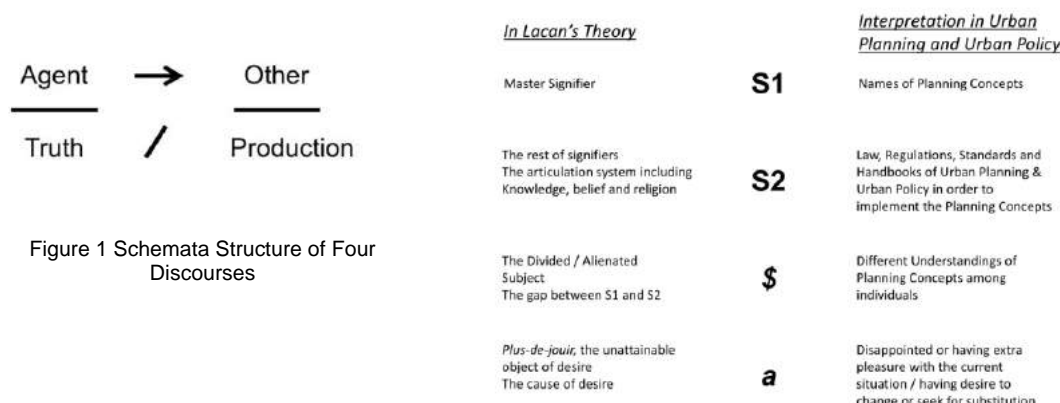

Figure 1 Schemata Structure of Four Discourses

Interpretation of Four Elements

Figure 2 Interpretation of Four Variables from Lacan's Theory to Urban Planning

In most cases, the Agent (master) and the Other (receiver/slave) are explicit to define the type of discourse (Figure 3). The interaction between the Agent and the Other is probed based on the archives, documents and interviews (such as Section 3.3 and Section 3.5.3). The motivation of their actions (Truth) and productions emerges. It offers a structure to have a look at the hidden factors of each discourse and actions.

Figure 3 The Typical Method to Define the Type of Discourse

In some unusual cases, the production or the truth is easier to define (such as Section 3.4 and Section 3.5.2). The discourse might be defined when other voids are confirmed rather than the Agent and the Other, depending on the recourses for analysis (Figure 4).

Figure 4 A Special Method to Define the Type of Discourse

3 APPLICATIONS TO THE BRITISH URBAN VILLAGE CAMPAIGN

3.1 WHAT IS URBAN VILLAGE?

Urban village, an ideal supported by the Prince of Wales, emerged in the UK during the late 1980s and gained increasing popularity in urban development in 1990s. At its peak popularity, it was prioritised in the UK Government's core and regional planning guidance and applied to more than 50 urban projects across UK (Biddulph, Franklin, & Tait, 2003). After the mid-2000s, this planning concept became less and less popular after the shift of British urban policy towards sustainability.

In 1989, the Prince of Wales proposed ten principles to advocate his personal beliefs concerning future urban environments in his book *A Vision of Britain: a personal view of architecture* (The Prince of Wales, 1989). In 1990, he called on the Urban Village Group (UVG) - a group of professionals which are predominantly estate developers, to further develop his notions into the language of architecture and urban planning. The UVG published three books about how to build urban villages, organised urban village conferences and lobbied for a national planning policy.

As the result of the campaign, the urban village concept was included in the national planning policies in Planning Policy Guidance 1: General Policy and Principles (PPG1) (DoE, 1997) and Regional Planning Guidance for the South West (RPG10) (DTLR, 2001). At its most popular time, Biddulph (2000, p. 65) claimed that "urban villages seem to be everywhere in the UK" and "we claim to build urban villages" instead of "only housing or estates".

However, another new planning concept, millennium village, emerged in the UK in the late 1990s and became the UK Government's new development initiative - Millennium Villages and Sustainable Communities in 1999 in order to "achieve more integrated sustainable settlements" (DETR, 1999). Urban village was no longer widely advocated, nor was the UVG, which was later incorporated into the Prince's Foundation for Architecture and the Building Arts in 2003, active anymore.

In 2002, Biddulph, Tait, and Franklin (2002) concluded the urban village ideal was abandoned after 15-year use since the loose nature of the planning concept led to some tensions between stakeholders. The new national planning policy, Planning Policy Statement 1: Delivering Sustainable Development (PPS1) which replaced PPG1 was the official end of the advocacy of urban village in UK Government's planning policies (ODPM, 2005).

3.2 SOCIAL POSITIONS TOWARDS URBAN VILLAGE IN BRITISH PLANNING POLICY

Many of people involved in the Urban Village Campaign represented different social positions depending on their professions, beliefs and interests. This section categorises them into the following social groups depending on their discourse and actions in the campaign for further analysis in Four Discourse Schemata: The Prince of Wales, the UVG members, Léon Krier, the UK Government, estate developers, rational researchers and pro-Modernist critics (Table 1). Through the analysis of public speeches, governmental documents (planning guidance, funding initiatives and local plans), academic publication and media reports, it uses the analytical schemata of Four Discourses to probe how people in different social positions understood and reacted to urban village.

Table 1 Different Social Positions on the Urban Village Campaign

3.3 URBAN VILLAGE – A COMMAND FROM THE PRINCE OF WALES

The urban village concept firstly appeared in the Prince's book *A Vision of Britain*: "... I am hoping we can encourage the development of 'urban village' in order to reintroduce human scale, intimacy and a vibrant street life" (The Prince of Wales, 1989, p. 14). Essentially, Prince Charles proposed this new concept due to his disappointment with the then-ongoing post-war Modernist urban development. He had addressed this issue in the 1980s through public speeches, TV broadcast and book publishing (Rossiter, 1988; The Prince of Wales, 1984, 1989). Nevertheless, his actions attracted severe criticism, especially from Modernist architects (Jencks, 1988). His bold proposal of the urban village concept was another attempt to defend his beliefs concerning the built environment.

As the heir to the throne, his will had a huge impact on the established system of the urban planning knowledge. The UK Government, the Town and Country Planning Association (TCPA), the Royal Institute of British Architects (RIBA) had to react to his urban village ideal. The RIBA strongly rejected Prince's ideal on a new model of urban development (BBC South, 1990), while the UK Government and the TCPA adopted it and reacted positively to the Prince's dream (DoE, 1997; Hardy, 2006). Furthermore, a group of estate developers, bankers and urban planners gathered together to form the Urban Villages Group (UVG) in 1990 upon Prince's call for support for the new ideal (Email correspondences with Leon Krier, 21-25 July 2016). The analysis above can be interpreted within the schemata of Master Discourse. The term urban village (S1) is the Agent of the Prince's planning concept or the Master's will, driven by the Prince's opposition to Modernist urban development (\$). His proposal shook the existing regulations of urban practice and the existing paradigm of urban research (S2) because of his enormous political influence. After defining these three variables, we can analyse the social effects between the Prince of Wales and organisations involved in urban village within the schemata of Master Discourse as shown in Figure 5.

Figure 5 Master Discourse of urban village

Usually, the production from organisations, especially the Government's policy documents, is regarded as a reliable resource. However, the schemata of Master Discourse indicate that the production is merely the unattainable object of desire. This means that the Production of the discourse did not fully conform to the ideal of the Prince of Wales, but reflected the organisations' desire to some extent. After the formation of the UVG upon the Prince's call, the UVG produced a report which I call 'the manifesto of urban village' since it was the first time that the urban village concept was explicitly introduced with details of planning and design strategies (Aldous, 1992). It contains some uncertainties and contradictions such as the

location choice and its relationship to existing urban areas, despite being the first attempt to comprehensively define urban village. The manifesto tried to make urban village more flexible and versatile so that it could appeal to more participants' interests and make the possible implementation of the ideal more viable.

The discrepancy was more obvious in the policies of the British planning policies. The UK Government incorporated urban village in the mixed-use section which is one of its three approaches in Planning Policy Guidance 1: General Policy and Principles (PPG1) (DoE, 1997). The Government used the concept in a less important position as a reaction to the UVG's lobbying. In contrast to PPG1, the Regional Planning Guidance for the South West (RPG10) emphasises the sustainable character of urban village, denoting that mixed-housing and mixed-use could provide residents with a choice to live, work and use public facilities locally with a reduced travel need (DTLR, 2001, p. 53). The interpretation of urban village varies from one to another, demonstrating the conflict between the original ideal of Prince Charles and the explanation in different policy documents.

Though urban village was not understood as the same as the Prince's initial concept, urban policymakers tried to cater to this new ideal for their development objectives. The broad definition in UVG's manifesto and the contradiction in the planning policies reconfirm that the Master's ideal is difficult to implement with only the process of imposing a new planning concept to the existing planning system.

3.4 MANIFESTO, HANDBOOKS AND GUIDANCE – POLICIES TO IMPLEMENT THE IDEALS

This section probes the social effects that occurred when the knowledge package of urban village - its manifesto, handbooks and planning guidance - were implemented in practical urban projects. The type of this discourse is easy to define since the Agent and the motivation (Truth) are obvious. The agent is the new knowledge package of urban village, and the motivation is to impose the urban village concept in urban development. Therefore, the discourse is easily defined as University Discourse, as shown in Figure 6.

Figure 6 University Discourse – urban village

It should be noted that the production in Section 3.3 - the knowledge package of urban village - becomes the Agent in this discourse. The key characteristics in this manifesto included mixed-use (buildings, land use and tenure), pedestrian permeability, walking distance size (less than 40 ha area with a population of 3,000 - 5,000), public involvement and quality environment (Aldous, 1992). The characteristics of urban village in PPG 1 are compactness; mixed-function; mixed dwelling types including affordable housing; employment, leisure and community facilities; infrastructure and services; good urban design, public open space and green spaces; and good access to public transport (DoE, 1997, pp. 3-4). At the regional planning level, RPG10 claimed that "urban villages may provide a more sustainable model for development in existing urban areas, suburban areas, urban extensions or new settlements" (DTLR, 2001, p. 53). Compared with the manifesto and handbooks of urban village (Aldous, 1992; Neal, 2003), we find that the UK Government's planning guidance only focuses on some specific aspects of urban village.

According to the diagram of University Discourse, estate developers, urban planners and architects could choose whatever they like to pursue their own interests for their extra pleasure. Therefore, they held a different understanding of urban village or implemented the urban village concept in a different way. For instance, Léon Krier, the master designer of Poundbury, attempted to implement his ideal of urban quarters instead of urban village, although Poundbury is widely cited as a pilot urban village project. As a crucial founding member of the UVG, Krier was an active participant in the early UVG meetings as the urban theorist for two years (Thompson-Fawcett, 1998), but was later excluded from the UVG (Email correspondences with Léon Krier, 21-25 July 2016). In the masterplan of Poundbury, Léon Krier uses urban quarter as his real design concept: a geographic and social concept of an urban community, with the following characteristics: less than 33ha to guarantee 10-min pedestrian distance; dimensional, geometric and functional variety of buildings to create authentic urban community and public realm; mixed use within every quarter (Krier, 1998).

The real estate developers did not care about the original ideal either. For instance, Mr Morrish, the co-director of Morrish Builders, just regarded urban village as a sales premium for good quality masterplanning and architecture (Email correspondences with Steven Morrish, 2 August - 9 September 2016) and Morrish Builders' official website and sales booklets neglected any non-profitable characteristics of urban village such as social housing. The situation is the same for architects who participated in the architectural design in urban village projects. For instance, ESHA Architects followed one design principle of urban village as their starting point of affordable housing design "one of the founding principles of the urban village of Poundbury is that the social housing is freely intermixed with the private houses and that the two are indistinguishable"¹.

3.5 MODERNISTS' CRITICISM VS. RATIONAL EVALUATION

3.5.1 THE ARCHITECTURAL DEBATES BEFORE THE CAMPAIGN

The debates on urban village cannot be separated from the Prince's early intervention on architecture. Urban village was the Prince's attempt to react to the opinion that it is easier to criticise the defects in Modernist urban development than to build better urban projects (Hebbert, 1996). Since the RIBA's 150th Anniversary Gala speech in 1984, the Prince explicitly criticised some deficiencies of Modernist architecture and expressed his support to Community Architecture and Traditionalist Architecture². The intervention of the Prince provoked a popular public debate in which, a barrage of journalists, who had little interest before the Prince's intervention, escalated into a nationwide discussion (Jencks, 1988, p. 7). The wider debate was successful as the Prince wished to "stir things up [and] throw a proverbial royal brick through the inviting plate glass of pompous professional pride"³.

Although the failures of the Modernist built environment in the 1970s and 1980s seemed to be unanimous among the Prince, architects and planners (Goldberger, 1988; Hutchinson, 1988; The Prince of Wales, 1989), the opinion on its responsibility and the future approach were extremely divided. For the Prince and his supporters, the key theme was against Modernist Architecture which the Prince was extremely disappointed with. Aiming to gain extensive supports, the Prince widened his views in his speeches between 1984 and 1987 from merely Community Architecture to Traditionalist Architecture, Neoclassical Architecture, Conservation and Partnership (Jencks, 1988). Therefore, Traditionalist, Classicist and Community architects collectively applauded for the Prince's intervention. They believed that the Prince encouraged the public to express their opinions against the prevalent ideal among modernist architects within the RIBA. In contrast, Modernist architects and architectural journalists strongly criticised the Prince's intervention. One strand of criticism questioned the legitimacy and ability of the Prince's intervention. They believed that the Prince's criticism of architects was violating the principles of a constitutional monarchy (Games et al., 1989; Rogers, 1989). The then RIBA president, Maxwell Hutchinson (1988), believed that the architecture profession should develop with its rich heritage and enduring strength rather than through the privileged intervention. Another strand of criticism accounted for different visions for future cities. The majority of Modernist architects were confident in technological development and believed that architecture should catch up in the relentless flow of time and evolve with the society (Foster, 1987; Hutchinson, 1988, 1989; Manser, 1989; Rogers, 1989). Their opinions of future architecture and cities are so different from the Prince's perspective of learning from the past that their disagreements were inevitable.

¹ ESHA Architects were the coordinating architects in Phase 1A, and participated in the design of 20 affordable housing units in Phase 2E. Their design statement for Poundbury social housing design was retrieved from <http://www.eshaarchitects.co.uk/Poundbury-Affordable-Housing.html> on 15 May 2016.

² Prince's speeches on Architecture between 1984 and 1988 are available in the appendixes of *The Prince, The Architects and New Wave Monarchy* (Jencks, 1988).

³ Extracted from the Prince's 'Community Enterprise' speech on The Times/RIBA awards for Community Architecture on 13 June 1986

3.5.2 MODERNISTS' CRITICISM

The debate continued after the Prince shifted his focus from criticism to advocating his beliefs of future cities - the urban village ideal. Similarly, urban village attracted numerous comments since the ideal was put forward by Prince Charles. Although the Urban Village Campaign technically avoided the mention of the choice of architectural taste, and instead focused on mixed development – mixed tenure, mixed-use and mixed-scale (Bunting, 1990), urban village projects were associated with anti-Modernist styles in practice such as Vernacular style in Poundbury and Lightmoor Urban Village (Dorrell, 2003).

The de facto association with anti-Modernist style attracted severe attacks from Modernist architects and journalists. Reporting the urban village practice in Hull, Dench (1995) associated the urban village concept with fake historic doors, windows, balconies and pueblos, summarising it as 'theme-park city'. Colin Ward (1992) argued that the urban village manifesto was merely the kind of 'townscape manual' used to be published in the 1950s and 1960s. Maxwell Hutchinson claimed that the Prince's 'nostalgic ideal' of the past Golden Era could only create 'exclusive home for the rich' (Hutchinson's interview in BBC South, 1990) or 'life styles of the rich and famous' (Hutchinson, 1989, p. 9). Their writings and speeches pointed out the flaws of urban village and argued the possibility of creating a new approach based on Modernist rather than Traditionalist or Conservativist, at least looking forwards rather than backwards.

As we can see in the discussion above, Modernist architects and journalists were disappointed with the urban village ideal (a) and attempted to persuade others to believe in their opinions. They expressed their opinions to persuade the confused public (this of course included architects and planners) who still did not have strong stances in the discussion of urban village (\$). Many of their criticisms merely served to advance other new terms, like 'theme-park city', 'townscape manual', 'nostalgic ideal' and 'exclusive home for the rich' (S1), which themselves still suffered from a lack of definition/clarity. Their actions conform to the schemata of Analytic Discourse in which there is a deliberate subversion of the prevailing Master Discourse. Therefore, their criticism can be analysed within the schemata of Analytical Discourse (see Figure 7).

Figure 7 Analytic Discourse – Intuitive Criticism on Urban Village

Similar to the architectural debate before the Prince's proposition of urban village, the key reason that Modernist architects and journalists rejected urban village was that the new ideal was different from Modernist architects and journalists' beliefs in future architecture and cities and could not fulfil their own desire of Modernist urban environment. Therefore, they tried to point out its speculative flaws according to their established knowledge (S2). Maxwell Hutchinson believed this type of housing would have to be expensive on sale since the large-scale development was too expensive due to the huge amount of the infrastructure, such as roads and service (Hutchinson's interview in BBC South, 1990). Architect and anarchist thinker Colin Ward (1992) argued that the urban village ideal lacked two key factors: the economic motivation of developers and a motorised suburban hinterland supporting the urban centres. The editorial of the Architects' Journal argued that urban village had a good imagination for the urban form but a lack of the content and structure for economic activities (The Editors, 1992). Architectural journalist Matheou (1994) criticised that the publication of Economics of Urban Villages (Lichfield & Aldous, 1995) was a direct command to the UK Government to make urban village feasible. The criticisms of urban village above were from different perspectives, but all tried to argue that urban village was not a feasible solution to future cities.

According to the schemata of Analytical Discourse, the true motivation of their discourse was that their established knowledge (S2) had been attacked. As the then RIBA head, Hutchinson needed to speak

on behalf of the professional society in which Modernist architecture was the mainstream. As an anarchist thinker, Ward was strongly against all kinds of top-down command, especially from the future monarch. In fact, their real motivation made some arguments quite emotional and biased. Hutchinson was blind to the fact that most urban village projects were required to build social housing integrated with private selling products. Ward and the editors of *Architect's Journal* did not predict the developers' enthusiasm for this ideal.

3.5.3 RESEARCHERS' RATIONAL EVALUATION

Besides Modernist architects and journalists, there was another group who evaluated the urban village ideal, but in a more rational way – an academic approach. This approach is naturally less emotional and less personal than the Modernists' criticism since it needed to collect data as much as possible for comprehensive evaluations and is under the monitor of peer-review system.

The majority of this group were scholars in urban research and architectural research, who initially were sceptical of the urban village ideal (\$) and questioned the urban village ideal (S1). How much can urban village contribute to urban regeneration (Biddulph, 2003; McArthur, 2000), aesthetics and place-making (Biddulph, 2003; Forsyth & Crewe, 2009), and social and environmental sustainability (Brindley, 2003; McArthur, 2000; Thompson-Fawcett, 2000)? Is urban village a fixed planning ideal (Biddulph et al., 2003)? Or does urban village improve the emergence of women into the public sphere (Roberts, 1997)? The researchers probed the urban village ideal from the perspective of their expertise, which is different from its original objectives.

Therefore, researchers' evaluations can fit in the schemata of Hysteric Discourse. The two explicit variables are researchers' initially different understandings of urban village (\$) as the agent in the discourse, and their questions on urban village (S1) as the receiver in the discourse. The schemata of Hysteric Discourse reveal the true motivation and the real production of the rational evaluations (see Figure 8).

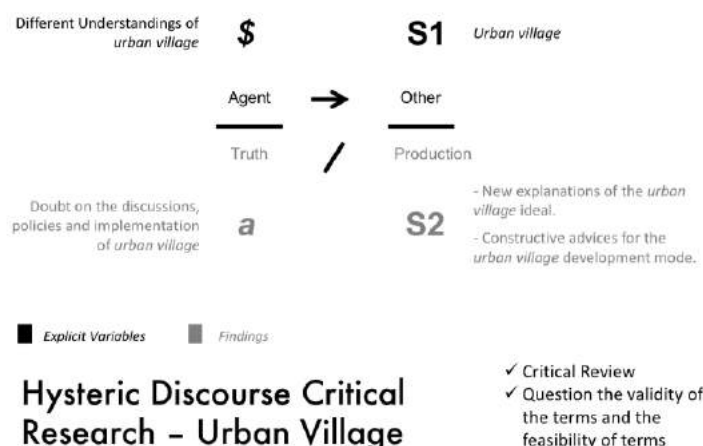

Figure 8 Hysteric Discourse - Rational Evaluations of Urban Village

Hysteric Discourse as Lacan stated, is the real scientific research to produce new knowledge. One thing to emphasise here is that Hysteric Discourse is not necessary to associate with any hysteric symptoms. Rather, it is a unique way to question the ideological environment through asking 'so what' or 'but what about?' (Hillier & Gunder, 2003).

The real motivation (Truth) of the research evaluations were researchers' chances to insert their own expertise into the academic discussion, urban policies and practice of urban village (a). McArthur (2000) regarded urban village as a stimulating process of self-sustaining regeneration, while Roberts (1997) used urban village as one of Traditionalist approaches to contemporary urban development. Thompson-Fawcett (2000, p. 287) explained the urban village ideal in the popular context of sustainability, while Franklin and Tait (2002) analysed urban village with a light touch of textual analysis and urban sociology. As analysed above, almost all researchers attempted to reshape urban village in a way with which they were familiar.

Unlike the Modernists' comments, the production of research evaluations was much less emotional since they had to follow the academic paradigm of a comprehensive investigation. Although the opinions on urban village were divided among researchers, most of the evaluations agreed with some positive

aspects of the ideal. A number of project case studies supported that mixed-use and compactness were generally achieved as the key feature.

Nevertheless, they pointed out their concerns on other aspects which needed caution, such as the context of the dynamic urban processes in contemporary society (Thompson-Fawcett, 1996), the powerful capital force and the complexity of the real projects (Thompson-Fawcett, 2000), the fuzzy and ambiguous definition (Biddulph et al., 2003; Franklin & Tait, 2002), the danger of regarding pre-industrial urban form as the only strategy (Roberts, 1997) and the importance of the aesthetic quality rather than the visual style (Forsyth & Crewe, 2009).

Furthermore, the research evaluations provided some suggestions about how to develop better urban village projects. Reviewing the Glasgow Crown Street project, McArthur (2000) suggested transferring resources from ownership housing to social rented housing to improve social inclusion and social sustainability. The case study of London's Docklands suggested that the social activities needed incubated together with the physical environment rather than merely 'carved up' by architects and planners (Tait, 2003). Thompson-Fawcett (2003) argued that the survey in Poundbury suggested that the urban village building code needs some flexibility for modification or even reversal in a long-term framework.

The research evaluations linked the ideal with the research areas which urban village did not extensively touch upon. Therefore, the evaluations added new thoughts to the urban village ideal, simulated the discussion in a rational way and generated more knowledge for urban village.

4 CONCLUSION

The article reviews the British Urban Villages Campaign to reveal the complex social effects behind a new planning concept – urban village, with the help of Lacan's Four Discourses social theory. It discloses that the praises and objections are not only driven by individual's judgement of the new planning concept but also associated with the interests (or pleasure) they want to achieve from the standpoint of their social positions.

The statements and policies produced after the Prince of Wales's call for a new ideal urban village actually did not follow his original intention, since the UVG members could achieve their own interests to interpret the ideal in different ways. The urban practitioners' actions did not conform to the manifesto, handbooks and guidance of urban village since they wanted to seek their own 'pleasure' under the policy package. The real reason that the Modernist commentators attacked the new concepts was not the bad quality of urban village, but the conflict between their existing knowledge and the new planning concept. It was difficult to keep urban village in a stable definition since the involvement of different social positions kept the concept changing and evolving.

From the analysis of urban village, this research speculates some characteristics of contested planning concepts in the planning discourse. Firstly, planning concepts might be understood and reacted differently depending on individuals' social positions. To some extent, their social positions, rather than the quality of the planning concepts, determine the potential actions towards planning concepts. It explains the uncertainty and mutability of planning concepts keep following the participants' interests in planning discourse.

Secondly, the more radical the planning concept is, the more divided challenges it might face. The challenges of Analytic Discourse are triggered by the changes impacting on an individual's established knowledge. Rigid planning concepts are likely to quickly attract attacks since they are more difficult for other social positions (except for the Master) to accommodate the ideal in their own ways of achieving their own interests. In contrast, flexible planning concepts have the possibility to fit for wider interests, although the definition of the ideals might mutate to a degree far away from their origins.

Lastly, the public's passion on a discussion about new planning concepts does not last long, but urban development projects need decades to complete and become mature. Many critics and policy-makers were eager to appropriate new concepts based on their own knowledge system before the popularity disappears (McCann & Ward, 2011). Although a new planning concept might be ephemeral as British urban village which faded out after being popularity for nearly 15 years, its legacy remains for a longer time.

ID 1512 | ESSEX SCHOOL OF DISCOURSE ANALYSIS: A LOGIC-BASED APPROACH TO ONTOLOGICAL INVESTIGATION OF PLANNING

Elham Bahmanteymouri¹

¹Lecturer, School of Planning and Architecture, The University of Auckland, New Zealand

e.bahmanteymouri@auckland.ac.nz

1 INTRODUCTION

Planning discipline historically emerged to modify the side effects of capitalism. Consequently, the discipline has undertaken a paradoxical role: while planning provides facilities for a better condition of life through provision and distribution of public goods and services, it also facilitates accumulation of capital and market operation (Harvey, 1985). Friedmann (1987) discussed the difficulties that we as planners face to present a definition of the essence of planning discipline. Furthermore, Gunder (2005) through a Lacanian approach illuminated the linguistics reasons for difficulties in presenting a concise definition of planning, specifically where we present contradictory significations for the dominant concepts of planning such as smart growth, sustainability, and public interest. As Gunder and Hillier (2009) argued, it seems planning is signified with a series of terms and phrases which inherently have different and sometimes contradictory significations. This paper suggests that planners require an ontological investigation of planning to respond to a question of the planning functions. An ontological analysis is merely possible on the light of logic. Namely, a logic approach is able to provide a window on ontological studies of the essence of phenomena including planning.

This paper deploys Essex School of Discourse Analysis (ESDA) to explain how an Aristotelian logic-based approach may assist to illuminate the functions and relations of planning. ESDA is based on a Logic Approach of Critical Explanation in social and political theory which has been inaugurated initially in political studies by Laclau and Mouffe (1985); then, developed by their students including Glynos and Howarth (2007). The method is not simply a Discourse Analysis method that focuses on reading texts or considering the language of documents. Instead, it has been applied in policy analysis to investigate how and under which political and social circumstances, a particular policy logically supersedes all other alternatives. In this paper, the logic approach critically analyses how three logics social, political and fantasmatic work to make a planning practice such as an urban growth policy possible.

The paper introduces ESDA as a logic-based approach and presents results of applying ESDA in a comparative study of urban development in two case studies: Western Australia (Perth) and Iran (Tehran). Using this logic approach, the paper analyses the factors inherent in these homologous policies, including oil and mineral exports as economic drivers in both cases. Importantly, the research emphasises the need to understand universal trends and their connections with particular context-dependent issues in order to recognise the rationale behind these policies.

This method is being deployed for the first time in planning by the researcher to explicate the logics which have created Ellenbrook and Parand as extensions respectively within Perth and Tehran metropolitan areas. The method will explain how political and fantasmatic logics are associated with the social logic to make the practices and to maintain them at both the social and psychological levels of different actors in the urban development process. Three logics of social, political, and fantasmatic analyse the impacts of different actors including state, citizens, local institutions, as well as regulations upon the policy of urban growth management.

2 PLANNING AS A JANUS-FACED DISCIPLINE

Retroactively, and with a genealogy investigation into the history of planning, I found that planning emerged with the modern era to pacify the side effects of capitalism (in particular industrial capitalism) (Friedmann, 1987; Harvey, 1985). Planning was largely created as an agent of the state to facilitate market relations, that is, to help in the provision of labour and resources to secure capital formation (Harvey, 1985, 1989; Yiftachel, 1998). In this manner, planning has had to undertake a paradoxical role to achieve these paradoxical aims. Often, planning engages in the promotion of economic growth rather than its initial 'public good' promises such as providing affordable housing. Indeed, planning is entangled in the contradictions of capitalism such as use value versus exchange value, as well as the right to private property against common property rights (Harvey, 2014). Yet, planning is designated to mitigate the adverse effects of these contradictory traits of capitalism.

Therefore, planning can be seen as a Janus-faced discipline. It is necessary to iterate that the problem stems from the essence of planning which operates as an apparatus of the state to adjust the failures of

the market economy, such as providing affordable housing for the poor, or as Harvey (2003) terms it, for labourers. In terms of housing policies, as one of the most important dimensions of planning, Harvey (2014) argues that planning policies aim to provide affordable housing; yet, these policies often result in price rises that make houses unaffordable for low-income groups.

As Lefebvre (2003) stated as a consequence of the contradiction between exchange value and use value in the urban phenomena, and particularly for housing, the function of home-ownership changes to a form of saving as a speculative financial mechanism. This contradiction works as a driver for most housing policies (Harvey, 2014). In particular, neoliberalism as the hegemonic ideology of our time relies on this contradiction through the financial innovative mechanisms, derivatives, alongside housing policies (Harvey, 2014). Harvey (2014, 121) maintained that neoliberalism is characterised via “accumulation by dispossession through debt encumbrance and debt peonage (and less legal predatory practices) provide a lucrative supplement [intertwined with global financialisation] to boost the overall rate of return on capital”. However, this mechanism of the housing and real estate markets halted in the 2008 economic crisis, when the enormous housing bubble burst in many parts of the world (Baker, 2008).

According to the above-discussions, this paper assumes a specific definition of the planning mechanism that presents a Janus-faced discipline for planning in relationship with capitalism, particularly neoliberalism. The research investigates planning practices, policies and plans in relation to the capitalism as a western approach – specifically Anglo Saxon or American approach – of planning. Harvey (cited in Roberts, Hite, & Chorev, 2015, pp. 333-334) argued that many people in non-English speaking countries for example Brazil may think neoliberalism and its crises and failures are “Anglo Saxon disease and have nothing to do with” other cultures and countries; however, neoliberalism as the hegemonic ideology of our time have internationally influenced local planning policies and plans since the 1980s (Harvey, 2014). I investigated how two countries – Australia and Iran – have been influenced by neoliberalism as an ideological framework which raised from western countries since the 1980s.

I have selected to analyse the land supply policies and UGMPs as the subject of this investigation for two reasons. First, because different kinds of housing schemes including land supply and UGMP have been applied as one of the most important tools of the planning function under the hegemony of neoliberalism. Importantly, I have selected to investigate UGMP because since the late 1970s and the rise of neoliberalism, discussions regarding the removal of planning controls, and also the relationship between restricting urban growth management and perceived failures of planning to provide sufficient housing, has widely been one of the most controversial issues of neoliberal planning (Allmendinger, 2016). Second, these practices of planning were my main concern during my work as a planner at the Ministry.

I assume practices of Urban Growth Management (UGM) and the land supply in the fringe areas of cities as a policy rather than as plan. Policy is a problem-solving or problem-oriented process that can be undertaken through deploying different skills and approaches; policy can be implemented in different stages and through the use of different plans such as a town plan, structure plan, comprehensive plan, detail plan, etc. (Patton, Sawicki, & Clark, 2013).

UGMP as a practice of planning often begins with a demographic housing demand forecast and then an economic assessment often resulting in a recognised lack of sufficient housing in the market operation. The increasing population in cities has been one of the determinants of the availability of land supply. In other words, population growth is regarded as a new induced demand; consequently, market reasoning offers an increase in supply of housing to respond to the new demand in the market. Through a series of zoning and land use policies including UGMP, planning is often deployed to resolve these housing market deficiencies (Austin, Gurran, & Whitehead, 2013).

Internationally, planning actors – people, planners, and politicians – accept that urban containment policies make housing less affordable; conversely, new suburbs supply cheaper land and more affordable housing (Gurran, 2008). However, as soon as policies and plans are ratified, high demand is often shaped because people anticipate future increases in property prices (Balchin, Bull, & Kieve, 1988). These newly planned areas turn into ripe areas for market speculation. Indeed, market speculation ends in the over-valued price of assets or a ‘housing bubble’ (Evanoff, Kaufman, & Malliaris, 2012). Many speculative buyers often do not even intend to reside in their properties, because of the lack of appropriate transport services, and inefficient services and infrastructure (Balchin et al., 2012). Instead, they anticipate increases in property prices in the future, or in the Marxian terminology ‘surplus value’. In this manner, housing becomes a speculative investment for one group while an unaffordable, but essential good for another.

Although, buyers may rent out their assets or add value to their lands by building on it, the main motivation for this act is to gain surplus value. Finally, “the pursuit of exchange value destroys access to housing as a use value” (Harvey, 2014, p. 21). Therefore, because of the high prices of houses, many of these new housing areas cannot provide affordable housing for disadvantaged groups. Often, asset speculation causes large numbers of properties to be held idle in the form of empty lands or empty buildings and the over-valued price makes the assets unaffordable for many groups (Healy & Rosenberg, 1979).

Therefore, I realised that the discipline of planning has inherent limitations, including that of many of its functions, roles and responsibilities as well as, its fundamental definition and the role of planners and citizens as actants involved in planning functions. It became clear that a great deal of the planning literature is involved in questioning the essence and ontology of planning, for example, what is planning's purpose? And what are the roles and responsibilities of planning actants? I did not find any research undertaking an Aristotelian ontological investigation of planning to systematically investigate the logics concerning the existence of planning practices, or to reveal why a specific practice of planning exists, or why another kind does not exist. An Aristotelian ontological investigation clarifies the relationships and identifies the causes that bring an entity into existence and I found a lack of Aristotelian ontological investigation on the essence and the existence of the planning practices in the literature. Therefore, discovering the need to undertake an Aristotelian ontological study of planning, I have decided to categorise my research as an ontological investigation on planning that aims to achieve an in-depth understanding of planning practices and their actants. The next section will explain the Aristotelian meanings of ontology and ontological research, what ontological research may reveal about the planning discipline and how it provides a beneficial and essential approach for planning.

3 ARISTOTELIAN ONTOLOGICAL APPROACH

An ontological investigation is involved in "our underlying presuppositions about the way the world goes round" (Glynos & Howarth, 2007, p. ii). This approach can provide a framework to answer questions about "what sorts of things exist ... and how they exist" (Glynos & Howarth, 2007, p. 11). The Aristotelian ontological investigation suggests a logic approach to discuss logic of possibility and consequently impossibility of phenomena or practices (Aristotle, 2001[1807]). Therefore, an Aristotelian ontological framework of planning investigation reveals the reasons for the existence of a practice of planning, for example, an UGMP (why the practice exists), and also how and under which conditions a practice is created (for example under neoliberalism).

Discussion and analysis of ontology is possible only in the light of logic. Logic and questions concerning the logical possibility of the existence of objects provides a window on ontological studies of issues, entities, and essences (Jacquette, 2002). Namely, what kinds of logics make a practice possible is the subject of an ontological investigation. Thus, applying a logic framework can provide a systematic ontological study of a practice to find the failures and the causes of the failures.

Therefore, the main questions of an ontological investigation are as follows: What is the essence of a phenomenon (e.g., a planning practice such as UGMP)? How is it created? Where does it locate and why? Moreover, what are the relations of that phenomenon to other beings? The responses to these questions present the logics of possibilities or impossibilities of the phenomenon's existence. In fact, a logical necessity of something inscribes its impossibilities (contingencies) in itself (Jacquette, 2002).

Therefore, "the logic of a practice comprises the rules or grammars of the practice, as well as the conditions which make the practice both possible and vulnerable" (Glynos & Howarth, 2007, p. 136). Laclau (in Butler, Laclau, & Žižek, 2000, p. 283) compared the logic of social and political practices with the rules of the practice of playing chess; namely, with basic entities, rules and relationships we can have "myriad moves at the level of tactics and strategy" (Glynos & Howarth, 2007, p. 136). I have chosen Essex School of Discourse Analysis (ESDA) as a logic-based approach to analyse the logics of possibility of a practice of planning. As explained above, I have chosen the policy of UGMP as a practice of planning to ontologically investigate the logics of this practice. The next section introduces ESDA and explains how this method might be deployed in planning and policy analysis.

4 ESDA AS AN ARISTOTELIAN LOGIC APPROACH

The method was founded by Laclau and Mouffe (1985) and followed by their students in the Essex School of Political Studies. In particular, ESDA approach explores a phenomenon via a focus on specific practices or policies through texts, speeches, rhetoric and interactions or in other words, linguistic/non-linguistic axes (Glynos, Howarth, Norval, & Speed, 2009). Thus, following ESDA, this research endeavours to investigate the mechanism of planning in relation to hegemonic ideology via analysis of urban plans and projects, policies, laws, bylaws, planning codes and contracts, and official reports. It also includes documented speeches or orders of authorities. The following four sub-sections will explain the core arguments and principles of ESDA.

4.1 BEYOND THE DICHOTOMY OF UNIVERSALISM AND PARTICULARISM

The discussion on the dichotomy between universalism and particularism comprises the foundation of this methodology. ESDA's special explanation of the dichotomy is developed from Laclau's (1996) point of view. Following Laclau, Torfing (1999) undertook a genealogical scrutiny of universalism and particularism. He explained how these philosophical terms derived from classical ancient philosophy and the interpretation of the transcendental and immanent notions of god. This paper avoids repeating the long history of these terms. The discussion is limited to what is related to the subject of the research. Briefly, the discourse of modernity replaced the universal rationality of god, as a foundation and reference, by science, that of natural science or 'causal law' (Torfing, 1999). However, in both logics of divine foundation and modernity, a universal transcendental mode of rationality is the foundation of human reason. This displacement of god by human science is encapsulated in Descartes' famous dictum "Cogito ergo sum", "I think therefore, I am". This universality continued with Enlightenment thinkers, such as Hegel and Marx, amongst others, through the hegemonic thoughts of historicism, structuralism and the materialistic approach. Later, post-modernists and post-structuralists challenged this metaphysically privileged universal approach. Thus, with increasing hermeneutical insights in social and political science, the context-dependent and particular approach has gained privilege in many discourses (Flyvbjerg, 2001; Glynos & Howarth, 2007; Torfing, 1999).

Although the hermeneutical critique of positivism, naturalism and structuralism has provided effective insight into social science, close and careful interrogation of this approach shows that particular context-dependent rationality and perspective loses a common ontological ground, which without universal norms and rules will lead to antagonistic clashes between incommensurable identities (Glynos & Howarth, 2007; Torfing, 1999). Indeed, while hermeneutists highlight a number of deficiencies in the scientific paradigm, they replace the subsumptive universalism with a descriptive or normative particularism which still is not fully responsive to social phenomena (Torfing, 1999). Žižek (2008b) as an opposition thinker against hermeneutics, post-structuralist and post-modernist approaches in social studies, criticises these approaches for providing the possibility for distortion of meanings and reducing truth to "one of the style effects of the discursive articulation" (Žižek, 2008b, p. 172). To deny poststructuralism as an appropriate approach, Žižek (2008b, p. 172) argues that "Lacan always insists on psychoanalysis as a truth-experience ... [which] has nothing to do with a post-structuralist reduction of the truth-dimension to textual truth effect".

In sum, structuralism, positivism, and naturalism, or the scientific perspective – universalism – are criticised for being reductionist. These approaches universalise theories and generalize scientific laws for particular cases in social science through deductive or inductive modes of reasoning. Universal approaches overemphasise the ideals of prediction and underemphasize contexts and particulars. However, the later approaches including post-structuralism, postmodernism and hermeneutics – particularism – are criticised because they failed to consider different dimensions of phenomena and social and political events and a lack of clear and coherent methodology. In fact, the particularistic approaches fail to see similarities and differences as well as logical universal relations between phenomena due to considering contextdependent descriptions of events. These approaches focus on contextualized self-interpretations, which overemphasise the particularity of context (Glynos & Howarth, 2007).

Laclau, Mouffe and their followers have attempted to find a way beyond this dichotomy. In this regard, ESDA presents a possibility to use both rationalities – universalism and particularism – to investigate social phenomena. Indeed, the method of the logics of critical explanation (Glynos & Howarth, 2007) presents one of these attempts. The turn to the logic approach in political discourse theory responds to the mentioned dichotomy and challenge in contemporary social science.

Torfing (1999, p. 168) states that "the discourse theory of Laclau and Mouffe accepts the chasm between the particular and universal; however, it challenges the idea that a radical choice must be made between universalization of the particular and particularization of the universal". Therefore, one of the fundamental principles of ESDA is the existence of the circular relation between universalism and particularism. "As a consequence, the metaphysical hierarchies privileging either a pure universality or pure

particularism are revealed as political and ideological attempts to arrest the undecidable game between the universal and the particular" (Torfing, 1999, p. 168).

Following the ESDA, it is necessary to accept two assumptions: 1) there are some universal functions, theories and rules to make commensurabilities possible, while 2) these rules may operate quite different in different contexts. First, as a universal theory or "a complete explanation that is not reducible to the contextualized phenomenon", planning ontologically exists and operates in relation to the hegemonic ideology of capitalism (Glynos & Howarth, 2007, p. 83). Second, a context-dependent analysis is "an indispensable element of any properly constituted" research of planning (Glynos & Howarth, 2007, p. 83). Thus, every context presents its own mechanism in a series of complex relations. In this manner, although a counter-logic of the status quo of planning may emanate from a counter-logic to market reasoning/capitalism, it can be as varied as the many cases and practices of planning.

The key methodological response of ESDA is a problem-driven approach or practice of problematisation instead of the technique-driven and purely theory-driven approach (Glynos et al., 2009). However, it avoids any kind of relativism or subjectivism in order to avoid any constraint on the critical evaluations of practices. This means the focus of the methodology is on the empirical problems, retroductive explanations of the identified problems, logics for actions of professional and non-professional actors, articulation of actors and critiques of them (Glynos & Howarth, 2007). Therefore, investigation of a practice (for example UGMP) within more than one case study presents a better and in-depth understanding and analysis of the practice and circular relation between universalism and particularism (Glynos & Howarth, 2007). It shows differences and similarities of a planning practice such as UGMP within different contexts. It clarifies how a universal practice of planning works through different logics in different contexts.

Consequently, I have chosen two diverse case studies to examine how the mentioned universal mechanism of planning works through different contexts and how it causes differing effects which require differing planning practices. I have applied the mentioned method to evaluate the role of ideology in two planning case studies from Australia - Perth and Iran - Tehran.

According to Laclau and Mouffe and following Wittgenstein and Lacan, every social or political practice works based on three logics: the social logics including economic, financial and institutional operations and structures, the political logics, and the fantasmatic logics which support the possibility of a practice (Glynos & Howarth, 2007). The three logics will be explained in the following sections.

4.2 SOCIAL LOGICS

Social logics are not simply equal to social orders; rather, social logics intervene to different degrees in the constitution of every social order (Laclau & Mouffe, 1985). Social logics are not formal logics, or even general dialectical logics or casual logics; rather, social logics imply a "rarefied system of objects, as a 'grammar' or cluster of rules which make some combinations and substitutions possible and exclude others" (Butler et al., 2000, pp. 76, 77). Social logics often characterise what has been called 'discourses' such as 'the logic of kinship', 'the logic of the market', and so forth. Laclau (Butler et al., 2000, p. 76) stated that this kind of logic "coincides what in Lacanian theory is called the 'symbolic'". Therefore, the symbolic implies all terms of social life, social logics, or social practices. Social logics "characterise practices in a particular social domain, say the practices of consumption and exchange within an economy, or an entire regime of practices, egalitarian policies, Thatcherism, apartheid, or even the audit regime of a particular university" (Glynos & Howarth, 2007, p. 133). Furthermore, "social logics characterise the patterns of established practices by dominant organising principles" such as financial practices "with a whole range of managerial, technological, and economic norms and processes" (Glynos et al., 2012, p. 298).

Every social order has its own political logics in the background. Indeed, political logics extend the ESDA argument beyond social logics to find what kind of power relations construct the current social logics. The next section explains how political logics are involved in a practice.

4.3 POLITICAL LOGICS

Political logics provide the means to explore how social practices are instituted, contested, and defended (Glynos & Howarth, 2007, p. 133). Political logics explain the ways in which actants are involved in a practice and signify the social logic. Political logics can be explained through different logics such as the logics of equivalence and difference, and sameness which are the most important components of political logics. In addition, the Lacanian concepts of identification and identity assist to explain political logics, which are related to the different ways within which a subject is confronted with an identified lack.

The main point of the ESDA methodology is the Lacanian ontological lack – an identified lack in the symbolic order such as lack of affordable housing – that is located at the center of all analyses and logics. The argument is that every hegemonic (dominant) discourse (symbolic order) maintains a lack/a deficiency in the symbolic order. "every symbolic order is penetrated by an impossibility that has to be filled or covered-over for it to constitute itself" (Glynos & Howarth, 2007, p. 14). The lack makes pressure on the symbolic order. Indeed, political logics are the subjects' struggles over recognition of the pressure of the lack and over filling the lack through signifiers. Laclau (2005) argues that in the case of pressure of the lack, a promising empty signifier¹ emerges (what Lacan termed a master signifier), which "signals the introjection of this signifier as 'enigma-plus-promise' that accounts for a common identification (yet) a

¹ To Laclau (1996), this empty signifier promises to make possible the fullness of a lack; for example, 'Justice for All' is an empty signifier that promises justice for an unjust situation. An empty signifiers promise a meaning, which make a political struggle possible – "subjects are engaged in a search for identity and a struggle over meaning" (Glynos & Howarth, 2007, p. 131).

common identity” (Glynos & Howarth, 2007, p. 130). This is in itself the cause for another series of struggles between subjects over its meaning. The result of these struggles (political logics) is a new symbolic order (social logic) as a series of signifiers and significations, which are constituted around and in relation to an identified lack.

In order to establish and distinguish a new discursive formation, it is necessary to put limitations and boundaries (e.g. regulations) on the discourse. This is possible by means of political logics including a sameness logic that is referred to the subjects’ identification with these new boundaries as signifiers in the symbolic order. It makes collective actions and consequently changes possible. Namely, new discourse

operates via “hypergoods” such as god, justice, democracy, or “self-determining freedom” as boundaries which “are constituted, reproduced, and transformed through political identification and collective mobilisation” (Glynos & Howarth, 2007, pp. 72-73). These boundaries or regulations are compulsory for political identification and power struggles or political oppression. To sum up, through political logics such as logic of difference and equivalence, ESDA explains how individual and collective movements and struggles are shaped to make the practices and discourses possible in a society.

4.4 FANTASMATIC LOGICS

Fantasmatic logics can be explained by drawing on a range of different concepts including ideology, different modes of enjoyment, desire, drive, and the explanations of those feelings and emotions, which assist a particular ideology to act normally and consistently in terms of society’s beliefs. These concepts will be explained in this section. According to Glynos and Howarth (2007, p. 15):

if political logics are most closely associated with the political dimension of social relations, fantasmatic logics are closely linked to the ideological dimension. More precisely, with the logic of fantasy we aim to capture a particularly powerful way in which subjects are rendered complicit in concealing or covering over the radical contingency¹ of social relations.

In fact, fantasmatic logic reveals our emotional investment in that promise that rewards us with more enjoyment (Žižek, 2008a). If social and political logics provide the reasons and explanations for how practices and policies come into being, fantasmatic logics provide “the means to understand why specific practices grip subjects” (Glynos & Howarth, 2007, p. 145). Fantasmatic logics assist social orders and political practices to appear as normal and natural. Accordingly, “the logic of fantasy provides us with the means to talk about the subject’s mode of enjoyment, and thus about the way the ideological and ethical dimensions of socio-political reality are foregrounded or backgrounded” (Glynos & Howarth, 2007, p. 132).

As mentioned, the critical-explanatory concepts of ESDA – social, political, and fantasmatic logics – “are explicitly linked to the ‘lack’ ... in any given symbolic order or the radical contingency at the heart of Being” (Glynos & Howarth, 2007, p. 82). Therefore, all other concepts are meaningful in their relation to this ontological lack. Every symbolic order is ontologically penetrated by a lack or an impossibility. In dislocatory moments such as an economic crisis, the symbolic order “is disrupted by an experience that cannot be symbolized within and by the pre-existing means of discursive representation”. As explained, this experience or thing that cannot be symbolised – the Real – creates pressure on the symbolic order. The dislocatory event such as an economic crisis re-activates the contingent foundations of a discourse and makes the lack – the lack of the Real – visible.

Based on the Lacanian concepts, at the moment of dislocation, subjects may react to the event in different ways; how they identify themselves explains the subjects’ positions towards contingency and it reveals an ethical dimension in our analysis of the subjective level of the phenomenon. In fact, the dislocation reveals a lack of meaning in the dominant hegemonic discourse and when subjects start to make a new meaning to fill the lack, the lack works as a productive operation. As Laclau (Butler et al., 2000) argued, a unique desire can emerge to fill the lack and to create a new discourse to replace the old one. Facing the symptoms/pressures of the Real – lack – as limitation or failures always causes anxiety for us. The important point is recognising the lack as the cause of our anxiety. However, the subject continuously attempts to replace the lack, and the sense of anxiety that it creates, with enjoyment. Lacan analysed and categorised different psyche statuses to explain how subjects react to the lack – a missing signifier – or misrecognise one of the (main) signifiers. The subject may have different behavioural reactions to fill the lack, deal with it, or avoid it and escape the anxiety. In the Lacanian approach, this categorisation of reactions has a close relation with the ethical position of the subject. Here, just desire and drive which are related to the subject of this paper will be explained.

¹ Radical contingency is the logic of impossibility that is located at any given symbolic order (at the heart of being). It makes pressure on the dominant symbolic order to reveal the hidden logics of impossibility of the symbolic order (Glynos & Howarth, 2007).

Based on the Lacanian attitude, some concepts, particularly desire, drive, and *jouissance*, assist us to interpret and to analyse how the mode of enjoyment can be categorised. In fact, drive and desire refer to two ways in which “the subject arranges her[his] enjoyment (*jouissance*)” (Dean, 2012, p. 65).

Lacan explained how drive suggests a potential mode of satisfaction, which provides a way between sublimation and idealisation around an object. Referring to Freud, he explained that “idealisation involves an identification of the subject with the object, whereas, sublimation is something quite different” (Evans, 2006[1996], p. 111). Therefore, “the subject here makes himself [sic] the instrument of the Other’s *jouissance*” (Lacan, 2006, p. 697). Lacan (2008) argued that in capitalism, the capitalist subject puts herself/himself as the object-instrument of the Other¹, which is the market. Then, the subject, through the market, deploys the most appropriate knowledge and technology in order to produce the structure of her/his enjoyment. Indeed, the only knowledge which is allowed is what is related to capitalist production and development. Copjec (cited in Olivier, 2011, p. 29) argued that this produced a surplus of enjoyment that cannot be abided by capitalism:

the pleasure that the unconscious sets to work accumulating is a surplus pleasure which has no use for material reward or even well-being; it contributes nothing to the subject’s inclination towards survival. This less-than-useless surplus pleasure cannot, therefore, enter the calculus of capitalism except to undermine it.

In addition, Dean (2012) similarly interpreted the relations between capitalism and drive. To Dean, what is important about the mechanism of drive is the way drive provides the subject with another way to enjoy. Unable to satisfy or maintain desire, the subject enjoys in another way.

Drive is not a quest for a fantastic lost object; it’s the force loss exerts on the field of desire. Drives don’t circulate around a space that was once occupied by an ideal, impossible object. Rather, drive is the sublimation of desire as it turns back in on itself. (Dean, 2012, p. 173)

The difference between desire and drive can explain the reasons behind the rejection of possible contingency in a hegemonic ideology. In fact, we sublimate a desire for a caring society into several drives. We “renounce any project of a global social transformation, and limit ourselves to partial problems to be solved” (Butler et al., 2000, p. 101). Regarding housing policies specifically UGMP, drive mechanism stimulates actors in subjective level to enjoy from speculative activities on land and circulating around the lack of affordable housing.

5 A NEOLIBERAL PRACTICE OF UGMP LOGICS

Based on the literature review of economics, planning and political studies and also published evidence and analyses of the 2008 economic crisis, the logics of a neoliberal housing policy can be summarised as a ‘critical theory of neoliberal UGMP’.

As previously explained, the Lacanian ontological lack in symbolic orders, or what ESDA explains as “ontological incompleteness of social objectivities” (Glynos et al., 2012, p. 298), is the core of this research and is the starting point of a planning practice. The practice, which this research focuses on, is related to the lack of housing. This research considers the lack of housing as a fundamental lack because it “becomes evident in moments of dislocation” (Glynos & Howarth, 2007, p. 129), when the dominant discourse fails to supply (affordable) housing to meet the equilibrium point of the market. Under the ideology of neoliberalism, the invisible hand of the market – the general equilibrium theory of the market – as the basis of market logic is allegedly presented as the best solution for the lack of housing. Contemporary neoliberal planning systems often deploy land supply, different housing schemes and UGMPs when facing this lack.

Thus, social logics, in this research, investigate and reveal the economic, social, institutional and financial logics involved in the above-mentioned policies in the two cases. Flows of money from other market sectors to the construction and housing, higher housing demand, and new governmental and official law, orders, and land use plans are enumerated in social logics. According to the analysis, they may change during the analyses of each historical phase within its cases.

At the first phases of most practices, political logics operate primarily in an institution mode. Political logics “serve to establish and facilitate the operation of innovative social logics” (Glynos et al., 2012, p. 300). Regarding neoliberalism, it “was launched as an attack on socialism/communism, as a statecentric project”

¹ According to Žižek (Butler et al., 2000, p. 133), “the Other’ does not designate merely the explicit symbolic rules, regulations, and social interactions,” it also indicates the sets of “unwritten ‘implicit’ rules” which indeed regulate our actions.

(Davies, 2013, p. 1). The defeat of communism and the Soviet Union as the last important barrier to globalisation (Harvey, 2005) set in motion extreme free market practices in the hope of ongoing capital accumulation and infinite growth. Two logics of articulation and equivalence against socialism/communism have worked to make neoliberal reasoning possible globally. Importantly, the logic of equivalence explains how people come together spontaneously and act automatically in a homogeneous way based on shared economic interests in housing markets.

Furthermore, the logic of difference has had a great impact in making neoliberal housing schemes possible; in particular, through the division of organisations into many sectors including innovative institutions and financial sectors. Indeed, the logic of difference has been applied to institutional modes, which it pre-empts, and reserves the practice through the definition of implementations based on 'privatisation', 'individualism', and 'free market' fantasies and rhetorics (Glynos & Howarth, 2007). As explained, the numerous private and semi-private institutions that operate alongside the state are examples of the function of this political logic.

Within this research, fantasmatic logics focus mainly on the psychoanalytical aspects of the most important contradiction in capitalism – that is, the contradiction between use value and exchange value specifically in housing, which according to Harvey (2014), gave rise to the 2008 economic crisis. Based on the Lacanian concepts previously explained, such as drive, desire, these logics attempt to demystify the root cause of the fallacies and unachievable objectives.

6 TWO CASES FROM AUSTRALIA AND IRAN: ANALYSIS AND RESULTS

To apply ESDA, I divided UGMPs into different historical phases within two cases. A policy may experience many changes from the start point through an evolutionary process. The historical phases clarify how different political, fantasmatic, and social logics operate to make possible the changes in terms of the objectives and process of the policy.

Through retroductive and abductive reasoning, this theory explains the logics including visible and hidden or overlooked logics that make possible a neoliberal housing policy in the form of UGMP. This theory will be examined within two cases to reveal their similarities and differences. The research not only attempts to explain and evaluate social and political phenomena, it also commences to create an alternative approach in planning. The logic explanation intrinsically reveals both the possibility and the vulnerability of the practice. Thus, the examination of the theory in each case uncovers the logic of vulnerability – the contingencies in each case – and may open a discussion about an alternative logic for the current mechanism of each case.

A case study in Perth, Western Australia (WA) was investigated to examine the critical theory of the neoliberal UGMP as a practice of planning, which was suggested above. The theory was examined to reveal to what extent and how neoliberal logics – social, political, and fantasmatic – make possible the development of Ellenbrook. In doing so, over four phases, I investigated and provided an in-depth understanding of the existing ontological roles and functions of planning and its actors in the area in relation to the ideology of neoliberalism to achieve the first aim of this research. To analyse the Ellenbrook case study, the process of policy-making and implementation of the policy were divided into four phases: (1) a venture, (2) a rhetoric of no bust only boom, (3) economic slowdown, and (4) policy's outcomes as a re-emerging the lack. Table 1 summarises the role of the social, political, and fantasmatic logics that ontologically constructed Ellenbrook through four phases of urban growth. Therefore, based on the information, explanation, evidence and analysis, the theory of the neoliberal UGMP created in this research is totally credible for the Ellenbrook development.

Table 1 - The social, political, and fantasmatic logics of the Ellenbrook development (Bahmautemouri, 2016)

	Phase 1 (prior to 1992) A venture	Phase 2 (1992-2008) Boom time	Phase 3 2008-9 Economic slow down	Phase 4 2010-2015 Outcomes
Social logics	<ul style="list-style-type: none"> ➤ An identified lack of affordable housing ➤ Land supply ➤ UGMPs ➤ The Ellenbrook venture through ALEs and privatisations 	<ul style="list-style-type: none"> ➤ ALEs ➤ Speculative activities in property ➤ Regulatory approach to the zoning of land ➤ Design projects ➤ Media and advertising ➤ Innovative financial mechanism 	<ul style="list-style-type: none"> ➤ Innovative financial mechanism ➤ Re-emphasis of the increasing land supply as the solution to unaffordability ➤ Provision of affordable rental housing ➤ Not-for-profit housing investment providers as a new market solution 	<ul style="list-style-type: none"> ➤ Failures in achieving the initial objectives ➤ Following implementation to solve the lack of affordability: <ul style="list-style-type: none"> ○ New land release (village 8) ○ New housing research ○ New market-led system of partnership

Political logics	<ul style="list-style-type: none"> ➤ Retreat from professionals and reliance on evidence-based policies ➤ Prediction of further activities in the mining sector ➤ Population projection as a result of increasing immigration ➤ Political techno-logic as the economic impacts assessment that warned of increasing prices in 15 years ➤ Privatisations and ALEs 	<ul style="list-style-type: none"> ➤ More mining export and immigration ➤ Political-techno logic of time lag between demand and supply ➤ Neoliberal institutional logics 	<ul style="list-style-type: none"> ➤ Global economic crisis as a dislocatory event revealed the lack in the market reasoning and resulted in housing market slump, raising unaffordability and homelessness 	<ul style="list-style-type: none"> ➤ Warning from some academics about bubble and economic downturn, malfunction of the market and financial system as well as inefficiency of housing schemes and land release policies ➤ Retreating from professionals and academic
Fantasmatic logics	<ul style="list-style-type: none"> ➤ Without mining there can be no civilisation ➤ The fantasy of Australian dream e.g. the ideology of home ownership leads to a better life, security, and success ➤ With the emergence of neoliberal ideology, homeownership shifted from a social project to an economic special project as a source income and investment 	<ul style="list-style-type: none"> ➤ No bust, only boom ➤ Over-attachment to the fundamental fantasy of the free market ➤ Operation of the drive mechanism: more revenue from lots sales and more development 	<ul style="list-style-type: none"> ➤ Deployment of fantasies through media and advertising to bring money to the market ➤ Attachment to the fundamental fantasy – the free market 	<ul style="list-style-type: none"> ➤ Disavowal mechanism: attract more people into market to safely pass the crisis

A case study from Iran was examined to reveal to what extent the neoliberal logics – the social, political, and fantasmatic – made possible the development of Parand as a new urban area within the Tehran metropolitan area. Similarly, the case was divided into four phases, to provide an understanding of the ontological roles and functions of planning and its actants in the area in relation to the ideology of neoliberalism. To perform an ontological investigation of the Parand case study, the process of policy-making and implementation of the policy was divided into four phases: (1) A defined solution, (2) Economic and political liberation, (3) Political and economic crises, (4) Planning returns and the re-emerging lack. Table 2 summarises the role of the social, political, and fantasmatic logics that have ontologically signified and constructed Parand through four phases.

Table 2. The social, political, and fantasmatic logics of the Parand development (Bahmanteymouri, 2016)

	Phase 1 (Prior to 1998) A solution	Phase 2 (Late 1990s to 2005) Economic and political liberation	Phase 3 (2005-2013) Political and economic crises	Phase 4 (2013-2015) Planning returns
Social logics	<ul style="list-style-type: none"> ➤ Informal settlements problem as an identified lack of affordable housing ➤ Land supply policies ➤ <i>New Town Law</i> as an UGMP ➤ <i>Parand Development Plan</i> for middle income groups 	<ul style="list-style-type: none"> ➤ Boom time: economic growth ➤ In 2002 an amendment added to the <i>New Town Law</i>: NTDC land sale to finance compulsory services ➤ The highlighted role of PDC 	<ul style="list-style-type: none"> ➤ Dissolving the MPOI as the result of the retreat from experts and professionals and planning as a Western approach ➤ The highest oil revenue in the history of Iran ➤ The highest budget allocation for low-income housing policy ➤ Many innovative fiscal and financial policies and institutions 	<ul style="list-style-type: none"> ➤ Return to prudent planning and professionals
Political logics	<ul style="list-style-type: none"> ➤ Population projection as the result of increasing internal emigration ➤ An increase in oil revenue ➤ Equivalence logics: Interior census for getting out of the post-war recession and devastation ➤ Political-techno logic of the market equilibrium ➤ Policies based on the evidence from Western countries ➤ Imperialism 	<ul style="list-style-type: none"> ➤ Political maturity and a reformist and moderate government ➤ Political-imperialist logics: International forces in Iran and postcolonial policies in the last years of this phase 	<ul style="list-style-type: none"> ➤ Return to the anti-Western/American logics ➤ Housing policy as the engine or complementary growth policy ➤ Increasing global sanctions and isolation ➤ Postcolonial policies ➤ Retreating from economists and critical thinking especially from planning 	<ul style="list-style-type: none"> ➤ Negotiation with West, hope for people and change of President
Fantasmatic logics	<ul style="list-style-type: none"> ➤ Misrecognition of the lack ➤ Colonialism and imperialism ➤ Anti-Western and anti-American discourses (1979) resulted in retreating from planning 	<ul style="list-style-type: none"> ➤ New roles (fantasies) defined for the town in the revision plan to sell the lands and to attract residents in the area ➤ Drive mechanism 	<ul style="list-style-type: none"> ➤ HSK as a pro-poor policy ➤ Mechanism of drive and further development ➤ Fantasies to attract capital such as a reshaping Parand to a metropolitan centre 	<ul style="list-style-type: none"> ➤ New government struggles to hinder and overcome the colonial impacts

7 CONCLUSION

ESDA is a logic-based approach that has initially been applied in political studies. The method endeavours to consider hidden immeasurable political and psychoanalytical aspects of social phenomena through the three logics of the social, political, and fantasmatic.

The discernment of social logics enables us to characterise practices or regimes by setting out the rules informing the practice and the kinds of entities populating it; political logics allow us to account for their historical emergence and formation by focusing on the conflicts and contestations surrounding their constitution; and fantasmatic logics furnish us with the means to explain the way subjects are gripped or held by a practice or regime of practices (Glynos & Howarth, 2007, p. 213).

The logic approach is a more inclusive and complicated methodology that takes more aspects of a practice of planning into consideration. The method comprises different theories and concepts from different disciplines to cover political-economic and psychoanalytical aspects while it is equipped by specific tools to analyse the efficiency of the technical, mathematical metrics, as well as the linguistic paradigms that can be deployed as instruments of planning and policymaking. In this regard, this methodology was used in this research as an ontological investigation of phenomena to elucidate which logics work together to make a practice possible and how the practice may continue working despite failures and problems. To present an in-depth understanding of the ontological function of planning and its actants, I applied ESDA as a logic-based approach. ESDA, through a discussion of universalism and particularism, provided a method to place an axiom at the core of the research. The axiom accepts neoliberalism as the hegemonic/universal discourse of the planning function. Then, through retroductive reasoning, a critical theory of neoliberal planning was suggested to resolve which social, political, and fantasmatic logics make a practice of neoliberal planning possible. The theory was examined in the two different contexts of Australia and Iran to see to what extent each case is aligned with the neoliberal discourse.

Based on the critical theory of neoliberal housing policy mentioned above, Table 3 summarises the logics that make possible a practice of neoliberal planning. Overall, the outcomes of examining the theory in the two cases showed that both the Ellenbrook and Parand development have been in alignment with the theory at least at some stages.

ID 1513 | EXPLORING THE ZONING AND LAND USE MISMATCH – AN EX-POST EVALUATION OF A DETAILED PLAN IN A LAND READJUSTMENT AREA IN TAINAN

Hsiu-Tzu Betty Chang¹, Chun-Tzu Fan¹

¹National Cheng Kung University

hsiutzuchang@mail.ncku.edu.tw ; fanchuntzu@gmail.com

ABSTRACT: Over the past twenty years, planning scholars have paid more attention to evaluation research as local governments request performance measurements for future decision making, and as citizens and stakeholders request higher accountability and transparency on policy interventions. Planning evaluation can take place at three different times: ex-ante, on-going, and ex-post evaluation. The latter two receive relatively little attention in the literature due to the lack of resources, the norms of organization culture, and the limited availability of data and analytical methods. As the legitimacy of planning and its effects has been increasingly questioned in Taiwan, this study takes on the challenge of the ex-post evaluation, to evaluate the effect on plan implementation on the ground in Taiwan, using a case study of a detailed plan of a land readjustment neighborhood in Tainan City to empirically demonstrate the quantitative evidence for planning implementation. Due to the regulatory planning system in Taiwanese city

areas, this research takes a conformance-based approach on planning implementation evaluation. The mismatch of land use, built area ratio, and floor area ratio will be analyzed quantitatively for its spatial distribution, patterns of concentration, and potential social-economic factors that may be associated with the implementation. An empirical assessment of the gap between plan and outcome is the foundation to define the success or failure of the plan in its relationship to the urban development process. This study is a significant attempt to provide empirical evidence on the effect of zoning and the ability of a plan to create change in Taiwan. As New York City's Zoning Resolution reaches its first centennial, this study attempts to join the international dialogue on connecting planning theory, planning practice, and education.

KEYWORDS: zoning, land use, plan implementation, ex-post evaluation, conformance-based, Tainan

1 INTRODUCTION

Over the past twenty years, planning scholars have paid increasing attention to evaluation research as local governments request performance measurements for future decision-making, and as citizens and stakeholders request higher accountability and transparency for policy interventions. While planning scholars have been committed to identifying the links between planning theory and evaluation, developing assessment approaches and methods, and exploring the factors that lead to the failure of planning implementation, many local governments are trapped in the myth of “new plan syndrome” (Calkins, 1979), devoting resources to making new plans rather than assessing the implementation of previous plans. Many inefficient plans were made due to negligence in evaluating the success of earlier planning implementation. Putting efficiency aside, the gaps between reality and plan, as shown by the variances and the zoning activities mismatches, are important lessons for planning scholars to bridge theory and practice.

Zoning regulations in land use control were first implemented beginning almost fifty years ago in Taiwan, but the concept of Floor Area Ratio (FAR) was not implemented until the late 1990s. These zoning regulations were implemented within the detailed plan system (細部計畫) in Taiwan, and used as a tool to restrict the types and intensity of land use to reach a balance of land use and reduce the negative influences of intensive land use on nearby areas. Despite the zoning regulations, the mismatch of land use, such as industrial use in agricultural zone and mixed use in residential zones, is a common phenomenon. Such uses, which were not originally planned that way, not only showed the poor execution and management of the plan, but also the gap between planning goals and practical requirements. This is the consequence of many reckless plans that did not learn any lessons from previous plans.

The current research takes on the task of the ex-post evaluation, to evaluate the effect of plan implementation on the ground in Taiwan, using a case study of a detailed plan for a land readjustment neighborhood in Tainan City. An empirical assessment of the gap between plan and outcome is the foundation to define the success or failure of the plan, particularly in its relationship to the urban development process. This research is a significant attempt to provide empirical evidence for the effect of zoning and the ability of a plan to create change in Taiwan. As New York City's Zoning Resolution reaches its first hundred years of implementation in the United States, while Taiwan is reaching its fiftieth year, this study attempts to join the international dialogue on the reflective thinking of connecting planning theory, planning practice, and education.

2 LITERATURE REVIEW

Planning evaluation is defined as a systematic assessment of plans, planning processes, and outcomes compared with explicit standards or indicators (Laurian et al., 2010). The significance of evaluation in planning has been expressed in much of the literature. The necessity of the exercise is acknowledged despite its complexity and difficulty. Planning evaluation is believed to contribute to a better planning practice and is important for numerous reasons, including proving legitimacy, improving decision-making, and fostering continuous learning (Oliveira & Pinho, 2010; Guyadeen & Seasons, 2015). The assessment of planning evaluation can be done at three different times: ex-ante evaluation, on-going evaluation, and ex-post evaluation. The latter two have received relatively little attention in the literature due to the lack of resources, the norms of organization culture, and the limited availability of data and analytical methods. Oliveira and Pinho (2010) believed that the exploration of these two dimensions is one of the main issues for future research to focus on.

The approaches to ex-post planning evaluation can be generally assorted into two types: performance-based approach and conformance-based. Both are used to assess the success of the implementation of the plan, but with different orientations. The conformance-based approach considers whether the outcomes adhere to plan policies and objectives, which is a rational approach; the performance-based approach considers if the plan was consulted irrespective of outcomes, which is a communicative approach (Guyadeen & Seasons, 2015). These approaches are based on the different sets of assumptions about the function of plans (Laurian et al., 2010). In other words, a conformance approach is needed if a plan is meant to be implemented; otherwise, the assessment should take a performance approach if a plan aims to frame lower order plans and subsequent implementation decisions (Guyadeen and Seasons, 2015).

Owing to the scarcity of methods in evaluation, some researchers attempted to construct the evaluation structure in on-going and ex-post evaluation practices. Among various efforts, Talen (1996, 2010) in particular, had called for developing both empirical and quantitative evaluation techniques for assessing how successfully the plans were implemented, and made an effort to outline various assessment methods that delineate how one particular aspect of plans—for example, the allocation of public facilities—can be evaluated. Furthermore, Talen (2016) in her most recent empirical conformance-based research has investigated the disconnection between zoning and land use at the parcel level. Her spatial approach using GIS delineates the spatial distributions of land use and zoning mismatches, shows the existence of land use concentrations, and identifies possible factors that contribute to the disconformity.

The legitimacy of planning and its effects on the control of land use has also increasingly been questioned in Taiwan. Lai and Chen (2006) had indicated the evidence by which the zoning regulations have a decisive influence on the distribution of land use. The process of exactly how the zoning regulations impact on the changing of land use has also been discussed. Zhang (2005) tried to build a comprehensive framework of understanding the internal and external factors of the land use change. Tsai (2009) built a model of land use changing over time to explore the factors by which zoning affected that change. Some other factors that can influence the land use distribution had also been discussed in other studies. Using GIS tools, Hsu (2006) discovered some physical factors that can affect the distribution pattern within spatial autocorrelation and spatial regression analysis. Most planning evaluation has aimed at developing ex-ante evaluation systems. The potential factors that contribute to land use occurrence and land use change, as well as the analytical tools used to measure the distribution pattern of land use, have been discussed by planning researchers. However, similar to the planning evaluation literature elsewhere in the world, there is little discussion on the ex-post evaluation, judging how successfully the plan was implemented by assessing planning outcomes. Regardless, by law the land use plan needs to be updated every five years, and no scholarly research in Taiwan has paid enough attention toward assessing the plan implementation evaluation to help planning practitioners to make informed decisions. Such findings motivate the authors to take on the empirical study of disconformity between land use and zoning in Taiwan.

3 METHODOLOGY

The design of a methodology to assess planning evaluation must be clearly linked with planning evaluation theory (Oliveira & Pinho, 2010). Due to the nature of planning law in Taiwan, we took a conformance-based approach on planning implementation evaluation in order to empirically demonstrate the quantitative evidence of planning implementation. In this study, we took a similar approach as Talen (2016) to map and measure the extent of mismatched land use using descriptive statistics and spatial analytical methods. As Talen (2016) suggested, there are four overlapping dimensions of the zoning-land use disconnect that can be considered: temporal, legal, aspirational, and social-economic dimensions. By taking a land readjustment area (a type of planned neighborhood in Taiwan) as the empirical site, we exclude the consideration of the temporal dimension. That is, the disconformity of land use cannot be grandfathered in, because the developments have all happened after the plan implementation. The major consideration and discussion among the zoning-land use gap in this research will be in the legal dimension and the aspirational dimension. In legal terms, the legitimacy of the non-conforming use will be examined according to the practical regulations. For the aspirational aspect, land use goals will be criticized if the mismatch use goes against the goals of the original plan.

To address the inconsistency of land use and zoning first, we obtained three sources of spatial data: land use/land cover, zoning, and parcel data. The land cover satellite imagery and zoning map, last updated in 2012, is made available from the Urban and Rural Development Branch of Construction and Planning Agency of the Ministry of the Interior. The parcel data comes from the Department of Land Administration of the Ministry of the Interior. All the data are converted into ArcGIS in order to overlay with the parcel layer and to be analyzed at the parcel level. Site visits and field observations to document the individual land use in the study area were made between February to April 2017, to verify and update the land use/land cover data. In the following analysis, we employed spatial analysis tools to analyze the distribution pattern of land use and demonstrate the clusters of mismatched use. Basic statistic methods are used to describe the distribution of the on-the-ground land use. To further evaluate the planning outcomes, a spatial analysis tool in GIS was used to quantify the extent of the mismatch use. The original land use shapefile were converted into raster data to characterize the clusters of different types of land use by spatial analyst. Non-conforming use and the extent of clustering in specific categories of land use were identified. Some of potential factors that contribute to the phenomenon of land use/zoning mismatch will be discussed at the end of the paper.

4 EMPIRICAL ANALYSIS

We took a detailed plan of a land readjustment neighborhood in Tainan City as the empirical area to examine the implementation of the detailed land use plan of Taiwan. Huwuiliao land readjustment neighborhood was the 9th readjustment area in Tainan City, where the cadastral patterns of land have been replotted; streets, public facilities, and new subdivisions were built to make the area suitable for new development. Before the replotting and subdivision in 1984, this was an undeveloped area before the execution of the detailed plan, making it ideal to review and measure the planning implementation directly. We excluded the area of east of the highway from this study in order to focus on the mismatch in the area that was zoned for residential use.

The Huwuiliao area had several transformations in its planning history despite its current plan as a low-density residential area. It was first planned for industrial use in 1979, primarily due to its proximity to the highway. However, its undulating terrain proved unsuitable for industry development. The area was rezoned both in 1984 and 1992. With only small portion designated as a commercial zone, the area was mostly zoned for low-density residential to target the high-end single family housing market that was rare in this portion of the city. There are three types of low-density residential zones in Huwuiliao. The first type (LR-1) only allows for residential use, LR-2 allows for certain categories of retail/commercial use for neighborhood services delivery, and LR-3 allows all categories of commercial use except for industry. In the detailed plan (see Figure 1), we can see that those blocks zoned for LR-1 are located either at the inner blocks or the periphery, surrounded by LR-2 and LR-3. The land use layout reveals the intention of the plan to keep the inner parts of the neighborhood for a high-end living environment, and place non-residential activities further outside to maintain the quality of life.

Despite the current zoning categories, “zoning with development condition” has been added as an amendment to reflect the market conditions in 2012. Those blocks zoned with condition of development can be altered to another zoning category by conditions, which means that developers could obtain upzoning for those parcels. By paying a linkage fee, developers can apply for a modification of zoning; for example, making LR-2 upzoned to LR-3, or LR-3 to commercial. Owing to the flexibility of the regulation of the updated detailed plan, we now examine the zoning and land use mismatch in two aspects. One is the mismatch of usage types in legal terms, and the other is the mismatch of using categories that may conflict with the original purpose of creating a high-end residential environment.

Figure 1 -Zoning plan in the case study area Huwuliao

4.1 DISTRIBUTION OF MISMATCHED USE

To identify the mismatched use, we first used the land use/land cover set to do a preliminary examination on the scale of mismatched land use. We overlaid the land cover data with parcel dataset polygons, then converted the polygons into points to delineate the land use activities at the most detailed level. To distinguish whether the use of land conformed or not with the zoning, three boarder categories of land use were made: residential use, unused, and other use (see Figure 2). In total area of residential zones of in the land use plan is 80.5 hectare. In reality, only 49.5 hectares of land cover, which account for 61.6% of the area, are for residential used. Other 31 hectares of area are covered by non-residential use, including unused area of 17.6 hectares (take over 21.8% of lands) and other land use of 13.4 hectares (take over 16.6% of lands). Table 1 shows the counts of each type of land use activity. Not surprisingly, residential took over 82% of the development activities in the study area. The amount of other use, counted as 534 land covers, takes over 9.21 percent of the total amount of land cover. The unused category, — mostly vacant lots—comprised the rest of the land cover in the area.

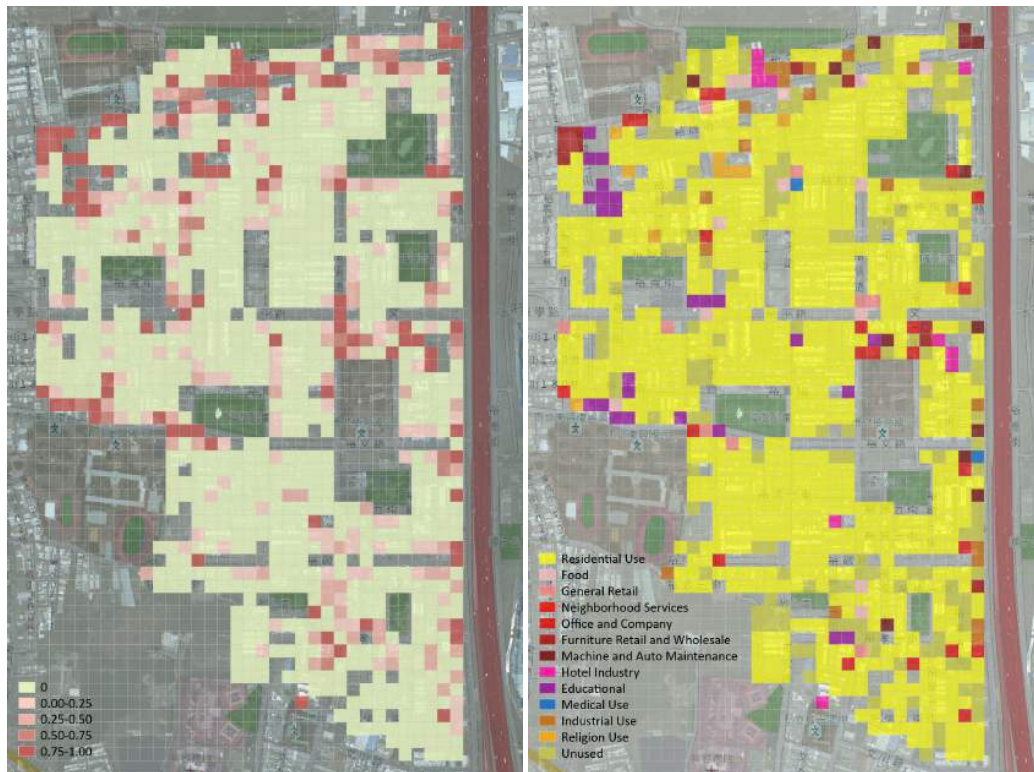

Figure 3 - Percentage of non-residential use in the land cover grid analysis (left)
 Figure 4 - Frequency of mismatched use categories in residential zones (right)

	Other Use Proportion	Number	Percentage
Conformed	0.00	762	71.02%
Not Conformed	0.00-0.25	114	10.62%
	0.25-0.50	79	7.36%
	0.50-0.75	21	1.96%
	0.75-1.00	97	9.04%
Total		1,073	-

Table 2 - Other use proportion in the grid analysis

The “other use” category can be further subdivided into different sub-categories. By examining the most frequently used in each grid, the different patterns of spatial distribution in various categories of uses appeared (see Figure 4). In Table 3, which shows the count of grids in each category of uses, we can see which kind of uses were most frequent. Comparing both the number of land use parcels and the frequency, the extent of clustering in each sub-category can be learned. Office/company and educational use are the highest concentrated in the sub-categories among “other use”. The other sub-categories, like food, general retail, and neighborhood services, have more activities by parcel analyses but lower frequency in grid analyses; this shows their relatively even distribution in the community. By contrast, those sub-categories of use with lower count in parcels but higher frequency in grid tend to be aggregated and usually are distributed towards specific locations (see Table 3).

Categories	Count		Frequency	
	Number of Parcels	Proportion	Number of Grids	Proportion
Residential Use	4,753	(81.9%)	777	(72.4%)
Unused	514	(8.9%)	162	(15.1%)
Office and Company	106	(1.8%)	22	(2.1%)
Educational	85	(1.5%)	25	(2.3%)
Food	74	(1.3%)	13	(1.2%)
General Retail	63	(1.1%)	9	(0.8%)
Industrial Use	58	(1.0%)	19	(1.8%)
Machine and Auto Maintenance	43	(0.7%)	13	(1.2%)
Furniture Retail and Wholesale	31	(0.5%)	10	(0.9%)
Religious Use	24	(0.4%)	10	(0.9%)
Neighborhood Services	22	(0.4%)	1	(0.1%)
Hotel Industry	14	(0.2%)	10	(0.9%)
Medical Use	14	(0.2%)	2	(0.2%)
Total	5,801	-	1,073	-

Table 3 - The frequency of land use category in the grid analysis

5 DISCUSSION AND CONCLUSION

In legal terms, those non-residential uses are not allowed in LR-1 zones, and no industry is allowed in any residential zones. Such non-conforming use could have happened due to the consequence of conditional development, or the lack of law enforcement. The condition of development provides developers a convenient way to upzone the original zoning to a higher density zoning. As a result, not only commercial retails and higher-density residential could be developed in LR-1 zones, but also all commerce and industry could be permitted in LR-2 and LR-3 zones. Such amendments on the conditional development in the detailed plan updates could be the result of developers' pressure, but the original purpose of making this neighborhood a high-quality, low-density environment could be altered as the result of the zoning relaxation via conditional development. Regarding the aspirational dimension, the actual development conflicts with the stated purpose of building a high-quality residential environment. Those industrial uses, as well as some others like machine and auto maintenance, seem to be legal. However, resulting pollution could be a nuisance to the quality of life in the residential environment. Yet to what extent rezoning may jeopardize the quality of life in the study area requires further study. As the urban theorist Jane Jacobs advocated, these service provisions may add to the diversity of the street life in the neighborhood. It will be critical to identify the factors behind the amendments in each detailed plan update, so that researchers and practitioners can understand the dynamics of plan implementation as it relates to the market, politics, property rights, local culture, and planning practices. In relation to Talen's (2016) research, we see similar results. The mismatched uses are spatially clustered instead of being random. In this empirical assessment, we have identified the patterns of the gap between the plan and outcomes. Our future research will continue to investigate the case study area through planning document analyses and interviews with the government officials, planners, and real estate developers. Understanding the precise reasons for the gap between the plan and the outcome is beyond the scope of this assessment, but it directs future research to understand the dialectic process between plan and social reality.

ID 1540 | ON WHAT GROUND STANDS STRATEGIC PLANNING?

Sophie Sturup¹, Nicholas Low²

¹Xi'an Jiaotong Liverpool University; ²University of Melbourne
sophie.sturup@xjtlu.edu.cn ; npl@unimelb.edu.au

ABSTRACT: We live today in a world where there is enlarged freedom for many of us to invent and reinvent who we are. This freedom, in late capitalist modernity, has also come at a cost. The freedom to invent and reinvent is grounded on an expectation that we can renegotiate the fundamental threads of what we are, and what we are known as. This freedom has spread beyond the individual to our institutions, political parties, and of course public persons. No longer is it possible to say definitively what or who someone is, nor is it possible to hold them to account for who or what they said they are or would be. Such holding to account would be tantamount to a reduction of their liberty. This paper explores what impact this lack of saying, and lack of accountability for what was said has on strategic plans. Starting from Hannah Arendt's discussion of the loss of the public realm, we explore the consequences for strategic planning of this capacity to reinvent ourselves and consider how in this pluralist and individualised world a collectively arrived at vision of the future might be grounded and survive beyond the next saying of ourselves.

KEYWORDS: Heidegger, Arendt, Ontology of planner

1 INTRODUCTION

A strategic plan for a city or metropolitan region is a spatial expression of the public will which endures over time. Albrechts' (2006: 1152) definition serves well: 'Strategic spatial planning is a transformative and integrative, (preferably) public-sector-led, socio-spatial process through which a vision, coherent actions, and means for implementation are produced that shape and frame what a place is and what it might become'. Strategic planning: the making of visions, aligning policies to planned outcomes and the taking of actions in accordance with those visions; is a critical part of the project of planning. It is where the 'will to improve' (Li, 2007) in planning is most clearly situated. But more fundamentally it is the place where

communities can imagine that they have a say over what future they produce, and the opportunity to produce it.

Despite its importance, or perhaps because of it, in many places strategic planning has become deeply politicised, with plans being changed regularly in accordance with the current political climate, the latest technological developments, and the problems of the day. An example would be in the state of Victoria, Australia where since the release of the strategic plan Melbourne 2030 in 2002, there have been two subsequent major revisions (in 2008, and 2014). Under these conditions of constant updating and change there is little possibility for the material realisation of one vision or another. Whatever stable ground strategic plans of the past found (as they appear to have in places like Copenhagen), it seems to have been lost. It would be easy to conclude that nowadays strategic plans are more about keeping the guess about what will happen accurate or up to date, and less about creating some kind of realised future. If that is true then the real purpose of strategic planning has indeed been lost.

This paper however argues that although it is true that strategic planning has in some sense lost its footing, there is a possibility to regain it. Although this loss of footing may have been driven at times by a kind of politics subscribing to neo-liberal ideology (e.g. of Hayek, 1960), it began much earlier and involves an ontological shift of a kind to which Hannah Arendt refers. ((Arendt, 1998). Arendt posits that the public realm has been replaced by a social world. In the social world, it is necessary to 'say oneself' constantly. Unlike the public realm this saying doesn't stick. There is no-one to hold one to account for what was said. Although it remains true that when what is said, and what is done are in constant alignment, we can still become known as someone, the only one we are accountable to for that appears to be ourselves.

Strategic planning is about transformation, and we argue that fundamentally the transformation is one of who a community is being. Transformation in being comes about through authentic dialogue, combined with changes to the materiality of the world, which are achieved in accordance with particular rationalities, that together embed transformed practices or ways of living (Low & Sturup, 2017). This kind of transformation requires not only authentic consultation to develop the strategic plan, but actual implementation of material changes to give the plan effect. It also requires that the material changes embed the rationalities of the strategic plan, in other words the reason for doing it needs to be delivered, not just the object. This takes time. The conversation about why something is being done needs to be maintained, with integrity, throughout the lifecycle of the thing delivered. Without the public realm it is much more difficult to maintain these conversations. We believe it is possible to create sufficient ground for this kind of transformation, but it will take a new kind of advocacy.

The next section of this paper reviews the philosophical discussions within which our thinking about this problem are placed. We begin with a discussion on the relationship between different kinds of being in Heidegger's thought and the concept of fabrication of the world in Arendt's. In this discussion we consider how these ideas inform the notion of strategic planning as transformation, and particularly how what is thus required includes fabrication of both rationalities, and their material expression in order to embed the planned future into structure of our lives. Our discussion then turns to consideration of Arendt's theory about the destruction of the fabricated world and the public realm, and its replacement with the 'social'. The following sections will consider some evidence for both the need for transformation as the basis for successful strategic planning, and evidence for the loss of the public realm. We will conclude the paper with a discussion of what this means for strategic planning.

2 DIFFERENT KINDS OF BEING AND THE FABRICATION OF THE WORLD

What something is and the way something occurs are two sides of the same coin. They happen together, if something ceases to be it cannot occur, if something doesn't occur as that something it is not that something. This is both completely obvious and entirely not obvious. We can understand the first part easily enough, but the second part goes against our idea (and indeed our experience) that we can be something different than how we apparently occur. For example we can be a 35 year old, female, neurologist, acknowledged by our peers as at top of our field, but occur for great aunt Mildred as 'the little girl that likes honey oat cookies'. The resolution to this apparent contradiction can be found in the truth that what we 'are' isn't fixed. Thus whatever we may be in our own occurring, we are also 'the little girl that likes honey oat cookies', and indeed it would not be unusual to find ourselves in the presence of great aunt

Mildred with a craving for, or indeed eating, honey oat cookies. Critically this demonstrates that being is multiple, and that does not in any way reduce the 'reality' of what something is.

Heidegger positions himself as the philosopher of the 'everyday' - one who looks at the everyday experience, from an everyday perspective, which is a phenomenological perspective (see for example Heidegger, 1962: 163-168). In his work we can observe three different types of being (relationships between what something is and how it occurs). He notices that much of what we experience and on which we confer being is fabricated for our use. To see this we only have to name the entities we encounter, houses, plans, organisations, strategies and so forth, but also all the tools we use and the objects around us, hammers, books, paper, laptops. The mode of being of these items is what Heidegger terms 'ready-to-hand' (zuhanden); they have their being as useful for us (Heidegger, 1962: 98).

Another sort of being Heidegger reserves for those objects to which we have not attributed a being for our use. Such being he terms 'present-at-hand' (vorhanden, Heidegger, 1962: 103). These present-at-hand entities, or objects, are thing-like. Entities that are ready-to-hand typically become thing-like when they are broken, as with a broken hammer which devolves to pieces of wood and metal (see Mulhall, 2013: 58). Thus it is not that some things are 'ready-to-hand' and others are 'present-at-hand' rather a particular thing may be occurring/and thus being 'ready-to-hand' at one moment but could at another moment be occurring/and thus being 'present-at hand'. Many planners will understand the truth of this, because they actively alter the occurring of things all the time. The approach of the scientific gaze renders things 'thing-like' (objects subject to objective analysis), under this gaze things occur as 'objects' and we become a thing that is observing them.

Finally, in turning to the matter of the relationship of how those that are aware of being (Dasein – the one that is there) are to others of its kind, Heidegger insists that we must not make the mistake of starting from an isolated 'I'. To characterise this relationship Heidegger introduces another term marking a mode of being, Being-with (Heidegger, 1962: 154, 157). Being-with is the kind of being we share collectively with those which occur as also creating an occurring world: our fellow Daseins. Collectively those which create an occurring world come to an agreement about that which 'is' sufficient to allow society to function. This collective, agreed 'is-ness' is the always already world, the creation of das Man (the 'they')¹. The market is perhaps now its most familiar manifestation, an occurring world in which we find ourselves dissolved, being without intent. Entities which occur as capable of being-with are provided room to present themselves 'as they are', or at least as they would occur for themselves.

In Heidegger's terms, then, the being of the world, or the is-ness of the world, is given by its occurring. Being occurs as ready-to-hand, present-at-hand, or being-with. For example something like the environment can occur as present to hand (Vorhandene) when it occurs as 'that which we are in', or as ready to hand (Zuhandene) when we search the Amazon for cancer curing plants, or able to create its own occurring world (to be-with) when an environmentalist experiences it as itself. However we are also given being by the occurring of the world. When the environment is present to hand so to are we, when it is an object of exploitation so are we, when it can create it is experienced as itself, so to are we. That is to say what occurs (the occurring of everything) is perfect correlation with the being to which it occurs. Who we are being provides a world view from which what it is logical, necessary or possible to do is derived, and with which our actions are in perfect accord. When we learn to distinguish the world in particular configurations, they are said to have 'become' something, for example a planner.

Arendt (Arendt, 1998) posits that, at least in the past, the world could be understood as fabricated by humans (the one that is there). In this discussion she is pointing to the phenomena that Heidegger observed, albeit from only one direction – the creation of the world, rather than including in the world who we are being. In her view fabrication is the act of bringing into being an object which is already envisaged, an object which is designed to hold an envisagement of the world through its existence (Arendt, 1958). Such objects include tables, institutions, and persons of historical significance. Arendt considers this fabrication critical to the human condition, because it is these fabrications which hold us apart, make us distinct, or distinctive, giving us distinctive differences. Not only giving us identity (when we fabricate

¹ In German 'man' is the neuter 'one' as in what 'one thinks' – man glaubt, but when capitalised as Man by Heidegger it usually translated as 'the they'.

ourselves) but also giving us a way to see the world which is shared, and embedded enough so we can function without having to invent everything all the time.

Taken this way, Arendt could be taken to be talking about the process through which humans in a society create shared understandings of what things are. That if we are viewing a table as ready to hand, there is a generalised understanding of what that means one can do. For example sit at it, put things on top of it, not stand on it. Alternatively if we are viewing a table as present at hand, then it is an object to be moved around, not bumped into, judged by its aesthetic value.

Like Heidegger, Arendt suggests that these generalised understandings are reached through the development of a 'conversation of the they', a thrown way of being. This they-ness to use Heidegger's term is the way everyone understands something. It is the automatic mode of being, into which all inauthentic beings can be pulled (for more on this see (Low & Sturup, 2017)), but it can be transformed if a person does the work of thinking through for themselves what being to attribute to something (and thus themselves). We are arguing that an effective strategic plan generates a way of being in the world which is held in the automatic interpretations that arise in relation to the fabricated world. It becomes part of the thrown way of being. Because in that way what there is to do is automatic. Each person doesn't have to generate the being over and over.

Importantly Arendt suggested that the fabricated world needs a ground on which to be maintained. She suggested that in the past there has been a public realm in which humans can fabricate themselves as public beings, beings which they come to be known as, and have a kind of historical longevity. This public realm is also the space in which humans come to create and maintain the distinction between one another.

3 THE LOSS OF THE PUBLIC REALM

The public realm was the place where a person could fabricate themselves in some sort of permanent way. The promise of the public realm was posterity, it provided the space whereby one could speak oneself into existence, and be held to account for that speaking. Acting and speaking in the public realm needed to be in alignment, so that the observed would be interpreted as who they were speaking themselves to be. Arendt's (1958) proposal is that the public realm has been replaced with a 'social' world. The social world is one that allows complete and ongoing creation of the self, without any prior envisaging of who we might be. It is a world which displaces any relationship between the social self and the fabricated world in which human society functions and is maintained with any longevity. As a result we obtain freedom to construct and reconstruct ourselves, but we also lose the capacity to maintain that self except in the moment of our saying it. The world no longer maintains the identity we constructed for ourselves. If we wish to maintain an identity without the effort of saying it, our only choice is to choose an acceptable label, so that we end up feeling as though we were constructed by something other than ourselves.

In losing the public realm we have lost the space that held our self-constructions beyond the moment of our speaking them. Accordingly we have also lost the space that held our social-constructions beyond the moment of our saying them. The social self is constructed, but in such a way that any accountability or authenticity for that self lies at a place so removed from us that we might as well be something external to ourselves or something that we cannot control (the other). Although some argue that the lynchpin of liberal democracy, namely the nation state and its democratic forums, which provide a means for the formation of the long term public interest remain intact (Streeck, 2014: 40), it seems increasingly the case that they are becoming empty shells, unfilled by any who is willing to speak themselves into existence, and none that would hear them even if they did.

4 EVIDENCE OF THE PROBLEM

Arendt (1958: 55) argues that the public realm has been lost. She foresaw consequences which we increasingly see appearing. 'Only the existence of a public realm and the world's subsequent transformation into a community of things which gathers men together and relates them to each other depends entirely on permanence. If the world is to contain a public space, it cannot be erected for one

been laid at a time when the public realm gave them stability, what holds them in place now? Perhaps they too are under increasing threat, remaining only because they are deeply embedded unconsciousness. Perhaps their guardians understand this at some level and thus resist subjecting them to conscious consideration. More likely in our view, there is some insight to be gained from the way that these strategic principles are manifest both in the (un)conscious use of rationalities, the types of knowledge brought to bear on them, and in the built fabric of cities.

5 DISCUSSION

Built into the definition of strategic planning is the notion of transformation, or put another way, the idea of an authentic construction of something. We have shown that it is in the fabrication of things, and their associated occurring that we construct what is and what we are. Whatever might be said today about the prescriptions of Howard (1946), Le Corbusier (1971), Geddes (1968), Jacobs (1963) and others of their times, they each spoke themselves and a new world into existence. This is the essential importance of strategic planning, it is a fabrication that reminds us of our capacity to invent the future, and indeed the world.

Our capacity to invent the world arises in being-with. When others are present this implies the need to develop a socially constructed understanding of what is there. This agreed world, is what Heidegger called 'the they', the world that we by default find ourselves in if we do not invent who we are. The thrown world is very like the 'social' world that Arendt refers to. The one in which, rather than distinguishing ourselves within, we merge into. 'absorption in "the they" means that it is dominated by the way things are publicly interpreted' (Heidegger, 1962: 264). We are always immersed in an ocean of public communication in which 'proximally and for the most part Dasein is absorbed in the "they" and is mastered by it' (Heidegger, 1962: 210). This idea approximates that of 'stories' or 'storylines' about which much has been written in the planning literature (Hajer, 1995; Sandercock, 2003). To find truth in these stories requires that we are reminded that they are stories and that we are the story teller.

But being-with is the kind of being that creates choice in how the world is constructed. Heidegger (1962: 165) suggests a possibility for authenticity, 'a clearing away of concealments and obscurities' which makes possible a self-invention. Taken together with Arendt's ideas of fabrication – the embedding of notions of what something is within the material things this suggests that strategic planning will be most effective when it combines the social construction of what is desired (perhaps through consultative planning), with appropriate constructions in our cities. As we have noted above, this fabrication needs time. Time in which the rationalities for what we are doing can become embedded in that which we create, what being it is granted and how it is then used.

We have seen that the social realm (for all the promise of freedom that it fulfils) is not very good at holding things constant. What then are our options? Can we renew the public realm or can we create a new kind of public realm that consciously holds particular 'sayings' of the world to account. There are of course good reasons to have reduced the public realm. Doing so has broken apart old conceptions of many labels (woman, man, landholder, lord, etc) and given us freedom to create our own conceptions of the groups to which we belong – indeed of what we are. But we have lost a significant level of stability in the process. Could we reinvent that stability for just some 'authentically' generated social realities? Doing so would require a new level of engagement by those who generate the plan. Not only would they be required to be consulted, but they would need to become the 'owners' of the plan, the custodians of the rationality, the logic behind what will be done. Like the one that holds the board in place while the other hammers it into place, those that agitate for something would need to hold it steady until it will stand up on its own. This would require a new set of skills, and a longevity for groups that protest.

6 CONCLUSION

In this paper we have demonstrated the occurring world is based on the three types of being; being present at hand, being ready to hand and being with. We have seen that strategic plans should be created in the plurality of beings which have the capacity to generate an occurring world. Those with whom it is possible to be with. We have seen that this being with can result in a social world, one in which it is

possible to merge and lose oneself. But we have also seen that we retain the capacity for authenticity. We can create an occurring world which aligns our experience and in which we can express some generated self. This fabrication of ourselves requires no more nor less than our willingness to speak it, and a set of people to listen to it. This can be done in a social world, indeed we are freer to do so than ever, because the social world does not hold us to account. Tomorrow we can say ourselves anew and who would gainsay us? If we are no more than who we say we are, why not change that as we would?

The public realm, the realm we have lost, is the place where what we say develops an existence of its own. In losing it we have lost the ability to fabricate a world that lasts beyond the saying of it. The institutions which used to hold the world in some sense fixed, that mediated which sayings would last and which would not, have disappeared. Nothing lasts, all is mutable, 'all that is solid melts into air' (Berman 1982). The lack of a public realm expands the complexity of planning, because the public realm is what provides the ground for a lasting collective vision. Just as we seem on the edge of solving the question of how to create a valid, pluralist vision, the ground in which such a vision could be planted and expected to grow has blown away like so much dust. The question then becomes who will hold the vision while it is fabricated into the entities occurring as present to hand, and ready to hand. Who will generate the stories of what is present to hand and what is ready to hand that will fix a certain occurring into what is fabricated? Since we have lost the institutions of nation states, and liberal democracy, we can no longer rely on the old structures of the public realm. Perhaps instead coalitions brought into existence for the purpose of creating a vision, must also take up the burden of carrying that vision, and ensuring it is embedded in an occurring world that lasts beyond one human saying.

1 INTRODUCTION

Cities are complex environments where different actors and stakeholders co-exist and learn how to live together. Within these complex environments, different types of citizens initiatives are arising that we consider to be important starting points for achieving urban transformations to sustainability (Niki Frantzeskaki et al., 2016). These kind of initiatives, typically enacted by social entrepreneurs, civic volunteers, local activists, freerange civil servants etc., are challenging the traditional ways of city making through which urban services, spaces and buildings are usually developed through policy and planning. They seem to stimulate the rise of several new types of interactions between citizens, entrepreneurs and freerange civil servants but so far are hardly facilitated and linked to urban planning in a systematic way. Such interactions can be considered as transformative social innovations (Avelino & Wittmayer, 2016) that redefine the relations and interactions between actors to realize sustainable alternatives contributing to wider transitions. These transformative initiatives can be nurtured, developed, replicated, or complemented in protected environments and are often seen as part of a broader transition movement (Gorissen, Vrancken, & Manshoven, 2016). Those transformative initiatives are triggering the rise of spaces for the interaction between different stakeholders in urban environment, which is a key element of participatory city making. This paper aims to explore the role of planning in participatory city making. It connects complexity in planning and transition theory in order to describe the space of the interaction between the different urban stakeholders.

2 TRANSITIONS IN CITY MAKING

Participation and interaction of different actors and stakeholders has always been a hot topic in planning research. The discussions about the necessity to include more actors in the planning process resulted in governance replacing government in planning discourses and practices. Following different paradigms emerged; such as traditional public administration, new public management and networked governance (Hartley, 2005). Consequently, new approaches were developed, i.e. the inclusion of private actors in different types of collaboration and partnerships in "making" the urban realm or in providing urban public services (R.C. Holland, 1984). Emphasis arose on the emerging role of citizens and communities in city making, this spread during the XXI century (Majumdar, 2008; Zhang & Kumaraswamy, 2011). What these diverse approaches have in common, is the willingness to open-up the decision making process to different stakeholders. While these approaches are developed in practice, also the academic discourse is repositioning the role of planning, highlighting how they moved from a technocratic practice to a communicative practice where planning is intended to enhance reaching consensus in decision making processes. Different modes of planning emerged from theories about urban and regional regimes (Hamilton, 2004), discursive and collaborative governance (Forester, 1989; Healey, 2007), relational geographies (Massey, 2005), agonism and institutional ambiguity (Bäcklund & Mäntysalo, 2010), and theories of spatial complexity (Portugali, Benenson, & Omer, 1994).

In the last years, there is a growing interest among planners to address complexity and its ongoing fluidity, openness, non-linearity and unpredictable development, considering this to be more in line with the reality of cities' development (Boelens & Roo, 2014; Roo & Boelens, 2014). Here, planners are questioning about

the role of their discipline within processes in which the system well as the sub-systems that acts in parallel, is co-created by a variety of actors (Boonstra & Boelens, 2011; Byrne, 1998; Urry, 2003).

Such discourse is grounded in complexity theory, which in turn has its roots in general system theory (Von Bertalanffy, 1968). Complexity theory arose during the 90s (Holland 1995; Kauffman 1993, 1995), focusing on how systems co-evolve. It focuses on complex systems that are open, interact with their environment and constantly evolve and unfold over time (J. H. Holland, 1995; Holling, 1987; Kauffman, 1995; Prigogine & Stengers, 1984). As highlighted by Rotmans and Loorbach (2009), the literature within the main category of complex systems identifies the special cases of complex adaptive systems: "These are systems that have the capacity to change and learn from experience. They are able to respond to and adjust themselves to changes in their environment. What makes a complex adaptive system special is the set of constantly adapting nonlinear relationships. Complex adaptive systems contain special objects - agents - that interact with each other and adapt themselves to other agents and changing conditions" (Rotmans and Loorbach, 2009 p.186).

Complex adaptive systems are indeed described through unique elements, such as co-evolution (Mitleton-Kelly, 2003), emergence (Goldstein, 1999) and self-organization (Bak, 1999; Prigogine & Stengers, 1984). Next to planning theory, transition research is another field that discusses the co-evolving dynamics in complex systems. It is an interdisciplinary field that takes complex systems theory as a starting point. Transition theory attempts to better understand the behavior of complex systems that run through cycles of relatively long periods of equilibrium, order, and stability interspersed with short periods of instability and chaos. Transitions are described as societal changes that involve a variety of actors (Geels, 2011), consisting of different patterns (De Haan & Rotmans, 2011; Geels & Schot, 2007), various phases (Grin, Rotmans, & Schot, 2010) and high levels of co-evolution, complexity, and uncertainty (Geels & Schot, 2010; Rotmans & Loorbach, 2009). One of the main analytical frameworks on transitions is the Multi-Level Perspective (MLP). It describes three levels of structuration and stability: niche, regime and landscape. The regime concept has been described as a set of rules and practices carried by different social groups (Geels, 2002). The niche concept refers to spaces for innovations. The landscape concept is seen as an exogenous, wider context. Transitions are understood as "outcomes of alignments between developments at multiple levels" (Geels & Schot, 2007, p.399). Geels and Schot also highlighted how alignments are always enacted by social groups, and it is through their activities that different levels of structuration (i.e. niche, regime) are continuously reproduced (Wittmayer, Avelino, Steenbergen, & Loorbach, 2016). The regime is said to "orient and coordinate the activities of the social groups that reproduce the various elements of socio-technical systems" (Geels, 2011; p. 27). In a transition perspective, cities are complex systems where the actions and interactions of different stakeholders generate structural changes. These changes are the results of both top-down activities and bottom-up emergent actions that generate self-organised adaptations of the system that are not necessarily under people's direct control (Cozzolino, 2015), but influenced by the dynamics happening between actors and agency in city making.

Those adaptations of the system take place at the urban level in a space where a variety of actors interact, here different transformative initiatives can be referred to as niches within a dominant regime because of the strong transformative power that they have. This space is defined as the space of interaction in transitions. A specific focus on actors and agency dynamics in transitions has been developed in the field of the governance of transitions (N. Frantzeskaki, Loorbach, & Meadowcroft, 2012; Grin et al., 2010). Different approaches have been described and developed in this field with transition management as an important one. Transition management has been described as the "attempt to influence the societal system into a more sustainable direction" by exploring future options through "searching, learning and experimenting" (Rotmans & Loorbach, 2010, pp. 108–109). Transition management is based on five guidelines that are partly descriptive, in the sense of basic principles, and partly prescriptive, in terms of rules for management (see Rotmans & Loorbach, 2009) for targeted interventions in complex systems, as cities, to influence the speed and direction of emerging transition dynamics towards more sustainable futures. The past few years a growing literature has emerged specifically addressing urban sustainability transitions and a particular form of transitions in which cities are simultaneously the places of experiments and niches for broader societal transitions as well as subjects of transitions themselves (Niki Frantzeskaki et al., 2016). This perspective leads to new approaches to urban transition management as a multi-actor process of experimentally developing new and sustainable urban regimes (Loorbach et al 2016). This approach implies new roles and tools for policy-makers and planners to work in a more organic, emergent yet selective and long-term focused way.

3 THE SPACE OF INTERACTION

During the last years, in the time of the implementation of austerity policies, in many cities different types of transformative initiatives are arising. Even though such initiatives have different natures (i.e. top-down, bottom-up) statuses (i.e. formal, informal, etc.), purposes and aims (i.e. business oriented, and current existing regime). They are creating new visions and actions, they attract attention and foster the rise of new type of coalitions between the urban stakeholders (public administration, citizens, third sector, private entrepreneurs). As highlighted in the previous paragraph, the groups of stakeholders acting in urban contexts are diverse. Generally, four type of actors are identified, the public and the private sector, the citizens' initiatives and the third sector. This paper takes special interest in the relationship between two of these groups: the public and the citizens' initiatives, which can be organised in different types of groups (i.e. associations, NGOs, informal groups, etc.). The reason for this special interest in these two stakeholders is that in an urban context the public sector is obviously playing a crucial role and, on the other hand, the term citizens allows for the inclusion of a broad range of types of stakeholders.

The emergence of the new coalitions highlighted before give rise to the space of the interaction between the different stakeholders; where the diverse sub-systems can find the opportunity to emerge, co-evolve and self-organise. The possible collaboration (or participation) between these different city makers is explored according to the description of the space of the interaction as represented in Figure 1. Such spaces are learning environments that can force an adaptation of the existing contextual conditions. We define the space of interaction of participatory city making by means of four quadrants, represented by two axes: (1) the citizen-government axis; and (2) the axis of the internal and the external way of working of the two groups of stakeholders.

In the space of interaction (Figure 1) the outside of the four coloured quadrants represents the boundaries of the existing regime, where the mainstream sub-cultures and rules are grounded. Within each of the quadrants, new transformative initiative can develop or arise as niches, represented in the figure by the black dots in the white circle. These niches are challenging the usual way of working of the system and they introduce new ways of working to the regime. They pressure the existing regime to change its ways of working but at the same time they receive pressure from the regime. Sometimes niches arise from the external way of interacting with other stakeholders, other times they develop within a specific organisation or social group. In transitions, while niches develop, scale and spread, they replace the existing regime. The interaction between these niches and the regime, both on the government and citizen side, internally and externally, is what constructs the 'space of interaction'. The interaction sometimes arise between groups of stakeholders as a whole, other times they are triggered and forced by specific actors within the existing groups. The latter are actors, often represented by free-range civil servants or by specific active

citizens, that are trying to facilitate the rise of experimental environments. They battle the cultural and practical resistance existing both in the way of working of the public administration and that of the citizen initiatives.

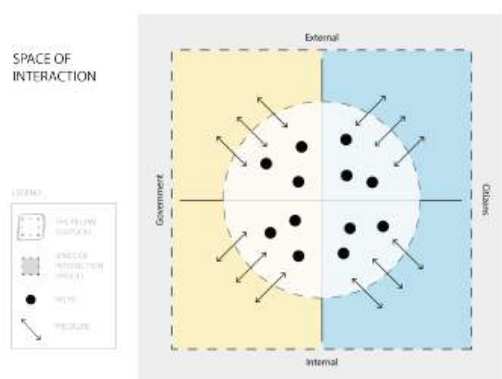

Figure 1 – Niches development within the space of interaction of Participatory City Making

Almost everything that it has been written about Neoliberalism in planning theory is on the negative side, despite few voices outside of the box that have tried to shift the attention on other issues (Stefano Moroni, 2016). Neoliberalism has been addressed as the cause of the shift of the border between public and private spaces, tending to expand consumer space and narrow citizens' space (Roivainen, 2002). The figure above highlights how the picture is much more complicated, as already Mäntysalo started to explore (Mäntysalo, 2016). Indeed, the consumers space do not correspond only to the citizens' space, but to the regime space, that can be found on both government and citizens side. The consumer space is shaped by those actors that are resisting to the changes that the transformative initiatives are trying to make. However, the citizens' space can be found where the niches are arising. Citizens and government become producer of services, while acting and experimenting new practices (Puerari, 2016). While experimenting

with transformative initiatives, they conquer space where they can interact with government and making pressure to the current regime.

In a transition management perspective, the interaction between the different urban stakeholders that are collaborating to make such transformative initiatives work, is a starting point for governance interventions. Through transition arenas (Loorbach, 2007) or urban transition labs (Neuens, Frantzeskaki, Gorissen, & Loorbach, 2013) actors representing such initiatives are brought together with entrepreneurial policymakers and other societal actors to develop shared strategies, visions and plans. But more often than that, societal initiatives are experimenting with new practices often acting with reference to the dominant cultural, practical and normative conditions, but not necessarily in conformity with them (see the concept of *nomotopism* in: Chiodelli & Moroni, 2014; Conte, 2000) or in a structured way seeking to contribute to a long term systemic change. Besides targeted governance interventions aimed at guiding and accelerating transitions, we thus argue that there is a much broader dynamic of unstructured interactions between citizen initiatives and policy that could offer a basis for contributing to desired sustainability transitions. To explore this potential and possibly increase its contribution to wider societal changes, we seek to better understand why and how such initiatives emerge and subsequently interact with policy to move forward.

4 DISCUSSION

The fields of complexity in planning and transition management form the basis to conceptualise the space of interaction as represented in Figure 1. In this article the values of combining the two fields have been presented for two stakeholders' perspectives: government and citizens' initiatives. There are three main notions that come forward from the combination of the two fields for the two stakeholders that are discussed below.

The first notion is that there is a shift from the focus on the dichotomy between government and citizen initiative towards a focus on niches and regimes irrespective of their traditional function of citizen or government. This shift from public administration versus the public towards the niches versus regime has been represented in the figure by a shift from a horizontal dichotomy towards an omnidirectional one. This shows the value of the combination of transition management and planning because it provides a different lens for looking at the different stakeholders or possible partners to involve.

This also brings forward the second notion, namely the consequence for participatory approaches between different stakeholders as also advocated by complexity theory in planning. It suggests that there is a need for approaches that recognize this second dichotomy and that are able to include both niche and regime actors from both citizen initiatives and government. Approaches that are able to bridge the gap between niche and regime, rather than government and citizen initiative; or, leastwise approaches that acknowledge the differences within each 'traditional' group of stakeholders.

This relates directly to the third notion: the three potential directions towards more participatory approaches in the space of interaction of city making. One can think of approaches that enable the niches to increase their pressure on the regime, to increase their influence and expand their reach. On the other hand, one can also think of approaches that lower the pressure of the regime on the niches, ones that give more space to niches and liberty to develop. The last potential direction for more participatory methods would be the one that is most in line with participatory thinking (Björgvinsson, Ehn, & Hillgren, 2010) and would be based on exchange. These approaches would foster the exchange and bridge or even diffuse the borders between niches and regime.

In this way does the conceptualisation of the space of interaction open up our understanding of multi-actor governance and introduces a more nuanced understanding of how government and society interact. It does however not explicitly address the types of interaction that would be most suitable to empower (or disempower) related to achieving specific urban goals. Taking a transition management approach for example would imply starting from a normative agenda containing long-term sustainability goals (such as achieving a shift to renewable energy, changing urban mobility systems or decentralizing specific social services) and then strengthening initiatives that contribute to such goals. However, as transitions imply structural changes and power shifts, this approach is also political: it implies institutional changes that not necessarily are desired by incumbent actors or structures. The space of interaction in this way also

represents that more informal waysthrough which ultimately existing policies and institutions might be disrupted and transformed.

5 CONCLUSIONS AND FUTURE RESEARCH

The notions listed above provide a new perspective to reflect upon potential roles of planners in facilitating, empowering and guiding transformative social innovation in cities. We here formulate three considerations but emphasize that these are not yet translated into practical tools or methods. But we do argue that our perspective necessitates a more fundamental reflection upon the roles and attitudes of planners, shifting from coordinators or semi-controlled planning processes producing policies and projects towards identifying potential societal challenges and emerging alternatives that can be synthesized, strengthened and empowered to more effectively contribute to desired urban transitions.

The first consideration descends directly from the first notion. Indeed, planners, in order to create and design places for dignity, should go beyond a dichotomy between public and the private space of citizens, embracing the fact that niches and regime are part of both groups. The lens described in this paper allow to think differently about what the space for citizens' action and influence is. The perspective changes: niches of new coalitions and initiatives can be found on both the government and the citizens side.

Hence, the second consideration is that the space of passive consumerism can be found on both sides. Stakeholders acting in conformity the dominant cultures and practices, resting to innovation and changes, are spread around the two groups of stakeholders. Planning should acknowledge this difference and approach the issue in alternative ways.

This leads to the third consideration, namely the necessity for planning to enable the emergence, self-organization and co-evolution of the system. Although, within complex systems, it is impossible to predict and to guide the emergent nature of cities with perfect solutions, planning should be able to generate the condition in which the stakeholders can act and interact producing new coalitions and niches within the system. As intentional action, planning gives rise to variations in the systems that remains unpredictable, its intervention can foster the emergence of certain conditions, through which an adaptable complex systems is better suited to deal with (S. Moroni, 2015).

Further research and action is required, however, in order to identify how planning can contribute to create the condition for the self-organisation, and adaptation of the system to arise. The next envisioned step will be the analysis of the transition dynamics happening within a specific city in order to first identify the barriers and mechanisms that are shaping the space of the interaction between the stakeholders in a specific case studies. Interviews with different actors and urban stakeholders will be carried out, as well as co-creative events that will be useful to understand existing problems and dynamics. Then, a further step will be taken in order to overcome the identified barriers through participatory design methods (Björgvinsson, Ehn, & Hillgren, 2012), aimed to experiment what could be the conditions that could foster the emergence of the conditions mentioned above.

ACKNOWLEDGEMENTS

This work is part of the research programme Research through Design with project number 14604, which is (partly) financed by the Netherlands Organisation for Scientific Research (NWO) and Taskforce for Applied Research SIA. The partners of the project are Delft University of Technology (TU Delft), Dutch Research Institute for Transition (DRIFT), Hogeschool Rotterdam, Gemeente Rotterdam.

1 EVERYDAY LIFE RESEARCH, UNSETTLED ROUTINES, AND PLANNING

Lefebvre's books on the 'Production of Space', 'The Right to the City' and the 'Urban Revolution' have been widely discussed in planning theory, and are constantly referred to in (scholarly-activist) planning practice, e.g. in the urban protests against massive gentrification and in recent solidary struggles against postpolitical regimes heralding austerity policies. However, Lefebvre's (2014) century-long oeuvre on the 'Critique of Everyday Life' spanning from (1) his analysis and observations of rising fascism in the 1920s/1930s; (2) the post-WWII urban modernization and the 'internal colonization' of everyday life routines in France and Europe in the 1940s/1950s; and (3) the advent of paradigmatic shifts between production and consumption in the city in the 1960s/1970s towards the era of global urbanization; has received few attention in the realm of urban studies, and even less so in planning. This is remarkable, as this three-volume work conveys several insights on un- and resettlement of urban routines useful to understand present changes mediated through everyday life in contemporary cities.

In a context of a felt unsettling of urban and national routines, particularly marked by the years 2011 and 2016, this paper pays tribute to Lefebvre's complex spatial understanding of the critique of everyday life as an analytical perspective to detect, identify and qualitatively understand changes on the micro-, meso- and macro-levels of society. Then, focus will be set on the time span since the early 1980s to highlight contributions from social, political and cultural theory that have engaged with a more contemporary (spatial) critique of everyday life. These shifts in theorizing the city are connected to the contemporary critique of the earlier generation of post-positivist planning accounts and pave the way to (loosely) start thinking about conceptualizing a more recent generation of planning theories much more interested in affective, agonistic, performative, insurgent, relational and counter planning approaches, and thus, in the nitty-gritty political, cultural and social nuances of an updated spatial critique of everyday life.

2 THE CRITIQUE OF EVERYDAY LIFE

One of global capitalism's most powerful modes of expansion is urbanization (Lefebvre, 2003(1970)), implying an understanding of cities and urban space as key sites that catalyse growth, competition and individual freedom (Molotch, 1976). It is the ambivalent nature of processes of urbanization, and the uneven interplay between nation states and cities, that make the city a key field to understand, analyse and interpret different formants of capitalism, its inherent contestations, pitfalls and collapse (Schmid, 2005). Cracks, fractures, ruptures and the perpetuated crises at the heart of the current flexible capitalism get first visible in cities, mediated through processes of urbanization, yet contested through acts of urban resistance (Lehtovuori, 2010; Mayer, 2013).

While developing and following academic training schemes that would often deal with abstract space, the spatial arts have tended to neglect an understanding of the city as lived space (Tornaghi and Knierbein, 2015). Lived space is a contested and yet hopeful space characterized as much by affect, experience and sets of values, as by rational decisions and interest based struggles. But what exactly is this everyday life about, and how does it spatially manifest? How can the city as lived space be connected to a study of changing everyday life patterns? What can planners learn from scrutinizing everyday life? Lived spaces in the city are those places, where everyday life routines unfold and where new patterns and ways of living gain momentum. The minutiae of everyday life, however, are understood as a messy field, as there are everyday conflicts (e.g. exclusion, segregation and discrimination). Empirically speaking, spatial patterns of everyday routines become fundamentally unsettled (e.g. through everyday contestations) even before paradigmatic socio-political shifts gain momentum, when emancipatory movements grow and political mobilization starts to unfold out of unbearable everyday life conditions (Goonewardena et al., 2008).

Schmid (2005, p. 10f.) locates the emergence of critical urban studies with the rise of the crisis of the city in the 1960s which signified a loss of everyday qualities of life caused by massive Fordist urban expansion schemes (based on street infrastructure construction and related suburbanization as a spatial model to sustain the dominant expansion of car producing industries). Lefebvre has detected this crisis somewhat earlier, by studying the emerging industrialization-urbanization of France before and after the Second World War, where cities were organized as a type of 'new colonies', with those colonized living a commodified life in the banlieue, and those colonizing occupying cities' social and material centralities.

The city and the urban thus can be analysed as a palimpsest of constant crises of capitalism and of diverse attempts to overcome these crises through collective forms of self-organization. This new type of urban crises peaked at a moment when the impacts of capitalism's changing strategies were increasingly felt in everyday life, culminating in the wide social mobilization and urban resistance movements of the late 1960s, and the related global movement of the New Left. Some critics argue that the global social movements of 2011, the "year of dreaming dangerously" (Žižek, 2012), can be interpreted in a similar way, as now neoliberalization's impacts on contemporary everyday life routines had become unbearable in the direct aftermath of the global financial crisis of 2008 (Kaika and Karaliotas, 2017). The seismic precursors of these types of general paradigmatic shifts and civic upheavals (as in 1968, 2011) can be detected through a constant empirical monitoring of changing patterns of urban lived space, and often happen with a relevant delay after the introduction of new modes of urban restructuring (e.g. in France after the Marshall plan restructuring in 1950s/60s; worldwide after the introduction of neoliberal ways of urban policy making in the 1970s/80s).

An important point here is to stress that these types of more paradigmatic 'urban crises' rather mark an understanding of the urban as (1) a social, political and cultural culmination point of crises at different scales and in different fields and as (2) crisis machine in which modes of de- and reterritorialization are ventured as constantly changing, adapted, invented or renewed modes of (flexible) capitalism's accumulation strategies inscribed into spaces, societies, ecologies and cultures through an effort of seizing, capturing and high-jacking the meaningful patterns and practices of everyday life, and as (3) a catalyst for social self-organization to overcome the constant pitfalls, aporia and fragmentations inherent in flexible capitalism, taking forms of response, resistance, struggle, detour, and counter cultures in the city.

Following changing urban patterns, phenomena and practices through the lens of everydayness thus is a key entry point not just to understand urban life, but also to retrace how we gain knowledge about urban change and transitions, and how the social urban world is constituted: "Everyday life may be familiar to us, but this does not mean that it is understood. Analysing the everyday may bring out the extraordinary in the ordinary (...)" (Elden, 2004, p. 111).

2.1 LEFEBVRE'S CENTURY-LONG OEUVRE (UNTIL 1991)

The lived urban spaces of the city are key lenses to develop such a dynamic understanding, as here the socio-material impact of structural changes, but also the acts of resistance and of new paths of action get visible. However, some linguistic nuances need to be acknowledged, as Lefebvre (1988, p. 78) has delineated: "The word everyday [quotidien] designates the entry of daily life [vie quotidienne] into modernity (...) the concept of 'everydayness' [quotidienneté] stresses the homogeneous, the repetitive, the fragmentary in everyday life". Shields works with Lefebvre's distinction and explains that there is a notion of the banal, trivial and repetitive quality of social life under capitalism in which "these terms were ... used to refer to the uncatalogued, habitual and routine nature of day-to-day living rather than used critically to refer to the alienated, dry "everydayness" of daily life" (Shields, 1999, p. 66). In the lived spaces of the city, everyday life (now reinterpreted as a theoretical tool of critique as it bears the dialectic of the ordinary and the alienated) inscribes itself into the material arrangements of the urban fabric. Any attempt to intervene into the urban fabric (e.g. through planning, design), vice versa, means to unsettle urban everyday routines and practices, and thus, everyday life. Through spatial interventions proponents of the spatial arts may shape new chances and opportunities and an enhanced quality of life; yet their spatial interventions may also tend to contribute to accelerating processes of spatial alienation, for instance through paving spatial strategies for gentrification, displacement and dispossession. This way, on the contrary, quality of life is further diminished for those who have fewer resources (money, power, voice, networks, etc.) at their disposal. This way, planners may sharpen the social divide, by contributing to the uneven development

inherent in capitalist urbanization patterns. Smith's (2010 (1984)), uneven development has been an important concept as regards, as it is based on a conception of deep space which refers to "(...) the space of everyday life in all its scales from the global to the local and the architectural, in which (...) different layers of life and social landscape are sedimented onto and into each other. Deep space is quintessentially social space: it is physical extent fused through with social intent" (ibid., p. 214). Any study of everyday life draws near to acknowledging the uneven distribution of access and resources to pursue a decent everyday life that is visible not just with regard to uneven development between global North and South, between European North and South, between nation's major cities and their hinterlands, but first and foremost – as Lefebvre has it – between the urban centre and a city's periphery, a process of urbanization that Lefebvre referred to as the internal colonization.

As follows, main arguments that have characterized the scientific reflection of everyday life in relation to uneven development of urban space, will be gathered. Limits of such an endeavour issue a doubt on "the uniqueness of urban milieu for studying everyday life", as this has been "sociologically challenged" (Kalekin-Fishman, 2013, p. 721) e.g. by everyday life studies in rural areas. While acknowledging that everyday life and lived spaces are not limited to the study of the city, this research focuses on urbanization as 'thick' empirical source of possibilities to study deep space and to engage with everyday life (as both an investigation of the ordinary and of alienation). Yet the spatiality of everyday life has often only been randomly treated as a problematique in urban studies and planning theory accounts, in order to understand the everyday life not as it appears (on the surface, as visual reality), but in a more 'geological' way of approaching social theory. Everyday life forms the social magma that is both producing material surfaces and their slow, but continuous change, and from time to time, visible material and embodied eruptive moments (and rapidly changing urban landscapes) of social transformation.

Lefebvre has not developed a philosophy of everyday life, but a social theory of the critique of everyday life, by promoting a critical spatial understanding of the changing social world under capitalism. The early parts of his overall oeuvre focused on everyday life, a thread that would run through all different aspects of his work, sometimes implicitly, sometimes more explicitly. Lefebvre's oeuvre on everyday life was initiated in the 1920s/1930s when he started to prepare the first out of three volumes of "Critique of Everyday Life" 1946, to be followed by vol. II (1961) and vol. III (1981) (Lefebvre, 2014). While France entered a phase of rapid modernization after the Second World War, "Lefebvre progressively recoded his initial concept of 'everyday life' into a range of spatial and urban categories" (Ross, 1995, p. 150, cited by Shields, 1999, p. 39).

In the post-Second World War phase, it was seemingly accompanied by Lefebvre's utopian vision that (French) society would reconstruct a better (socialist) future (overcoming pitfalls of capitalist organization), whereas his later works concentrated on the analysis why and how capitalism was able to survive. At that point, Lefebvre did not go along with Marx' understanding that capitalism would die any more, rather the opposite: Following Rosa Luxemburg's early enquiry of why and how the capitalist mode of production was able to continue, Lefebvre (1988, p. 80) attempted "to answer not only how capitalism survives, but also how it is able to grow: (...) it could integrate an industry. It integrated agriculture, it integrated the ... city, it integrated space; and it produced what I call *la vie quotidienne*".

With the increasing urbanization of ways of living, "a realm that is essential to everybody but becomes increasingly deficient for its users as social space is integrated ever more directly into processes of capital valorization" (Ronneberger, 2008, p. 135). These findings marked a key shift in Marxist approaches to understand space and the city: "Whereas the economic had long played an overarching role under capitalism, the everyday was now acquiring the same significance" (ibid.), thus opening critical spatial inquiry to a range of disciplinary and cross-disciplinary endeavours ever since. Soja states that "what Lefebvre was doing was substituting everyday life for the workplace as the primary locus of exploitation, domination and struggle; and redefining social transformation and revolution as intrinsically more socio-cultural (and less economic)" (ibid., 1996, p. 41). He "envisioned the emergence of a new revolutionary subject that would revolt not only against the exploitation of labour-power, but against the destruction of its entire living environment", states Ronneberger (2008, p. 135). In this sense, "urban struggle, not class struggle" became "the motor of history, urban praxis and not industrial praxis, the new local of revolt" (Merrifield, 2002, p. 117). By the late 1980s and shortly before his death, Lefebvre adds another level of interpretation as "it is at this moment that technical revolution substitutes itself for social and political revolution, while capitalism seizes the ground that had escaped it in large part until then: everyday life"

(Lefebvre, 1988, p. 79), thus shedding light on the emergence of the dominance of technocratic thought over social and political concerns.

2.2 CRITIQUE OF EVERYDAY LIFE (AFTER 1991)

While Lefebvre's project remains one of the most important "diagnosis of modern everyday life and a reclamation of its critical potential" (Highmore 2002, p. 225), many traces in his work have been referenced and used by feminists, post-colonialists, art historians, aesthetic theorists, architects, human geographers, urban planners, urban activists over the last couple of decades (Shields, 1999). During the late 1980s and 1990s, however, research on everyday life started to fade. Yet, in the new millennium, publications such as "The Everyday Life Reader" (Highmore, 2002), "Philosophizing Everyday Life" (Roberts, 2006), "Space, Difference, Everyday Life" (Goonewardena et al., 2008), the "Sociology of Everyday life" (Kalekin-Fisherman, 2013) and the first one-volume edition of Lefebvre's threefold critique of everyday life (ibid. 2014) mark a renewed attention for de-everydaying the familiar, and connecting it to space. Highmore's (2002) work offers a potential to bridge the emerging gap of understanding and theorizing the everyday that Lefebvre's death in 1991 has left. Another vanguard contribution that actively revisits the notion of the everyday by launching a critique of the modernist and Western version of social theory based on big collective organization and grand-scheme revolution is Bayat's (2010, p. 11) work "Life As Politics: How Ordinary People Change the Middle East". His considerations raise a fundamental critique to the Western concept of 'public space' (as a modernist institution to which only a few have institutional access), while his intellectual focus remains on the spatial praxis and lived spaces of ordinary people.

2.3 TOWARDS A CONTEMPORARY CRITIQUE OF EVERYDAY LIFE

The most ambitious part of everyday life research is to overcome attempts of banalization which state that everyday life is all and nothing. Highmore (2002, p. 4) emphasizes that "the problem with the everyday is that its contours might be so vague as to encompass almost anything (or certain aspects of everything)", and continues to shed light on this challenge: "taken as an amorphous whole, work on everyday life might suggest that any fixing (especially in time and space) of the everyday is going to hamper discussion and perhaps limit the productivity of enquiry" (ibid., p. 37). To set up and offer a dynamic frame for situating scientific attention back on everyday life studies in the spatial arts, as follows, six aspects of everyday life enquiry have been synthesized to allow for a more in-depth understanding of contemporary global urbanization processes under capitalism, and its implications for planning: (A) Everyday life's uncanny character; (B) Everyday life as colonization, (C) Feminist perspectives on space beyond domination/marginalization, (D) Post-colonial everyday life research (E) Urban resistance as 'quiet encroachment of the ordinary' and (F) Everyday life as spatial praxis and social action.

(A) Everyday life's uncanny character: Lived space analysis involves an understanding of "the everyday as a problematic, a contested and opaque terrain, where meanings are not to be found ready-made" (Highmore, 2002, p. 1). A wider conception would start from an understanding of the ambiguous, ambivalent and antagonistic character of everyday social relations and their spatial manifestations, because "the everyday does not supply happy endings or even happy beginnings" (ibid., p. 8). This points to the messy minutiae of everydayness: ordinary urban life bears certain uncanny and scary features that prevent any delving in romantic ideas of the ordinary as a field of urban enquiry. In "attempting to reveal the unconscious or nonapparent structures of everyday life" deep aspects can be uncovered "that are relentlessly gothic in their dimensions" (ibid.): For Freud it is the almost inevitable tragedy of loss, forbidden love and death anxiety, which lurks bubbling under the everyday. For Marx, everyday capitalism is a catastrophic engine devouring material and human resources and structured across class antagonisms" (cf. ibid.).

(B) Everyday life as colonization: A study of new forms of colonialisms can be facilitated through the study of fetish and colonial relations in everyday practice and objects. Another aspect strongly related to understanding everyday life as a fetishized form of how capitalism was able to spatially grow and expand, is to link everyday life research to a spatial investigation of power relations. Effective power relations occupy the terrains of everyday life, resulting in the finding that "ideologies reside in precisely those places where they are not perceived to be (or perceived at all)" (Highmore, 2002, p. 7), for instance, in the ordinary act of shopping groceries. Lefebvre considers the relation between power and the ordinary

not just at different scales, but with emphasis on their mutual entanglements. In this sense, the study of spatial patterns of urban everyday life is a useful resource to potentially identify structural aspects through (1) the study of fetishized forms of domination visible in public and private ways of living (e.g. as commodification of public space; or as regards the introduction of new products that transform everyday life, e.g. smart phones); (2) analysing practices of colonization that materially sediment as contested spatial relations between (social, physical, geographical, cultural, political) peripheries and centres; (3) an enquiry into power relations which structure urbanization processes and urban development policies, while studying those spatial contestations which bear the capacity to transgress (e.g. action-based) practices of resistance towards continuous achievements of emancipation.

(C) Feminist Perspectives on Space Beyond Domination: Feminist spatial debates have encouraged a wider activation of urban research perspectives in a threefold way: (1) to recognize, relocate and re-centre spaces and groups at the margin as agents for resistance and radical change; (2) to develop new subject-object relations as regards how researchers study urban everyday life thus articulating the social relations between researchers, and between researchers and those researched; and (3) to emphasize the role of the body in the production of space, thus linking to cognate emphasis on non-representational theory, performativity, passions, and embodied space. Yet it needs to be acknowledged, that in the study of social difference in the city, “everyday life can both hide and make vivid a range of social differences” (Highmore, 2002, p. 2).

(D) Post-Colonial Everyday Life Research: Particularly post-colonial accounts rooted in cultural studies have added more dimensions to a renewed critique of everyday life: (1) the dialectics of difference and commonality as an inseparable relation in lived space (Highmore 2002); (2) the radical change of positionality to choose marginality as a position to start research from (Soja 1996) and (3) the chronopolitical focus on ‘the art of practicing the now’ (Thrift, 2008). Present forms of emancipation and empowerment are performed by those social movements studied by activist-scholars interested in how everyday life patterns become unsettled and resettled in historical moments. These may relate to the emerging moments in which a European-centric model of exclusive urban modernity is deconstructed through a post-colonial critique to shape a path forward towards a worlded theory of urbanization, thus showing a changed understanding of global issues of public concern. However, it is not enough to develop postcolonial theories from the standpoint of the Western scholarly tradition and focus on neo-colonial patterns in Western societies. Western scholars also need to radically learn from cities and colleagues from other urban and world regions both as regards the way how the spatial analysis is framed, and as well regarding the empirical phenomena at hand and respective theorizations for the fields of urban studies and planning theory.

(E) Resistance as ‘Quiet Encroachment of the Ordinary’: What happens when everyday life is conceived from non-Western theories and empirical findings? Bayat’s work focusing on everyday life based theorizations combines an empirical contribution relating to the micro-scale of urban research claiming to analytically expand the notion of everyday forms of urban resistance with a fundamental critique of the modern conception of Western ‘social movements’ and of public space as an institution of (Western) bourgeois modernity which many of the urban subaltern – especially in contexts of authoritarian state rule – seek to avoid or circumvent. Empirical research from Middle Eastern cities has shown that new global urban restructuring is affecting these places and has pushed people living in informality further towards the margins.

Neoliberal modernity and its pace of global restructuring has brought (additional) masses of people into newsocio-spatial peripheries from which they now take (mass) action to improve their lives on their own. To study neoliberal modernity through the prisms of social non-movements, as Bayat (2010) has it, has reaffirmed the need for a politicization of registering the everyday: “the insistence that non-Western lives impact at the level of everyday life in the West is an important aspect of many recent forms of political culture (...) what happens at the level of micro-culture also reverberates at a more global level” (Highmore, 2002, p. 18). (E) Everyday Life as Action: One of the key sources to acknowledge Lefebvre’s critique of the prevailing abstract philosophies in the 20th century has been an understanding of everyday life as a philosophy of praxis, in which praxis can be considered to be a vehicle to embed conceptions of (present) time(s) into spatial analysis of changing patterns of lived space. Space, in this sense, needs to be understood as “an ensemble of a plethora of societal actions” (Schmid, 2005, p. 300) mediated through both individual and collective (everyday) social relations that are in a constant interplay in the self-creation of human beings. But which relevance then has the study of everyday life and lived space, if all niches can

be fruitful? The study of changing everyday life would cut across all these three fields, as (a) a study of action and praxis of the worldman has shaped; (b) a study of the experience, affect and altering potential of the lived social space; and (c) as a critique of abstract philosophy. Because “to study philosophy as an indirect criticism of life” as Lefebvre (2014, p. 272) put it “is to perceive (everyday) life as direct critique of philosophy.” But why, Shields asks, did Lefebvre opt into an investigation of life becoming seemingly boring under capitalism? Shields (1999, p. 67) emphasizes that such a scrutiny “indicates a domination of areas of human activity and relationships whose richness, if revealed, could become the basis for a reconstruction of human society”. This way, lived space becomes an intriguing subject allowing for constant crossovers for (ex-post oriented) social, cultural and political research in connection to (ex-ante oriented) perspectives into future planning praxis and theories, as it includes both the analysis of structural conditions and the impetus to sketch ways of action forward.

3 A NEW GENERATION OF POST-POSITIVIST PLANNING THEORIES?

As follows, an initial attempt to loosely rethink selected contemporary planning approaches will be presented, that stems from empirical public space research and the renewed critique of everyday life as sketched in rough contours above. Social change of the past 50 years, but also of the past decade, their spatial causes, side-effects and implications indicate a need to connect planning endeavours again to much more basic questions about whether, if and how planners intervene in everyday life conditions, and how planning contributes to a (re)production of everyday life patterns (seen as ordinary-alienated dialectics). As many urban societies are increasingly characterized by uneven development patterns, and the general level of socioeconomic well-being for bigger parts of the urban population has been constantly eroded, times for keeping planning in the safe-haven of apolitical thought have long passed by. But what is the societal role that planners can fill in order to address these pressing challenges? Many would argue that these are structural problems that planners are unable to address as this is out of their field of expertise. Others would suggest that planning should focus on a more liberal tradition to spatially promote growth and help the state to organize the conditions for that growth in order to provide prosperity and progress. Others would contest that more of the same will only enlarge the divides and reproduce structural constraints based on the disruption of equity, equality and emancipation. In the light of the current increase in de-democratization of political ways of decision-making (post-political condition); new nationalisms and xenophobia visible through antagonistic public space contestations (anti-pluralist condition) and an increased financial capitalism that disempowers and dispossesses (commodification-through-crisis condition)—all transitions that constantly produce severe restrictions on the ability to access everyday life’s opportunities—planners cannot shy away from their responsibility to think about how they (re)organize space and thus power relations, and how they frame their own positionality in a spatial field characterized by constant struggles between politics and the political. With communities evicted and displaced, jobs lost, pensions evaporated, cost of living rising, citizens harassed and killed by the police, and with no effective or available democratic process to hold back and reverse these trends, planners often have to refocus on a task that has been deemed forgotten: to provide more basic and decent human living conditions, to propose alternative ways of urbanization and development that politically intervene into the cracks and crises of the current capitalist model and to propose spatial entries into how democracies can be constantly renewed.

Critique of Everyday Life	Urban Studies	Political Science	Planning Theory
3.1. <i>Public space under siege.</i> <i>On urban restructuring.</i>	postFordism, birth of neoliberal urban policies, social inequality	governmentality, neoliberalization and postFordism	Planning as governmentality
3.2. <i>The body under pressure.</i> <i>On politics of affect.</i>	embodied space: role of body politics, embodied space occupations	politics of affect, non-representational theory, performativity	Performative planning
3.3. <i>Contested modern public space.</i> <i>On everyday mass action.</i>	everyday urbanism, ordinary city, critique of modern Everyday Life	postcolonial accounts: social non-movements, everyday mass action	Insurgent Planning
3.4. <i>Lived space dialectics.</i> <i>On combined activism.</i>	emancipation, housing and public space: anti-eviction and de-commodification action	right to the city, feminist, Marxist and postmodern critique of everyday life	Relational planning
3.5. <i>Urban resistance.</i> <i>On increasing social inequality.</i>	struggles against depoliticisation of public space, weakness of representative democracy	presentist democracy, dissent vs. consent, marginalization vs. marginal positions	Counter hegemonic planning

3.6. <i>Urban emancipation. On consent and dissent.</i>	the post-political and its discontents, struggles against disenfranchisement	post-foundational thought, politics of dissent, passion and politics	Agonistic planning

Table 1 – Transfers between Urban Studies, Political Theory and Planning Theory

From this perspective, urban studies may serve as a field bridging empirical insights from publicspace research based on an (empirical, detailed, precise) critique of everyday life to the fields of socio-politicaland socio-cultural theory, from which many planning theorists draw their insights. This concluding part,therefore, does not offer a systematic reading of all post-positivist accounts in the Anglo-Saxon world, it israther a plea to (re)connect the field of planning to a deep reflection about those recent approaches inplanning that seek to render a relation between planning, everyday life and lived space, and thus preciselyaddress the respective societal, cultural and political context of a given planning situation. Some of potentialapproaches have been gathered in table 1 and will be briefly sketched as follows.

3.1 PUBLIC SPACE UNDER SIEGE. ON URBAN RESTRUCTURING.

This section combines three parts which (1) address different interpretations of patterns of urbanrestructuring (e.g. postfordist, neoliberal), (2) offer a political science-inspired reading of Foucault's theory ofgovernmentality as an explanatory frame for a historical analysis of urban restructuring and neoliberalization,and (3) establish a connection to understanding planning as gouvernementality. Critique of everyday life isaddressed here with a focus on power relations and on an understanding of planning as governmentality:practices shaping the actions of others and strategies for the management of a population with the aim toshow the unwitting effects of these regimes of practices on everyday life, yet to break free of the commonsenseacceptance of categories such as the ordinary, to open up ways of thinking differently (compare Huxley,2002, pp. 145-146). Hence, although power is an omnipresent dimension in human relations, and thus, inspace, power in a society is never a spatially fixed and closed regime, but rather an endless and open set ofsocial relations. The governmentality focus helps to explain how actually existing neoliberal urbanizationcame into being initially as a way of thinking in economics, and later as a practice of governing throughplanning which managed to literally transform the experience of societies, mediated through everyday life.

3.2 THE BODY UNDER PRESSURE. ON POLITICS OF AFFECT.

This second approach offers (1) an entry perspective into conceptions of space that discuss socialrelations through aspects of body, performance and action, thus promoting an understanding of embodiedprotest as an affective form of staging dissent and thereby shaping 'the political' in the city. It furtherconnects (2) 'the political' to considerations of the role and meaning of 'affect' to access a wider strand of(feminist) thought in political theory. Theories of affect address the minds' power to think (reason) and thebody's power to act (passion) (Hardt, 2007). They force us constantly to pose the problem of the relationshipbetween mind and body with the assumption that their powers constantly correspond in some ways (cf. *ibid.*,7). In this vein, affection assigns a relational moment, through which the capacity to act is decreased orincreased through the encounters between bodies, affected or/and affecting each other. Non-representationaltheory (Thrift, 2008) includes much of the non-intentional and non-discursive aspects of everyday life into anunderstanding of space and links this to the way politics and the political work beyond reason, using acombination of reason and passion, of thinking and acting. Thrift used the concept of "performance" tounderstand "the art of producing the now", the urban present conditions of everyday life (Dirksmeier andHelbrecht, 2010). Finally, (3) a transfer will be established between considerations linking embodied spaceconceptions, politics of affect and a more recent strand in planning theory, that is, performative planning.Recalling on Lefebvre's urge to centre praxis as any point of departure for further theoretical reflection,performative planning reconstitutes public space as a realm where praxis and theory meet. It thus meansmore than physical design; it is also concerned with social settings and activities (Altrock and Huning, 2015).

3.3 CONTESTED EVERYDAY SPACE. ON EVERYDAY MASS ACTION.

In the past decades, alternative urbanisms have enriched the spectrum of public-space-focused planning interventions (e.g. everyday urbanism, ordinary city, insurgent planning, insurgent public space, guerrilla urbanism, etc.). Many of these contributions stress the relevance of lived space dimensions for planning, albeit in nuanced ways. While (1) urban studies scrutinize approaches to adopt, appropriate and act(in) public space through changing everyday practices, (2) political scientists are currently discussing the theory of “social non-movements” (Bayat, 2010), as sketched above. Planning theorists link Bayat’s position to (3) insurgent planning with a post-colonial focus on the everyday dimension of urban space. Miraftab (2009) has revised Western notions of radical planning by elaborating this concept: Practicing insurgent planning acknowledges what the hegemonic drive of neoliberal capitalism tries to obscure: the oppositional and transformative practices that citizens and marginalized populations invent day-by-day outside global capitalism’s definition of inclusion. Insurgent planning approaches strip ‘democracy’ and ‘inclusion’ of their formalistic elements, recognizing the ability of counter-hegemonic movements to choose own ways of constituting their collectivities and their participation.

3.4 LIVED SPACE DIALECTICS. ON COMBINED ACTIVISM.

In the context of the introduction of neoliberal urban policies in very different urban contexts, many cities around the world witness an increase in urban inequalities which is visible and can be analysed at the interface of public space and housing research. As a case study, struggles and resistances to push for the right to housing and for public space to reinstitute democratic decision making in praxis have been successfully intertwined. Housing rights movements have brought silences and absences that exist in the private realm into the public debate, and have simultaneously re-framed what was considered as individual and personal failure a structural problem of public concern (Garcia-Lamarca 2017). These empirical findings echo (2) the feminist critique that public space debates often do not include the fates of the so-called urban subaltern, the marginalized and disenfranchised urban populations for whom to become public would potentially pose a threat: this relates for example to a whole range of professions working in grey legal and labour conditions, such as nannies, housekeepers, gardeners, etc (visible in the private households). This critique sheds a light on the private-public relation vice versa, as it criticizes the silences and absences in public space that get visible once we carefully realize an ethnography of the living and working conditions of (un)paid labour and its reproduction in the private realm. These considerations are linked (3) to the concept of relational planning which stems from the family of approaches that coin public space as relational (Tornaghi and Knierbein, 2015), where feminist approaches need to be integrated into planning for relational public space. These approaches include (a) transdisciplinary approaches to city making; (b) context-specific, people-centred urban development tactics; (c) social space based conceptions of public space and urban cultures to conceptually recover the lived spaces in the city; (d) a focus rather on ‘inclusion through action’ (performative, material) than on ‘participation through discourse’ (communicative, symbolic); (e) alternative development paths beyond top-down modes of territorial urban restructuring.

3.5 URBAN RESISTANCE. ON INCREASING SOCIAL INEQUALITY.

This section is an attempt to better understand that the current waves of urban protests are inherently linked to rapidly changing structural conditions and the decline of (national) democracies. It offers (1) an insight into youth’s struggles in public space against a new tech- and expert-led gentrification and traces of a qualitatively new contestation unfolding around the use of public sports grounds. In San Francisco, tech workers from the Silicon Valley and related IT areas are not just the new gentry to habit the houses where former communities of colour (Afro-American and Hispanic-Americans) have been displaced through massive gentrification along the Google bus routes, but the city authority also facilitates that new IT related dwellers (particularly young white affluent men) are offered to ‘hire’ a sports pitch for money, a public space which is already a lived space for young people who grew up using the pitch in an inclusive way for newcomers (Maharawal, 2017). This empirical case is (2) discussed against theories that point to the current conjuncture of post-politics in seemingly democratic societies while emphasizing the omnipresent democratic deficits of state governance: Rancière (2010, p. 60) states that democracy (...) is the constituent power of “those who have no part – which does not mean the ‘excluded’ but anyone whoever”. Lorey (2014) expands on this thought as a critique of representative democracy as a form of

bourgeois democracy by developing the concept of 'presentist democracy' which she claims has been globally practiced through the principle of horizontality in the recent civic uprisings. For her, the modern promise of coming democracy has remained unfulfilled, as the political democracy remains separated from an achievement of claims of social equality. This debate is transferred (3) to the planning field by elaborating on what Purcell denominates as counterhegemonic planning, by asking: How planners can best resist neoliberalization? For Purcell (2009, p. 141) "democratic resistance to neoliberalism must explicitly and directly challenge the foundations of the neoliberal project". Purcell (2009) concludes that planners must learn from counter-hegemonic movements' struggles, and must make it their business to actively nurture them, for they offer a way out of the wilderness of neoliberalism: "Reclaiming power through political mobilization is our best hope for creating more democratic, more just, and more civilized cities." (ibid., p. 160)

3.6 URBAN EMANCIPATION. ON CONSENT AND DISSENT.

This last part connects (1) post-foundational thought in urban and planning theory (Wilson and Swyngedouw (2015, p.6): "in post-politics, political contradictions are reduced to policy problems to be managed by experts and legitimated through participatory processes in which the scope of possible outcomes is narrowly defined in advance." Post-foundational thought characterizes processes of post-politicization with the following aspects: (a) depoliticization; (b) disappearance of the political; (c) erosion of democracy; (d) weakening of the public sphere; (e) politics of ethnicized and violent disavowal; (f) exclusion and containment of different political-economic models (ibid). To keep liberal democracy alive—Mouffe (2013) states—, dissent needs to be cultivated within agonistic struggles (by adversaries), to prevent that political passions are misguided into extremist political forms of agonistic struggles (between enemies). Agonistic struggles are thus part of the constant renewal of the balance between equality and freedom, whereas antagonisms prioritize freedom over equality. Current modes of post-positivist planning (3), however, are heavily consensus-based, while dissent is not actively cultivated in planning schools (Purcell 2009). Formal participatory modes of communicative and collaborative planning tend to use consensus-building and majority-decisions, while (in)advertently flattening the contradictory voices of minority or marginalized groups. This situation calls for a more radical and egalitarian democratic thought in planning. Consensus-based liberal planning approaches have been criticized for they may silence out citizens and leave reasoning about decisions to managers, politicians and experts in processes of multilevel governance. Hillier (2002) has thus been advocating a dissent-based conception of agonistic planning, and has simultaneously asked what Mouffe's agonistic democracy would look like at an urban scale of decision-making. Yet while agonistic planning has been introduced, the power of public space research to understand the link between politics and passions in planning, that is a key aspect linking to current everyday life transitions, still remains to be explored in depth. Albeit not new, the claim for a re-democratization of planning as spatial praxis seems all too urgent, as in times of increasing everyday life restrictions and threats to democratic ways of living "it is a question of a slow, but profound modification of the everyday—of a new usage of the body, of time and space; of sociability; something that implies a social and political project; more enhanced forms of democracy, such as direct democracy in cities" (Lefebvre 1988, pp. 86f) that planners do need to engage with. This concerns as well innovative ideas about a "definition of a new citizenship; decentralization; participatory self-management(...)—that is, a project for society that is at the same time cultural, social and political" (ibid.).

If there is a new generation of post-positivist planning accounts that actively makes use of a renewed critique of everyday life, then this critique must work to reconnect political, social and cultural theory to planning praxis, with a strict focus on the ambivalent dialectics inherent in lived space.

elena.gilcher@ru.uni-kl.de; gerhard.steinebach@ru.uni-kl.de

ABSTRACT: Pilot projects are implemented in order to obtain knowledge and experiences that can be reused later on – either in other pilot projects, in large-scale projects or even in the legislature. In this paper, we address the question of efficient and effective distribution of insights between pilot projects. We present detailed considerations on the required structures to share the experiences and knowledge obtained by evaluations of the stages of a pilot project. Foremost, a systematic interaction between project participants and a central collection of experience is required. The collection should be publicly and freely available. By establishing such structures, the reuse of existing knowledge and experiences is significantly simplified. A common structure for pilot projects, for example, allows for information sharing between equal stages of pilot projects. Given that the obtained knowledge and experiences of these individual stages are easily accessible, the hampering need to review a comprehensive final project report is eliminated. For future pilot projects as well as large-scale projects, the cost associated with reusing existing experiences and knowledge is reduced and the cost-benefit ratio improves. We exemplify this by investigating systematic information sharing between equally structured pilot projects. To that end, we present the relevant background on knowledge management as well as project structuring – two complementary parts for the success of pilot projects – and contribute their systematic linkage for an efficient and effective reuse of knowledge and experiences.

1 INTRODUCTION

Spatial planning often has to deal with novel challenges where no experiences or knowledge pre-exist – neither specific nor general. In such scenarios, it is common scientific practice to create a model and test a hypothesis on it. Models reduce the complexity of reality and are simplified projections of real systems or issues they help to understand. Simplification is characterized by illustration, reduction and pragmatism. If a developed model turns out to be too simplistic with respect to a specific aspect, e.g. because it abstracts certain aspects too much, it is usually refined. Afterwards, examination is repeated on the more elaborate model that, in turn, might reveal decisive weaknesses in a different aspect. Then, the process is repeated. After the model's accuracy was assessed positively and if obtained results are promising, real-world tests are conducted.

In spatial planning, however, this approach is usually destined to fail as the model cannot be refined to a level that allows for sufficient certainty. Spatial planning activities are always embedded into a socio-cultural environment. They involve many participants that are linked by complex structures. Neither the participants nor the structures can be captured appropriately in a simplifying model. Therefore, spatial planning implements pilot projects – small-scale, short-term real-world studies. They constitute the preferred instrument approach for novel challenges in spatial planning.

Pilot projects are an important research tool in urban and regional planning in particular. For these planning activities, the objective is to reproducibly obtain novel, reusable knowledge and experiences. Within a single pilot project, various regions or municipalities carry out different, individual (sub-)projects in a definite period of time. Academic and/or private institutions scientifically monitor pilot (sub-)projects in order to identify the generally valid results that highly qualify for reuse [Gilcher and Steinebach, 2016a].

The importance of monitoring already indicates the significance of its result: project evaluations. In previous work, these evaluations were presented in a final report that focused on determining the following two aspects:

- i. Were the initial (sub-)project goals achieved?
- ii. Are there results that can be reused on a larger-scale?

However, our monitoring experience [Gilcher and Steinebach, 2016b] revealed that this overall evaluation of an entire pilot project does not necessarily cause reuse of knowledge and experiences in subsequent (pilot) projects. The final report is a too large unit to share knowledge efficiently. Among the main reasons, we noticed that a comparison of existing final reports with an ongoing (pilot) project is associated with too much effort. I.e. the cost-benefit ratio becomes negative. Therefore, we established a common structure for pilot projects in previous work [Gilcher and Steinebach, 2016a]. This work introduces six stages every pilot project will experience. The common structure already reduces the cost of sharing knowledge. To that end, we aim at intermediate evaluations of projects at the end of each stage.

In this paper, we contribute detailed considerations on the required structures to efficiently and effectively share the experiences obtained by these intermediate project evaluations. Foremost, a systematic interaction between project participants and a central collection of experience is required and the collection should be publicly and freely available.

By establishing such structures, reusing existing knowledge and experiences is significantly simplified – the complete final report need not be reviewed. For future pilot projects as well as large-scale projects, the cost associated with reusing existing experiences and knowledge is reduced causing the cost-benefit ratio to improve. We show that structuring pilot projects into stages and systematically linking them to knowledge management activities is decisive for pilot projects' success to achieve efficient and effective distribution of knowledge and experiences.

2 BACKGROUND

2.1 PILOT PROJECTS IN GERMAN SPATIAL PLANNING

Experimental research in the form of pilot projects is particularly useful if current or potentially future research questions cannot be adequately clarified in a different way. Furthermore, pilot projects are initiated for urgent current challenges in order to develop transferable solutions for other regions or municipalities facing the same issues. They are specifically designed for such a challenge and evaluated with respect to it. In order to do so, a detailed evaluation is carried out to determine whether the originally defined objectives have been achieved and whether the results can be reused on a larger scale. Pilot projects differ from classic product- and result-oriented research assignments that primarily include a reflected conception and systematic preparation as well as evaluation of existing experience knowledge. In contrast, pilot projects support the process-accompanying analysis of research questions and objectives, implementation strategies as well as the realization of measures. Thus, pilot projects are rather process- than product-oriented.

Within a single pilot project, various regions or municipalities carry out different (sub-)projects in a definite period of time. During this period, the exchange of experiences and knowledge between the participants of the pilot project as well as a reporting of current pilot projects is organised. In this way, the process orientation is evident. The selection of pilot projects aims to ensure a preferably safe generalizability and transferability of the obtained results to other regions and municipalities with similar challenges [Steinebach, 1992; Wiechmann et al., 2012; Gatzweiler and Runkel, 1997].

Academic or private institutions scientifically monitor pilot projects in order to identify these generally valid and thus reusable results [Gilcher and Steinebach, 2016a]. Continuous evaluation of the activities implemented in the (sub-)projects is most important. Therefore, cooperation between science and the executing local stakeholders is a priority task. The role of academia is strengthened compared to established conception processes of the federal government and the federal states of Germany [Einig, 2011].

In previous work, we identified a common structure for pilot projects to efficiently share knowledge [Gilcher and Steinebach, 2016a]: identification of a novel challenge, project initiation and public bidding, applications of potential participants, evaluation of applications by the initiator, execution, final evaluation.

Each stage of a pilot project is briefly described in the following in order to conclude a first contribution of this paper: a pilot project's lifecycle resemble the non-iterative waterfall model.

1. (Identification of a new challenge) The federal government or states apply pilot projects if a novel challenge of spatial planning is identified and its research questions cannot be answered in a different way. Such a kind of challenge is characterized by a significant impact on spatial planning, e.g. demographic change, economic structural change, sustainable development, climate change and climate protection as well as environment protection. These challenges have several consequences at federal, federal state, regional as well as municipal level and solutions to rise to them have to be found [Gilcher and Steinebach, 2016a].
2. (Project initiation and public bidding) The application process consists of two stages. In the first stage, meaningful project outlines have to be submitted for each project proposal. The received project proposals are evaluated according to various criteria – e.g. quality of the approach, innovativeness, qualification of the partners, application potential, applicability of the results for other German municipalities as well as transferability. The received and peer review-enabled project proposals are evaluated according to the listed criteria, potentially with the help of external reviewers. Based on the reviews, the project ideas deemed appropriate for funding are selected. In the second stage of the application process, the promoter asks the applicants of positively evaluated project proposals, to submit an official application for funding. In a final evaluation, it will be decided if the project is to be funded [Gilcher and Steinebach, 2016a].
3. (Applications of potential participants) A pilot project public bidding attracts many applicants from the various stakeholders that are envisioned to take part. Depending on the public bidding, it is possible that stakeholders apply individually or in groups [Gilcher and Steinebach, 2016a].
4. (Evaluation of the applications by the initiator) The initiator evaluates the received applications on the basis of various criteria. Most important among them are an application's innovativeness in the proposals to cope with the novel challenges researched in the project. Furthermore, if the municipality can serve as a comprehensive example [Gilcher and Steinebach, 2016a].
5. (Execution) During the execution of the pilot project in the selected municipalities, research questions are examined and strategies as well as measures are implemented. To ensure the process-orientation, a collaboration of the participants, an exchange of experiences between collateral pilot projects, and a continuous communication of running pilot projects to an expert audience take place [Gilcher and Steinebach, 2016a].
6. (Final Evaluation) A pilot project is completed by a final presentation and a final report written by the academic or private institution entrusted with the scientific monitoring. Furthermore, generally applicable criteria have to be identified and transferred to large-scale problem solutions.

These stages are in a sequence and each stage is executed only once during the life of a pilot project. I.e. unlike the refinement of a model in other scientific fields, no iteration takes place within a single pilot project. Thus, the lifecycle of a pilot project resembles a waterfall-model. The waterfall model was first defined by Dr. Winston Royce in 1970 in the context of software development [Royce, 1970]. However, it is more generally applicable and its fundamental insights on sequential, non-iterative processes are transferable to other scientific disciplines such as the urban and regional planning context of this paper. The model takes its name as the progress is seen as flowing steadily downwards (like a waterfall) through the different stages (figure 1). The number of stages varies depending on the project, but there is a clear

transition from one stage to the next that appears if a stage is finished. Thus, requirements for the next stage are known before entering it. Each stage has a predefined start and end point and proceeds in order without any overlapping. Originally, feedback to previous stages of the process may only be applied to the immediately preceding stage, yet, in spatial planning's pilot projects this is not the case. As this is a linear model, it is easy to implement and thus many projects besides software development and spatial planning contexts follow this waterfall lifecycle model. A further benefit is the minimal amount of resources required for its implementation as it is neither iterative nor has overlapping stages. For pilot projects, this also allows for different stages to be executed by different stakeholders as outlined in the brief descriptions above. However, these two properties also impose weaknesses. Foremost, the waterfall model is unsuitable for projects with many unpredictable factors that require more flexible adaptations. Furthermore, errors in early stages are oftentimes only visible at the end of a project – another fundamental similarity between pilot projects and the development of systems that we utilize for this contribution.

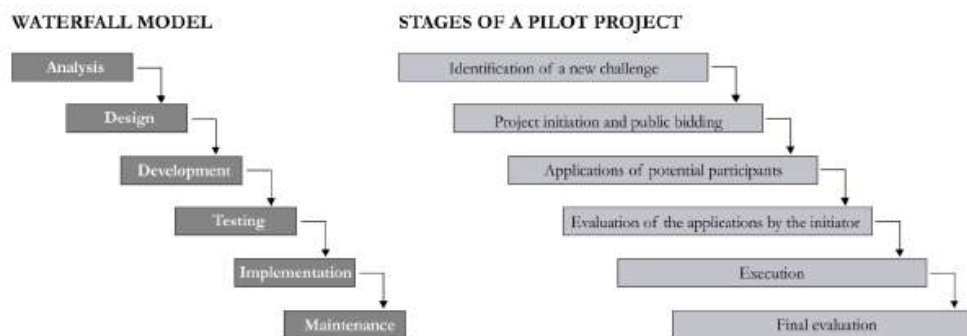

Figure 1: Waterfall lifecycle model. Its original context is the development of software systems, yet, the lifecycle model's properties also hold in pilot projects that are structured into self-contained stages, too.
Source: Own illustration, based on [Royce, 1970].

3 KNOWLEDGE MANAGEMENT

The main aim of pilot projects is the reusability of previously obtained experiences and knowledge in future (pilot) projects as well as spatial planning practice and potentially even legislation. However, so far the existing experiences and knowledge are not saved in a format or a central place that allows for efficient and effective sharing. The final report is a too large unit to efficiently share knowledge. Comparison of existing final reports with an ongoing pilot project's setting is associated with too much effort. I.e. the cost-benefit ratio becomes negative. Therefore, the reutilisation of the experiences and knowledge is not guaranteed. Therefore, we aim to develop a structure to store knowledge and experiences centrally and to make it easier available. The established stages of a pilot project process are one part of the foundation to achieve this goal. In the following, we turn to the second part that is crucial in our context: knowledge management. It consists of the three fundamental aspects (a) knowledge, (b) knowledge management, and (c) the knowledge management process. We first define these and then contribute their integration into the waterfall lifecycle model of pilot projects in Section 4.

a) Knowledge is defined as facts, information, and skills acquired through experience or education. Furthermore, knowledge is the theoretical or practical understanding of a subject. It is an immaterial good, whose value is increased through use and sharing. Thus, it can only be assessed in retrospect. It is more complex than unvalued information and cannot be easily stored and processed due to these factors defining its value.

Various kinds of knowledge can be differentiated. They are designated by contrasting conceptual pairs. These are e.g. implicit and explicit, demonstrative and intuitive, individual and organisational. In the case of knowledge management, the differentiation in implicit and explicit knowledge is the most significant. Implicit knowledge is not publicly accessible individual knowledge that it is only accessible to the organisation. Generally, accessible knowledge is referred to as explicit knowledge.

b) Knowledge management tries to turn implicit knowledge into explicit knowledge and vice versa. Hence, we share this goal with knowledge management. It demands structured dealing with the development, distribution and utilisation of knowledge. In current times, efficient and effective processes implementing these management tasks are ever more important as the amount of knowledge increases rapidly but also

becomes obsolete faster. Furthermore, a stronger trend towards specialization in professional environments requires adaptable and convertible knowledge. Basically, the resource knowledge should be consciously used as a capital to realize competitive advantages.

Theoretically, the implementation of knowledge management promises various advantages that we also aim to achieve for pilot projects: less effort for searching knowledge; better application of existing knowledge; more time for generating novel ideas and innovations as reliable foundations are reused; better internal and external communication; quicker project activities and better collaboration with partners by transparency of structured and current knowledge. The actively pursued tasks of knowledge management are the expansion, utilisation as well as protection of knowledge in an organisational unit. These processes take place on a superior meta-level. In spatial planning these levels are nationwide, regional, municipal or – as in our forthcoming example of sharing between two consecutive pilot projects – project-based.

c) As in every planning and implementation process, four fundamental aspects have to be observed in knowledge management: purpose definition, situation analysis, deduction of measures based on a nominal-actual-comparison, and a success monitoring Note, that we can find these four aspects reflected in our six stages of a pilot project as well. Probst, Raub and Romhardt differentiated these four aspects in order to implement phases of knowledge management [Probst et al., 1999]. Their method of knowledge management includes eight phases, six of them form the key process of knowledge management. Two phases build an orienting and coordinating frame of this key process. The division of the key process of knowledge management is briefly explained in the following as well as depicted in figure 2 (cf. denotation in parentheses). This is the foundation to integrate the phases of knowledge management into the pilot project lifecycle.

(knowledge objective) The first step is the definition of knowledge goals. They state, which abilities should be established on which level. Normative (influencing the business culture), strategic (aim for future competence requirements) and operative (target on specific implementation) knowledge goals can be differentiated.

(knowledge identification) The identification of knowledge aims on getting an overview of internal and external data, information and skills.

(knowledge acquisition) Knowledge acquisition means the acquisition of external knowledge carrier or even the acquisition of knowledge products like e.g. software or patents. In this way, the own body of knowledge can be extended. Thus, existing knowledge gaps can be closed and the setup of future or current required competencies accelerated.

(knowledge development) Knowledge development is an additional phase to knowledge acquisition. The knowledge that cannot be covered by the acquisition of knowledge has to be developed internally.

(knowledge sharing) Knowledge has to be divided and distributed, if it should be used consciously or unconsciously. But knowledge should not be distributed randomly. Groups or individuals should rather have an access to that knowledge relevant to their specific task.

(knowledge utilisation) Knowledge utilisation is the productive application of organisational knowledge.

(knowledge preservation) To obtain valuable experiences, a process of selection has to be created as well as appropriately saved and updated afterwards.

(knowledge evaluation) The evaluation of the achievement of the knowledge goals is the focus of the last step.

It is suggested in [Probst et al., 1999] that these phases are processed in a circular flow, starting with the definition of the knowledge goals. The results of the knowledge evaluation are then feed back into the knowledge objectives. In reality, the individual phases are strongly interconnected (see figure 2), i.e. a multitude of different orders of these phases is possible. We will use this degree of freedom when we incorporate knowledge management into the phases of pilot projects. This is in particular necessary as the waterfall lifecycle model is non-iterative. I.e. we cannot feed back into the objectives of the same project. Thus, we will focus our illustration on the sharing of knowledge between two consecutive pilot projects.

Figure 2: Phases of the knowledge management process. Source: Own illustration, based on [Probst et al., 1999].

4 STRUCTURE TO EFFICIENTLY SHARE EXPERIENCES AND KNOWLEDGE OBTAINED IN PILOT PROJECTS

The goal of our work is to provide means to centrally store (preserve) and efficiently share experiences and knowledge obtained in a pilot project. To achieve this, we aim to create a novel structured approach, derived from the stages of pilot projects' common waterfall lifecycle and the phases of knowledge management. To that end, we also identify the parts of knowledge management that need to be transferred into a central, external and independent infrastructure being accessible to any pilot project. We start with an analysis of the management process that is targeted towards the requirements of pilot projects.

The definition of the knowledge management process has various strengths. It structures this management process into logical phases that can be taken within the stages of a pilot project. Moreover, it offers approaches for interventions and it provides a proven search grid for the causes of so-called knowledge problems – two further features that can be used by pilot projects. At the same time, it is emphasized that the individual phases interact with one another and that phases of the process may not necessarily be considered isolated. As pilot projects are non-iterative and have a definite end, we will investigate this last aspect in order to preserve knowledge beyond a pilot project's life. In this context, the planning principles and processual method in spatial development processes have to be the focus. Therefore, the stages of a pilot project are the guiding principle for the integration of the lifecycle of knowledge management.

Knowledge management is a cross-sectional task that undergoes all stages of a development process – in our context, this is the development and execution of a pilot project captured in the waterfall model. The organisational structure of the development process has to support activities that identify, share, use as well as preserve and evaluate relevant knowledge and experiences. In a pilot project, these tasks may be split between the different participants, depending on the current phase. For example, all the tasks need to be executed by the project initiator in stage 4 (Evaluation of the application by the initiator). Yet, in stage 5 (Execution), the scientific monitoring should be responsible for identification and evaluation and the pilot municipality should accomplish use of existing knowledge. We propose that preservation and sharing are to be provided by a central, external and independent infrastructure.

To achieve this in an efficient and effective way, several aspects have to be considered. Identification of knowledge is currently the most time-consuming task. A structured and consequent approach to this challenge, pursued from the start, may extend the initial phase of the project implementation. Holistic approaches are necessary, if knowledge should be handled in a structured way. Punctual activities are not effective. The organisational structures – planning and project implementation processes – must allow a structured handling of knowledge. If knowledge and information are easily accessible for the planning and project implementation, this potential drawback can be mitigated.

Until now, the elements of knowledge management were only deployed in the final stage of pilot projects when the projects lifecycle reached its end. I.e. its unit of operation was the project's final evaluation report. It is the final evaluation report's purpose to identify, distribute and preserve the knowledge and

experiences gained in the pilot project. This procedure was supposed to ensure that these have after-effects on planning practice and were transferred to municipalities that strongly resemble the pilot municipality. However, observations of current pilot projects [Gilcher and Steinebach, 2016b] reveal that existing knowledge and experiences are not necessarily used effectively and efficiently. Comparison if the extensive evaluation report of a previous pilot project with a current one corresponds to the time-consuming knowledge management phase aiming to identify internally or externally available knowledge. Given the definite duration of a pilot project that causes time restrictions and the lack of automation to assist with this task, this phase cannot be executed exhaustively. Knowledge and experiences remain unrecognized and are often just taken into account later, e.g. in the final evaluation of the current pilot project. Therefore, we propose that each stage of a pilot project undergoes its individual knowledge management process. This is possible, as the stages of a pilot project are strictly separated from each other and proceed in one direction of succession – i.e. we make use of the properties of the waterfall lifecycle model and the fact that each phase ends with an evaluation. The advantage of our proposition is that only small parts of the pilot project lifecycle have to be completed before the obtained knowledge and experiences can be stored and shared. When smaller units of a pilot project undergo the process of knowledge management, knowledge and experiences gained in a single stage can be collected, stored and shared. These smaller units of information are also easier to compare and thus the knowledge identification, acquisition, and utilisation become a less time-consuming task. Therefore, their potential to be reused in future pilot projects as well as further planning practice is improved as the cost-benefit ratio improves significantly. This also allows reuse of current insights as the pilot project providing them need not be terminated yet.

The development of this structure, integrating the phases of a knowledge management process into the individual stages of a pilot project, is key to achieve this goal. Figure 3 illustrates the structure on the example of two consecutive pilot projects. Pilot project 1 integrates parts of a knowledge management process (blue) into its project stages. Relevant phases to be executed are knowledge objectives, knowledge identification knowledge acquisition (for the purpose of presentation this is assumed to be internal only), knowledge development, and knowledge evaluation. These phases have been rearranged to suit the pilot project's stage. Most importantly, the two phases knowledge preservation and knowledge sharing have been moved into a novel sharing infrastructure that exists outside of and thus independently from the pilot project's lifecycle. It is supposed to persistently store the results of knowledge evaluation and potentially knowledge development, too. This central infrastructure should be used by all pilot projects for knowledge preservation and knowledge sharing. This is illustrated by the consecutive pilot project 2. It has its own knowledge management process (green), uses the central infrastructure. Most importantly, the knowledge utilisation if pilot project 2 should use results from pilot project 1. Moreover, knowledge identification and acquisition can make use of the centrally available source for knowledge and experiences for this stage of a pilot project. This scheme repeats in every phase of the waterfall lifecycle (not depicted).

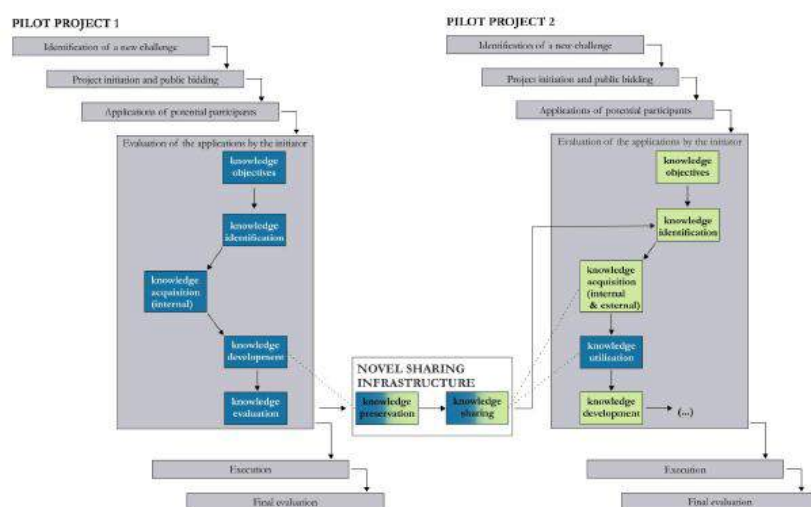

Figure 3: Integration of knowledge management into the waterfall lifecycle of pilot projects.

5 CONCLUSION

In this paper, we identified the lifecycle of a pilot project to correspond to the waterfall lifecycle model of development projects. This categorisation of the proceedings of pilot projects allows for reuse of known properties of a waterfall lifecycle. Most notable is the non-iterative nature of these projects that manifests in non-overlapping subsequent stages that do not incorporate feedback. As we aim for the efficient and effective sharing of knowledge and experiences, the latter property is very important. It contrasts to the fundamental feedback step of the knowledge management process we propose to integrate into pilot project stages. To that end, we present the concepts to overcome this mismatch and to integrate knowledge management into the lifecycle of pilot projects. As mentioned, this integration repeats for every stage in order to reduce the unit of sharing from a comprehensive final project evaluation report to smaller pieces of information. This should reduce the effort of knowledge identification, acquisition and utilisation. I.e. it improves the cost-benefit ratio of these steps of knowledge management and makes them attractive for pilot projects. In this paper, we presented the required background and contributed a theoretical solution for this integration of knowledge management into pilot project stages. Moreover, we exemplified the knowledge preservation and sharing via a novel, external sharing infrastructure on the example of two consecutive pilot projects. In the future, we aim for investigation of benefits of digitalisation and automatization to further simplify the tasks knowledge identification and acquisition. We plan to implement our concepts in a small scale and test it on data from pilot projects we monitored in the past.

ID 1598 | PLANNING ETHICS IN MAJOR TRANSPORT SCHEMES: REFRAMING THE CHALLENGE

Ángel Aparicio¹

¹Universidad Politécnica de Madrid
angel.aparicio@upm.es

1 INTRODUCTION

This paper revisits the various visions of justice in transport planning, with a focus on major schemes, and the role played by transport planners. Whereas extensive discussion has taken place in the case of urban schemes affecting particular communities, less attention has been paid to major planning concepts at the

metropolitan, regional, national or international level, beyond the well-known discussion on “megaprojects”.

The paper elaborates on the merits and limitations for transport of the distributional, participatory and social/recognition dimensions of justice, and their disappointing limited influence in decision making at these planning levels.

The paper opens in section 2 with a description of the various perspectives of justice in contemporary political philosophy, and how they have been received by the planning community within the general discussion on planning ethics. Section 3 reviews the differences of transport with other dimensions of spatial planning, and suggests that its comparatively high degree of autonomy facilitates the analysis of the planning cycle in this sector. Section 4 analyses different approaches to justice from transport planning, highlighting their similitudes and differences compared to other planning sectors, and advances a conceptual framework for the analysis of justice in transport planning. Section 5 applies this framework to three case studies: the Trans-European Transport Network, the Spanish National Transport Plan 2005-2020 and Madrid Chamartín redevelopment project², defining their respective decision-making environment, the prevailing justice concept, and the legitimization process for the planning concept. Section 6 concludes suggesting that, although far from being mainstreamed, transport planning is making efforts to assume its complexity, and to adapt its practice to the interrelated justice requirements at the normative (procedural), descriptive (distributional) and cultural (recognition and participation) levels. A pragmatic practice is emerging, probably as a reaction to increasing criticism from the economic community (which attempts to address transport from the classical utilitarian approach) on the one side, and to unsatisfactory results of the autonomous practice, on the other side.

2 PLANNING ETHICS AND JUSTICE

In her extensive review of how ethics are being integrated within planning practice, Hendler (1995) suggests that planning ethics “is based on notions of inclusiveness, communication and equity”. These notions can be seen as a reflection of the evolution of contemporary discussion on justice within political philosophy: the “political turn” from Rawlsian’s distributive justice to Young’s or Fraser’s widening of justice to political participation and communicative action, and the “cultural turn”, to take into account the challenges of an increasingly multicultural and global context. (Benhabib, 1992, Agra, 2008).

From this perspective, equity has been mainly associated to distributional justice, along the traditions of the liberal and the communitarian approaches to the distribution of goods. For the liberal approach, equity is mainly dealing with equal opportunities, so that everybody can have the opportunity to gain access to competences and means acquired through education and other public goods; inequalities as justified as long as they result in a social benefit, with a priority for those that are worse off. As we will see, distributional justice understood as “accessibility to” provides an appealing justification for transport planning to understand itself as a facilitator of distribution, by taking “accessibility” from a purely physical basis. The communitarian criticism to the liberal concept of justice in Rawls and Dworkin as a good with a priority to other goods, and the need to adopt a broader perspective based on the social background of the self (Taylor, 1991).

The position of the critical theory towards distributive justice is partly anticipated by the communitarian perspective. As Walzer (1983) puts it, the objective of justice is more related to domination than to inequality. Incidentally, Walzer’s view of distribution of different goods in their own “spheres” has been appealing to transport planners, eager to keep the autonomy of their discipline (Martens et al, 2012). However, the enlargement of the concept of justice is more ambitious in I.M Young (1990), as she points out three dimensions not considered by the distributional paradigm: structures and procedures for decision making, division of labour, and culture; the ideal of justice would therefore be liberation, rather than equity. Young’s criticism towards the distributional paradigm is shared with N. Fraser (1997): the challenge is to address the ideals of redistribution with those of social recognition, and this can be made through parity of participation.

The challenges of social recognition can be difficult to accommodate with those of economic distribution. The focus on minority groups can be seen as independent and not conflicting the distributional paradigm

(e.g. Kymlicka, 1995). Groups' specific rights have also been inspiring transport planners' criticism of the "average user" paradigm and the customization of the transport system to different social groups.

This quick review has put in evidence three major components within justice: the distributional, the procedural, and the social-cultural. All of them have informed planners' approaches to justice. Uitemark and Nichols (2017, p.38-39) provide a simplified overview of these approaches, along two variables: on the one side substantive conception of justice and on the other side, engagement with communities. The first variable would differentiate among planners focusing on procedure (e.g. the traditional rationalist approach to planning or alternative approaches such as collaborative planning), and those with a strong substantive conception of justice (e.g. the Fainstein's (2010) views on "the just city" or Soja's approach to advocacy planning). Likewise, the second variable would relate to the relationship between planners and marginalized communities, particularly on the leading or supporting role of the former vis-a-vis the latter.

The nature of planners' engagement with communities raises the debate on the actual relevance to be given to the views of the marginalized, at the core of the well-known controversy between Habermas and Foucault. From Habermas's perspective, the merits of the "archeology of knowledge" practiced by Foucault to understand the Lifeworld would be dubious: the position of the marginalised, of those without power or conventional knowledge- so important for Foucault- does not provide particularly valuable components for sound social criticism, as Habermas sees it (Cusset, 2007). The justifications of planners have been twofold: on the one hand, on the basis of the virtues of "local knowledge": in spatial planning, the locals have a particular insight of the social-place relationships that cannot be replaced by technical knowledge, no matter how specialized (Innes, 2004); on the other hand, on the basis of providing a fair balance to a communicative process in which marginalized groups would not be recognised, and would have difficulties to properly participate in the conversation (Healey, 2006).

Notwithstanding these controversies, the case emerges for convergence in practice among planners initially inspired by different views of justice: those with a focus on distributive issues, which could be translated into regular technical tools, for example through a revised concept of the public interest beyond utilitarianism (in the footsteps of Amartya Sen); those with a normative focus on the reform of decision-making institutions and procedures, and those primarily interested in their involvement with marginalized groups through a variety of tools and mechanisms. The prospects for this pragmatic convergence can be better explored within the particular (and maybe parochial) realm of transport planning, as a relative isolated field where these approaches can be better described and analysed.

3 WHAT MAKES TRANSPORT DIFFERENT IN SPATIAL PLANNING

The transport has traditionally enjoyed wide autonomy within the realm of public policies, and has consolidated a particular approach to the planning cycle, compared to spatial planning at large and also with other sectors of public policy strongly linked to physical space, such as water management or energy.

A variety of factors can be mentioned for this autonomy. In first place, the technical/engineering intricacies of the transport system, which makes it easy to engineers to monopolise any discussion by putting forward technical feasibility issues. Technical specialization facilitates the justification for a separate, specialized governance and institutional framework. In some cases, dedicated tax funds or regulations provide the bulk of the funding necessary for system operation, consolidating this autonomy.

This is not to say that the autonomy of transport planning has not often been challenged from different fields. In Western Europe, spatial planning made repeated attempts in the post-war period (1940s-1970s) to integrate transport within a comprehensive planning approach on the basis of optimizing public policies for regional development. In the 1980s, environmental critics suggested to subsume transport within broader public policies favouring sustainable development. More pervasively, critics from the economics field have stressed the virtues of applying the concepts of micro and macro-economics to transport, and to base transport decisions on the same grounds than for any other public policy related to the economy. These critics have stressed the (economic) inefficiencies of decision-making in transport and the virtues of addressing an increasing number of topics in the sector through standard market solutions (e.g. Button, 2010).

technical characteristics of the network. Obviously, mobility and accessibility interact as people and places do: whenever people are distributed in particular places and have interests in conducting activities in other places, they may find that their needs are well or poorly served by the transport system).

Di Ciommo and Lucas (2014) provide an inspiring assessment of equity in transport policies. The case study refers to a road-pricing concept to be implemented in the main orbital motorway in Madrid and the resulting gains and losses in accessibility, due to the different disposable income of residents in different parts of the metropolitan area. Lucas et al. (2016) further elaborate on the use of accessibility indexes in the way economic assessment is currently done, providing an “equity assessment” that could be compared to current utilitarian cost-benefit analysis.

The procedural approach to equity in transport would focus on current governance in transport. The analysis of governance in transport has been particularly active from an environmental perspective. In the last decade, the introduction of compulsory Strategic Environmental Assessments (SEA) for certain plans and programmes in the European Union raised significant discussion on the needs for normative reforms in transport planning. A similar interest has arisen in the last years based on the challenges of sustainability and the achievement of the climate change mitigation targets set up at the Paris Summit (COP22). An early and optimistic reflection is provided by Lawrence (2000), showing the potential of environmental assessment procedures to integrate a disparity of concepts and theories in a flexible way; justice-related concerns could therefore find a favourable framework for formalization through environmental assessment procedures. Sager (2009) draws a dimmer picture, stating how the dominance of the neo-liberal paradigm is driving public policy processes throughout Europe back towards a purely utilitarian, efficiency-focused approach, and is transforming the citizen back into a mere customer, a consumer of transport services. A more recent review of procedures in transport planning is provided by Gudmundsson et al (2016), and is related to the need to reform transport planning procedures in order to cope with sustainability challenges and, particularly, with climate change mitigation. The review of the governance system in transport concludes on the need to reform the current dominance of powerful actors, and the need to open up procedures to other policies, overcoming the current isolation and lack of accountability.

The social/cultural perspective of justice can be approached from the perspective of the involvement of marginalised groups, and the relationship established between planners and these groups. The evidence shows a growing presence of reference to “at risk” groups in policy rhetoric. The identification of marginalised groups seems to be unequal, with generalised presence of references to gender issues, and some focus on people with reduced mobility, children or the elderly, whereas considerations to more specific groups, such as those based on low-income, cultural background or lone parents, are less frequent. Elvy (2014) provides a review of 32 Local Transport Plans in Britain, concluding that current efforts to get marginalised groups involved in transport policy are far from satisfactory. Not surprisingly, the consideration of marginalised groups at the regional or national planning level is still scarcer, for the time being.

A framework for the assessment of the consideration of justice within existing transport policies can be established based on the three perspectives of justice presented above, so that they can be explored in each case study. The distributional perspective would focus on the identification of the “public good” provided by the transport policy and deserving distribution, and the place- or people-focus in the consideration of that public good. The procedural perspective reviews whether potential equity-sensitive procedures (mainly SEA) have been followed, and whether other already existing or ad hoc procedures have also been used, as well as whether the transport policy has resulted in a revision and formalisation of procedures. The socio-cultural perspective takes into consideration the identification of marginalised groups, the level of detail in their definition and the approach to integrate the interests of these groups: from top-down approaches without participation to empowering strategies, advocacy approaches or insurgent actions. Finally, an additional analysis category is set up to assess the degree of openness of the transport sector to other public policies as a result of the planning exercise.

5 JUSTICE IN TRANSPORT PLANNING PRACTICE: THREE CASE STUDIES

The case studies selected for this review refer to transport planning at three different scales: European, national and metropolitan. Although not necessarily representative of currently prevailing planning

practices in Europe, they provide useful evidence of the challenges and difficult options planners have to make in the transport sector.

The first case study refers to the approval process that led to the adoption of the revised guidelines of the Trans-European Network for transport (TEN-T) in 2013 (EU, 2013). The revision started with three technical working groups, put in place to provide a sound methodology for the exercise. The revised TEN-T guidelines, approved in 2013, managed to reduce the ambition of the original TEN-T by selecting a reduced or core network, with 2030 as horizon for completion. This reduction served to liberate the EU from getting involved in projects of a purely regional interest, as had been the case in the past, and received sharp criticism from those considering TEN-T as a key policy for regional development. The new TEN-T guidelines provided some additional requests to member states, for critical aspects that- surprisingly- had not been addressed at the European level, including the need for strategic environmental assessment, network vulnerability and adaptation to climate change and contribution to mitigation of greenhouse gas emissions. The new planning narrative strengthened the "transport efficiency" rationale whereas the previous focus on accessibility and territorial cohesion seemed to be relegated. Otherwise, the new planning narrative remained lacking any ambition on the improvement of the planning process itself. The obvious limitations in terms of access of stakeholders to the deliberative process, lack of formalization of consultation and isolation with respect to other policy fields were not even mentioned (Aparicio, 2017).

The Spanish national transport plan 2005-2020 (Plan Estratégico de Infraestructuras y Transporte, PEIT) was presented as an opportunity to replace the short-term programming without formal participatory and approval procedures with long-term strategic planning based on a collaborative, formalized approach. The plan was successful in establishing a consistent methodology, which was subsequently followed by the plan approved by the new government in 2015, and served to introduce SEA in national transport planning, but failed in consolidating a formalized planning procedure (Aparicio, 2007).

Madrid Puerta Norte (MPN) is an ambitious redevelopment project in the north of Madrid, first proposed in 1994. The redevelopment area includes one of the main railway stations in the city (Chamartín) and other public land (such as the depots of the municipally owned urban bus company, EMT), and the northern section of the urban motorway M-30. The total surface involves more than 3 million m², mostly dedicated to office space. Some densely populated (and mostly low-to-medium income) neighbourhoods within the area or in its vicinity will be deeply impacted by the scheme. The planning concept has been changed at several stages and not agreement has been reached yet among the main stakeholders: the railway company, the real estate developer in charge of the scheme, and the municipality¹. Transport plays a major role in the project, as the functionality of the railway station for commuter and long-distance trains imposes major limitations on land requirements and what can be done in the vicinity of the terminal, and the impressive addition of office space creates new accessibility pressures on the area. Furthermore, the developer's vision of the area as prime office space raises concerns on social segregation and future displacement of residents and activities. The character of the M-30 section in the area (to be maintained as a motorway, with increased capacity to accommodate additional traffic demand or to be transformed into an urban arterial, giving priority to public transport as main access to the new office space) is another point of controversy. After significant reduction in the amount of office space and high-level housing, and prioritization to certain facilities for current residents, an agreement among stakeholders is expected by the end of 2017.

The table below summarizes the main justice-related components in the three planning processes.

¹ <http://distributocastellananorte.com/en/>

	TEN-T	PEIT	Madrid P.N.
Distributional perspective	Focus on efficiency and transport operations. Mobility (people and goods) as a public good. Justice-related challenges such as distribution of EU funds, improvement in access to markets for peripheral regions, reduction of accessibility gaps among regions with a trans-border focus.	Focus on accessibility (place-based). Attempt to define a people-based accessibility concept based on sufficiency, not accomplished. Fair distribution of national transport funds among regions. Avoiding transport subsidies to those better off.	Focus on economic development, and railway expansion. Trickle-down economics. Mixed land uses expected to avoid displacement. Quality of life expected to increase for all (newcomers and residents). Distribution of benefits partly dedicated to public space and transport facilities.
Procedural perspective	Formalised EU “co-decision” procedure, complemented by participatory channels (workshops, working groups...) for selected stakeholders. SEA not undertaken. Basic objectives and scope of the revision process decided at the highest political level. Key stakeholders: national governments, European Parliament and European Commission. Interested regions and socio-economic agents through Committee of the Regions and European Economic and Social Committee.	Ad hoc procedure defined by the government, including SEA. Follow up procedure for plan implementation defined. However, these procedures are not formalised. Key stakeholders: national and regional governments; key transport and construction agents.	Formal procedure established in land-use legislation. Participation: increased public participation lately encouraged by mayor. Key stakeholders: private developer, railway company, municipality. Other agents include other land owners, local economic associations, professional councils and residents’ associations.
Socio-Cultural perspective	No identification of potentially marginalised groups.	Marginalised agents poorly identified (e.g. environmental NGOs); no particular action with marginalised social groups.	Residents generally lacking public support and self-organizing on a voluntary basis. Particular marginalised groups poorly identified, if at all.
Transport Autonomy	Limited interaction with other EU or national policies. Autonomy is reinforced.	Transport autonomy reduced due to (1) plan formally approved and (2) SEA requirements	Transport autonomy limited by the global concept, although major options proposed by transport planners are seldom challenged.

Table 1 – Assessment of the case studies

As a summary, it can be concluded that the three processes show pervasive difficulties to contain the tendency of transport to high autonomy with respect to other public policies and needs. The three case studies provide different approaches to justice (on distribution in the first case, on procedure in the second case and on participation (in the sense of increasing the consensual basis) in the third case, but it can be said that an effort to better identified the justice challenges at stake can be perceived, and is facilitated by the requirements imposed by the formalised procedures set in place, and the planning effort gains in legitimacy compared to the previous situation. However, the planning process seems still far away from the identification and involvement of marginalised groups.

6 CONCLUSIONS

It is fair saying that none of the case studies reviewed show evidence of taking justice at the core of the planning process, but rather as an additional consideration to be addressed in general, rather than specific terms. Under this framework it is not surprising that technical experts and planners are being asked to “integrate” justice considerations within their approach, rather than undertaking a serious procedure to engage marginalised agents or to reform existing procedures: the vision of planners as facilitators of dialog seem to be absent in these case studies.

The distributive value of the transport scheme is highlighted in all case studies. In all cases, the key stakeholders remain fully confident of the virtues of markets to fairly distribute the benefits, and the capacity of transport to provide those benefits. Past imbalances are expected to be corrected by providing more equal access to the transport system to all relevant actors, thus fostering the expansion of the system. It can be argued the limited capacity of transport to provide significant accessibility gains, and to effectively reduce remaining accessibility gaps once the system has reached a significant level of development, as is the case in Europe: under these conditions, the confidence on the distributional capacities of transport systems seems poorly founded; on the contrary it could be claimed that such focus on “distributing accessibility” is probably a bad (and expensive for the public sector) idea. Following the Rawlsian approach to inequalities, unequal accessibility could be justified by the contribution it provides to society at large, if these benefits are properly redistributed, at their turn: this would require a different approach to transport policy assessment.

Procedures do matter, but they cannot provide for justice on their own, and they can be effective only in the medium and long term. New procedures are difficult to implement and even more difficult to get formalized and enforced by legislation. In the meantime, planning professionals can see an opportunity in exploring and strengthening existing procedures, and making better use of them. SEA offers a good example of the potential and limits of formalised procedures: it was influential in getting the planning process better formalised in Spain (PEIT), but it has been repeatedly avoided by European authorities (TEN-T). All in all, a procedural approach to justice looks like a long-term battle, with limited concrete results in the short and medium term.

Notwithstanding the existence of formalised procedures (as in MPN), public authorities do retain a strong control of the planning process, and can effectively make use of it. Timing is particularly relevant: as long as public authorities do not feel the pressure of self-imposed deadlines, they can try to improve results through extended negotiations: most stakeholders are open to accommodate their goals and strategies to perceived changes in the political environment and priorities. This can be discouraging for the weakest stakeholders, who need quick responses, but there is evidence that quickly agreed deals do not usually take much care of those interests.

The marginalization of social groups remains a major challenge in most transport schemes and policies, and attempts to address them are too weak to be effective. Ironically, the opposite is obvious in some cases: the beneficiaries of transport projects happen to be a minority of privileged social groups, without raising much concern among planners, on the basis of the expected trickle-down effects...

Under the current approach, transport planning processes tend to result in an ever-growing request for scarce resources, with no comparatively reasonable results in terms of justice. There could be a case for further reducing the well-established autonomy of transport policies, encouraging more acute competition among bureaucracies for public resources, as this could provide comparisons among the justice dimension in alternative policies. At any rate, it is fair to say that the concept of justice remains problematic in transport planning, but this should not be surprising for this and for any other discussion dealing with values. Even under this uncertainty, we can agree with Berlin that transport planners and professionals at large, even if they may not fully agree on their visions, they will certainly be able to describe what most of them, in most cases, would easily perceive as outrageous injustice¹.

ID 1600 | IF NEOLIBERALISM IS EVERYTHING, MAYBE IS IT NOTHING? QUESTIONING NEOLIBERAL IDEOLOGY IN SPATIAL POLICIES AND PROJECTS

Simonetta Armondi¹

¹Politecnico di Milano

simonetta.armondi@polimi.it

1 INTRODUCTION

Neoliberalism is held to be the dominant and pervasive economic policy agenda of our times, apowerful and expansive political rationality of class domination and exploitation, the manifestation of 'capitalresurgent'. Anderson describes it as 'the most successful ideology in world history' (Anderson 2000, 17). This paper tries to demonstrate how the new development project MilanoSesto in the metropolitancy of Milan, Italy – an ongoing large-scale development project of housing, retail, offices, and publicservices, symbolically built on former Falck steelwork industrial areas – can't be understood as one of the embodiment of current pervasive neoliberal planning practice of the Western societies.

Using this example, it is argued that contemporary transformation projects – and in particular largescaleurban development projects – are the epitome of a set of contradictory processes, but cannot beunderstood as an example of ‘actually existing neoliberalism’.

North East Milan is a particularly complex spatial context, one of the former heartlands of westernEuropean Fordism which experienced a significant level of deindustrialization and a reconfiguration ofproduction at the local scale, with the crisis of the Fordist mass production system. In the ‘90s, North EastMilan was also subject to an intensive process of tertiarisation, triggered by decline in the manufacturingsector and exacerbating some of the structural change processes already initiated in previous years. With adensely populated and infrastructured territory, North East Milan is currently facing a second round ofeconomic restructuring following the economic shock caused by the global financial crisis in 2008.The paper reflects the change of an established sector of the urban region to grasp the socio-spatialrelation and dynamics that characterized the geography of North East Milan during three main, intertwined,phases of capitalist development:

- the long phase of growth and urban expansion;
- the season of the Fordist crisis and the subsequent economic restructuring;
- the current cycle of economic and spatial shrinkage after the 2008 global crisis.

The paper analyses the different construction processes and treatment of problems that define thespace of public policies and private transformation projects, questioning if it can be identified as neoliberalplanning project.

2 DEALING WITH THE CONTESTED AND UNSTABLE CARACTER OF NEOLIBERALISM

After a long period of constantly hostile critique of the pervasive neoliberalism paradigm incontemporary cities by critical neoliberalism literature(e.g. Peck, 2010; Springer et al., 2016, Rossi, 2017), inthe recent literature a number of authors have focused on the ambiguity and strong contradictions in whatdifferent approaches identify as neoliberal (Venugopal, Storper 2016), also in planning practices (Sager, 2015).Venugopal in particular recognizes that neoliberalism is almost everything, in fact a conceptualproliferation related to neoliberalism critique has led to the over-identification of different sets ofunconnected phenomena under a single misleading label (in which neo-liberalism is confused with classicallyliberalism). Oddly there is no contemporary theories or body of knowledge that calls itself neoliberalism, norpolicy makers that implement it. Also in planning practices, advocates of market deregulation, private sectorledgrowth, real estate developers, and any of the components that radical urban theorists call ‘neoliberal’,define themselves neoliberal. Instead, paradoxically, “neoliberalism is defined, conceptualized and deployedexclusively by those who stand in evident opposition to it” (Venugopal, 2015, 170).

3 ENTANGLED ROUNDS OF SPATIAL RESTRUCTURING IN THE NORTH MILAN URBAN REGION

For much of the last century, North Milan in general, and Sesto San Giovanni in particular,represented a kind of incarnation – the purest – of the Fordist model of development in which the crisis ofthat industrial geography assumed dramatic proportions and visibility. North Milan as an historic region ofthe economic development of Milan and Lombardy, can be interpreted as an enlightening “litmus test”, emblematic of the current processes.

In the recent strategic plan of the Metropolitan City of Milan (2016), North Milan is identified withseven municipalities (Cinisello Balsamo, Cormano, Bresso, Cologno Monzese, Sesto San Giovanni, CusanoMilanino, and Paderno Dugnano), in an area of 5,788 hectares with important demographic weight –registering 315,494 inhabitants – and intense economic activities with 120,039 employees. However, the boundaries of North Milan do not exist from the administrative point of view. The geography of NorthMilan as a whole is a policy outcome and was structured in the early twentieth century through a variety ofinvestment decisions and policy agendas imposed from outside and other scales – industrial

decentralization– and by reason of local social processes, for instance the formation of a skilled labour force.

In addition, the northern urban strip of Milan municipality area has been home to the Pirelli industry from the early twentieth century. Industrial plants were abandoned in the 1980s, and after an international urban design competition, Bicocca Project was realized between 1983 and 2008. This is one of the largest urban transformation projects in Milan by size (700,000 square meters) with innovative urban functions in culture and knowledge economy such as: the new Milano-Bicocca university, the Pirelli HangarBicocca (Fig. 8) – one of the largest centers of contemporary art in Europe –, research centers, a residential neighborhood, and the great Arcimboldi theater (Fig. 6).

Looking at the spatial pattern side, two elements generated the North Milan geography:

- the territorial structure formed along the northern axis, governed by an investment of the ruling class between the 1800s and the 1900s since the industrial settlements between the northern part of Milan and the municipality of Sesto San Giovanni (in relation to the railway line) and the location of several housing developments for the working class, concerning the municipality of Cinisello in the 1950s and Cologno Monzese in the 1960s.
- The spontaneous process of metropolitan integration and the formation of large urban areas from east to west, from the Sempione area to the Vimercatese one, with a transverse link in the Milan urban region (Fig. 1.X).

The trajectories of three municipalities are essential for the understanding of the nexus between production and spatial patterns.

The historical spatial transformation of Cinisello Balsamo and Cologno Monzese is linked to the large-scale heavy industry development of Sesto San Giovanni. Their growth as medium-size urban centers –with the ability to attract not only dormitory suburbs of social housing in Cinisello and self-construction housing in Cologno, as well as productive activities – occurred after the Second World war, much later than nearby Sesto San Giovanni. From 1951 to 1971 the population of Cinisello, for instance, increased from around 15,000 to more than 77,000. Cologno redefined its urban economic base following the model of the Mediaset system suppliers' network in the audiovisual sector.

The process of urbanization is one of the key elements within this broader geography of capitalist socio-spatial organization (Brenner, 2004). Sesto San Giovanni became the social and productive model of Fordist industry and labour organization. Establishments such as Breda, the Falck steel industry, and the Ercole and Magneti Marelli industry have long characterized the country's industrial ethos, marking a material and symbolic dimension embodying values and social practices closely linked to factory work and working class subscriptions to the Italian Communist Party. The myth generated by these labour and industrial spatial patterns has labelled Sesto San Giovanni as, firstly, the Manchester and, then, the Stalingrad of Italy, but it has for years hidden deep changes throughout the local society. Consequently, the industrialist culture emphasized this leading role, neglecting and limiting important changes in the social and production configuration of Sesto.

The friction between the image of the autonomous city with a strong identity and that of a Milanese satellite city would linger and in some ways is still an open question. In fact, the urban and production renewal of Sesto San Giovanni and North Milan seems contradictory when compared with Milan.

Thus the crisis of the manufacturing industry in the steel and engineering sector (the last blast furnace was shut down in 1995) and the redefinition of the Fordist regulation system mainly hit Sesto San Giovanni – leaving many abandoned industrial buildings and areas – but it also ended up becoming the symbolic representation of the entire North Milan area, profoundly affecting the local social regulation mechanism. The demise of large industrial manufacturing plants was only one aspect of a more general process of transition of the overall production system, which involved both a deep-seated restructuring of the industrial manufacturing apparatus, and the emergence of new production patterns, also based on research and the application of new technologies related to the field of electronics, information technology and multimedia communication.

After the end of the Fordist/Keynesian cycle, North Milan exploited system-diversified production, with small and medium enterprises specialized in construction and trade and, on the manufacturing level, in engineering and in information and communication technologies.

Furthermore, North Milan's historically varied profile begins to take on a unique role as "policymaker" and its borders became increasingly recognizable in the metropolitan area during the 1990s. The main processes of rescaling (Brenner, 2009) that built this territory up as a recognizable area and that led to the pioneering role of the North Milan area in local development policies were as follows (BolocanGoldstein and Pasqui, 1999; Pasqui, 2002).

Firstly, on the national level, the recognition of the territory as a "crisis area" according to law 236/1993. Labelling North Milan as an industrial area in crisis within a national policy, not only had an influence on additional financial resources for the promotion of active employment policies and reindustrialization initiatives, but also a growing inter-relationship between the various municipalities in regards to redefining a development path for the area.

Secondly, on the local level, the establishment in 1996 of the North Milan Development Agency (ASNM), limited company under private law whose shareholders are the main four municipalities (thus a very different structure from the Anglo-Saxon example of Urban Development Corporations); initially a company for the management of re-industrialization processes, the ASNM has gradually taken on the role of accompanying actor and pioneering promoter of local development, also supporting the drafting of a North Milan Strategic Plan.

Thirdly, always on the local level, the practice of sharing policies between local governments and especially among pro-active mayors directly elected by citizens by the mid-1990s.

Fourthly, at that time on the national level, a different specific programming context – the so-called *programmazione negoziata* - started up in Italy. This type of negotiated programming had explicit contractual content which aimed to reconsider the tools and forms of public intervention in the economy, promoting endogenous economic development in weaker areas of the country (Governa & Salone, 2005).

Together, these processes and policies contributed to shaping North Milan; this territory is therefore the result of a plurality of processes, policies, framing and reframing activities in which a number of different actors have participated on various levels.

After the decline of the Fordist model and the consequent dramatic de-industrialization, following the closure of large scale industry in the steel and metallurgical sectors, the production system has been severely weakened by the global financial crisis of 2008, with a 33% decrease in employees in the manufacturing sector between 2001 and 2011 (see Table 1).

The economy of North Milan has undergone a troublesome period. The shifting hierarchies of international economic networks passed it by for the most part, and even multinational companies like Oracle, but also headquarters and large electromechanical manufacturers such as Aab or Alstom industry, which set up business in the area in the early 2000s, partly left Sesto San Giovanni. This shift is partly counterbalanced by a high share of employees in innovative sector (Table 1).

Even the ASNM, after passing under the control of the province of Milan (its majority shareholder), which was subsequently renamed Milano Metropoli Spa, closed in 2013, leaving thirty employees out of work.

	1971. Population	2011. Population	Tot. workers 2001	Tot. workers 2011	Change 2001- 2011 workers (manufacturing)	Change 2001-2011 workers (commerce)	Change 2001-2011 workers (financial, insurance, real estate, professional)	2011. Share of employees in innovative sector
Milan	1,732,000	1,242,123	688,427	773,571	-23%	5%	5%	0.18
North Milan ²	324,977	304,601	102,015	106,064	-33%	8%	23%	0.91

Table 1 - North Milan before and during economic crisis: socio-economic data

4 THE UNCERTAIN FATE OF THE LARGE VACANT INDUSTRIAL AREA: THE MILANOSESTO URBAN DEVELOPMENT PROJECT

The project of the former Falck steel industrial area in Sesto San Giovanni is a paradigmatic case of a large scale development project – the most important example of urban transformation and functional renewal – undertaken in the Milan urban region, that traversed the three established periodization of capitalist development. There is a significant amount of vacant industrial areas in Sesto San Giovanni – around 235 hectares, about one fifth of its municipal area – suitable for potential transformation. The entire area subject to intervention – 1,430,000 square meters – is the largest in the Milan urban region and maybe the largest regeneration project of former industrial area in Europe.: larger even than that of Expo, which measures 1.1 million meters square.

- 1980s-1995. Falck industrial activities suspended.
- 1995. First development project by Kenzo Tange commissioned by the Falck company. The project is focused around the realization of theme parks.
- 1997. First land use change in the Sesto land use plan (from industry to services, housing and park).
- 1998. International competition organized by ASNM on “Falck areas urban park” (project winner by Paola Viganò).
- 2000. Falck areas are sold to a local developer (Pasini) for about 190 million euro.
- 2001. Master plan for a business center by a group directed by Mario Botta. The economic functions were strongly pushed forward by a private sector investment with a bank (Banca Intesa).
- 2001. Project proposal by Pasini for a residential project.
- 2004. New land use plan approved, reducing the volumes.
- 2005. Conflict between property owner and public administration. Pasini sells the areas to a national developer (Risanamento, owned by Zunino) for 218 million euro.
- 2006. First Master Plan proposal by Renzo Piano based on previous activities with working groups involving the citizens.
- 2007. Program Agreement between the Municipality and Lombardy region for the environment reclamation.
- 2008. PII (integrated initiative plan) proposal by Risanamento.
- 2009. New land use plan of the Sesto municipality.
- 2010. Risanamento files for bankruptcy.
- 2010. Risanamento sells the areas to a new developer (Sesto Immobiliare, poi MilanoSesto). Value: 405 million euro.
- February 2011. New PII proposal based on a revision of Renzo Piano’s Master Plan.
- July 2011. Inquiry into corruption, involving developers and the Municipality.
- September 2011. PII approved with 900,000 of park. Consequently Risanamento Spa is granted double the volumes given to the previous owner.
- 2012. Agreement Programming on the implementation of the City of Health and Research in the municipality of Sesto San Giovanni. The City gives the area to MilanoSesto, owner of Falck areas. Currently MilanoSesto holds the commission for the land reclamation (38 million euro). Following reclamation, the Municipality concedes the area for free to the Lombardy Region, to build the City of Health and Research.
- 2016. Agreement between the developer and Fawaz Alhokair, a Saudi Arabian group. MilanoSesto sells 130,000 (for 500 million euro) to Fawaz for the new development of a shopping center and a leisure park.

The analysis of the complex and yet incomplete progress of the project (Tab. 2) contests the existence of a pro-growth coalition. Following Storper (2016) it confirms that cities and regions are extensively regulated, especially land use and housing. Instead, we can find a deep-rooted left-wing municipality exhibiting a nostalgia for its industrial past and hesitant in defining a strong and shared trans-scalar policy agenda for urban renewal of the historical vacant industrial areas.

Tot. Gross Floor Area Project	1.012.134
Gross Floor Area residential	607.280
Housing	485.824
Affordable housing (20% del tot.)	121.456

Social housing	11.907
Private parking lots	602.409

Table 2 – Former Falck Areas Building Program (MilanoSesto)

Early 2013 was a crucial time, because with a trans-scalar governance process, regional and local governments and the private foundation (Besta neurological hospital and Milanese Tumor institute) signed their intention to join this project and agreed to search for practical solutions to the implementation thereof by relocating the two hospitals in a new City of Health and Research (180,000 square meters). After twenty-one years of expectations, two competitions, the involvement of architects (Kenzo Tange, Mario Botta, Renzo Piano), and the recent new real estate investment by a Saudi Arabian global real estate investor-buyer, and the new manager of the MilanoSesto society Carlo Masseroli – former councilor of the past Milanese center-right urban government, identified with a laissez-faire approach in urban policies, labelled 'neoliberal' –, important issues like infrastructure and the high strategic trans-scalar potential of the advanced services localized in the activities City of Health and Research, but also to the development of the shopping center and leisure park, were not outlined in the local, metropolitan and regional settings of governance.

5 CONCLUSION. NEOLIBERALISM AS AN IDLE LABEL?

A number of authors emphasized the neoliberal character of the urban project transformation for former Falck areas, similar to other large – scale urban development projects (Baeten, 2012). Notwithstanding these interpretations, it is very hard to recognize a fixed neoliberal strategy in the extended, problematic, former area Falck transformation, such as the reworking of actors, policies institutions and regulatory framework in order to facilitate market driven land use changes.

The current global socio-economic crisis is related to multiple local events of preceding cycles under capitalism and is manifested in a series of socio-spatial effects. Is in the present conjuncture, as it was in the 1960s and in the late 1990s, North Milan a territory of urban change, experimentation of new relationships between spatial organization, settlement forms of the new economies and urban development that challenge both the traditional hierarchical urban image and the city/hinterland nexus? How do crisis and austerity mold urban regional geographies? This contribution has showed that in time of austerity North Milan is witnessing the emergence of a much greater unevenness in local systems that has

led to the development of a mosaic of differentiated productions of space, that does not support a claim of removal of the public sector from the urban policies and with the imposition of a market 'attitude'.

In North Milan a number of controversial, entrenched spatial strategies emerge.

Since the 2008 economic crisis, large scale development projects haven't captured the most interesting spatial transformations, in particular in Southern European territories (Knieling & Othengrafen, 2016). On the one hand, the effects of the global crisis and the negotiation over land use regulation, are making it difficult to carry out large urban transformation projects, such as in Falck areas. Some of those that are related to vast industrial vacant areas often stagnate due to the difficulties and bankruptcy of real estate investors and construction industry developers. There is little chance of investment, especially when compared to the demand of very large complex developments projects.

The singular large urban transformation project has trans-scalar effects not only redesigning and the local geography of governance (Büdenbender & Golubchikov, 2017), but also getting stuck in a trans-scalar territorial relations system which was profoundly changed as a result of the economic recession.

Nonetheless, large scale development projects are poorly integrated into the wider urban region processes and planning system. As a consequence, their impact on the urban area as a whole and on the areas where the projects are located remains ambiguous. Place branding in former Falck areas is a crucial example. The label "City of Health and Research" focuses on the representation of healthy space, considered as a permanent, singular, and sanitized image of place, which nonetheless inevitably means highlighting some elements and neglecting others.

Furthermore, the geopolitical domain of transregional policies and governance is remarkably absent. Although situated in the heart of the Lombardy region, former Falck areas do not serve as a "model" for border-crossing initiatives and new networks. Despite representing the broadest example of former industrial area redevelopment projects, the former Falck areas do not even have strategic priority in national, regional, and metropolitan policies.

To conclude neoliberalism as analytical framework is becoming inconsistent and useless, a sort of idle and – definitely – mainstream categorization to describe almost every contemporary urban transformations.

Instead of using (again) the neoliberalism as a cover, we have to move toward a deep understanding of the fleeting, complex and nuanced geographical urban processes related to both the role of planning and policies (Armondi & Bruzzese, 2017) in contemporary societies.

ID 1612 | WHEN ACTIVISM MEETS RADICAL POLITICS - LANDSCAPE PLANNING AS A CATALYST FOR TRANSFORMATIVE CHANGE

Louis Albrechts¹; Angela Barbanente²; Valeria Monno²

¹Catholic University of Leuven; ²Politecnico di Bari

angela.barbanente@poliba.it

1 INTRODUCTION

Planning for radical change has been conceptualized in different ways. A number of strong manifestos for change have been drawn up – for reconsidering the absolute faith in economic growth (Mishan, 1967; Hamilton, 2004), for living inter-culturally (Landry, 2000; Sandercock, 1998, 2003), for creating a more sustainable society (Sachs and Esteva, 2003), for social mobilization (Friedmann 1987), for an urban political ecology (Heynen et al., 2005), for recapturing democracy (Purcell, 2008) and for a more radical planning (Albrechts, 2013, 2015). In the vast literature that has been produced on approaches, forms and contents of radical planning, to our knowledge, there are no examples that discuss planning experiences developed by regional governments inspired by program guidelines explicitly aimed at countering neoliberalism (see also Purcell, 2009 on resisting neoliberalization).

This paper documents a planning/political process – the Territory-Landscape plan-making process developed in Apulia region¹, from 2007 to 2015-that counteracts the pervasive penetration of neoliberal thinking in the urban and regional planning practices. The relevance of this plan is that it parallels the coming into office of a new regional government elected in 2005 on the basis of a reaction against the excesses of a harsh neoliberal policy in Apulia a region that is characterized by a persistent social, economic, cultural and political issue of regional inequality.

The current competences of Apulia region essentially stem from the reform of 1999 that introduced the direct election of regional presidents and the constitutional reform of 2001. Both were approved by the centre-left government under pressure from the Northern League. These reforms furnished Italian regions with greater symbolic recognition, legislative autonomy and the scope for future implementation of fiscal autonomy (Masseti and Toubreau, 2013). As an ordinary-statute region, Apulia, gained "concurrent legislative powers" with the state, inter alia, in the issues of territorial government, management and enhancement of cultural and environmental heritage, infrastructures, protection of health². Even though, as

¹ Apulia, with about 4,1 million inhabitants in an area of 19,347 sq. km., is one of the fifteen ordinary-statute regions that together with five special-statute regions cover all the country and compose the "regional state" of Italy (Groppi and Scattone, 2012). It is located in the southern part of the peninsula, called Mezzogiorno and interested by the social, economic, cultural and political issue of regional inequality that since the late 1800s has been known as "Southern Question".

² Thus it is not possible to understand the Italian planning system and territorial transformations without linking it to regionalisation processes (Gelli 2001), and the consequent progressive differentiation of spatial planning models among regions (Lingua and Servillo, 2014). During all its existence as a unified state, Italy has seen a shifting tension between centralism and regionalism, centripetal and centrifugal forces of politics and administration (King 1987, 327), which have often resolved in failed attempts of institutional reforms (Bull and Pasquino 2007). However, in the recent years, similarly to other Western European countries, Italy faced a trend towards regionalism, i.e. the transfer of state power downwards towards the state's regional levels (Newman and Thornley 1996, 40).

Hudson (2005, 621) put it, regional authorities claim that “what has been devolved [to them] is responsibility without authority, power and resources.”¹

The Territory-Landscape plan-making process can be considered as an “extreme/deviant case” (Flyvbjerg, 2006, 229) from different points of view. The Territory-Landscape planning process is one among the few radical planning/political processes that have been developed by a Spatial Planning Department of an Italian region. It reflected the radical change in Apulia with the coming into office of a new regional government in 2005. Where the neoliberal policies promoted economic investments wherever they were located, ignoring territory-landscape collective values and fragilities the new government focused on counteracting the pervasive penetration of neoliberal thinking in urban and regional planning practices. Both the planning process and content are atypical, at least with respect to well-established ideas of political participation, the regional tradition of land-use and landscape planning and the Italian national landscape planning practices. Despite its radical approach and antagonistic feature, the Ministry responsible for landscape considered the plan-making method and procedure as a good practice, since it was the first regional plan that it had managed to bring to an end after about ten years from the approval of the new Italian “Cultural Heritage and Landscape Code” (2004) and fifteen from the signature of the European Landscape Convention (Council of Europe, 2000). This is certainly unusual for a Southern Italian region that is used to negative records both on economy (eg. GDP, employment) and natural resources conservation (high rates of illegal buildings and wells), and is considered unable to produce innovation and change.

Besides drawing on documents and other research materials, the case study is based on the personal experience of one of the authors who from 2005 to 2015 was deputy president of the regional government with responsibility for Spatial Planning, Social Housing, Urban Policy, Landscape, and Cultural Heritage. The frame to investigate the case study was developed through a continuous interaction among the authors.

After this introduction the paper analyses the triggers for change, illustrates the search for a new substantial and procedural approach and finally reflects on what could be learned from the case.

2 TRIGGERS FOR CHANGE

In 2005, the Apulia region was preparing itself to undergo a great political change, which would last for the following ten years. Such a change was the result of a process triggered by two opposite tendencies which had begun few years before.

2.1 TOWARDS A NEW IMAGINARY

The first trend concerns a process of constitution of a new local imaginary that, following Castoriadis (1995), we could define as ‘radical’. Therefore, radical, in this paper, expresses the unpredictable social process that took place in the region and was characterised by the capacity of the local population of re-appropriating imaginaries enclosing “the emergence of something new” (ibid., 1995) in history, and “a new definition of reality, of what counts and of what does not count – therefore, of what does not exist (or nearly so: what can be counted and what cannot enter into accounting books)” (Clark, 2002).

¹ The Apulia regional budget amounts to about € 13 billion in revenues, of which only € 2 are from autonomous taxation capacity, and € 14 billion in expenditure, of which more than 50% is transferred to the regional healthcare companies. As a “convergence-objective region”, Apulia receives a substantial share of European Regional Development Fund (ERDF) and European Social Fund (ESF)³. After the approval of the Community Support Framework 2000-2006, the National Operational Programmes became a “justified exception” to the priority assigned to the Regional Operational Programmes prepared and implemented by the regions³. The proportion of funding directly allocated to and managed by the regions increased from less than 50% in the 1994-1999 cycle to 70%, and this is still the distribution of the 2014-2020 programming cycle. About 65% of the EU cohesion funds managed by the regions are reserved for the five “less developed” southern regions, where a population just under 30% is concentrated.

From a socio-economic point of view, it was produced by a widespread need to dismiss the stigma designating Apulia as a receptor of national funds and exogenous development models and therefore part of a static Mezzogiorno. As such it could be deemed to be unable to become competitive because of its atavistic laziness associated to illegality, the dissipation of public resources and political patronage. As occurred in other Southern Italian regions, the policies of industrial development implemented after WWII had dramatically failed and the local economy had been dominated by the construction sector, agriculture and a labour market based on the very few employment opportunities available in the public administration.

Just like the entire Italian Nation, and despite the surge of neoliberalism, this region of the Italian Mezzogiorno had been living a culturally vital and economically prosperous end of 1900s and beginning of 2000s (QSN, Documento strategico Mezzogiorno: Linee per un nuovo programma Mezzogiorno 2007-2013), determined by the rise of globalisation and the Europeanisation process.

However, in Apulia, such vitality was characterised by unique features. In particular, Europeanisation was perceived and used as the most favourable condition to realise the so many times fought-to and hoped “end of history” of the Mezzogiorno (Viesti, 2003). The rise of the multilevel European governance systems and the new hope for a vital European economy based on small-medium sized enterprises, would eventually terminate the Apulia assimilation to the Italian Mezzogiorno. The myth of creativity and competitiveness were assumed as a powerful picklock to shake the Mezzogiorno. Especially in Apulia, a region that has been often represented (and self-represented) as different from the rest of Mezzogiorno, this myth gives the opportunity to the new small and medium sized entrepreneurial class to lead a novel project of regional development.

The image of the ‘Apulia of districts’ (strengthened by the desire of a local enterprise to be priced in Wall Street) replaced that of a poor agricultural land dominated by several as well as different types of local powerful elites, or mafias. Above all the new wave of entrepreneurialism was trying to build a local network governance based on trust and cooperation rather than political patronage or lobbyism. The emergent multipolar Apulia was looking for something new not necessarily anchored to its past.

On the other hand, if seen from a political and cultural perspective, the radical imaginary was also fuelled by a strong necessity to better understand and valorise the oppressed “local mind” and define a new self-representation of Apulia, to be firmly grounded in the proactive behaviour of its inhabitants and (above all) stakeholders.

In Apulia, just like in the Italian Mezzogiorno, the narrative of crisis and the ghost of being considered an “underdeveloped” local community, or one of the “waste” communities scattered around the world, had not only acted as a social and institutional barrier to radical change, but also as a trigger for local protests against oppression and/or the construction of critical analyses. Mainly based on the intertwinement between the need of survival and ideological belongings, the emergence of such critical analysis had determined a myriad of macro and above all micro political conflicts which in turn had stimulated the construction of social, cultural and political development alternatives, although shared by a relatively small minority if compared to the 4 million inhabitants of the region. The micro-conflicts and the narratives concerning possible alternatives to the idea of a Mezzogiorno as a failed area had shaped a new local storytelling capable of perforating socio-institutional barriers and changing the established collective imaginary.

The pride of being Mediterranean rather than citizens of the Mezzogiorno sketched a sort of third way to be practiced. In effect it stressed that the construction of the Apulian identitarian self was much more necessary than a reference, for example, to sustainability or else. This new consciousness and imaginary were finding a visible place as both a part of a global movement which was fighting to rewrite the history of colonialism and a mere defensive behaviour against the ‘discriminatory’ tendencies of political movements governing the northern regions (and for some time even Italy as a whole). The main goal of such local thinking was to explain the difference between the Mediterranean and Northern thinking and show its potentialities in terms of an alternative world (Cassano, 2005). Around such desire to re-write the local story rather than abolish it altogether with the Mezzogiorno, a cultural alternative (immaterial) movement emerged. It catalysed several different and yet divided components of a nascent but fragmented civil society including catholic movements, the radical left, local environmentalism and others NGOs. Some of

them established more or less close relationships with a group of intellectuals, academicians and professional from different fields, including urban and regional planning.

Although underrepresented, this civil society grew up and its ideas blew in the region inspiring the old as well as the new generations. As happening all over the world, in Apulia too as a result of the crisis of democratic representation, the existing lively local civil society was slowly coming to the light, or taking its first steps. It promoted another democratic political system: one led by the active citizens/society acting in the sake of the common good. However, it lacked leadership and a clear and catalysing alternative developmental model (Cassano, 2004).

2.2 A NEW (RADICAL) REGIONAL GOVERNMENT

In 2005, opposed by a great part of the general staff of the Italian centre left, Nichi Vendola, a politician of the so called radical left, i.e. Partito della Rifondazione Comunista (Party of the Communist Re-foundation), surprisingly won the Apulia regional primaries and then became president of the regional government. This was the first direct participation of the Left in the government of this region in the past uninterruptedly governed by centre and right political coalitions. The new government was able to propose a different vision of fulfilment and hope, which offered conviction and steadfast commitment (see also Amin and Thrift, 2013, 184): the president was re-elected in March 2010, and thus his government became the most enduring in the history of the region.

The reasons for this unexpected election are manifold. Their roots are in the social, cultural and economic processes outlined in the previous paragraph combined with the widespread mistrust in the local political leadership in both the well-established right and centre-left wing, equally considered in some way responsible for the effects of more and more aggressive neoliberal public policies and the dismantlement of the welfare state.

Vendola was deeply rooted in the regional context, ever engaged in the most important local emancipatory struggles, and well known as vice-president of the anti-mafia parliamentary committee. He was able to turn discontent into a new hope in an enlightened political leadership and radically different social, economic, environmental and cultural policies directed not by a clientelistic machine but entrusted to competent members of politics and civil society. He was strongly supported by political, social and cultural movements, more or less organised in "Civic participation committees", and spontaneously born anywhere in Apulia out of already active civil society groups on local political-administrative issues (Romano, 2005).

Merging in unique manner leadership and participationistic rituals (Romano, 2009), he expressed a radical alternative to the centre-right managerial, technocratic, efficiency-oriented style of government of the president that had ruled from 2000 to 2005 and who lost the 2005 elections (Gelli, 2006).

Leaving aside the controversial issue of the actual results of the implemented policies, the new government offered the perspective for a radical change from the historical condition of marginality to a new identity based on its Mediterranean vocation and from the well-rooted practices of clientelism to unconventional grassroots democracy (Duran, 2015, 251-252). It proposed an alternative model of development focused on the enhancement of regional resources: social capital, especially youth, and considered culture and environment as common goods (Damiani, 2011). The "Programmatic statements" specified the initiation of "a new development cycle based on the strengthening of tangible and intangible resources, set up by women, men, youth, and cultural and environmental heritage of the territory (...) ". In a region with a history of exogenous socioeconomic dominations and dependencies, this is a demanding challenge, which requires many and differentiated instruments to be implemented, including new planning tools, as the "Programmatic statements" clarify. For those parts of the Apulia society who had opposed regional spatial planning policies that had used the unemployment blackmail as a weapon to build consensus on their affairs, destroying common goods for the benefit of economic powers and worsening social and environmental injustices, the establishment of a new government that critically challenged such practices, was seen as a sort of achievement of the impossible.

2.3 A LANDSCAPE-TERRITORY PLAN AS CATALYST FOR TRANSFORMATIVE PRACTICES

The decision to initiate a new Territory-Landscape Plan (T-LP) must be seen against the background of political and cultural climate sketched above. In Italy, landscape planning has been traditionally confined in a sector and island vision: detached from the complex and conflictive transformations of the territory. The plan, for the first time in Italy, according to the European Landscape Convention (ELC), extends landscape policies to the entire territory, including urban and rural areas, outstanding as well as everyday or degraded landscapes, abandoning the traditional focus on “natural beauty” or extra-urban spaces of landscape protection (Gambino, 2015).

The T-LP is a statutory spatial planning instrument, legally required by the State Legislative Decree No. 42 of 2004 (amended in 2006 and 2008), known as the “Cultural Heritage and Landscape Code” (Code). This combines the principles of ELC with the Italian legal system of landscape protection. The Code provides that all the Italian regions approve a landscape plan that must contain binding rules aiming at preserving the parts of landscape protected by national laws or decrees, to be concerted with the Ministry responsible for landscape.

However, the Apulia regional government did not promote the T-LP because the approval of such instrument became compulsory for Italian regions. Actually the Code does not imply any sanction for the Regions that do not respect this obligation. In this sense, the decision to carry out the plan relies on the voluntary agreement of the regional government's members, with the support of parts of civil society and intellectuals from different fields. The new Italian landscape legislation and the concept of landscape as defined by the ELC were considered levers to start the construction of a new history in the interpretation and development of regional territory. The plan was looked upon as a unique opportunity to change the local culture and practices of territorial transformation in line with the political vision and programmatic declarations.

The main arguments for the government's decision to take the landscape plan as a spearhead for its transformative ideas are manifold. They are generally related to the political vision that dissociated itself from the so-called ‘emulative paradigm’ (Bevilacqua, 2000), or rather, from the passive acceptance of an exogenous development model, and searches a foundation for a new development model fuelled by its endogenous cultural and natural resources.

The territory-landscape concept served this purpose. Landscape is not anymore the objective, scenic, spatial framework of a location, but a place constituted through the tangible and intangible social and cultural practices that shape the land (Owig 2007, 581). Perception is an integral part of the concept of landscape, well before the ELC established that “Landscape means an area, as perceived by people, whose character is the result of the action and interaction of natural and/or human factors”. The perceptive character of landscape implies a ‘cultural image’ or a way of seeing the world, a subjective observation and experience (Cosgrove and Daniels, 1988; Antrop, 2005). Landscape is a polysemic concept that refers both to the material-physical world and to immaterial values and symbols. It is shaped by values, perceptions, practices, knowledge, wishes and needs, which are met by the physical characteristics of geographical space, modify and are modified during the territorialisation processes (Raffestin, 2012). It is the result of this collectively perceivable change or, in other words, the “empirical manifestation of territoriality” (Turco, 2002, 7) and as such is a result of conflicts and compromises.

Apulia varied landscapes have been largely shaped by human labour in the *longue durée*. The region is characterised by the highest incidence of agricultural land of the Italian regions, the lowest incidence of surface covered by forests, and approximately 900 km of coastline. Thus, in Apulia natural landscapes are rare, while cultural landscapes prevail. These are dynamic social constructions that mirror physical and social change through historical and contextual experience, with important symbolic meanings (Cosgrove, 1984). They are organized at the ‘human scale’, having been ‘built by hand’, and have been historically linked to local society and economy (Selman 2004).

This notion allowed the regional government to intercept the growing social awareness that the post WWII exogenous development models had destroyed in many places the unique intertwining of natural and cultural characters of regional landscapes. Especially in the industrial development poles and in the over-urbanized areas, these development models had produced human and territorial desertification, the

standardization and homogenization of material and immaterial cultures and the consequent loss of local knowledge, experience and skills.

Landscape planning offered arguments in favour of the need of a social reconnection (Selman 2012) of what, in the past decades of intense “modernisation without development” (Sapelli 2005), had been compromised by progressive disconnection and disruption: people’s sensory and social experience of places, attachment to and pride in their living places.

Landscape planning offered the possibility to envision different development perspectives based on the ability to produce, inhabit and transform their own territories by individual subjects acting for the benefit of his/her own well-being, but so contributing also to the good life, without overriding other kinds of goods (Arler, 2011, 497-98). Individual subjects can so be as beneficial in the landscape as those specifically acting in the common good and can contribute to increase the collective well-being and to protect and pass on to future generations a common good such as landscape (Pedroli et al., 2013).

Both the Code and ELC required approving a plan for the entire regional territory, with the selective purpose of improving landscape quality. For the ELC, meeting the “landscape quality objective” involves, for a specific landscape, “the formulation, by the competent public authorities, of the aspirations of the public with regard to the landscape features of their surroundings” (Council of Europe 2000, chap. 1, art. 1, c). This implies that not primarily the experts are to plan and develop landscape, but rather, the people whose daily practices and perceptions shape it (Olwig 2007, 581). This is in tune with the programmatic statement of the regional government, which emphasised the will to “meet the extraordinary demand for public participation” which allowed the election of a ‘off-team’ president, by raising the skills of citizens in the solution of political and social problems, and citizens’ desire and ability of self-organization and self-narration (Gelli, 2006). It also strengthens this programmatic option, as it places this in an international cultural framework of great political potential, thus preventing that it was caught as tied to a closed, narrow perspective, or worse, as a rhetoric.

3 IN SEARCH FOR A NEW APPROACH: CONTENT AND PROCESS

The challenges mentioned above required a great effort to innovate regional, provincial and municipal planning, which cannot be illustrated in this paper. The T-LP is just one of the many new instruments that were approved in the form of laws, guidelines, projects, and documents throughout the administration cycle 2005-2015. The existing fragmented and varied local planning system is still centred on more or less old statutory land use municipal plans. The new regional T-LP could help municipalities (to at least start) to get out of the ditches of an abstract and bureaucratised land use planning and share different ways of interpreting their territory-landscape as a precious common good rather than as a white sheet on which to draw any function or object in return for the promise of some economic investment.

The challenges could not even be met by amending the regional landscape plan which was approved in 2001 in compliance with National Law no. 431/1985. In Puglia it has never been in force a regional territorial plan like those documented in Fabbro (2003). The landscape plan in force lacked any underlying political vision of the landscape role in future regional development. The regional centre-right government had largely entrusted the plan-making process to the technical consultants and regional planning department. They had considered the plan as a mere obligatory fulfilment of the national law.

The plan was reluctantly and hastily approved in 2001, under the threat of the appointment of a state commissioner by the Ministry for Cultural Heritage and Landscape. The plan was based uniquely on the imposition of binding constraints for physical transformation of landscape-protected areas ‘cut out’ according to the national law or the plan itself. These areas were ‘administered’ under the authorities of the Ministry or the Region through landscape authorizations partly devolved to municipalities. How could this plan be used to foster reconnection between territory-landscape and local communities (Selman, 2012)? Moreover, the plan had been progressively socially delegitimized during the implementation by municipal governments, street level bureaucrats, citizens, and entrepreneurs. This was due above all to the out-to-date cartographic base maps and wrongly drawn perimeters of landscape-protected areas. Both gave rise, on the one hand, to blatant injustices and huge legal disputes, on the other hand, to widespread infringement of plan’s rules as combined with insufficient controls, corrupt/collusive practices, and the slowness of justice.

3.1 A STRATEGIC PLAN EMBEDDED IN A STATUTORY SETTING

A new plan based on the inspirations and motivations outlined in the previous paragraphs required a strategic approach, intended as a “self-conscious collective effort to re-imagine a (...) territory and to translate the result into priorities for area investment, conservation measures, strategic infrastructure investments and principles of land use regulation” (Healey, 2004, 46). It comprised the building blocks of an ‘alternative’ strategic (spatial) planning process, since it was conceived as “a democratic, open, selective, and dynamic process” (...), which would have produced “a vision to frame problems, challenges, and short-term actions (...)” (Albrechts, 2004). Landscape intended as an evolution whose collective construction does not cease requires a planning approach that is able to incorporate the before and after that prepare a future which is itself difficult to describe (Raffestin, 2012). The planning process needs to generate collective becomings, with a specific focus on people becoming attached to their living territory-landscape and interested in taking care of it (Metzger, 2013).

Notwithstanding its emphasis on being an instrument (just one of the many) to enable change (Albrechts and Balducci, 2013), the T-LP embodies a regulatory framework designed to prevent the cultural / natural heritage, on whose values the new development vision is based, may be further compromised by the business as usual practices and the neoliberal agenda (Legacy and Leshinsky, 2016). Long-term vision, selective range of objectives and issues, project and action orientation, openness of the plan-making and implementation process, are combined with legal certainty about the boundaries of protected landscapes and clear rules for the authorisation that the Code states for any transformation of them. Both the strategic approach and certainty of rules were emphasised in order to point out the substantial differences from the old landscape plan. So, the tension between the statutory and the strategic characterises the Apulia Territory-Landscape Plan.

As a result, the plan’s form, content and process are innovative in comparison not only with the Apulia planning tradition but also with other regional planning experiences in Italy. The T-LP is clearly detached from the still prevailing “urbanism tradition” emphasising the regulative role of plans (CEC, 1997; Espon, 2007). It is different from the late 1990s-early 2000s regional territorial plans that, at least in their intentions, redefined their aims and nature among principles difficult to harmonise such as sustainability, competitiveness, and territorial cohesion (Fabbro, 2003, 58). It is also distant from the first generation landscape plans, which focused on individual landscapes and were designed separately from regional territorial planning (Cinà, 2000; Gambino, 1988). Its innovative characters is noticeable also in comparison with the only other plan approved so far in accordance with the Code by the Tuscany region (Marson, 2016) and with those still in preparation (Magnaghi, 2016; Gambino, 2011; Quaini, 2011; Garau and Pavan, 2010).

The T-L P does not just seek merely for a better integration with other sectoral plans but gives landscape a central role for the envisioning of future regional development and considers territory-landscape heritage as a foundation of a different model of local development and related territorial transformations. This approach seems to be still rare in Europe, where landscape planning generally remains something of a ‘Cinderella’ activity (Kidd 2013, 378), and is looking for ways to better integrate with statutory planning and go beyond its prevalent interest in distinguished landscapes of special quality and attractiveness (Jorgensen et al. 2015). On the other hand, sectoral integration is not enough, since landscape planning seems anyway to be penalized in favour of other more politically prominent policy areas and to be relegated to single experiences of land owners associations or designated – mainly rural -protected areas. Comparative studies converge in pointing out a few exceptions to this picture, such as Germany and the Netherlands (Kidd, 2012; Voghera, 2011).

The plan is divided into two main parts: the Atlas of Territory-Landscape Heritage and the Strategic Scenario. They can be synthetized as follows.

The Atlas includes the identitarian representations of the regional territory-landscape. These do not reflect a classification of landscapes based on (quantitative and/or qualitative) attributes and scale of values, as in the assessment approach used in most planning experiences in Italy and Europe (Brunetta and Voghera, 2008). The plan represents (with an emphasis on their identitarian characters) the varied of cultural-natural relationships of regional landscape through a systemic ‘structural’ approach which uses diachronic analyses (in geographical, ecological, anthropological, ethnographical, historical and archeological, and territorial terms) to identify the ‘genetic codes’ and identities of places which have been refined over time through the development of co-evolutionary relationships between nature and culture (Magnaghi, 2011).

The Strategic Scenario suggests the future organization of landscapes and serves as a point of reference for specific activities, projects and plans which aim to bring Apulian territory closer to the proposed vision through time.

3.2 MULTIPLE ROLES BETWEEN POLITICIANS, PLANNERS, AND ACTIVISTS

The production of the plan lays is closely linked to the profiles and roles of leading actors.

The deputy president, who promoted the plan, before being appointed in this position, was an activist planner. Since the 1980s, together with a small group of planners and some environmentalist associations, she had been challenging regional planning policies, as opposed to most of the professionals who formed, alongside building contractors and politicians, a very powerful lobby determining urban development, usually without any kind of opposition from local populations. For a long time, these saw the land and rural areas as a punishment and working in the building industry as the only opportunity to aspire to enter into the social lift.

The deputy president entrusted the scientific coordination of the plan to an activist planner, founder of an association called “territorialist school”. The territorialist approach, in line with the political vision, is based on a critical analysis of the contemporary ‘metropolis form’ and its impacts on de-territorialisation, social mobility, the fragmentation of modern urban living, the degradation of public space, the standardisation of landscapes and a functionalist approach to urban development, as the material expressions of Western imperialist rationale, capitalist industrial society and its post-industrial development (Magnaghi, 2005, 7). As a radical alternative, it proposes to promote “self-sustainable local development”. This concept emphasises the balance between three objectives: directing development towards human requirements which cannot be reduced to the material needs, self-reliance and the development of self-government by local society, and enhancing environmental quality (Magnaghi, 2005, IX-X). With reference to the T-LP, the concept implies the ability of local society (and institutions) to rediscover and enhance the local territorial heritage as foundations for an alternative development model, which finds in the reproductive rules of its local resources the self-generating capacity of being durable for the benefit of present and future generations. Being founded on the recognition and appreciation of local territorial identity by local dwellers/producers, and on their ability to (continuously) shape and take care of their living environment, local self-sustainable development requires new forms of participation and learning of local society aiming at increasing their “place consciousness”.

For the first time in the Apulia region the preparation of the plan was assigned to a group of 15 young professionals specialized in different fields, who then became an in-house planning team fully integrated in the organization of the regional planning department.

Planners, in accordance with the political narrative built up by the deputy president, played an important role in the storytelling. Also their storytelling was selective and purposeful; that is, necessarily political (Throgmorton, 2003, 128), i.e. partisan, based on choices that involve values and are contestable. It was not simply persuasive but also constitutive (Throgmorton, 2003, 130). It includes parts that tell the past and parts that are future-oriented: the representation of the criticalities left by the prevailing urban development models in the form of images, maps, diagrams, strengthened the political narrative aiming to demonstrate the urgent need for change such models. Planning knowledge added technical expertise and arguments that helped understand what and why to change. It also provided future-oriented figures/forms/images that enriched the social imaginary and the real and rational works produced by this imaginary. In such a way, the plan documents written or drawn by the scientific coordinator and his young collaborators, and the numerous presentations and discussions of the plan with the public influenced people and culture.

3.3 THE SOCIAL PRODUCTION OF THE PLAN

Both the Atlas and the Scenario were supported by the so called “social production” of the plan, or more specifically the activation and mobilisation of citizens, stakeholders, local administrations, associations since the very beginning of the planning process, in order to bring to the fore patrimonial descriptions, matters, critical situations and to jointly – the regional department together with local institutions and associations -produce “integrated experimental projects” (see below) out of their usual settings.

The engagement of stakeholders and public at large has evolved steadily if sporadically in landscape planning, pushed by the ELC (Selman, 2010) and seems to be limited to experiences at the local scale (Roe, 2013). The plan was participatory in a very unusual way. Besides the promotion of a wide public involvement through hundreds of forum and assemblies, the government and social groups activity interweaved in a peculiar way. Radical change in planning policies (not only in regional landscape planning) was a political perspective that the regional government shared with counter-hegemonic groups that, mostly in isolation, had raised and continued to raise, many local contentious issues and conflicts with/against governmental (state, regional and municipal) decisions that had negative environmental, cultural and socio-economic impacts on their territory. The involvement of these groups was important for the regional government not only in order to enlarge cultural awareness about landscape values or to ensure the social support necessary for the plan to be approved, but also to stir social practices able to defend and promote landscapes as a public good.

The “social production” of the plan was carried out using various tools to involve public and private organizations, institutions, associations, communities and individual inhabitants. Aside from hundreds of informal meetings, thirteen formal conferences were held in several cities to share with local communities landscape knowledge frameworks and planning strategies. In the initial stage of the processes politicians and planners emphasized the negative consequences on the regional territory-landscape of “things” that the myths of economic growth and globalising modernisation have produced: marginal ghetto neighbourhoods lacking primary services and connection with the historical city, low quality, homologated settlements, redundant volumetrically, which have impeded the public use of coastal streams, consumed fertile agricultural land, fragmented open spaces, interrupted ecological continuity and created visual barriers to landscape perception. They projected images and photographs, and set up exhibitions in order to make it evident what many people cannot perceive due to habit, indifference or even insensitivity. In this way, they built a sort of wire that starts from negative situations produced during the recent post WWII decades, and connects them to the future vision and the “integrated experimental projects” mentioned above.

To enlarge public involvement an interactive Internet site made continuously information available on plan-making progress and an on-line “landscape observatory” allowed everybody to point out on interactive maps what they perceived as landscape values to be protected or that have been injured, and what they considered as best and worst practices of landscape transformation to be promoted and replicated. Both tools have been helpful in capturing social meanings and perceptions of landscape. Eco-museums and community mapping were promoted or supported to use the narratives of people who live and work in different areas as a primary information source, and to actively involve people in landscape interpretation, conservation and improvement. A prize was launched for the promotion of best practices in landscape protection and design, and “manifestos” were written for signing agreements with main “landscape producers”: farmers, building contractors and renewable energy companies.

The local knowledge provided by the participants in the initial meetings or collected through the on-line “landscape observatory” offered politicians and planners arguments for a radical critique of the bequest that the dominant regional development model had left in specific places. This narrative was essential to rise social awareness of the consequences on the living environment of a development model that, especially in a “less developed” Southern Italian region, has frantically pursued economic growth and globalising modernisation, which has been freed of territorial constraints and even the territory itself, treating it as a mere support for economic processes, as the source of resources to be exploited to produce goods for the market: wasteful use-abandonment, lack of maintenance, consumption of non-renewable resources such as groundwater and soils, land degradation and desertification, biodiversity reduction. Technical planning knowledge had an important role in order to highlight detrimental effects of “business as usual” to place making and so to nurture the collective aspiration for a practice of transformative planning geared to the protection and improvement of territory-landscape understood as a common good to be safeguarded and used to support a development model able to create greater socio-spatial justice and well-being.

On the other hand, “integrated experimental projects” were developed as co-designing experiences aiming at testing the innovative regulatory corpus of the T-LP, which results in the evolution from a restrictive-regulatory tradition to a complex dynamic planning process. Regional planners/politicians did not use a top-down approach in promoting these projects. They grasped stories of innovative experiences, experimentation niches, not yet known to institutions and the general public, which showed new ways to

protect and enhance territory and landscape heritage. They used them purposively as examples of “concrete utopias” and transformed them into “integrated experimental projects” to show how changes consistent with the normative vision were possible. Then these experimental projects were extended in other less vital regional areas through agreements between the region and local public and private actors. European Structural Funds and Agricultural Fund for Rural Development were used to finance experimental projects design and implementation. Thus, Community programming, instead of requiring ‘special’ procedures to allow the approval of single private projects that do not conform to municipal plans, became to be seen as a support for the regional plan’s implementation. This contributed to re-legitimizing planning (and the plan) as a process (instrument) useful to improve people well-being and trigger local development.

Each of these experimental projects adopted a coproductive type of approach. Thus, they had also the effect of spreading public involvement on the issues of territory-landscape preservation, improvement and rehabilitation in a number of local contexts, and enabling the region to overcome the difficulty of interacting with citizens which typically concerns the regional planning scale.

Examples of experimental projects carried out during the planning process include the multifunctional agricultural park of Paduli in the lower Salento, the multifunctional park of towers and farmhouses in the area north of Bari, requalification projects for a number of peri-urban, coastal and abandoned areas, the construction of soft mobility and pedestrian paths in parks and tourist areas, ecomuseums and community maps. In some cases the region supported projects already started by local communities, in other cases it promoted new projects in areas without public and private proactive actors, using the formers as concrete practices from which the latter could draw inspiration. For example, the construction of community maps and eco-museums in several municipalities in Valle d’Itria and Capitanata was based on the experience that had been developed in Salento since the beginning of 2000s. The agricultural park of Paduli was founded on the experience that had been involving since 2003 a group of youths in the recovery of an abandoned piece of countryside, and later ten municipalities and local (and external) population, in a process of awareness building. This allowed to transform a forest of centuries-old olive trees from an abandoned and degraded area to a propulsive centre of rural local development where to promote new activities related to place identity, such as specialised crafts, foods, cultural artefacts, recreation and tourism.

3.4 OUTPUT OF THE PLAN

As a result of the “social production” of the plan, the Strategic Scenario includes twelve general aims and specific objectives, and five territorial projects for regional landscape which aim at increasing the value of the territory and landscape heritage which was identified through the above-mentioned identitarian representations. They can be summarised as follows:

- the regional ecological network aims to improve the overall connectivity of the regional ecosystem by a multifunctional reinterpretation of existing biodiversity, historic infrastructures, river systems, marshlands, karst pits and the environmental value of rural landscapes;
- the city-countryside pact aims to improve the quality of life both in rural and urban areas by combining urban and agro-silvo-pastoral policies through the regeneration of urban peripheries and the functional strengthening of periurban agricultural areas and the deep countryside by encouraging an alimentary, recreational, hygienic and enjoyable exchange between the city and the countryside;
- the infrastructural system for soft mobility is structured around the (re)discover and improvement of alternative ways of enjoying the regional territory-landscape through networks of ancient roads, cycle lanes, pedestrian footpaths and greenways, scenic railway with lines which go through or brush areas of outstanding landscape value, multifunctional corridors connecting coastal with inland areas, a multimodal coastal transports including a regional ferry service, interchange nodes near railway stations and docks;
- the integrated protection and improvement of coastal landscapes includes sixteen coastal landscapes of high naturalistic value which are to undergo improvement policies assuring the general public to enjoy coastal areas or regeneration policies if on states of decay and deterioration. These policies follow a system of actions and projects which specify and territorialise the general objectives of the strategic scenario in coastal areas: for example, to

ecologically improve recently developed tourist settlements with particular regard to beach tourism, to give the coast more depth by creating synergy with inland areas, to safeguard the long-standing alternation of developed areas and open spaces in order to limit the consumption of land and contrast the formation of a continuous linear front all along the coast, to decompress the coast through building and infrastructure delocalisation;

- the territorial systems of cultural heritage management aims to overcome the logic of cultural heritage protection entrusted with the tracing of a safeguard perimeter, and proposes a project for the fruition of “stratified topographical contexts”, which embraces inter alia points of access to the area from major road networks and soft mobility systems, points of visual perception and of points of access to individual examples of heritage within the area, museums and eco-museums.

The plan entrusts projects’ implementation to public and private subjects by privileging forms of co-design and agreement, and specifically singles out actions, actors and policies to be involved and activated at the regional and local level.

4 WHAT COULD BE LEARNED?

Designing the future by means of the construction of visions and the devise of strategies is a political task, implying societal conversation and political debate (Mazza, 2010). Planning is profoundly intertwined with politics and “the political” since it involves decisions that unavoidably implicate some re-distributive effect, and different costs and benefits for diverse social groups. In the Apulia experience the boundary between politics and planning expertise is fuzzy due to the background in planning of the deputy president responsible for the L-T P. It also illustrates that roles should be not considered fixed in planning annex political processes. But also the boundary between politics and “the political” is blurry, because an activist planner, with a long background of joint commitment with antagonistic groups, became a government member. Thus, she acted as a sort of interface between these groups and the politicians, and thus was an important part of the storytelling.

When seen from the vantage point of practice, the difference between the political and politics which equates to a conflict between a collective and a liberal (individualistic) view of society seems to be reductionist. The co-presence and interplay between the political and politics are almost unavoidable (Castoriadis, 1995; Deleuze and Guattari, 2006).

Seen from the “inside” of movements, dissent is not always aimed at initiating a conscious radical change of society (Zizek, 2013). Moreover, when the emancipatory corresponds to a radical change, the absence of politics and power to materialise it leaves the dissidents without any possibility to see their hopes realized. Therefore dissidents want/need politics. In Apulia some dissidents had the opportunity to find themselves in an authoritarian/leading position and others had the possibility to look at the government not as an antagonist but as an ally. Together they had the opportunity to change the situation they had criticised. Most of them grasped this unique chance for emancipation/change. However, even when working for emancipation/change, hegemonic control is always present, at least until new institutions are created according to the dissidents’ vision.

Activist planners, in their (new) roles of governmental politician and planners, become interceptors of social practices seeking to build citizenship rights in the territory-landscape, stimulators of new social practices, and creators of conditions that favour joint action between activists and regional/local governments, so as to make the exercise of citizenship rights also an opportunity for greater responsibility for people and organizations towards the future of territory-landscape.

The strategic approach to territory-landscape planning did not seek to replace the antagonistic, more open and transparent role and purpose of planning in mediating between conflicting and often irreconcilable interests by highlighting the strategies, mechanisms, actors and networks that mitigate conflict and undermine critical discourse (Oosterlynck and Swyngedouw, 2010, 1580). Its formation was the product of a specific institutional setting which shaped what was imagined as strategic and yet which may come to have the capacity to challenge and transform that setting (Hajer, 2005).

The Apulia T-L planning process can suggest directions for (radical) transformative planning practices, since it was possible to trigger some in a regional context where spatial planning is traditionally weak,

regulations governing land-use and transformation are often infringed, and the market siren is likely to exert a strong attraction due to the high unemployment and low average income levels.

Carrying out “experimental integrated projects” during the plan-making process anticipated the implementation, at least for some significant examples, at the elaboration phase to show “live” the ways in which the T-LP could have been implemented after approval. As mentioned, some projects were already in progress, and the region supported and made them known to a wider audience; others were co-designed by the region together with municipalities or local associations; others are being developed around Apulia after the plan approval, due to the voluntary initiative of municipalities or local groups, for example the ecomuseum of the sail swamp in Taranto promoted by a group of associations and funded by the Foundation with the South, the implementation of city-countryside pact in municipality of San Severo in the Province of Foggia, the integrated project for creating a linear inter-municipal park linking Martina Franca, Noci and Alberobello in Valle d’Itria.

Furthermore, the aim of sustaining on-going experiences and promoting new ones contributed to bring to the fore the milieu, or rather the foundation of a specific collective identity, with its endogenous development potentials related to protection and enhancement of local heritage. This was an important change of perspective after decades of top-down development policies, including the growth-pole policy, which had been dominated by purely functional concerns relating to economic efficiency and modernity. This revealed the potential of social innovation based on culture and identity building (Moulaert et al., 2005) to break self-reinforcing processes at the basis of path-dependence in many distressed areas of Apulia, thereby initiating a process of change that could amount to an unlock-in path (Greco and Di Fabbio, 2014).

The strategic approach was essential for not considering the plan’s intentions, visions and rules just limitations to the individual freedom. Intentions, visions and rules were consistent with a narrative that at least a part of the economic, social, cultural, political groups shared as a support for a new form of self-sustainable development that assigns great protagonism to local communities. Allocating resources to municipalities and local socio-economic actors for projects and actions in line with the plan helped these groups understand that the vision can result in concrete actions, and this further strengthened the legitimacy of the planning process and the reliability of the politicians that had promoted it.

The institutionalization of the new landscape planning narrative, stated in the most sensitive social groups, i.e. its penetration in the norms, attitudes and practices, thus providing a basis for structural change, requires great efforts and much time (Albrechts and Balducci, 2013). The long process of “social production” of the plan was essential to create a common base of storytelling, language, and awareness through interactions. It helped to resolve conflicts triggered mainly by regional opposition councillors and municipalities, landowners, and energy companies in the approval phase.

But, probably more importantly, it is crucial that politics is willing to take risks of proposing a radical change. This requires the ability to demonstrate, through robust arguments and concrete examples, the social, environmental and economic damages caused by the dominant development model in their everyday living places. At the same time it requires building a new imaginary and joining the unthinkable to the experience, that is giving concreteness to this imaginary by means of a series of present actions that show that what seemed to be impossible is possible. This repopulates the political with new visions, hopes, and modes of organisation, taking them out of the cage that makes them consider the present as closed to any kind of change. Of course planning and the political are only a part of this story. Building a coalition of interests around the territory-landscape imaginary is an important (and difficult) task. The political vision underlying government policies has to be -at least in part -consistent with the planning objectives. In the Apulia government experience, tourism, culture, agro-food, and youth policy programmes were considered drivers of a new local development model based on the improvement of cultural and environmental heritage of the territory. These policies and programs produced short-term actions and Community financial resources that contributed to bolster the strategic scenario designed by the Territory-Landscape Plan.

5 EPILOGUE

Strategic planning is usually thought of as producing new images. But these are often “images of” rather than a social imaginary, as conceived by Castoriadis. How can the vision in strategic planning be seen as instituting a radical imaginary? What kind of relationships should be envisioned in strategic planning between instituting and instituted imaginary in order to make planning the beginning of a new history? What happens when strategic planning is used in a context in which the old social imaginary has been challenged and there is already a movement to institute a social imaginary embedding specific emancipatory ideas of social justice? How can the collective and community play a role? How can this problem be faced in order to find new urgent support to the transformative potential of planning? This case study can suggest directions for (radical) transformative planning practices, since it was possible to trigger some deep change in a regional context where spatial planning is traditionally weak, regulations governing the use and transformation of land are often infringed, and the market sirens are likely to exert a strong attraction due to the high unemployment and low average income levels.

ID 1613 | SUBVERTING THE PRESENT, PLANNING THE FUTURE: PROPOSING A COUNTER-PLANNING

Rainer Randolph¹
¹IPPUR / UFRJ, Brasil
rainer.randolph@gmail.com

1 INTRODUCTION

Our discussion references are the realities of contemporary, capitalist societies under the (more or less) domain of a neoliberal market ideology and economy. In this context of political and institutional changes and mobilizations of different orders and scales in streets and squares, there is an increased academic production regarding processes of insurrection and subversion in the most different spheres of politics and society. (Pierce and Williams, 2016, Olson, 2016 and others).

Also in the discussion of different modes of planning, insurgent and subversive practices of planners can be identified under certain circumstances. Sager (2011, pp. 8ff), in a broad systematization of forms of planning, describes a range of situations and activities that characterize planning as "radical" and planners as insurgents and subversives. As he states, in a reference to Friedman, "state engagement in radical planning seems close to contradiction in terms". For this reason, he understands that radical planning is "an oppositional but overt activity performed by planners with their professional base in civil society and with a strong commitment to a cause" (Sager, 2011, p. 9).

Stimulated by experiences of alternative forms of planning, we try to discuss, in this essay, their possibilities and potentialities to contribute to such a "radical" society's transformation as it is put in their proposals. Without referring to a specific country and its society, the adopted approach seeks to show, generically, existing structural conditions for the necessity of "another" planning and its characteristics.

This seems nearly a paradox in the face of discussions about reformulations between State's and society's relations in the sense of transferring public (state) responsibilities and tasks to private agents or to the anonymity of market forces' performances - even in the form of public-private partnerships or new forms of governance with the participation of stakeholders.

Nevertheless, encouraged by the above-mentioned approaches of "radical planning", it is the aim of this text to show why and how, especially in these (neoliberal) societies, planning could gain an even increased potentiality and necessity than in the past.

Our argument will be that it is necessary to abandon planning's main features to anticipate or forecast situations and events in the future; and give up that it has to prepare decisions rationally or even to increase problem solving capacities. Obviously, such conditions would be unconceivable for the traditional planning modes and methods, even of those like communicational and collaborative forms; a discussion about the different modes and their characteristics see in Limonad (Limonad, 2015).

Instead of this, like presented in the title of this essay, planning's main incumbency should be to subvert the relation between present and future: shrink the future and increase the present. This will demand a shift in the "temporal dimension" of planning which has its consequences for the understanding of planning as a social process how will be shown afterwards.

But, there is a second dimension, a "spatial dimension", linked to the understanding of planning practice as an element of producing (social) space. Besides the "subversion" of time, there will be discussed a "subversion" of space (and its representation) as the second constituent element of our argumentation.

Both of them, together, will signify an "epistemological shift" in planning understanding. What we intend to show in this essay is: that planning's future depends on an "epistemological shift" on behalf of time and space in planning. That, dialectically, even a planning, which not wants to be a "planning" in the former sense, remains planning within a shift to a new episteme and a different comprehension of the "world".

Therefore, it is necessary, as hypothesis of the present work about the "subversion" of planning, to "open" the potentials of the present and focus on the (real) potentialities of the future. In other words, it is necessary to "subvert" the very logic of planning.

2 EXPANDING THE PRESENT, CONTRACTING THE FUTURE: VALORIZING DAILY LIFE EXPERIENCES

The contemporary consciousness of time was formed in the end of the eighteenth century with its references to an actual epoch itself and not to the coming eternity that would arise until the final judgment's day. Since then, according to Habermas (Habermas, 1987 ; see also in Randolph, 2016), "past" and "future" are established from a conception where the actuality is a passage to the new. This actuality - the present - "lives in the awareness of the transitoriness of historical events and in the expectation of other configurations in the future. ... Actuality linearizes the rupture with the past as continuous renewal".

Confidence disappears that present problems could be solved in relation to examples from the past; other times do no longer serve as guidance for overcoming problems and time becomes a scarce resource for accomplishing this. Thus, as the author says, modernity finds itself "completely abandoned to itself, it has to extract from itself its normativity. From now on, authentic actuality is the place where the continuation of tradition and innovation are intertwined". Planning certainly belongs to this place of intertwining tradition (past) and innovation (future).

With respect to the future – as an "utopia" –, as expectation of better and less endangered life forms, it was only in the Twentieth Century that future – as utopia – was "rehabilitated as an unsuspected medium for the design of alternative possibilities of life, which must be potentialized in the historical process itself. The utopian perspective (of futures) was inscribed in the very consciousness of politically effective history" (Habermas, 1987).

Like Habermas, Boaventura Santos realizes a reading of time and highlights the change of comprehension that occurred in recent periods. He identifies, on one hand, a contracting of the present and, on the other hand, an expansion of the future. The contraction of the present, occasioned by a peculiar conception of wholeness, transforms the present into a fledged moment, entrenched between the past and the future. In the same way, the linear conception of time and the planning of history allowed to expand the future indefinitely. It seems, that, the broader the future, the brighter are the expectations confronted with the experiences of the present (Santos, 2003).

Nowadays, besides the ending of the utopian energies, alleged by Habermas, Santos affirms that this situation of valorization of the future by neglecting the present is responsible for a huge waste of social experiences as it conceals and discredits alternatives to neoliberal globalization and capitalism produced by social movements and non-governmental organizations.

To change this situation, it is necessary to work with "a different model of rationality. Without a critique of the Western rationality model for at least the last 200 years, all proposals presented by a new social analysis, however they may be judged as alternatives, will tend to reproduce the same effect of concealment and discredit" (Santos, 2003).

The central argument for our discussion is the author's proposition that another rationality must pursue, "in this phase of transition, ... the reverse trajectory: expanding the present and contracting the future. Only in this way will it be possible to create a space-time necessary to know and value the inexhaustible social experience that is going on in today's world".

For "expanding the present", Santos (2003, p. 4) proposes a sociology of absences; for "contracting the future," a sociology of emergencies. Without following in more depth or details Santos' argumentation, his approach can give valuable indications to identify essential characteristics of actions which can promote the valorization of the present as the very moment to recognize its future potentialities. In this way, "expansion" of the present – to the future – will be "contract" the future to the potentialities of the present (in Bloch's words, to a "concrete utopia").

The subversion of planning means that “planning” itself should be able, in practice, to contribute to extension of the “present”; in other words, to the expansion of social experiences already available, as well as to experiences as potentialities of the present. But, in Santos’ perspective, there are two problems with the multiplication and diversification of the available experiences: “... the problem of extreme fragmentation or atomization of the real and the problem, derived from the first, of the impossibility of giving meaning. This author “solves” these problems by two forms of reason: a metonymic and a proleptic one which seem to involve some “planning” afford. We shall argue, that these “problems” have to and can be solved by the same actors who create their experiences in their own “rationale”.

To show how this will be possible, it is necessary to take a look at an opposition between two different reasons which are responsible, on the one hand, for the above-mentioned reduction of present and expansion of future, which shall be called an “instrumental” reason; and, on the other hand, for a certain “survival” of social actions and forms of social reproduction responsible that there are even social experiences, not submitted to that instrumental reason. Without this “communicational” reason – not submitted, entirely, to the “dialectic” of reduction/expansion of time - there would be no possibility to think in social experiences which could have the potential to confront the reduction/expansion processes, promoted by traditional planning processes.

But, as we have shown in other place, it is not the simple communicative speech act which will be able to confront the instrumental reason (Randolph, 2015). We will discover first indications about the characteristics of this “new” (“subversive”) actions by adopting a “pragmatic turn” in linguistics as introduced by Habermas (Habermas, 1990).

In its preparation phase, these actions will have, to some extent, characteristics similar to those of communicative actions. Thus, the same way as in the pragmatic perspective of communication contacts between life-world agents cannot be based on a pretension of “truth” as a (“true”) representation (speech) of the objective world. Appealing to this (objective) “truth” is indeed a very common strategy in attempts of “experts” who advocate being the “masters” of the truth - even by relying on scientific knowledge.

Regarding the turn, (pragmatic) “truth” of any action depends on the relations of sincerity and correction between those life-world agents engaged in an action against that reduction/expansion processes.

Preserving sincerity and correctness is essential in order not to jeopardize the very power of this type of action that has its origin, in the last instance, in the collective recognition - through communicative rationality - of the contradiction between the two reasons mentioned above.

For at the time of the decision on or adherence to these actions, we may call them “subversive actions”, the lack of subjective sincerity and normative correction will infallibly lead to the infiltration in it of a latent strategic rationality compromised to reduction/expansion processes.

The preservation of subjacent communicative rationality at these moments is not at all trivial because, unlike communicative action, the actions opposed to the “reduction/expansion dialectics” does not exactly have as purpose a mutual understanding between life-world agents and those of systems – the realm of instrumental reason and reduction/expansion processes. At the moment of interaction, subversive actions apparently resemble some “instrumental acting”: speech acts, not as mere communication, but with an objective - which is subversion - and needs of certain means to reach it.

In other words, observing the two moments of gestation and the realization of subversive actions, its “hybrid” character appears because it needs, at first, to assure the communicative rationality to elaborate the “social transformation” (Santos, 2003, p. 29). This author “solves” these problems by two forms of reason: a metonymic and a proleptic one which seem to involve some “planning” afford. We shall argue, that these “problems” have to and can be solved by the same actors who create their experiences in their own “rationale”.

To show how this will be possible, it is necessary to take a look at an opposition between two different reasons which are responsible, on the one hand, for the above-mentioned reduction of present and expansion of future, which shall be called an “instrumental” reason; and, on the other hand, for a certain “survival” of social actions and forms of social reproduction responsible that there are even social experiences, not submitted to that instrumental reason. Without this “communicational” reason –

not submitted, entirely, to the “dialectic” of reduction/expansion of time - there would be no possibility to think in social experiences which could have the potential to confront the reduction/expansion processes, promoted by traditional planning processes.

But, as we have shown in other place, it is not the simple communicative speech act which will be able to confront the instrumental reason (Randolph, 2015). We will discover first indications about the characteristics of this “new” (“subversive”) actions by adopting a “pragmatic turn” in linguistic as introduced by Habermas (Habermas, 1990).

In its preparation phase, these actions will have, to some extent, characteristics similar to those of communicative actions. Thus, the same way as in the pragmatic perspective of communication contacts between life-world agents cannot be based on a pretension of “truth” as a (“true”) representation (speech) of the objective world. Appealing to this (objective) “truth” is indeed a very common strategy in attempts of “experts” who advocate being the “masters” of the truth - even by relying on scientific knowledge.

Regarding the turn, (pragmatic) “truth” of any action depends on the relations of sincerity and correction between those life-world agents engaged in an action against that reduction/expansion processes.

Preserving sincerity and correctness is essential in order not to jeopardize the very power of this type of action that has its origin, in the last instance, in the collective recognition - through communicative rationality- of the contradiction between the two reasons mentioned above.

For at the time of the decision on or adherence to these actions, we may call them “subversive actions”, the lack of subjective sincerity and normative correction will infallibly lead to the infiltration in it of a latent strategic rationality compromised to reduction/expansion processes.

The preservation of subjacent communicative rationality at these moments is not at all trivial because, unlike communicative action, the actions opposed to the “reduction/expansion dialectics” does not exactly have as purpose a mutual understanding between life-world agents and those of systems – the realm of instrumental reason and reduction/expansion processes. At the moment of interaction, subversive actions apparently resemble some “instrumental acting”: speech acts, not as mere communication, but with an objective - which is subversion - and needs of certain means to reach it.

In other words, observing the two moments of gestation and the realization of subversive actions, its “hybrid” character appears because it needs, at first, to assure the communicative rationality to elaborate the “pragmatic truth” of its action; and in the second moment of execution and interaction with the system as realm of instrumental reason, the “effectiveness” of the action as subversive depends, to a large extent, on a “programmed incomprehension” of its meaning by agents of the system. This “incomprehension” is not due to the subjective failings of certain agents, but is structurally programmed because only the “life-world agents” - as the it was said form the former proletariat - really has the conditions to understand society in its totality (especially in its contradictory totality). “System agents” interpret society from its instrumental perspective, and although they may believe that they understand it in its totality (that is the origin of their ideology), this comprehension is only partial - and therefore becomes susceptible to certain “programmed misunderstandings” that take advantage of the “black spots” in their understanding.

In Habermas’ terms, this “hybrid” character (between communicative rationality and latent strategic rationality) of “subversive” acting as speech acts would allow us to take advantage of ambiguities of the language itself to create, purposely and “communicatively” misunderstandings aimed at subverting actions created through an instrumental rationality.

We believe that social subjects’ daily life is full of these “deviations” of understanding and the production of intentional misunderstandings that protect the communicative rationality of the advances of instrumental rationality. This is not an open fight between these two rationalities; but of a real daily “subversion” of rules, orders and guidelines in the private and - why not – public sphere, which are imposed to people’s lives by the systems.

Here, as well as in the case of subversive action in the public sphere, it is not a matter of entering into a “symbolic struggle” between different conceptions or proposals, or eventually to “win” such a dispute.

Subversive action not necessarily must arise prepared by great mobilizations and movements of communication and mutual understanding, but condition of sincerity and correction has to be minimally assured.

In this way, that two problems of extreme fragmentation or atomization of the real and the problem, derived from the first, of the impossibility of giving meaning to social transformation will be "solved" on the basis of the daily experiences and within its own logic: the articulation of collective actions (as speech acts and intervention) against the realm of the logic/dialectics of time reduction/expansion. Without any need of some external actor to create "reciprocal intelligibility between the experiences of the world" (Habermas, 1990).

3 EVERSAY LIFE, SPATIAL PRACTICES, AND THE PRODUCTION OF (SOCIAL) SPACE

In the previous item we postulated, more implicitly than explicitly, that there is some "force" in everyday life that does not permit its submission - at least totally - to the dictates of an abstract/instrumental reason, to bureaucratic demands and to a "commodification" of life's vital manifestations. Without intending to open a debate with authors who believe that in neo-liberal societies this possibility no longer exists (Dardot and Laval, 2014), we shall show here, briefly, the arguments of those authors who defend this daily life force and its opposition against instrumentalization and transformation into a commodity.

In fact, Certeau (Certeau, 1998, p. 42) sees the basis for social transformations in daily life's potentiality through its manifold manifestations of cunning and anti-discipline. Opposing Foucault's "networks of surveillance" and "microphysics of power" approach, he recommends that it is more urgent to discover how society is not reduced to networks or the microphysics of power:

that popular procedures (even "tiny" and daily) play with the mechanisms of discipline and do not conform to them except to change them; that "ways of doing" form a counterpart, on the side of consumers (or "dominated"?), of the mute processes that organize socio-political ordering.

The author realized an entire research to find out what rules obey these tiny daily operations that are "fragmentary, relating to occasions and details, insinuated and hidden in the devices of which they are the ways to use, and therefore devoid of ideologies and its own institutions." (Certeau, 1999, 42).

In his critique of Foucault, Certeau points out that this neglect of the cunning of groups and individuals and their everyday anti-discipline leads this author to replace

the analysis of the apparatuses that exercise power (that is, the institutions that are locatable, expansionist, repressive and legal) by means of "devices" that "vampirize" institutions and clandestinely reorganize the functioning of power: "tiny" technical procedures acting on and with details, redistributed the space to transform it into the operator of a generalized "vigilance". (Certeau 1998, p. 41)

As showed above, even using other terms, Habermas identifies similar forms of resistance and anti-discipline as deviations from productions of purposive misunderstandings which protect a "communicative rationality" against the advances of an "instrumental rationality". In general, there is no apparent struggle between these two reasons, but a real daily subversion - that is, anti-discipline and disobedience - of rules, orders and guidelines in the private sphere, which are imposed by systems on people's lives.

If for Certeau everyday life is the place (or non-place, utopia) of cunning and anti-discipline, for Habermas it is in life world where the forms of living together (tradition, socialization and formation of personality) derive from a communicative logic of practices which suffer from tempted intrusions of (system) institutions. Both readings mutually reinforce each other.

Only to mention, briefly, another argument in favor of the potentiality of this "revolutionary force of daily life" is provided by Vaneigem (Vaneigem, 1967). For him this force seemed to have at certain moments in

history even the potentiality of inaugurating a new society. Albeit the examples delivered from him not being successful, they show that, beyond their origins in daily experience, it is necessary to overcome the perception of everyday perceptions as particular, and that a more profound rationality has to be revealed or recognized.

We agree with Vaneigem that this everyday life force can be revolutionary, in certain circumstances, and has the potential to transform entire societies. Even considered as “small, tiny or minuscule” on behalf of someone’s daily experiences, it can become “gigantic” when it is turned to a collective practice. To justify this statement, we have to direct our attention to the spatial practices which are determined and determinants of (social) space.

Therefore, with the intention to fulfill this promise, we choose as our theoretical reference Lefebvre’s conception of space as a social product.

In his conception of social space, Lefebvre (2013) confronts the elaboration of discursive space representations by certain specialists - architects, urbanists, planners – with, what he called the “spaces of representations” formed by people and groups permanently in their daily life and experiences. These spaces of representation, as a sort of emanation of people’s living experiences are not always discursively accessible.

The representations of space express the dominant (ideologically hegemonic) perspective of that society regarding its social space always related to the social relations of production and the orders that have their origin in them. These spatial representations as the official comprehension of social space seek to impose their perspective on social experiences of that people whose spaces of representation are often at odds with them. Because, the spaces of representation may be linked to a more clandestine and underground side of social life which does not obey the rules of consistency and cohesion; its “maps” involve not so much reflection and reason, but passion and feelings. As Lefebvre says, these spaces (of representation) have an affective nucleus and embrace the places of passion, action and the lived situation and therefore implies time (Merryfield, 2002, p.90).

Therefore, we discover here another intrinsic conflict/contradiction in capitalist societies. Maybe we can call this the “spatial dimension” of societal contradiction where one spatial representation tries to subordinate all those representational spaces which do not agree with the dominant version. A rather similar situation that we found in relation to the dominant (capitalist) instrumental reason of economic accumulation and political oppression which tries to subordinate life world processes to its order.

This intrinsic conflict of social spaces in modern (capitalist) societies emerges throughout history - and is expressed differently in certain periods - with the separation between perception, experience and conception of space, introduced in the Renaissance (see Lefebvre 2013). It characterizes the production of modern (social) space ever since.

The “connection” between the lived space (representational space) and the concept of space (representation of space) is spatial practice. These three “moments”, as Lefebvre calls it, in their contradictory configuration, constitute the triad which determines the dynamics and production of social space: spatial practice, space representation and representational spaces.

Representations of space and representational spaces are ‘secreted’ by spatial practices which ensure that conceived and lived space coexist in dialectical unity. They secrete stability as well as contradiction. Spatial practices invariably relate to perception, to people’s perceived take on the world, on their world – particularly their everyday world. Spatial practices make sense (and nonsense) of everyday reality, and include routes and networks, patterns and movements that link together spaces of work, play, and leisure. ... They maintain societal continuity and ‘spatial competence’, and somehow mediate between the conceived and the lived, keeping representations of space and representational spaces together, yet apart ... (Merryfield, 2002, p. 90, author’s highlights)

In a former comprehension of participatory, communicative or collaborative planning (Randolph, 2007), spatial practices task was providing mediations between the abstract representations and conceptions of

architects, urban planners and planners, and the lived spaces (spaces of representation) by those who are object-subjects of the process of transformation.

In our line of argument, we do not search the "mediation" capacities of spatial practices. On the contrary; in overcoming these above-mentioned forms of planning, we are looking for the subversive potential of spatial practices. This will be the case by those spatial practices when expressing and oriented by the representational space of a person or a group of people and will have the same potential of contestation as we found in the subversive (speech) actions.

This subversive potential of spatial practices can be directed against the domination of the representation of spaces – and the ones responsible for turning a certain representation of space dominant. And it has to be directed against space representations that try to expropriate the population of their spaces of representation – and, in some way, with this threaten also to expropriate their space practices. Without arguing here that these spaces constructed in the daily life must be untouched or absolutely preserved, they deserve to be considered as a potential for subversive action capable of organizing concrete actions in concrete contexts as concrete expressions of subversive actions – prepared by subversive speech acts.

4 SUBVERSIVE ACTIONS AND THE SUBVERSION OF PLANNING – SOME NON-CONCLUSIONS

It needs to be made clear that subversive actions are not understood, in this essay, as "coup d'état" ordered against order, law, government or system itself. Subversion seeks to de-structure and to annihilate, yes, actions that are directed against the above-mentioned life world processes – shrinking the present, enlarging the future and submitting representational spaces to dominant representation of abstract spaces. In a specific way, the understanding of subversion here proposed follows the comprehension elaborated in the context of anarchy and situationalism (Randolph, 2014, pp. 42ff). In its "natural way", always present, the "subversive" capacity of the daily life – in time and space – acts against concrete manifestations of exploration, oppression and submission where and when it can be identified.

For example, urban social movements – such as those that broke out in June / July 2013 – may have had a "subversive" intent and oppose advances in the increasing dominance of exchange value in the city. As Melucci says: "I define analytically a social movement as a form of collective action (a) based on solidarity, (b) involved in a conflict and (c) breaking the boundaries of the system in which action occurs." (Melucci 1985, p. 795, emphasis added).

Subversion, within the conceptual framework outlined here, can or must be understood as a permanent, everyday social practice that is part of the daily life of social agents when they become aware the permanent attempts to harm their life through abstract and instrumental logics. Ultimately, subversive actions and practices may be understood as counter-hegemonic when they seek to expand the present and the realm of representational spaces. It is worth to subvert what Vaneigem expresses at the end of his book about the revolt:

The moment of revolt, which means now, is hallowing out for us in the hardrock of our daily lives, days that miraculously retain the delicious colours and the dreamlike charm which – like an Aladdin's cave, magical and prismatic in an atmosphere all its own – is inalienably ours. The moment of revolt is childhood rediscovered, time put to everyone's use, the dissolution of the market and the beginning of generalised self-management. (VANEIGEM 1967; our highlights).

In the previous items of this essay, by looking for a "new" planning as a subversion of previous forms, we tried to show that there are in the everyday life of people in contemporary societies potentialities of subversive actions, both in relation to a transformation of dominant temporal relations as well as of dominant spatial relations. Its first aim is to "defend" the everyday life against the imposition of a temporal logic, as a spatial logic of those societies that pursue to submit life to its abstract, instrumental and commodification dictates.

Finally, counter-planning – as a subversion of planning – appears in our argumentation as an emancipatory action of those whose everyday life is submitted and threatened by the shortening of the present and

whose space practices undergo transformations because of the dominance of the representations of space over their own spaces of representation. This first, reactive form of counter-planning can only be carried out by the very people who suffer or are threatened from the impacts of other forms of planning and their "dialectics" of shortening/extending the time horizons of planning and imposing representations of space colliding with their own spaces of representation. A second form can be seen as an active attitude of "counter-planners" towards the deliberate extension of the present and the extension of validity of their spaces of representation.

As a concrete form of opposition to the diffusion of instrumental and abstract logics in the world of life, for this counter-planning there is no "recipe" for its realization. Its dynamic seems more like a mobilization or movement, than an institutionally organized performance.

It is possible, for the moment and in the first approximation, to establish some characteristics. The agents of this counter-planning are people, groups, segments or even social classes who pursue common goals or strategies. They meet in a concrete situation or to counter threats of the present or weakening of spaces of representation or to. The scope of the actions of this counter-planning is contingent and will depend on the agenda itself drawn up jointly by those who have gathered around certain issues.

These "subversive" activities need not necessarily be clandestine in capitalist societies crisscrossed by contradictions and subject to permanent crises where even "counter-hegemonic" initiatives, as history shows, are essential for survival or renewal of the system. The "activism" of this "new" subversive planner, aimed at strengthening civil society itself in terms of increasing its autonomy and combating inequalities, may be possible at an infra-systemic level that does not immediately pose any threat to the order. Different from the understanding of "insurgent planning" which is, as reported by Miraftab (2009, p. 46) concerned to marginalized and oppressed groups and offers a critical analysis and understanding of the structural forces that marginalize and oppress population, counter-planning is not limited to these groups because of certain problems – on temporal and spatial basis – are more generalized in capitalist societies, especially in the neoliberal societies.

This is, as we have tried to show in previous works, what the very social dynamics in capitalism seems to allow without a direct confront which will easily be smashed down by the dominant forces (Bey, 1985).

1 INTRODUCTION

Places are landscapes as seen from far away, places are cities lived from inside or cities imaged from outside: are they ecological ecosystems too? We intend to focus our attention on lived places. Physical places are complex entities. Nonetheless, we should first distinguish a concept of space from a concept of place. Each of these concepts has different declinations and for each declination there is a possible definition. From a cognitive or a designer's perspective space is instead conceived as something different, at least not explicitly a 3-dimensional subspace (Freksa et al., 2014).

A place is an interpreted space, a reasoned space, a space with feelings, a result of an aesthetic fruition of a physical space. We can define physical space as a set of mental images, spaces of representation, and the architecture of cognitive processes in vision theory. The essence of place lies in the quality of being somewhere specific, knowing that you are "here" rather than "there" (Rapoport, 1977) for example enclosure becomes a very important aspect of place-making which also seems, in some way, to be related to the concept of territory.

We understand places through cognitive contexts. This is the reason we 'read places' we live in. We can interpret our being in a space as an objective proposition according to geometrical rules/indications. Nonetheless, our being in a place is defined only via a richer description. Every single person that stays in a place has a subjective point of view. Points of view and contexts are results coming out from a historical – cognitive -cultural selection. Our knowledge of places can derive from experiences, from stories that structure ideas and feelings about them. When we talk about 'subjective knowledge' of places, what are we really dealing with? 'Subjective knowledge' is a kind of representation of places, and a representation vary not only from different subjects, but even during one subject's life (Orr, 1992). "Knowledge of a place — where you are and where you come from — is intertwined with knowledge of who you are. Landscape, in other words, shapes mindscape."(Orr, 1992)

In literature there are many attempts to get a definition of representation of space. Ontological research is increasingly seen as providing methodologies and tools to move forward in this direction. Ontologies, these systems being typically specified in languages that allow to abstract away from data structures and implementation strategies. The languages of ontologies are closer to first-order logic than languages used to model databases. In computer and information science, an ontology is a technical term denoting a conceptual artifact that is designed for a purpose, which is to enable the modeling of knowledge about some domain, real or imagined (Gruber,1993).

2 ABOUT PLANNING

Today's awareness of the complexity of social and natural environments implies that in using state-of-the-art techniques to model these complex systems we must accept a dramatic, and perhaps discouraging, level of uncertainty. The traditional deterministic and quantitative approaches to urban planning and design in risky contexts seem to increasingly fall short of expectations in environmental domains; and this is now widely recognised (McConnell, 2010).

Planning tries to manage complexity, it is the result of an interaction between collective knowledge and project, through the intersection of knowledge: it is a value that should be treated with the principles of sharing, as the foundation of a necessary political dimension of the contemporary design (Formato and Russo, 2014).

The 'futurisation' of reality (pro-jectus) finds consistency and dynamism in the concept of process as a source of reflection that constantly provides new impetus to new proposals and a consistent updating of that locally-based langue, the expression of a culture's identity (Gregotti, 2007).

An urban project as a plan or a strategy have to evolve over time, it can't stay frozen [8]. The planner like the urban designer has always to look at changes of the territory and have to read the different relationship between built space and complex urban organization.

Architecture, social sciences or anthropology have an active role in the thinking and the development of urban projects. About anticipation city is a relational system and must be thought as a whole and not district by district (Ingallina, 2007).

We have to point out that knowledge in our domain is not completely coded. There are large part of non formal/uncoded knowledge; the more there is a knowledge not explicitly expressed.

Our domain refers to a low structuralized knowledge.

3 CARVING UP GEOGRAPHICAL PLACES

Humans live, move in and observe complex spatial environments using different paradigms. The interaction of humans with space is sophisticated. It continuously changes over time and relies on a variety of information types that can be classified in terms of topology, geometry perspective, dynamics, affordance, society, culture and so on. Perhaps due to the richness of this interaction, humans are not aware of how their understanding and interacting with space is realized. Ontological analysis, the study of what is at the core of our view on reality, can help to recognise, clarify and organise the essential elements

and features of space that is crucial to humans in terms of objects, properties and processes. Searching for a general framework where to discover and organise this kind of information, we can list a few levels that seem quite relevant. Without aiming at an exhaustive list, we propose to subdivide these levels as follows: spatial, artifactual, cognitive, social, cultural and processual. These levels, in turn, can be subdivided in finer levels as we show for some of them.

3.1 THE SPATIAL LEVEL

Mereological level (where one understands space in terms of spatial parts), e.g. recognising the subdivisions of an area like a neighbourhood
Topological level (where one understands space in terms of contact and unity), e.g. recognising the contiguity between neighbourhoods and the unity of a neighbourhood
Geometrical level (where one understands space in terms of shapes), e.g. seeing the geometrical shape of a neighbourhood
Geographical/morphological level (where one understands space in terms of locations and their descriptions), e.g. distinguishing being in a valley or having a radial/grid/linear pattern.

3.2 THE ARTIFACTUAL LEVEL

Material level (where one understands space in terms of materiality), e.g. seeing the presence of wood, concrete, water
Structural level (where one understands space in terms of qualified components), e.g. distinguishing natural vs manmade, residential vs production vs recreational area
Artifactual level (where one understands space in terms of intentionality), e.g. looking at entities as planned/intentionally modified things like buildings
Functional level (where one understands space in terms of functionality), e.g. understanding a building as a place for gathering or as a shelter.

Production level (where one understands space in terms of manipulation), e.g. seeing an object/material as needed to produce something else.

3.3 THE COGNITIVE LEVEL

Cognitive level (where one understands space in terms of experience), e.g. perceiving how to move across the objects

Representation level (where one understands space in abstract terms), e.g. perceiving the relationships among entities

Observation level (where one understands space in terms of how it does or may change), e.g. perceiving the change of the relationships among entities

Phenomenological level (where one understands space as a moving entity), e.g. perceiving space as an evolving situation

Perspectival level (where one understands space as something where one is located in), e.g. perceiving space from a specific point in it

Conceptual level (where one understands space as a collection of realised concepts), e.g. perceiving space as the manifestation of natural and artificial objects

Action level (where one understands space as an entity in which to act), e.g. perceiving the changes that one can bring to it

3.4 FURTHER LEVELS

The Social level is the level of norms and social roles and includes the organisational level, the service level, the economic level and the political level.

The Cultural level is the level of knowledge and meaning and includes the behavioural level, the living level, the knowledge level, the historical level and the community level

The Process level is the level of temporal change and transformation, it includes the dynamic level, the development level, the temporal level and the interaction level.

4 THE CASE STUDY

An example we can refer to is the making of the Taranto's strategic plan to 2065.

We started community-based, interactive processes of knowledge exchanging, aimed at building future scenarios for the new plan.

Community-based, interactive processes of knowledge exchanging were carried out in Taranto, southern Italy, aimed at building future scenarios for the new plan during the 2014's spring/summer.

They were carried out to support policies and decisions on urban socioeconomic as well as environmental domains, basing on a sequence of face-to-face brainstorming forums, aimed at cooperatively singling out strategic lines to build alternative development scenarios. From a methodological point of view, it was a 2-step scenario-building activity (Khakee et al., 2002). First, agents were invited to report problems they faced in their town districts. Then, each agent was invited to generate a reflection about the future of the district, particularly concerning expectations of future changes. Such sessions were organized in all town districts, indoor or outdoor, with participants divided in groups each of them sitting around a dedicated desk. A municipal representative coordinated each desk without taking part in the generative session, she/he had only the task of transcribing in linear charts concerns, problems, expectations and desires presented by the participants at the desk.

In order to manage the results in real time (synthesis and refinement), the interactive process was supported by the use of conceptual maps drawn using dedicated software tools (Decision explorer, Inspiration) (Heft, 2013) (figure 1). This resulted in a real/virtual hybridization of the process, following well-established research trends, as reported in a number of case studies (Borri, Scandale, 2005; Khakee et al., 2002).

Results achieved during the nine organized meetings were very different from one another. In particular, the first meeting was organized in the Città Vecchia (inner city district) with its great historical, environmental and cultural resources as well as significant environmental, physical and social degradation problems. In the Città Vecchia session the citizen participation was very high. About 80 stakeholders joined from different societal domains: residents, merchants, students, tourists, visitors. These agents, gathered around 6 desks and about 150 instances were collected.

The database collected during this session resulted interestingly rich and articulated. Because of this reason, it is a significant and valuable source for the present research effort.

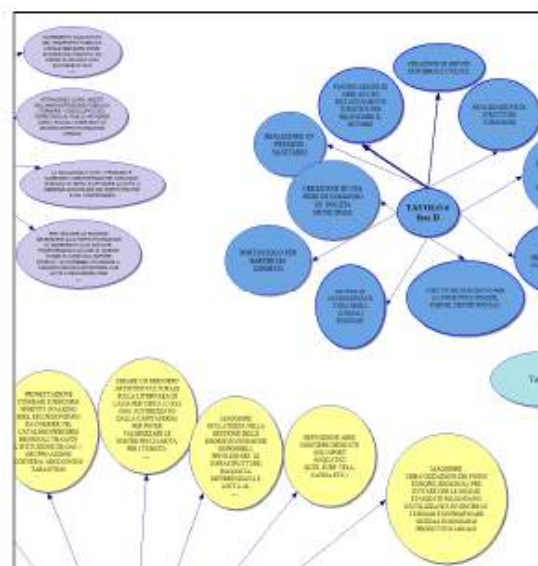

Fig. 1 – Example of di conceptual map

This process has allowed the definition of two great categories of instances: a. contextual problems; b. future visions. These two categories of instances are about each quarter of the city and about the city in general.

What emerges is that the environment is the most recurring issue. It is present in community problems and/or expectations, but also in the perceptions of the physical reality of the city.

The industrial problem often seems absent from protocols, but it is difficult that final strategies could ignore industrial relations.

A first common character is the natural environment that persists in many city representations, so apparently resisting the consequences of an industrial culture.

A second one is related to a more structural relationship with the sea, intended as an element of union and communication.

A third common aspect is the potential of tourist attraction to the city, linked to different characters in relation to the different peculiarities of the area.

The industrial problem often seems idiosyncratically absent from protocols, but it is difficult that findings can be used for strategies disregarding industrial relations.

There was an almost total absence of participants in the forum session held in the industrial district, perhaps given the disillusionment with past policymaking. Other issues are related to the inadequacy of urban and metropolitan linkages to the city center, as well as related to the recovery of many illegal settlements.

Other instances are about the inadequacy of the urban services and about the inadequacy of metropolitan connections, other instances are about the recovery of unauthorized coastal settlements.

The session held in the inner city was crowded and complex. The session was held with a hybrid computer-based and traditional, rather conflictual interaction. Outcomes showed a clear prevalence of visions on mere problems: important issues were the unstopped relation with the sea (for tourist aims and/or city infrastructuring) and the enhancement of Taranto as archaeological and historical center (Magna Graecia colonization).

5 ANALYZING THE SOCIAL LEVEL

Once we outlined the general framework we proceed to analyze levels one at the time. This analysis is useful to identify if every level is well structured or if it is necessary to model additional information. Then we can proceed to characterize every specific sublevel.

We intended to start from the higher levels of abstraction, so we have started our analysis from the social level, then we will analyze the cultural level and subsequently the process level.

The data we have about Taranto haven't been meant for research objectives, they were collected during the participation activities belonging to the strategy planning process. Nevertheless we thought that it could be useful to start from these data for a first delineation of 'objects', 'attributes' and 'relations' populating the social level.

First of all it is necessary to point out what we mean by 'social': we mean social practices, the way people live a city, or a part of the city (the quality of the interactions between people and how dynamics have been built). In the social level it is difficult to elicit the distinction among formal and informal knowledge, because the social knowledge is principally informal, tacit and implicit.

According to ontological analysis methodology we are interested in modeling this kind of information about this levels. In fact it is important to survey what kind of relation exists between places and the social meaning of places, and what kind of relation exists between social practices in the places. Agents that live the city have certain references of certain places and at the same time they have a common knowledge of the social places. As we outlined, this common knowledge emerges from the database that has been produced during the participative process that took place for the preliminary works of Taranto's strategic plan TA2065.

The procedure is: a. to single out references of places and landmarks that are of interest also for the relevance they have in social practices; b. to single out the kind of the relevant entities and the relations that exist between them; c. how inhabitants use those places and the habits they have.

Analysing the social level it emerges that the objects of the city (or of part of the city) are cognitive objects and that they are a set of many meanings/signifiers, so in this analysis it is necessary to model some complex entities' definitions.

Anyway it is important to clarify that the participative meetings that gave us the data we have were of a claiming kind and not narrative or expositive. We have chosen data about the ancient centre (città vecchia) because it has more stories, denser projections of sense and a denser presence of social places.

We have to underline that some objects of the city's tissue that a technician would image essential key points for the sociality are not mentioned in the database (for instance: Cattedrale San Cataldo, Chiesa S. Domenico, Ringhiera, Colonne doriche, Castello Aragonese, Piazza fontana, Ponte di pietra, Ponte girevole, Municipio). We wondered: are those objects not considered as landmarks?

The very first analysis about the social level for Taranto–Città vecchia has been about the search of entities/places/services useful to elicit social relations, as follows:

Places/Landmarks:

- | | |
|--------------------------------------------------------------------------------|-----------------------------------------------------------------|
| -Beachfront | +Gardens of the Vasto descent |
| +Bathing establishments | -Lanes (Garibaldi, Nove Lune, Zippro, Abbastante, Santi Medici) |
| -Porta Napoli's area | -The forty hypogeum |
| -Bulging of the port (for loading and unloading goods industry) | -Plazas, squares, courtyards |
| -Pier | -New Acropolis (in Cardo and Decumanus) |
| -Archaeological sites | |
| -Molo s. Cataldo (old fisherman's wharf, a project today to cruise ships dock) | -Prestigious Palaces (noble Palaces) |
| -The three levels of the old town | -Dewatering ILVA (steelwork industry) |
| -The island -The seafront | -Mar Piccolo (internal lagoon) |
| +Huts of fishermen | -Navy sites |
| | -Crumbling buildings |

Objects:

- | | |
|------------------------|----------------------|
| -Buildings | -Fishing boats |
| +Sheds (the fishermen) | -Crumbling Buildings |
| -Cruise ships | -Sea |
| -Pier | -Port |
| -Archaeological finds | -Lanes |

Roles:

- | | |
|-------------------------------------------------------------------------------------|-----------------------------------------------------------------|
| -Capital of Magna Graecia | -Old city as a place of urban junction between parts of Taranto |
| -Intermodal plate (area behind the port for unloading ship-borne goods-truck-train) | -City 'as old as eco-museum |
| -Convergence point (road junction and railways) | -Engines for tourism |
| -For service center | -Catalyst historical and cultural identity |
| | -University |

Services (existing and desired):

- | | |
|----------------------------------------------|-----------------------------------------------------------|
| -Pubs, cafes, restaurants, shops, bookstores | -Connections via sea |
| +Bathing establishments | -Pedestrian network (e.g., on the waterfront) |
| +Gardens of the Vasto descent | -Tourist routes, thematic tours for sightseeing |
| -Cinema -Refurbishment -Leases | -Organization of events and cultural attractions |
| -Recycling | -Subdivisions peripheral block |
| -Sewer services, electrical ... | -Business block 'loading / unloading material to the port |
| -Cultural workshops | -Parking lots |
| -University laboratories | +Mussel museum |
| -Toilet (for tourists) | -Police station |
| -Tours / excursions by fishing boat | |

Desiderata:

- | | |
|--------------------------------------------|-----------------------------------|
| -Tourism -Work | -Giving air and light to the city |
| -Involvement of local residents in tourism | -Close to traffic |
| -Break down the non-recoverable | |

Primary and secondary infrastructure:

- | | |
|----------------------------------|-------------------------------------|
| -Regulatory use of public spaces | -Refurbishment of ancient buildings |
| -Development history of the area | -Enhancing archaeological sites |

A first delineation of the elicited relations may be outlined as follows:

Space-city (division)

- | | |
|-------------------------------|------------------------------------|
| -Space-object | -Existing service -desired service |
| -Space-landmark / role | -Object-role |
| -Space-service | -Object-affordances |
| -Existing space-desired space | |

Service-social practice

- | | |
|---------------------------|-----------------------------------|
| -Space-social practice | -Social practice -social practice |
| -Landmark-social practice | |

6 CONCLUSIONS

There is a strong contextual aspect in the way we live in places. Here, by context we mean a description (often implicit) of a place that includes at least what are considered the relevant elements in it. Typically, in discussing a place where we are, the context is what surrounds us and can be perceived; ideally, the set of entities that we see and (actually or only potentially) relate with. Thus, a context provided by an place is

an information entity that contains: a (typically partial) description of the place, what there is in it and how the place is evolving (e.g. things moving, leaving or arriving, agents acting and transforming them etc.) and possibly the potential interactions between us and what is in the place. A ground context, as opposed to a generic context, is a context that refers to one or more actual/existing entities. A context has to furnish the link between the ontological classification of what we use for understanding places and the actual place that we are experiencing. For this reason, the context has to include physical elements (e.g. location) with material components (e.g. enclosed spaces, object distribution); agentive figures (e.g. habitants, organisations, social roles) with the relationships across them and objects (e.g. generic dependences and actual goal or habits). We intended to start from the higher levels of abstraction, so we started our analysis from the social level. Here we have reported the very first achievement of a long and complex path of an ontological analysis that could be useful to share the complex knowledge that forms the city.

clara.musacchio@uniroma1.it

1 THE TERRITORIAL PERSPECTIVE AS A PLANNING AND ANALYSIS MATRIX

The urbanization processes of the last thirty years show a profoundly changed urban framework related to the functional and formal orders of the previous periods.

The territorial organization of social and economic activities, in Italy, is affected by the contextual phenomenon of urban sprawling and “territorial coalescence” (Calafati, 2009).

As consolidated as stable forms of urban growth over the last two decades, these phenomena have occurred in path-dependent processes, starting from specific conditions and actions that are «unintended and deliberated, but that are tolerated as minor evils, in the absence of alternatives, or as a result of force relations that have prevailed over every deliberate and programmed regulatory instance» (Donolo, 2011:189, translated by the author). These urban changes are generically referable to a contest of “urban regionalization”, and show some relevant instances of “re-shaping” and “re-qualification”.

In facing the territorial dimension reached by the urban condition, some traditional criteria of analysis and interpretation – strictly focused on a basic and dichotomic “lecture” of urban “facts” – must be overcome.

Some systemic researches on the whole Italian territory and the monographic work of some authors, especially in recent times, contributed to the increase and improvement of the factors involved into the “urban matter”. The aim of those works was to create “dense” representations of territories, in a “laic” and transcalar approach, in order to reveal the potential of “discontinuity”, “fragmentation”, “heterogeneity”, by recognizing some forms of urbanity in marginal contexts, by researching new “models” of proximity relations in dispersed areas, by revealing “the interesting beauty” of unexpected landscapes. They suggest a new paradigm for planning, that comes out from the specific characteristics of each territory, from the “original conditions” (suggesting elements for a new urban governance paradigm that «is faithful to a methodological option, according to which political and decision-makers processes must correspond to the urban processes, by interrogating and interpreting the specifics of the territory» (Donolo, 2011: 177; translated by the author)).

So, in a context of “dense” interaction between the “knowledge” and the “decision” dimension, the “territorial perspective” seem to indicate “promising” paths to decline new taxonomies, to suggest new attitudes to plan the new “urban-territorial” city, in order to achieve re-composition and re-qualification objectives.

The urban relation between “city” and “territory” isn’t new and some forms of “civism” projected in large territories inspired, the anti-urban utopianism of the late XIX century, the Garden City theory and some European and North American experiences of New Urbanism and Regional planning.

In the construction of a territorial matrix for the planning projects, it is necessary to consider renewed factor. However, a reflection aimed at providing prospects for effectiveness in contemporary practices cannot limit to alluding to forms of autonomy of communities of ‘low-density’ settlements.

This contribution aims at reflecting, in particular, on three components implicable into “the territorial matrix” for the requalification of urban contexts: that of the landscape, the energy and the relation factor. The following proposal calls for a reflection on, in particular, three factors which, in the territorial dimension, can play a key role in regeneration and redefinition of settlements: landscape, energy and, ultimately, relational matrix. The following proposal calls for a reflection on, in particular, three factors which, in the territorial dimension, can play a key role in regeneration and redefinition of settlements: landscape, energy and, ultimately, relational matrix.

2 CONTRIBUTION OF LANDSCAPE COMPONENT

The idea of Landscape introduced by the European Landscape Convention¹ (extracted from the aesthetic matrix definitions²) leads us to reflect on the interdependence between places (whether urban, peri-urban, rural, natural, etc.), and people who live in and interact with them. Landscape expresses its full identity³ and uniqueness thanks to the persistent and balanced interaction between man and nature: through

¹ «Landscape designates a certain portion of territory, as perceived by people, whose character derives from the action of natural and / or human factors and their interrelationships» (Article 1, (a); translated by the author).

² Relazione illustrativa della legge 11 june 1922, n. 778, Per la tutela delle bellezze naturali e degli immobili di particolare interesse storico; Law 29 june 1939, n. 1497, Protezione delle bellezze naturali.

³ «2. The Code protects the landscape in relation to those aspects and characters that are material and visible representation of the national identity, since expression of cultural values» (Article 131, D.lgs. 42/2004; translated by the author).

spontaneous or forced relationships, created by direct connection with the territory or imposed by need for safety, welfare and renewal, which implies continued environmental stress. It determines the conformation and / or transformation of the physical features of places and of their aspect. (Legislative Decree 42/2004; L. 14/2006).

In this regard, taking into account the important interdependence between man and nature, means above all considering the relationship between new forms of urbanism (urban landscapes) and the exteriority of highly complex environments (natural landscapes) where better ecological-environmental conditions are essential, in order to optimize the quality of living spaces and create more “sustainable” typologies of anthropic intervention¹. If territorial transformation processes – from urban to peri urban – are not appropriately controlled, planned and managed, are the main advocates of the depletion of resources, especially the natural ones, whose customization by man causes and requires attitudes and abilities, by the resources themselves, of resistance, resilience or reaction to changes and anthropic interferences. «The landscape [...] the extra-urban, as the urban one, must be safeguarded in its entirety. Safeguard, however, does not always mean intangibility², because landscape need to be managed by man and the protection of its values must be the result of man’s interventions» (Campus Venuti in Oliva, 2010: 125-126; translated by the author).

Therefore, the “semi-natural landscape” seems to represent the weak link of a system of elements that follow and evolve from the city to the countryside, from the center to the periphery and vice versa. «As for the urban development, we perceive changes with greater difficulty, because the built environment evolves at a slow pace [...]. We are concerned about the aspect of the cities and both their social and environmental risks» (Ascher, 2006: 21; translated by the author). Moderating and / or reducing the exploitation of ecological-environmental components means improving landscape management and reconsidering urban renewal projects, so that environmental and anthropic factors are in harmony with each other. This consideration leads us to reflect on the complicated role of urbanism that «[...] has to equip itself with a new city and territory project, in which the borders cease to be invaluable and plans so rigidly drawn within administrative and not geographic and natural spaces [...] Responsibility towards a “borderless” nature must inspire the urban agenda and the plan» (Granata and Pileri, 2012: 90-91; translated by the author).

The most affected territories by deprivation and landscape alterations (loss of differences) are the marginal places (due to the continuous transformations), where the space generally recognized as urban becomes (sometimes gradually, sometimes suddenly) rural space. Within the latter, the real urban conformation is not entirely perceptible; «[...] from a physical and conceptual point of view, in a border zone between city and countryside, between artificial and natural areas [...]» (Ricci, 2005: 57; translated by the author). This is the controversial and problematic situation of the peripheral areas. They are characterized by an accentuated sense of abandonment and territorial dispersion, where natural and semi-natural environments blend with an indefinite system of built environments. In these areas, it is necessary to encourage the recovery, improvement and renovation of preexisting or contingent situations and conditions whose prospect of refunctionalization would prevent the abandonment of “refuge locations for diversity” (Clément, 2005). This territorial condition occurs when industrial and infrastructural projects, continuous expansions and urban dispersion, cause a rift between anthropic and natural environments: «large metropolitan areas produce visible lug and friction phenomena in the interface areas, that translate into disintegrating transformations of the city itself and the external environment, and in the loss of mutual territorial identity. The result is a set of areas that resemble landscapes [...] through the loss of differences [...] between urban and non-urban areas» (Ricci, 2005: 56-57; translated by the author).

The effort to focus on the “natural reaction” of some human transformation processes requires a sustainable conversion of “creation activities” (programs, plans and projects in support of natural landscapes). This is the approach that emerges from the analysis of a document on the conceptual and

¹ Landscapes evolve in form and content - they change and / or involve the organization of spaces and connections, functioning and localization of productive activities, scientific and technological service distribution, etc. - as the needs and lifestyles increase and diversify (Indovina, 2013).

² «The Republic promotes the development of culture and of scientific and technical research. It protects the landscape and the historical and artistic heritage of the Nation» (Article 9, Constitution of the Italian Republic; translated by the author).

design reconversion strategy of the “green” of Milan and its metropolitan area¹, which states that «the system of external parks allows a projection towards the urban region, linking the metropolitan city parks to the outdoor parks, and integrating them into a unitary design of the “territorial parks” around Milan. [...] This approach aims at promoting the ecological value of the metropolitan park, in addition to the urban and agricultural redevelopment, and at recognizing Milan as the center of an environmental network and not as an isolated area»². Besides, this project allows us to focus not on the dispersive set of empty and open urban and periurban spaces, but on the system of networks and places they are able to compose, despite the complexity of the fragments and the discontinuity of the connections (ecological-environmental). In a perspective of developing a continuous territorial system from the city to the countryside, it is necessary to create a project of sustainable integration of paths, places and people starting from the analysis of the components of two “territorial parks” of the province of Milan³, Parco Nord Milano and Parco Agricolo Sud Milano. This is important not only for the different territorial and administrative extension⁴, but also for the characteristics that mark them and that determine “landscape uniqueness”. Parco Nord Milano comes in the form of large discontinuous green areas within a strongly urbanized territory, because of the presence of peripheral districts, dismantled industrial areas, landfills, places that escaped further territorial urbanization but that are completely abandoned and / or degraded. However, the park, through renaturalisation and ecological-environmental redevelopment, tries to absorb (with difficulty) cementing operations that characterize territory, meeting the needs of the city and its inhabitants. On the contrary, Parco Agricolo Sud Milano has a completely different vocation, due to its geomorphological and functional conformation. It houses farmland, natural and semi-natural areas, goods of historical, architectural and natural interest. It blends with several urban areas, assuming the appearance of an ecological-environmental passage, extending from East to West. Above all, this park allows us to discover a territory nestled between periurban spaces and rural areas of a “complex landscape system” (Parco Agricolo Sud Milano – Metropolitan city of Milan).

The two case studies have different perspectives and requirements, but a common goal: to decide to what extent a “challenging attitude” towards territorial contexts that are difficult to manipulate by man, can improve their conditions. The ability to select, shape, and interact with natural resources must be a prerogative of all human beings and their methods of intervention.⁵

3 CONTRIBUTION OF ENERGETIC COMPONENT

The concept of sustainable development is transversely recognised as a new paradigm for the spatial planning process and strategies (Camagni, 2000). The goal is to boost a co-evolution of different territorial systems: the economic system, the environmental/physical system and the social system, in terms of increasing the territorial quality in a long-term vision.

The lack of a common translation of this rhetorical concept in operative actions, is related to the difficult to understand the geographical scale of sustainability. In line with many authors (Magnaghi, 2005) and with the Local Territorial Systems approach (Governa and Salone, 2004) the territory is considered as the fulcrum of discussions on local sustainable development, following an approach which can be defined as “territorialist”, in which the territory is considered the base of tangible and intangible relationships (Bagliani et al., 2010). In the debate of sustainable territorial development, the energy factors (production, managing, delivering and consumption) are crucial. But, if is recognised the strong relationship between urban form and energy consumption and use (Owen, 1986), is underestimated the relationship between energy and territorial system. By recomposing and requalifying the huge territorial fragmentation – the core

¹ Annex A - to the proposal for Resolution No. 1219/2016 on “Approval of the Document named – Future Landscapes - Milan: open spaces in a metropolitan view”, useful for the definition of the Green Plan of the City of Milan (translated by the author).

² Id, p. 9 (translated by the author).

³ Id, p. 9 (translated by the author).

⁴ Parco Nord Milano has a territorial extension of about 600 hectares and is run by a Consortium of 6 municipalities (www.parconord.milano.it/storia-del-parco), unlike Parco Agricolo Sud Milano that has a territorial extension of about 47,000 hectares, and it is run by the Metropolitan City of Milan and includes about 61 municipalities (www.cittametropolitana.mi.it/parco_agricolo_sud_milano/index1.html).

⁵ «As for the present settlement, it is obvious that a different production of urban spaces will have to emerge, starting from the periurban areas, the urbanized countryside, in a word from the widespread city. What is at stake, [...] is the ability of these territories to be reconnected to landscapes that activate a new urban quality. [...] The central instrument becomes the organization of the vegetation system as well as the landscape project» (Belfiore, 2007: 199; translated by the author).

of the paper – we might reconsider the role played by the energy model, in achieving sustainable objectives. We are in an energetic and technology revolution, which imposes a change in the relation between energy production/consume and territories (Verbong and Loorbach, 2012).

The energy system affects and influences physical and spatial components (such as size, density, distribution of destinations of use, integrated technological systems, transport and mobility, characteristics of public spaces and common equipment, urban naturalness, comfort and microclimate both in-door and out-door) on one side, and social inclusiveness and economic growth, with a general improvement of territorial quality as common values, on the other side. Since the beginning of the nineties, several events had determined a shift in the way we deal with energy, including: EU directives, the liberalization process of the energy markets, the increasing of environmental restrictions, the scarcity of fossil fuels, the use of intermitted renewable energies, and the increasing share of small distribution generations systems (Bagliani et al., 2010). But, might these changings be assumed as a territorial potential? According to Dematteis (2007), the territory can be considered as: (1) a mere support; (2) a container of fixed (tangible and intangible) potential resources; (3) a place of possible exercise of active territoriality with the aim to activate and valorising local vocations by transforming the resources from potential into exploitable under the actions of development; (4) a network of material and immaterial relationships characterised by their ability to generate local synergies that lead to local self-organisation and local attributions of meaning.

In this way, the “energy matrix” (which influences the three meaning of sustainability: environmental, social and economic) should be assumed as a territorial potential in terms of reducing environmental impacts of urban growth; increasing the energy efficiency use; valorising the territorial peculiarity (types of renewable energy resources available); increasing the economic income from the decentralisation of energy production and consumption process; influencing citizen behaviours, as well as the social inclusion process; understanding and controlling the territorial metabolic process.

Behind these considerations and the evidence of consequences of our un-sustainable urban development and sprawl, the territorial scale of energy seems to be the appropriate one, especially because production and consumption have temporal and spatial discontinuity (Verbong and Loorbach, 2012). But, in order to re-organize the territorial structure, in spatial cohesion and identity dimensions. It's necessary an integrated approach able to recognise and manage the links between local values and potentials and a shift on the territorial vision: from a patchwork of discontinuous elements, to a network of material and immaterial flows, sources and capabilities.

A territorial energy approach should combine demand and consume, resource and opportunity, environmental system and urban system, agriculture and landscape, economic growth and social inclusion. It doesn't concern only the energy production or supplying, but it is related also to a correct mix of functions, mobility, land use, resources (both social, then environmental). Energy should be considered as a cross-sector issue in plans and policies regarding building efficiency, water management, air quality, emissions into the atmosphere, land use regulation, agricultural policies, norms on transports and traffic, and so on (Bagliani et al., 2010). Although the connection between territories and the “eco-energetic matrix” is internationally recognised. European and national energy policies are still sectorial. Territories are now in an unstable balance between resource exploitation, economic value and environment and landscape preservation. Fiscal incentives, developing strategies or policies related to energy system (especially in the RES¹ production or in building/industrial/agricultural sectors) follow economic and speculative objectives², without take in account environmental and landscape protecting instruments, plans³ and directives (both at national and European level). To translate the energy issue into a territorial developing key it is necessary to re-connect all the different layers, which make up the territory.

A shared vision is still ignored, leaving each sector managed by a specific policy, or by a limited administration task-force, with a negative impact on the dichotomies: energy/territory and energy/landscape.

¹ Renewable Energy System.

² A special focus is here dedicated to: energy crops production, wind farm installations, photovoltaic panels, which have a directly relapse into landscape and environment systems.

³ It is referring to Italian planning instruments system. The Italian Landscape plans aim to preserve, manage and valorize the landscape regional patrimony.

They might be seen as opportunities and no more as conflicts. In Italy, the recent National Law 221/2015¹, about the promotion of the Green Economy, aims to spread a new vision of environment² as the core of territorial development. A part of this mind change, is the creation of Green Community, where crucial is the valorisation process of territorial peculiarities in different fields: urban environment (form, organization, transportation); energy; industry; water resources; agriculture; tourism. About energy, it has been highlighted the role of RES local energy production and supplying, with an approach defined: bottom-up decarbonizing process³. It represents a step up in the sustainable vision of the interaction between energy and territories. But, is still necessary build common objectives and intersectoral actions, reduce the fragmentation not only in physical aspect, but also in the administration procedure. To draw an active energy territory is necessary an attempt to integrate planning activities and policies throughout different sectors and ambits. Therefore, energy policies should be accompanied by norms and standards that regulate all the different impacts of energy sources on various territorial systems.

A good practise in resolving the conflict between energy and landscape, is the Puglia Landscape Plan (Piano Paesaggistico della Puglia). This regional plan assumed the energy issue as a significant component for the valorisation of the regional landscape, mapping all RES productions in the territory. This map gives a general framework of local RES generation, and it relation with urban energy needs, understanding the quality; the localisation and the amount of energy production. In conclusion, a reformation of planning action, oriented by an eco-energetic prospective might: reduce territorial energy supply, guide the physical develop of urban areas, increase social inclusion, share environmental responsibilities, valorise territorial particularities, reduce greenhouse emissions, preserve the environment and incentivize the network between different sectors involved in the sustainable development objectives.

4 THE “RELATIONAL DIMENSION” IN TERRITORIES

Starting from the acceptance of renewed relation with the “exteriority” of high complexity environments and the “alterity” of the various actors which interact in territorial scene⁴ (Raffestin, 2012), from the beginning of 80's , some theories, in a straight contrast with the functionalist principle of urbanism, raised and suggested a “place oriented” approach, in order to recognize «into the territorial peculiarities a field of knowledge to be approached with planning and urban project instruments» (Palazzo, 2010: 5; translated by the author).

In this way, a relevant contribution come from the theories and practices of the italian “Scuola territorialista”, created by a group of researchers at the end of eighties – and later converged into the “Società dei Territorialisti” – with the objective of «rediscovering in urban practice the use of “territory elements” and of long lasting memories and signs which in territory are represented (Poli, 2010: 15).

At the end of nineties the Scuola Territorialista, with Alberto Magnaghi's guidance, for the Florence part, and Giuseppe Dematteis's, for the Turin part, reached an operative dimension and elaborated numerous plans both local and regional, such as: Piano Territoriale di Coordinamento della Provincia di Prato (2003), Masterplan of the Parco Fluviale della Media Valle dell'Arno (2008), Piano Paesaggistico Territoriale della Regione Puglia (2010), Progetto della Bioregione Urbana della Toscana Centrale (2010), and finally, Piano Territoriale Regionale della Regione Piemonte (2011).

In the territorialist approach it is possible to appreciate some recurrent profiles: «a critical distance from sovra-determined and global dynamics which impact on the territory» (Fanfani, 2010: 92; translated by the author); a “bottom-up” paths for the building of future scenery; an organized involvement of territorial

¹ Law 221/2015 “Disposizioni in materia ambientale per promuovere misure di green economy e per il contenimento dell'uso eccessivo di risorse naturali” (Environmental provisions to promote green economy measures and to contain excessive use of natural resource: translated by the author).

² Here environment represents a complexity of elements: resources, beauties, histories, identities, social interactions, anthropic influences and material or immaterial infrastructures.

³ Law 221/2015.

⁴ “Exteriority”, referring to the physical and natural environment, and “alterity” related to the social and relational environment are the characteristics that the geographer Raffestin attributes to the condition of “territoriality”, that is «the whole set of relationships that a society, and therefore people who belong to it, have with exteriority and alterity to satisfy their needs with the help of mediators in the perspective of obtaining the greatest possible autonomy, taking into account the resources of the system» (Raffestin, 1999; translated by the author), in one of the most appreciated definitions of the concept.

actors, often supported by empowerment practices; a deeply integrated vision, multi-scalar and multi-sectoral (Fanfani, 2010).

Some planning instruments were put in practice, such as the “Territorial Integration Areas” (AIT) of Piemonte Region. The AIT, are 33 sub-provincial areas, “cut out” in the Region, within the PTR, so that «in each of them it is possible to capture inherent connections that shouldn’t emerge through sectorial vision and which must therefore be the subject of integrated planning, as it is by its nature the territorial one» (Regione Piemonte, 2011: 66; translated by the author). AIT are constructed from the identification of «local inter-subjective spaces, defined on the basis of a relative self-containment of flows that are the cause and/or effect of such relationships» (PTR Piemonte, 2011: 67; translated by the author) and are the nodes of the superhighway networks.

The AIT derive from the application of a theoretical model of analysis and evaluation model, called SLoT (Sistema Locale Territoriale), developed by the territorialist school of Torino, which is based on the analysis of the interaction between local and regional systems.

From an analytical point of view, the model seeks the presence of a series of “clues” and “starting conditions” that favour, appropriately supported by government intervention, the building of a local development system (Dematteis, 2003; translated by the author): «relational, cognitive and organizational resources, “dynamics” that reflect the active role of the territorial subjects», territorial aggregations of public and private entities that have produced projects and actions of transformation and territorial development in the various sectors (productive, environmental, tourist, etc.).

All the local actors involved in the project are analysed through special analysis grids that take into account the types of project activities, actors involved, and territorial resources. These dynamics are then compared with order elements of the territorial organization in order to rebuild a territorial framework as fully as possible of the current dynamics and to guide the developmental paths.

Directly derived from the SLoT model, AIT are a device to support the diagnostic, evaluative and strategic phases of the Plan, with regard to the implications of local choices. They also play an important role in the analysis and in the actions of the large scale (regional, national, and European) networks, because they are complex nodes of these networks¹.

5 CONCLUSION

The above examples show different “territorial implications. The territory become a source and an opportunity for those areas: “intermediate”, “post-metropolitan”, “peri-urban”, “fringe”, in which the “deterritorialization” process (Choay, 2010) has triggered evident environmental (resources degradation and depletion) and social (marginal) impacts.

The territory assumes an active role, reacting to the anthropic effects with resistance actions, advantages and opportunities. It is a “subject which earns a new semantic relevance”, in which «all effects own a meaning» (Corboz, 2014: 190; translated by the author). It assumes the role of an unexpected “framework”, which combines infrastructural and natural components that have different relationship with the territory. It represents a “silent” place and, at the same time, the place of “outburst”, suggesting multi-paths of intervention and most of them are still unexplored.

ID 1650 | LOCAL IDENTITIES ON CHANGE- URBAN WATERFRONT REGENERATION WITHIN THE GLOBAL CITY ISTANBUL SERIN

GEAMBAZU

Serin Geambazu¹

¹Ion Mincu University

geambazuserin@yahoo.com

1 CASE STUDY I: INNER URBAN COMMUNITY UNDER A CASE OF WATER FRONT REGENERATION IN HALIC

1.1 TRANSFORMATIONS IN HALIC

Over the last decades, many cities worldwide have promoted urban waterfront regeneration for a variety of reasons building on the particular scenery of these sites. The success of the first well known urban waterfront regeneration project, Baltimore Inner Harbor regeneration (1960), has served as a prototype for cities around the world with the desire to position themselves in the race to become Global Cities (Harvey 1989) by providing strategically located high-quality investment opportunities to attract global capital, or by constructing attractive spaces to promote tourism and leisure. Nowadays, almost every city at water's edge is engaged in regeneration projects with strong political impetuses and interest from various parties: authorities, developers and neighboring communities (Hoyle 2001).

These developments have been critically examined by many scholars, many of which share the belief that urban waterfront regeneration is often not addressing the underlying, deep-rooted problems of the cities and furthermore, ignoring the socially and economically unstable landscapes in which they often occur, veritably contributing to the escalation of inequality, polarization and deprivation in the city (Harvey 1989; 2005; Brownill 1990; Gordon 1997b; Hoyle 2000; Saarinen and Kumpulainen 2005; Butler 2007; Healey 1997; Gordon 1997a, 1997b; Feldman 1999; Fainstein 2001; Granath 2005; Butler 2007).

Studying urban waterfront regeneration as a complex urban intervention, specifically its special governance, resistance and impacts on the neighboring tissue, could be considered a prism through which broader societal transformation processes and related planning challenges can be understood. For the scope of this study, the empirical research gathered both primary and secondary data through: literature review, review of laws, review of official documents and land-use plans, 31 interviews, 91 questionnaires, participatory- observation, an workshops, observation and photographs.

In order to understand the planning processes of the regeneration of Halic's waterfront, a reflection is done upon the peculiarities of Istanbul's urban regeneration policies and the institutional framework at city and national level that have facilitated it: Istanbul, Turkey has been experiencing a neo-liberal reconfiguration that is now in its final stage. In this context, urban regeneration is steered as a tool for development within a special legal framework and while the purpose of the projects seem to be in the name of upgrading the built environment and improving the living conditions of the poor, the top-down approach, reduce the projects to just transformation of physical space and neglecting the social, economic and environmental dimensions, which along with the unwillingness of government to allow grassroots participation in the planning process become the focus of discontent and protest.

Halic, a 7,5 km bay of the Bosphorus and the cradle of settlement since the birth of the city, was heavily industrialized and contaminated in the 1970s and since then has been experiencing a long process of transformation along its waterfront. In line with popular North- Western examples of urban waterfront regeneration at that time, this process was triggered by Mayor Dalan in 1983 who famously stated his mission: „The water of the Halic will be as blue as my eyes”. Behind the environmental concerns, there was also an economic motivation to bring Istanbul between the competitive global cities with a vision of a "Cultural Valley".

The following forced de-industrialization process of the 1980s was impressive and did indeed improve Halic from an environmental perspective, but the clearing process was pursued with a heavy-handed, top-down governmental approach to planning and the legacy of Dalan is contested: The project created an approximately 50m wide strip of vacant land– a great opportunity in terms of offering open green spaces for the city- but also mass unemployment and poverty in the backstage neighborhoods populated by former dock and shipyard workers.

The following initiatives to regenerate Halic's waterfront showed no intention of resolving the social and economic burning issues of the neighboring communities. Within the same top-down planning approach, as in the 80's clearance intervention, urban waterfront regeneration projects are ad-hoc initiative of different bodies of the government depending on ownership and planning rights over the land, creating developments for middle-high income citizens: "With empty convention centers in the middle of poor neighborhoods, a few art galleries right beside demolished historic buildings, and newly built museums next to squatter housing". (Bezmez 2008 pp. 817).

Still, this 7,5 km green belt of parks and recreational spaces in the heart of the city, represents an enormous opportunity for a congested global city as Istanbul and its citizens, but mostly for its low-income neighboring communities in need of public space.

1.2 HALIC SHIPYARD CONSERVATION PROJECT

Halic Shipyard Conservation Project is an urban waterfront regeneration project in on-going planning process, initiated and subsidized by Istanbul Metropolitan Municipality and creates hope in tailored outcomes, serving the citizens interest as a public project, but is missing its transparency.

The site of Halic shipyard was for long under pressure of transformation due to the opportune location and also being one of the last projects that could complement to the "Cultural Valley" vision. For understanding the area of the project and its relevance, it must be noted, that the shipyards aimed to be transformed are also important for their cultural and historical value at global, national and local level. Considering the legal framework, all three shipyards are under Law of Conservation and designated to regeneration and their current function will be changed with the suggested functions from existing plans: culture, recreation areas, commerce and education. Also Conservation Board No. II (representing Ministry of Tourism and Culture) will be added to the planning process.

The ownership belongs to different governmental bodies which makes a collaboration between these actors challenging. Major actors in the planning process of Halic Shipyard Conservation Project are: Istanbul Metropolitan Municipality, the initiator of the project, owner of the land and also the provider of the finance in realizing it.; the Department of Historic Environment Protection managing the project, having mainly the responsibility to assure the conservation and restoration of the historical monuments in the area; the Conservation Board No. II, representative of Ministry of Culture and Tourism, having also the main responsibility to assure the conservation and restoration of the monuments; Istanbul Metropolitan Planning in charge of the plans and design of the project and also IDO (private company), having the tender of the land.

In the interviews with representatives from the planning department of Istanbul Metropolitan Planning, the team planning Halic Shipyard Conservation Project, it has been revealed that the outcomes of the project will take into consideration the previous suggestions. Halic Shipyard Conservation Project will respect the 1/1000 Plans of Beyoglu in terms of conservation of the shipyards, along with the recommendations of implementing cultural and recreational activities. Moreover creation of green spaces is emphasized, the vision being to open the waterfront for the broad public, the citizens of Istanbul. However, the project contains no analysis of impact assessment such as: environmental, economic or social, this showing the physical focus of urban waterfront regeneration in planning, putting in doubt the success and purpose of this project. Strategies concerning the development have been proposed by Istanbul Metropolitan Planning: "conservation of the buildings, enhancing the transportation in the area, introduction of recreational and exposition areas, bringing the city to the waterfront, protection of green spaces and ensure the participation of the local people of the area." But although these strategic points presented, there was no information for the broader public about the project or the request for any collaboration from the citizen's side. This leads to questioning the outcomes of the project because of this type of non-transparent planning process that leaves no input from the citizen's perspective. As seen and criticized in other examples of projects along the Halic, the project could also potentially enhance existing socio-economic problems, a matter that will be presented in the following part of the article, by analyzing the neighboring community in rapport to the project.

2.1 BEDRETTIN INHABITANTS, A NEIGHBORING COMMUNITY ON STRUGGLE

This part presents the evaluation of the Halic Shipyard Conservation Project, considering the impact on the neighboring community. Bedrettin Neighborhood is chosen for analysis because it is the closest community next to Halic shipyard, also being the first group of actors impacted or that could benefit from this project will be exposed.

Bedrettin Neighborhood is a low income neighborhood (according to median monthly household income 2010) at the shores of Halic, in Beyoglu District. It was strongly connected to Halic Camialti and Taskizak shipyards, being occupied by blue collar workers at the shipyards. Therefore, the neighborhood was much affected by the clearance process done by Mayor Dalan in 1983, the first regeneration along Halic, its current problematic economic condition being outcome of the forced deindustrialization process of that time. Today, approximately 1500 people live in Bedrettin Neighborhood and are mostly divided as retired workers from the shipyards, people coming from Anatolian side of Turkey and a considerable group of roma minorities.

Based on the interviews with the "muhtar"(mayor of neighborhood) of Bedrettin Neighborhood, the questioners realized with the community and the personal observations of the researcher on site, is found that the neighborhood is in on-going transformation due to several reasons. First, Bedrettin Neighborhood was declared as Renewal Area in 2005 and, according to Law of Renewal, the neighborhood will go under a process of regeneration which will put in danger of displacement the poor citizens living in the area. Although 80% of the citizens living there own their land, the houses built are not in good condition, being classified as "gecekondu", squatter housing, and have to be renewed and improved for their safety, this being a hard task for the majority of the community which is poor. Second, the increasing prices of land in the area are the proof of the process of gentrification seen also along the whole waterfront of Halic.

These changes bring a strong opposition from the community, who is against this renewal project and afraid of displacement. Together with their muhtar, the community found a neighborhood association named Bedrettin Neighborhood Association. This has the purpose to fight in court, as the only way of

challenging decision-making, against the regeneration of their neighborhood and all other regeneration projects that could affect them. All citizens of Bedrettin Neighborhood signed a list opposing this intervention and the municipality's project was given to court. However, the results were not positive ones and this created mistrust between the community of Bedrettin Neighborhood and municipality along with loss of hope towards the actions of the government. In this context, although the purpose of the urban renewal project seems to be in the name of upgrading the built environment and improving the living conditions of this poor community, the top-down approach along with the unwillingness of government to allow any participation from the citizen's side can be questioned.

The reason for opposition, from the citizen's perspective was not only the fear of displacement, but also the difference between the new proposed plans and their actual needs. As reason for this are the un-transparent processes of planning with no collaboration or participation from the community's side. Public planning policy in Turkey gives rights of involvement in planning process just to the owners of the land and welcomes participation from the citizen's perspective at the end of the planning process. Still, studying the neighboring community of Halic Shipyard Conservation Project, it was found that the citizens have been informed about the development of the shipyards and active in influencing the planning process. The community doesn't believe that the project will be done for their interest and that will bring them job opportunities or other benefits of such. Also there is a lack of information regarding the project which proves the lack of transparency in planning.

The lack of information regarding the project makes the community come closer to Chamber of Architects, Neighborhood Associations and Halic Resistance urban social movement, the actors currently engaged in a fight against the waterfront regeneration of the shipyards. In the questioners conducted during the meetings of Halic Resistance, besides the fear of displacement answers also as: "to learn the truth", "because this project is being used strategically against us" were given.

2.2 TRUE NEEDS OF THE CITIZENS

Looking to Bedrettin Neighborhood, one could see a condensed living environment, trapped between wide boulevards and with a great view towards the shore of Halic. Analyzing the built environment, it can be seen through the narrow streets and lack of public spaces, that it evolved organically and unplanned. The lack of public space and also green areas is a main loss for this neighborhood, but also one of the main aspects that Halic Shipyard Conservation Project could improve.

Although, as previously mentioned, the citizens of Bedrettin Neighborhood are against the Halic Shipyard Conservation Project, outcomes of the questioners regarding what they would need in the future development were: green spaces, culture and education facilities, keeping the working shipyards, health facilities . In the discussions with the community, especially with the group of mothers, mostly staying home and taking care of their children, the need of closer public space and green areas was emphasized. It was found that families go to other parks along the Halic and make barbeques or just bring their children to play, this being the only recreational activity for these families. An intriguing vision of the children is the one of the "fisherman", a symbol of the waterfront of Istanbul which should not be blurred in the landscape of waterfront development for global economical gain given by projects in name of tourism and consumption.

The regeneration of Halic shipyard, is understood to be a big opportunity for the community in terms of creating public space for recreation, improving the quality of their life considerably.

Taking into account the vulnerable position of the neighborhood in terms of economical situation, the on-going gentrification process at Halic's waterfront and the renewal project in the agenda of the government, it can be argued that Halic Shipyard Conservation Project will contribute to this picture considerably, creating social and economical impacts on the community. From the questioners conducted in the neighborhood it is clear that the community is against Halic Shipyard Conservation project, the main reasons being in relation with the mistrust towards the regeneration projects initiated by the government, the lack of transparency in the planning processes, the lack of good quality information and the fear of displacement rather than the project itself or its outcomes. These aspects are also the reason why the neighboring community is engaging with other actors in opposition.

The community of Bedrettin Neighborhood is an important actor being the most affected by the project, but also by its potential to give inputs to the project. Due to the lack of consideration of this neighborhood in the planning process the true benefiting outcomes of the project will not be achieved. Opportunities for more inclusive and transparent processes in planning can be found after analyzing the neighboring community as the openness and interest of the community in participatory planning methods and in expressing their need. The community is not only in need of public green space which can be created with the Halic Shipyard Conservation Project, but also in need of programs and solutions for its vulnerable economical condition. Halic Shipyard Conservation Project, if planned carefully, might satisfy and resolve some of the problems faced by the community, but this is possible only if the community is involved in the planning process.

Urban waterfront regeneration in the context of Istanbul reveals the same features of the popular contested cases of North and Western examples . The leading factors are an entrepreneurial government and also a national policy on urban regeneration designated by the central government. The strong and constantly growing opposition is not only the resistance to this particular urban waterfront regeneration project, but it leads to a bigger picture of urban regeneration projects in Istanbul, realized through a top-down approach to planning, creating major social and economical impacts. One may argue that only through a change towards a more inclusive planning approach, along with clear targets for the improvement of the quality of life for the neighboring community, the urban waterfront regeneration project, Halic Shipyard Conservation Project, will be able to escape the current deadlocks and collisions between government, investors, resistance and local community and might have a chance to actually set an urgently needed precedent of a new planning culture in Istanbul.

ID 1659 | FLANDERS’ SPATIAL (POLICY) PLANNING IN THE MAKING: POTENTIAL AND LIMITS TO COLLABORATION AS COLLECTIVE LEARNING

Jan Schreurs¹; Annette Kuhk¹
¹University of Leuven - KU Leuven
jan.schreurs@kuleuven.be ; annette.kuhk@kuleuven.be

ABSTRACT: Planning has to adapt itself to changing challenges and circumstances. But also innovative ideas and new ambitions from within can lead to changes of an established planning system. In Flanders (one of three Belgian regions), the administration of spatial planning is currently developing a new concept, format and approach: spatial ‘structure planning’ will be followed-up by ‘policy planning’. To foster flexibility, a new legal frame and instruments redirect planning towards combining a long-term strategic vision with mid-term realization-focused policy-frames. The regional government hopes to approve the new planning system by the end of 2017. Worth mentioning here is the shift from hierarchical relationships

between planning levels to partnership-relationships based on equivalence. Collaboration at and between governance levels, policy domains, and relevant actors is central to this. The regional planning agency will provide rather guidance than norms. Since that kind of collaboration is not yet a structural part of the actual planning culture, this new direction is at odds with practices until now, and needs critical support. This paper has the ambition to assess the actual situation in Flanders and to contribute to theoretical positions on flexible planning within constellations of uncertainty, while developing concepts on collaboration and reframing concepts on participation. In terms of method, the recent 'White Paper' – approved November 2016 - about this 'policy planning', is scrutinized in the light of research findings from the Policy Research Centre (Steunpunt Ruimte: research by 3 universities for the administration Spatial Planning Flanders), i.e. conclusions from the research on methods for future explorations and collective learning for complex spatial issues (Kuhk, et al, 2016). This study analyses stimulating large-scale pilot practices, identifies crucial methodological issues and formulates valuable policy-recommendations. In our analysis, we acknowledge collaboration as means (methodological aspects), as a goal (collectivity aspect), and as a medium (collective learning as a mode of 'rehearsing the future'). Collective learning has a huge potential for collaboration in planning practice. The recommendations in the paper built on and attempt to widen results from separate case-studies, i.e. to allow for a more generalized implementation. It is hoped this critical analysis will stimulate the ongoing stakeholder consultations and partner debates and thus amend the document that will be prepared for preliminary approval and public consultation.

KEYWORDS: collaboration, collective learning, policy planning, uncertainty

1 INTRODUCTION

The socio-spatial issues which face spatial planners are complicated. Reasons can be found in the combined effects of interrelated (f)actors within the planning processes and of influences from a wider context. Consider, for example, how the city of Antwerp closed the slaughterhouses in the Lange Lobroek street after the European Food Agency changed the rules on slaughter in response to livestock epidemics in the 1990s. European food policies, in other words, had important implications for urban development, for employment, for existing infrastructure, In abstract terms, this means that elements from a broader 'contextual' environment interact with the 'transactional' environment of spatial policy (see Kuhk, et al., 2016: 12), i.e. elements outside the planner's influence with an impact on planning. Moreover, developing new land policy for the slaughterhouse site cannot be a purely public decision, but needs to be done in consultation with the private sector because of the distribution of ownership (see Kuhk, Dehaene, 2017). On top of that, any decision will generate effects that cannot be forecasted because of complex interferences between physical, social and mental agencies. The Dam neighbourhood, that is the historical location of the slaughterhouse, is going through a (still rather smooth) phase of gentrification, generated by replacing a strong physical barrier (a railway-yard) by a successful huge public park. Corollary, physical opening up is complemented by social transformations such as influx of wealthier inhabitants. New housing development and densification raise the price of real estate. At the same time uneasiness grows because of 'hanging' decisions concerning (the impact of) huge infrastructure works on and along the Antwerp Ring. The city government is confronted with growing socio-spatial activism and demands for participation in decision making. Mistrust grows because decisions are postponed and citizen participation is window dressing ... Such situations are very recognizable in planning. They are thoroughly complex. Goals are diverse; means are unknown or dispersed, the situation is frustratingly uncertain. 'At the edge of order and chaos' (Waldrop, 1992), the compact expression for complex systems is applicable: these phenomena are decentralized, highly spontaneous, dynamic, interacting in a non-linear way, but adaptive as a living system.

2 EMERGING APPROACHES IN PLANNING & DESIGN

2.1 SOME THEORETICAL POSITIONS VIS-À-VIS UNCERTAINTY

Planning theory has evolved in order to cope with the complexity of such situations. Although we are aware of "the growing diversity of approaches within what is now broadly categorized as spatial planning" (Houghton, et al., 2010: 2) two 'opposing' kinds of approaches can be mentioned as indication of a more general tendency.

Criticizing modernist comprehensive regulatory land-use planning, structure planning focused on essentials. The comprehensive character (encompassing, controlling, zoning, ...) is replaced by strategic choices, such as prioritizing crucial issues or transformations with a leveraging effect. The controlling blue-print character vanishes through planning for infrastructures and physical/natural structures, thus leaving room for further development, adaptable to territorial and social local characteristics. The abstract and passive character is replaced by dynamic integration of long term visioning, realized projects and continuous citizen participation. Albrechts' plea is to 'take strategic planning beyond its usual boundaries and traditions' and 'to reinvent itself' (Albrechts, 2017: 400). He stretches strategic structure planning to its rational limits. "Broadening the scope of the possible and imagining the impossible", strategic planning still 'needs an arena', "an open dialogue in which a plurality of interests and demands, opinions, images, conflicts, different values and power relationships are addressed" (Albrechts, 2017: 400).

Starting from a poststructuralist relational pragmatism, Jean Hillier re-conceptualizes 'planning as strategic navigation': structured experimentation, yet speculative and creative (Hillier, 2010: 470). "Strategic spatial planning as strategic navigation is a performance of risk-taking, of not being in total control, of transcending the technicalities of planning practice to create an 'open reading frame for the emergence of unprecedented events'" (Hillier, 2010: 473).

Strategic navigating involves the community by fabulation. 'Fabulation' is a 'conceptual groping towards potential-to-be', oscillating 'between reality and the virtual', intersecting in 'a state of transformation or a becoming'. (p. 470) Following Deleuze, Hillier states that becoming should be expressed as a collective will, 'a collaborative process of invention', belonging to a community, a collective but non-unifying articulation of differences, to produce 'common thought'. "Common thought is the outcome of a process in which differences are neither suppressed nor superseded, but in which they are integrated into a 'whole' " (Hillier, 2010: 470).

This implies starting with the living, changing and evolving actors or agents themselves in order to respond to such a non-linear world full of complexities (de Roo & Boelens, 2016: 20).

Both approaches, rather debating 'deliberative opportunities', or rather fabulating 'common thought', become aware of a condition of becoming, of open lines of flight, of uncertainty. This condition of uncertainty is partly due to the plurality of stakeholders. At the same time stakeholders are the basic 'ingredient' to cope with that uncertainty. And both deploy consciously rich concepts to imagine spatial planning by adaptive practices that involve stakeholders and communities intensively. But will 'arena' or 'navigation' work on the floor? In other words: would it not be helpful to construct an imagination for collaboration in conditions of uncertainty that is corresponding more to the need for sharing?

Uncertainty as a condition of planning has been addressed time and again. The most obvious uncertainty is produced by the fact that the future development of the complex socio-ecological system is not knowable because of the non-linear character of changes. On top of that at any moment, uncertainties in decision-making include 'uncertainties about the working environment', 'uncertainties about guiding values' and 'uncertainties about related decisions' (Healey, 2006: 255). When (many) stakeholders are involved, their different values, perspectives, desires and demands most probably will bring in disagreement and thus even more uncertainties about the outcome of a planning process. The most common situation entails so much uncertainty and disagreement about planning goals and means that it has been coined as 'irreducible uncertainty' (Bertolini, 2010: 413).

Collaboration is a second key-term. Bertolini is attracted by the notion of 'wicked' planning problems, as coined by Rittel and Webber, and even more by their suggestion of 'second generation approaches' to cope with the resulting irreducible uncertainty. "Approaches of the 'second generation' should be based on a model of planning as an argumentative process in the course of which an image of the problem and of the solution emerges gradually among the participants, as a product of incessant judgment, subjected to critical argument." (Rittel & Webber, 1973: 162)

Basically this quote has everything to help conceptualize planning as collaboration in uncertainty: stakeholders involved in a process of deliberative critical communication, gradually building an image of how ends and means are related. The tendency of emerging new models and practices in planning also reached Flanders. By analysing practices we can learn what kinds of capacities are needed for such adaptable trajectories of collaborative planning.

2.2 TOWARDS A 'POLICY PLAN ON SPATIAL DEVELOPMENT' IN FLANDERS

Flanders is a region of Belgium that became gradually semi-autonomous, due to an enduring step-wise process of federalization starting from 1980. During the last 50 years three important shifts in the planning system can be discerned.

In 1962 a new Belgian law installed a comprehensive planning system. The Spatial Planning Act stipulated that municipalities were obliged to design general as well as partial land use plans. Statutory land-use plans also had to be developed at regional and national level (gewestplan, streekplan, national plan). When installed, this law was considered to be a major step forward towards a systematically controlled and geographically complete spatial development. Practice was not completely fulfilling these expectations however. The statutory character was weakened because many compulsory plans were never developed. Binding land use plans only exist at the sub-regional level (gewest) and at (parts of) municipalities at the local level.

Already since the mid '70s critiques were formulated concerning this comprehensive land use planning practice (Albrechts, 1974). The planning system was considered to focus too much on legal aspects and control by zoning, to decide at hoc and treat plans in a passive way, Framed as structure planning, a new approach was elaborated which should be imaginative, strategic, action-oriented and participatory. Louis Albrechts, Charles Vermeersch and Jef Van de Broeck co-designed the new Spatial Structure Plan on the level of Flanders (RSV) (Ruimte Vlaanderen, 1998). They felt the "need for a planning discourse as a set of ideas, notions, concepts, a frame of reference, a system of meaning with which ideas and arguments are articulated and whose goal is to undertake initiatives that affect (spatial) development and everyday life." (Albrechts, 2007: 92).

Selecting a limited number of critical issues, constructing strategies, and carrying strategies forward towards implementation, while mobilizing the public in order to gain acceptance and support for the strategies and solutions to the problems, were the main principles of spatial structure planning in Flanders. The principle of 'subsidiarity' of relationships between levels of governance was brave, but almost 'forgotten' in practice. Albrechts sees the idea to "intervene more directly, coherently and selectively" (Albrechts, 2007: 92) as the crux of "the decision to replace traditional land use (zoning) systems by an approach wherein planning develops an overall spatial policy framework." (Albrechts, 2007: 94)

In 2011 already the Flemish administration of spatial planning started a broad participatory trajectory. An interactive information campaign and several debates were used as basis for reflection on the present state and on future spatial policy. This was the start to replace the (strategic) structure planning system by policy planning. The process towards the BRV started with a Green Paper (approved 04.05.2012) and has been elaborated into a second preliminary text, the White Paper (approved by the Flemish Government on 30.11.2016). This document is presented as a base for consultation with (possible) partners as a trajectory of operationalisation (Ruimte Vlaanderen, 2016: 3).

Accordingly, the RSV will be replaced by the BRV (Beleidsplan Ruimte Vlaanderen: literally translated meaning 'policy plan for space in Flanders'). Contrary to the RSV this preliminary document does not contain a graphic plan, but intentions, ambitions and principles. Therefor we will call BRV a 'spatial policy document', analogous to 'spatial structure plan'. BRV conveys a vision on future spatial development, which is however at the moment still largely to be translated into policy-frames, development programs and lists of actions, and to be supported by rules and instruments.

Reasons for this shift to policy planning are not expressed very explicitly, probably because they are diverse and partly eschewing discussion. We imagine the main reasons may be found within an inchoate implementation of structure planning, the (changing) context, political prerogatives and the planning system itself. Gaps between principles and practices have been identified and criticized repeatedly. These were a burden for the effectivity and the fame of structure planning. An official assessment of the RSV did not lead to devastating criticism (Ruimte Vlaanderen, 2010). According to the administration, which is developing the new approach primarily internally, the RSV is not so much a 'wrong' vision, but rather outdated (Ruimte Vlaanderen, 2016). New and changing societal challenges – mentioned are: globalisation, demography, mobility, climate, energy, technological innovation, food production, biodiversity and related spatial conditions – ask for an actualization. It sounds as a convincing argument. However, within the structure planning model, these challenges could have been easily added since according to its

principles the RSV needs to be actualized every 10-15 years anyhow. Therefore, frustration might be a more important reason for renewing the planning approach than outdatedness.

The White Paper expresses (finally!) a certain sense of urgency. Graphic representations of the cumulative effects of the daily 'consumption' (6 ha.) of space in Flanders, repeatedly shown, seem to work as a wake-up call. The nick-name of the policy document, 'betonstop' (meaning: stop pouring concrete in the Flemish landscape), reveals ambitions as well as slight panic. However, politicians feel hindered to intervene because of the rigid interpretation given by most administrations to the policy-vision of RSV, and also because of the rather cumbersome procedure to change a structure plan. Thus shifting from a structure plan to policy planning might as well be inspired by the occasions to introduce more flexibility. It is the explicit intention to not make a plan, but stick to general principles for development, complemented by strategic policy frames. These frames can be changed in a short time span, without too much interference from stakeholders or councils.

As to the planning system, several shortcomings have surfaced since 1996 and should be remediated. However, continuity is apparent. The White paper announces the intention to build further upon the main lines of RVS. The existing spatial structures remain the base for future spatial development (Ruimte Vlaanderen, 2016: 4). Development of cities and villages will be linked to public transport and facilities. Existing concentrations of companies are consolidated as a major economic structure. Concentration and bundling are still crucial spatial principles; together with performant collective transport those will be strategic measures to control mobility and safeguard open space. The centre of gravity for development will still be the Flemish Diamond (a main spatial concept of the RSV) but in a nuanced and amended form: centralities created by nodes of public transport and services will steer development. The main ambitions became stronger: gradually abolish the consumption of additional space for building and development while preserving qualities and (added) value for the whole society; use integrated area development as a motor for collaboration with stakeholders.

2.3 "WE WILL PRODUCE THE NEW SPACE TOGETHER"

The BRV explicitly enumerates 10 'policy-changes' compared to the RSV. These will support the new planning approach to shift from a comprehensive and regulatory attitude towards a spatial policy based on conditioned partnership. The new directions announced are: from comprehensive to strategic content, from hierarchic collaboration to equivalent partnership, from programmatic and territorial delineation to integrated territorial development, from geographic expansion to transformation of existing built-up space, from growth based on hierarchy to development based on potentialities of city-centres, from mono-functional to multifunctional roles for open space, towards innovative concepts for climate and energy, from supply-based policy to a project-based approach, from strict prognoses-based quota for housing to flexible programming, complementing land use control with monitoring realizations (Ruimte Vlaanderen, 2016).

While 9 out of 10 changes were repeated from the Green Paper to the White Paper, one intention was changed. It is not clear why the 1st intention – from technocratic to participatory plan-making – was dropped? To make room for monitoring, while sticking to the round number of 10 shifts? To avoid discussions about the meaning of a loaded word such as 'participation'? Or to evacuate the issue of participation and to stress instead collaboration, as a more neutral term?

Anyway, it is a fact that the policy-document (Ruimte Vlaanderen, 2016) on special development is leaning on and even depending on collaboration very much. It states that spatial development will be the result of collaboration. Each policy level will have its own responsibilities. Flanders will allow for partnerships by setting strategic conditions and allowing local implementation of these principles. Mutual agreements about preparing spatial development can be made via – much stressed – integrated area development. Deliberately, the new policy document will leave room for development to measure. The Flemish government will no longer test local plans based on a comprehensive assessment frame. Instead, the regional government will assist in looking for solutions, based on specific principles and frames, and argues that solutions will only exceptionally be regulated. Stipulating frames with conditions, being exemplary (project-)director and supporting territorial development will be the principles guiding the conduct of Flanders' administration. Striving for integrated (area) development, collaboration will be intensive. In short, collaboration is strongly imbedded within policy planning-in-the-making. Policy-actions will be a

result of collaborative trajectories. They will make policy action-oriented by summing up engagements of partners, including means and instruments, within an agreed time frame.

It is not clear however what 'collaboration' will mean in practice, both in terms of aims and of effects.

For provinces and municipalities collaboration is not compulsory, so it seems. Flanders' administrations is inviting those government levels to collaborate, by focusing on expected advantages such as quality gains, advantages of scale, coordination of policy, programs and tasks, creating better mutual understanding, diminishing risk for dissensus and conflict, etcetera. The White Paper hints to a broad pallet of possible modes of collaboration: between government-levels, across boundaries of municipalities, provinces and even regions, between policy domains, with a diversity of partners such as civil society, inhabitants, entrepreneurs. Probably the intensity of collaboration will differ according to the situations at hand. The main framing is however 'partnership'. The document qualifies this as a relationship based on equivalence. On the same pages however is announced that Flanders' government will create and set conditions. How contradictory this will be is unclear because they are not published yet.

The optimistic tone about the acclaimed collaboration is striking. Working around the table 'in consensus' is expected to integrate interests and to limit or avoid conflicts afterwards. This optimism sounds exaggerated at first sight. Consensus in spatial planning is not obvious, and Flanders' administration is not known as consensus builder either. Optimism might however also be the result of some successful experiences and experiments. Of the ones mentioned in the BRV, the more interesting seem to be three Territorial Development Projects (T.OP) for: the northern border of Brussels, the former coal-belt in the province of Limburg, the Coastal region. These are all initiated by Labo Ruimte (Lab Space), a formal collaboration between the administration Ruimte Vlaanderen (spatial planning) and the Team Vlaams Bouwmeester (Flemish government architect). These are ambitious and promising examples of integrated area development projects, where collaboration is at stake. And they are directed by the administration which is writing the White Paper.

Collaborating should go beyond working together on a contract-basis. Collective learning is a crucial aspect of collaboration because it delivers answers to important aspects such as arriving at consensus, suitable frames, and collective assets.

3 COLLECTIVE LEARNING RESPONDS TO UNCERTAINTY IN PLANNING

3.1 THE IMPORTANCE OF COLLECTIVE LEARNING WITH INCREASED UNCERTAINTIES

Why focus on collective learning processes in spatial issues? In the cases studied, similar changes become apparent. In the broader context, more and new challenges (climate change, migration, economy ...) raise uncertainties about future developments. New insights regarding the complex nature of the human-environment system are grafted to these challenges. Alternative planning approaches try to deal with different dimensions of uncertainty (unpredictable changes and complex adaptive systems, ...) through more open processes. Collective learning starts from a field of players who can differ significantly in terms of capacity, importance and position. These actors try to develop a shared problematization and a shared sense of meaning. A process of collective learning in the context of spatial innovations shows a strong resemblance to learning processes pure sang (Capello, 1999). What distinguishes both is the emphasis on the collective dimension of the learning process, and the intended collective purpose of the learning process (De Laat & Simons, 2002). The result of a collective learning process does not belong to one actor, but it has been shared in one way or another. In dealing with conflicting positions and dissensus in major social emergencies, collective learning trajectories, among other things, offer the opportunity to develop new or adapted frameworks, including the collective dimension of complex issues. Based on the cases studied, we briefly summarize the capacity we assign to collective learning.

3.1.1 COLLECTIVE LEARNING AS RECOGNITION OF MULTIPLICITY AND DISSENSUS

In current societal challenges such as climate change, aging, migration, mobility or energy transitions, there seems to be a growing consensus on the importance and urgency of these transitions. Whilst it is agreed that something should happen, this apparent consensus vanishes as soon as concrete objectives

are formulated and solutions are sought. Behind the consensus on urgency, conflicting interests and fundamentally different normative frameworks hide. Uncertainty about the future developments of the major challenges does not help the consensus to be installed. Pluralism and conflict indeed are well known phenomena in spatial planning.

In the cases we studied in the MOS research, current planning approaches show weak signals of a 'reassessment' in response to major societal challenges. In this regard, collective learning trajectories and sociocratic planning approaches seem to come more easily into the picture. Characteristic is a simultaneous attention to actors' ability to act, and to the broader contextual environment. For example, MKL2100 focuses on policy questions in a broader perspective of climate change, or does the proposals for LaboXX also take into account a changing demographic situation. Actors are involved in processes of change, sharing the provisional knowledge and the "advancing insight" with as many parties as possible. Collective learning does not focus on levelling out differences, but makes differences visible, discussable, and manageable in iterative processes. Organizing (more) equal and shared access to knowledge and expertise is essential: this strengthens the ability of a group to cope with pluralism and contradiction. In any case pluralism and dissensus may be recognized earlier in the process, which is crucial in any sphere of collaboration. It is only one step further to become aware that dissensus does not necessarily imply antagonism (see also Mouffe, 2000, 'agonism') and does not exclude searching for a shared imagination of collaboration.

3.1.2 COLLECTIVE LEARNING PROCESSES AS STRATEGY FOR APPROPRIATE FRAMEWORKS

The condition of uncertainty that spatial planning seeks to address is not just a matter of a changing contexts, new urges and targets weighting on consensus. Planning is also a search for suitable (spatial) frameworks to address problems: a scale level, a territorial definition, a proper sectoral bond, an institutional link or legal framework. Major social and physical challenges put pressure on existing relations. Social challenges such as accelerating urbanization, demographic growth, or systemically complex sustainability issues might possibly not be addressable within existing (institutionalized) relationships. Urban issues, for example, do not necessarily coincide with territorial contours (see, for example, T.OP Noordrand or Plantage issues), or can run square against the logic of planning demarcations or administrative frameworks. Economic relations, political networks or socio-cultural interactions are heavily structured by previous choices and path dependencies, thus provoking lock-ins. But also new relationships are developing in contingent and unpredictable ways, thus impeding addressing as usual. Collective learning has the potential to deal with contingency and path dependency. Collective learning trajectories jointly define appropriate paths, resulting in shared insights, practices and values, created in a field of collective experience. Collective learning trajectories heavily bear on experiments exploring and assessing various possible action frameworks. (For example, at the Metropolitan Coastal Landscape 2100, at T.OP Noordrand and at Living Labs, ad hoc or more structural cooperation across land, regional or municipal boundaries was sought because socio-spatial issues develop on a different scale than the Administrative institutional scale). New connections and overlapping synergies originate by connecting projects, as in the rather experimental setting of the Kolenspoor project (see Coaltrack as part of T.OP Limburg: Schreurs, 2016). Also new partnerships can help to categorize issues differently (for example, through an activist position and broad mobilization, Ringland faced the problem of the Antwerp traffic jam not only as a mobility issue, but first and foremost as a liveability issue. An ambition to act was installed already at a moment when the outcome was still anything but clear.)

3.1.3 COLLECTIVE LEARNING AS INSTIGATING COLLECTIVITY

Within the context of spatial issues, collective learning means learning from one another, learning to learn from one another, but also – and even more important - learning to recognize the collectivity-dimension of the subject of concern. Concerning spatial planning issues such as urban food supply, housing, mobility or energy, this dimension of collectivity has two sides. The spatial transitions which the experimental planning strategies we investigated try to offer, are not just challenges that need collective efforts in order to be successfully realized. They also confront us with the gains and losses the collectives (have to) face. Import of food, lack of affordable housing, traffic jams, fossil energy ... in one way or another externalize costs towards society at large or towards local communities. Social cost of Flanders' systematic dispersed development became very apparent in the issues at Living Labs, on the one hand, the corridor formation

along the N16 and the de facto clustering around the regional transport knot in Denderleeuw on the other hand, are examples.

4 ANALYZING COLLECTIVE LEARNING TRAJECTORIES IN A CHANGING FLEMISH LANDSCAPE OF PLANNING

4.1 AN ANALYTICAL FRAMEWORK FOR COLLECTIVE LEARNING

The Flemish spatial planning world is in motion: recently, some new kinds of initiatives were created with an important role for collective learning. In this contribution we present an analytical framework with four generic parameters as well as a number of process characteristics. The CALT-R framework was progressively developed for (and while making) a sharper description of running trajectories, but it can also be used to launch new collective learning trajectories in spatial planning. The generic concepts of the analytical framework are a preparation for tailoring concrete cases, based on negotiation or targeted experiments.

From 2007 to 2016 a Policy Research Centre Spatial Planning was founded by the Flemish Ministry. The last 4 years its research focused on four themes: polycentrism, resilience, monitoring & evaluation, and future explorations. The research on 'future explorations' aimed to concentrate on potential added values of combining scenario-analysis and research-by-design as strategies to deal with uncertainty. The research was based on literature (planning, design, policy-science, systems, future explorations, learning, ...) and on methodological workshops fed by thorough understanding of seven real life cases (amongst which the three T.OP already mentioned) and two pilots of living labs organized by the Policy Research Centre. A main focus was 'collective learning'. This was framed as a form of actor-oriented, flexible knowledge management focused on the recognition of uncertainty, a condition that is innate in future explorations.

In the so-called 'MOS' research (acronym for Methodologisch OnderzoeksSeminarie, meaning methodological research seminar), the work-package future explorations developed an analytical framework concerning collective learning trajectories in socio-spatial issues. This framework is a tool that leads to a more accurate self-description of complex trajectories, and that is designed to support a critical methodological evaluation. The analytical framework can also be a starting point to launch new collective learning trajectories. Based on the analysis of several different cases, we consider an explicit reflection on the methodology as being necessary for the further professionalization of spatial policies in dealing with complex socio-spatial issues. So far, methodological issues often remain underexposed, e.g. in the education for spatial planners, in multi-actor processes or in the evaluation of complex processes in the development of socio-spatial issues.

The analytical framework is not merely a theoretical-abstract conceptualization: it was gradually developed using the input from practitioners involved in regional and local cases (Kuhk et al., 2016). Participatory observation, document analysis and two series of interviews were combined. The results of the interviews were discussed and further deepened in two systematically documented methodological research seminars. The iterative process of interviews and methodological research seminars is in itself also a collective learning process, and can be conceived as a meta-trajectory to help building insights about existing projects. The analytical framework is referred to with the acronym CALT-R, which stands for "Conditions | Actors | Learning | Thresholds || Relations ". These notions refer to the recurring sections in the analysis of collective learning trajectories (CALT) as well as to the relationships (R) between these aspects. The analytical frame serves as a 'descriptive grid' for tangible cases. The framework uses concepts of public policy studies (e.g. about strategies for change), from sociology (including the concept of 'boundary objects'), from pedagogy (e.g. learning styles) and from literature on future investigations (e.g. dealing with uncertainties and path dependencies).

4.2 RELEVANCE OF COLLECTIVE LEARNING TRAJECTORIES IN A LANDSCAPE IN MOTION

For a long time, the rationally comprehensible model of planning has been relieved by variants of collaborative or strategic planning. This development acknowledges that the isolated, autonomous knowledge of the 'expert' is not sufficient to 'master' the complexity of social-ecological systems. Spatial planning, understood as deliberate dealing with spatial characteristics with a view to a more sustainable and resilient future requires dealing with irreversible uncertainties. The uncertainties are partly due to pluriformity and dissensus within society as well as to shifts in the nature of planning issues themselves (so-called 'wicked problems'). What is proposed in positive terms as a landscape in motion can also be experienced as a landscape in crisis, where inability to deal with uncertainties results in great uncertainty about the approaches to be applied and their institutional anchoring. We witness both institutional emptiness and institutional hustle and bustle. How can planning be a compass for urgent social issues while interventions for future developments are faced with irreversible uncertainties? How can spatial policy introduce 'planned' changes into a world that changes itself? We identified several conditions where collective learning pathways can be a relevant answer:

1. In a shared recognition of a problem, for the time being, without a shared normative point of view: Collective learning allows for conflicting positions. This is just as important in spatial planning, given that choices often make or prevent developments in the long term, involve a large group of people and require a substantial budget.
2. Recognition of a shared problem: Nevertheless, collective learning is relevant to issues with a clear collectivity dimension, where the effects of choices involve a large group of actors, where social, ecological or financial benefit can be achieved by collaborating with different policy areas and/or policy levels.
3. For shared recognition of shared frameworks: Collective learning trajectories are iterative processes with different experts (interdisciplinary), bringing together implementation-based practice with more conceptual reflections or explorations (transdisciplinary). In this constellation, existing frameworks can be adapted, can be searched for other or combined scales (e.g. by linking the local to regional, by understanding singular cases as part of a family of cases), or may be innovative sectoral, institutional or territorial relations.

4.3 CALT-R: FROM GENERIC FRAMEWORK TO TAILORED APPROACH THROUGH NEGOTIATION AND EXPERIMENTATION.

Based on the cases studied a number of recurring subjects were identified as important. Planning would gain if more rigorous attention would be provided to these. The CALT-R framework brings them together. The analytical framework holds an invitation for systematic reflection on the process and methodological development of collective learning trajectories, without pursuing uniform processes or methods. The conclusion is not that the process of the trajectory should be standardized, but that attention for and reflection on the process can be much more systematic. The best known search strategy to deal with such complex and uncertain situations is trial and error: keep trying until it works. In real life situations of spatial planning this kind of experimentation is seldom possible. Trial and error would probably imply important investments and possibly have a tremendous impact on different users (residents, entrepreneurs, investors ...). More intelligent heuristics are needed. Simulation could replace blind trial. Collective learning processes have been raised here as a more performant and effective search strategy for relevant and accurate interventions. Searching for variants creates tailored work, as is shown strikingly in the cases. For example, a selection of actors can be made based on institutional-sectoral affiliations or be based on discipline-specific expertise. These can be combined with socio-psychological type-casting and plausible roles of actors. A collective tailor-made learning process benefits from using different 'lenses'. It helps to look beyond the list of 'usual suspects', and rather to scan with an open, but sharp look, at a landscape in motion. Two action strategies are very important: negotiation and experimentation (cf. Christensen, 1985). Both can be seen as crucial modes of knowledge sharing. The majority of practices in the cases testifies of some Experimentierfreude, i.e. desiring - or acknowledging the need - to set up experiments. Experiments are an intelligent and cautious response to the difficulty of dealing with uncertainties. Learning by doing is a more intelligent and effective heuristic than sticking to transmitted certitudes. This results in trajectories that seek to acknowledge the complexity of current planning tasks, while testing methods, partnerships, roles and practices. Remarkably, the cases show that scenarios and design research are often pivotal for the emergence of experiments in a co-evolutionary iterative process. Typically variations are produced and

selections are made based on multiple cycles of debates, generated by the implicit questions 'what if?' respectively 'why not?'. This tailoring of relevant questions and possible answers is able to cross-link the more exploratory, long-term perspectives with action-oriented rationalities of current problems and demands. This meshwork of concerns helps to keep the trajectory open and searching, away from a linear project logic, rational means-ends relationships and overt sequential process steps.

4.4 COLLECTIVELY LEARNING ABOUT CURRENT CHALLENGES IN FLANDERS?

A number of initiatives were set up in order to develop the BRV as a canvassing and substantiated story in the planned shift from structure planning into policy planning: partner dialogues, various working groups, directing in 10 bottom-up test areas, etc. The BRV challenges are inextricably linked to wider societal issues and urgencies. On the one hand they are visible in current circumstances, but on the other hand also have consequences in the longer term. The White Paper recognizes a number of (shared) challenges, and acknowledges that new frameworks and suitable tailoring may be necessary. It is easy to argue why collective learning trajectories are the better heuristics with these types of questions. Through the lens of the CALT-R analysis framework, the BRV-process qualifies as a collective learning trajectory for some aspects, but to a lesser degree for other aspects. In terms of intensions there seems to be scope for negotiation, tailoring and experimentation (Ruimte Vlaanderen, 2016: 11, 45). The need for appropriate frameworks is acknowledged, for example for cross-border collaborations (Ruimte Vlaanderen, 2016: 135) or in response to specific local conditions. However, the White Paper also emphasizes the consensus principle (Ruimte Vlaanderen, 2016: 134), the orientation towards implementation, and sometimes even rather linear logic (e.g. on p. 45, indicating that the spatial program for area-based projects should already be known from the beginning). This contradicts the results of research into collective learning trajectories, which evidenced that precisely the accommodation of dissensus is an important aspect in dealing with complex issues and uncertainties. The aims of collective learning processes are expanding and enriching, in favour of realisation, but also of exploration of complex socio-spatial issues, thus interrelating short term (possibly in agonism) and long term (hopefully in consensus). Collective learning trajectories may run against regimes of consensual governance, but do not run away of complex issues. Rather: dissensus or "well-reasoned disagreement" is essential in democratic decision-making (see Laermans et al., 2016: 49), based on the expectation that, in the case of normative uncertainties, adapted frameworks will arise in particular from a deliberative debate, imaginative negotiation and targeted experiments.

5 CONCLUSIONS

Flanders faces urban and regional societal and spatial challenges. A new regime of policy planning (BRV) will be installed to cope with these conditions. In the White Paper, the preliminary text for BR, collaboration is seen as a relief of the existing hierarchical plan-cascade (Ruimte Vlaanderen, 2016: 11). This is a brave but correct choice. 'We will produce the new space together' is motto that deserves and needs support. But collaboration is not obvious. Collaboration implies more than bringing actors together and to discuss what needs to happen, why and when. Collaboration will have to gather collectives, working towards (shared) recognition of (shared) problems and giving these (shared) meanings. Within the conditions of extreme uncertainty, which are always present in spatial planning, collective learning is a crucial aspect ... That's what we found out, based on an intensive investigation of real live cases and living labs. Hoping to contribute to the concept of collaboration as collective learning, we conclude with three suggestions.

1. Collective learning is a complicated process. It is wise to be concerned about the crucial aspects of that process. From the MOS-seminars we learned that many of those aspects can be identified and linked in a framework we called CALT-R. This framework can help methodological follow-up during and after a collaborative process. It can also be used to anticipate the crucial characteristics in future processes. A systematic and explicit engagement with the methodological aspects seems a must to us. This will contribute to the learning within every collaboration process. It will also build up a meta-learning process across different cases: learning about collective learning.
2. Collective learning allows and enables work made to measure. The potentials for responding to the latent crisis are unevenly distributed, because the influence reaches evident, but also unexpected places, well-equipped but also unprepared situations of governance. The ability to organize collective

resilience requires a necessary critical mass in terms of expertise, means, An open process, fed by diverse attitudes, knowledge and experiences, interactively co-designing, co-operating and co-producing, is well-fit for dealing with specific situations (conditions, actors, knowledge, thresholds) and contexts. But flexibility without frames becomes chaos. Frames must and will play a role. As mentioned, finding or making practically adequate frames to address challenges and answers is part of the reduction of structural uncertainty. Therefor the role of the policy frames announced within the White Paper, will be crucial. The thematic choices are important, but even more the form that will allow addressability (and responsibility).

3. Collective learning seems to be a potential candidate for a collective imagination that can cope with planning in uncertainty. The terms of 'collective learning' imply both a vision (on learning as changing, adaptive, becoming, ...) and collaboration (exemplifying the collective as collectivity, equity, sharing, ...). Imagining a subject for collective learning would make this candidature even stronger. We suggest to conceptualize collective learning for trajectories called 'rehearsing the future'. Through that lens, policy planning becomes: directing performances of multitudes of actors, taking time to dive into the unknown, elaborating simultaneously strategies and frames, collectively, iteratively, learning by doing and reflecting while doing, until uncertainty becomes 'incertainty', that is: the merging of an uncertain avenir (French, a second term for future, meaning 'to be coming', 'becoming', 'ever changing') and an expected, seemingly knowable future (Schreurs and Kuhk, 2015).

ID 1660 | CHALLENGES AND TRICKY WORDS. A STRONGER ROLE FOR PLANNERS

Daniela De Leo¹

¹PDTA-Sapienza University

daniela.deleo@uniroma1.it

ABSTRACT: In the last 20 years, a deliberate strategy of impoverishment of local governments argued the imperative need of: a) involving at all (public) costs, the private sector through the “trojan horse” of governance (Miraftab 2004); b) designing big and shortsighted urban projects (frequently destroying public resources and ignoring public needs) through the mantra of the urban and territorial competition. As it has been already noted, “by elevating Governance above Government, and Economics above Politics, the globalpolicy undermined nation- and state-building capacities in many Countries” (Demmers, Jilberto, Hogenboom, 2004). Moreover, through the rhetoric on pluralism, the neo-liberal governance has contributed to shrink and destroy the relevanceof public interest. In fact, behind the 'screen' of governance and the representation of an amorphous citizenship and a notqualified of diffuse interests, the deployment of capitalism has prevailed. This legitimized the partial and strongest interests into shaping the public agenda within the polarized inequalities. In thisframework, the paper will give some suggestions and advices for rethinking current problems, and trying to deal with them,by starting by the critical evaluation of some words we use. Moreover, by focusing on the ethic of responsibility andaccountability of planners (and for most of us as planning scholars), the paper argues that a stronger role for planners andplanning scholars has to do with our own field of responsibility (such as professionals/practitioners/scholars), andmoreover with our commitment in building and using new theories and research approaches at least to: a) incorporate the 'others'/minorities by considering furthermore the interaction between capitalism accumulation in space and the minorities (Yiftachel 2013); b) improve critical urban theories mixing with place-based planning and research practices (Campbell 2012; 2014), by applying different approaches; c) co-produce (Watson 2014) a public model of development, being aware of the oligopolistic elites and extractive institutions (Acemougrou, Robinson, 2012).

1 INTRODUCTION

The paper discusses critical perspectives on contemporary urban planning from a sort of Southern-European point of view focused on:

- a. Challenges/a model of social regulation under discussions.
- b. Tricky words/suggestions and advices for re-thinking and re-setting problems by definition;
- c. Role of planners & planning scholars/implications for planners and planning theories and practices.

The first point regards the evidence that all around Europe there is a model of social regulation under discussions. In fact, behind the question of public debt, there is the question of change of model of social regulation there are the needs to underline in which condition we can think about critical perspectives in urban planning that are connected with this request of changing (urban) development model.

For this reason, the paper will underline some concepts (behind some tricky words we used for decades) trying to give some suggestions and advices for rethinking and re-setting current problems and try to deal with them, starting by the words we use.

Then, some directions and perspectives for planning theories and practices will be discussed by focusing on their responsibility and accountability for planners and for most of us as planning scholars to change our tools and way to do in a changing world.

2 MAIN CHALLENGES AND STARTING POINT

In the last 20 years, a deliberate strategy of impoverishment of local governments emphasized the imperative need for:

- involve at all (public) expenses, the private sector through the Trojan horse of governance;
- big and shortsighted urban projects (destroying public resources and ignoring public needs) through real estate speculations & big events "to make cash" (you are experts about it!), but cash for developers, not for people...

By elevating governance above government, and economics above politics, this global policy undermined nation and state-building capacities in many Countries... (J. Demmers)

Cities have become powerful machines of suspension of the rights of individuals and groups with important effects on security, socio-spatial segregation, and moreover the citizenship rights, by shaping, day-by-day the SO CALLED "dualistic city- scape" characterized by at least four factors:

- brutal inequality,
- neoliberal roll-back of the State,
- formation of a "vicious circle of exclusion, insecurity and violence" (reviewed by Koonings and Kruijt, 2007, p. 4).

In few words, we can say that especially in the last few years, Market organizes more and more urban spaces than we are able to do.... But spaces are our domain as public planners and PLANNING SCHOLARS!!!

The paper would like to emphasize here the role of PLANNING SCHOLARS also because our role has been underestimated by literature and research, even if we play many roles as participant in practices, as community based researchers, activists but also as instructors or thesis/PhD Thesis supervisors... and all this implies a special RESPONSIBILITY AND ACCOUNTABILITY especially within THE PUBLIC UNIVERSITIES...

So, according with this responsibility and accountability we have to redefine aims and tools of our everyday practices and research practices...

Moreover we have to redefine aims and tools of our every-day work and orientation.

In this scheme, from one side, there are efficacy & consensus, and on the other the equity & justice...the first are under the mainstream umbrella of governance, and the sphere of interests, in which conflicts are considered ObSTACLes, as incident for the efficient action...

The second – in a frame of citizenship rights – regards values and within this aims – in which most of us are operating – conflicts are considered as (important) opportunities...

Equity and Justice and moreover “Citizenship rights” are the key issues in the effort of moving from a professional-technical knowledge to a socio-political and ethical dimension of planning knowledge.

But in a conflictive dimension of opposing interests the role of values is fundamental!!!

3 SOME “TRICKY WORDS”

Here the some tricky words for resetting problems emerged. First of all, the Governance. Governance has been used as an assignment of sovereignty not to the people/citizens/weak and poor, but to the private sector (strong and bearers of particular interests). Thus, in the framework of the substantial impoverishment and weakening of public institutions, in the negotiations/mediation it means public costs for private profits; This is the problem or as Miraftab called “symbolic inclusion for material exclusion”.

Another tricky word is Mediation. The awareness about the limits of Mediation underline that obviously is not neutral about values. Thinking about mediation is clear that the argumentative turn fails if the discursive approach is not based on a truthful and open level of confrontation/especially when the asymmetries of power are strong. Hillier (2003) analyses the Habermasian concept of rational consensus formation and its fallibility, describing the possibilities of the permanence of conflict, non-reciprocity, domination and the related power-games which are inherent in planning decision-making.

Thus, by reducing notions of empowerment and participation to individualized and economic change, neo-liberal governance depoliticizes the emancipatory concepts; Meanwhile, to seek legitimacy for its acts, it adopts a socially concerned posture of social upliftment that politicizes decisions that government technocrats, policy makers and planners have traditionally claimed as mundane and technical.

These sorts of double move – depoliticization/politicization; inclusion/exclusion – are an important feature of neo-liberalism, highlighting the paradox of its policy processes and framework.

Empowerment, Miraftab, again/but also the relevance of agonism (Hillier)...An exemplum to be clearer: market for everything, there is not alternative TINA of 80es and the citizens as technicians for green area that is a Standard...or it is supposed to be a standard...

Moreover, it is on the principle of efficiency that the major criticism to the “agonistic” approach in the ambit of public decisions is built.

Costs/Benefits: analytical techniques apparently 'neutral' can facilitate a potential unequal distribution of benefits and costs; Public-Private Partnerships: can be reconsidered only by a renewed idea of public interest.

Then the two aspects (interests and values) often overlap in the plan of action, almost always confused for dialectic and rhetoric reasons. However, they do not coincide on the level of theoretical analysis, and results of their reciprocal opposition may vary.

In planning practices, the "revelation" of the values at stake (in opposition and sometimes irreconcilable), must be placed before the interests. Highlighting the values at stake appears to be ethically imperative and operationally necessary...

Moreover, in the last few years, the rhetoric on pluralism (far away from Davidoff, Advocacy and pluralism) by legitimizing the (strong) interests, neo-liberal governance has contributed to shrink and destroy the relevance of public interest.

In fact, under the umbrella of pluralism and behind the representation of citizenship amorphous and not qualified of diffuse interests, in the crisis of a definition of the general interest, behind the screen of governance, the deployment of capitalism has prevailed.

So, it legitimized the partial and strongest interests into shaping the public agenda within the polarized inequalities.

Territorial competition/according to Neil Brenner and David Wachsmuth, beginning in the 1980s TC has gradually become one of the dominant idea in main stream approaches to the local dev. >> the neoliberal preoccupation with competitiveness followed closely the transition from Keynesian "welfare state" to the post-Keynesian "competition states: instead of initiating local economic development it obfuscates the capitalist restructuring process. So it is necessary to escape from this "competitiveness trap". (((As you know better than me, all the GREAT EVENTS are based on this traps...))

4 A STRONGER ROLE OF PLANNER AND PLANNING SCHOLARS

Finally, to conclude, the perspective, not in general, as I said at the beginning, but starting from us and regarding a stronger role of planner and planning scholars. It has to do with the field of responsibility and the role of the planner (professional/practitioner/scholar) and with our commitment in building and using new theories and research approaches:

- Incorporate 'others'/minorities by considering furthermore the interaction between capitalism accumulation in space and the minorities;
- Improve theories CUT-Critical Urban Theory mixing with place-based planning and research practices
- Co-produce a public model of development.

The strong focus of the dominant development recipe on rapid free market reforms, efficient governance and the decline of state formation as a political project produced a loss of legitimacy of political and technical classes with important effects on planners and planning scholars roles.

- build and use new theories (((Dall'advocacy to radical planning what to save what you can not more 'use')))
- a. Incorporate 'others'/minorities by considering the interaction between capitalism accumulation in space and the minorities /

"The idea of identity should be governed in space" (Yiftachel) we cannot ignore minorities, we can't ignore capitalism and accumulation we need to look at them in interaction.

And we need to also think about justice that is a very important element in planning theorizing in more complex ways.

Here the old but increasable relevant idea of how resources are distributed, distributional justice on this axes and between on most conceptual idea of the market logic should determine how city is developed and between the idea that there is intervention, the most socialist perspective, on a just society.

But interacting with it in a more complex way means the idea of identity and how it should be governed in space.

This is more complex because different groups, different minorities, different community have different demands. Usually low income people demands for redistribution and the upper class ask for a state withdraw and let the market decide. It's more complex and here comes the issue of recognition.

Quite often it appears in a negative way, in a situation that I call of "hostile recognition". We have to open up the box of recognition not assume that recognition is necessarily good, because when planners talk about particular groups sometimes it's in order to isolate them, deride them, stigmatize them and this is the way in which grey spaces comes in very much because many planning documents actually mobilize against them, they criminalize them and with this kind of argument you have to look critically at the work of identity and planning even when it is mentioned.

- b. Improve theories: stretch them, the CUT-Critical Urban Theory, Critical Urban Theory ((Beyond the deliberative democracy)) coming from the clear limits of Communicative planning (remember Spivack: subaltern cannot speak...), for example, mixing with place-based planning and research practices...according with Yiftachel, Margo Huxley, Vanessa Watson, again...
 - P/PT needs to re-engage with the city, 'division(s)' and justice, and its ceaseless identity-power-resources conflict;
 - PT theory and research practices – must continue to research and explain the role/impact of planning on cities and their societies;
 - PT theory must improve its theorization including those from north and south, west and east! (Watson, Yiftachel) – gray space, urban citizenship, urban apartheid, insurgent citizenship etc;
 - PT must continue to be critical, as well as creative and positive;
 - PT should politicize the professional planner.

Last but not least,

- c. Co-produce a public model of development and State-society engagement:
 - modifying the forms and possibilities of listening and relationship with the "public demand";
 - structuring a not occasional reflection that also involves the development of new forms of relationship between universities, institutions and people, in order to help guide even the institutions in developing potential models to be tested;
 - overcoming the boundaries of a widespread simplification wanted for a long time, innovation oriented to competition and competition coupled to growth
 - accessing the state (Watson, again)

Be part of a co-productive but still public sector-led, that requires fundamental shift in balance of power in a context of civic or counter-governmentality (Roy) or a governmentality from below (appadurai) able to resist and comply with the top down rules...

ID 1668 | LEARNING FROM EUROPE?

Karl Friedhelm Fischer^{1,2}

¹University of New South Wales, Faculty of Built Environment; ²Universität Kassel, Stadterneuerung
k.fischer@unsw.edu.au; ffischer@uni-kassel.de

The rich history of European planning thought has been radiating out to countries outside of Europe for a long time, either in the form of colonial planning and by providing active guidance and orientation or simply by serving as a model for the look from the outside. Within Europe, the exchange of ideas and practical experience has been continuous from the beginnings of planning and urban design – whether we consider our professional field to have started in the Renaissance and Baroque era or whether we want to restrict our perspective to the discipline of ‘modern planning’ in the 19th century, or, again in a different context, in the 1960s. There is a rich literature dealing with periods and areas of planning in which the international exchange of ideas has been particularly lively and influential, extending from, say, the garden city movement, via the exchange of ideas in classic modernism and the period of post-war reconstruction to the very recent history.

My working experience while straddling two continents, Australia and Europe, in research and teaching for a number of years is the background for the survey in this paper. The paper essentially puts spotlights on the European scene of urban design and planning since the late 20th century and asks for the significance and prospects of the learning experience mainly in Australia.

I want to briefly mention, however, that the stream of ideas has not been a one-way street. There are windows upon the Australian scene that can help Europeans to learn from Australia. Colonel Light’s plan for Adelaide, which served as a model for Ebenezer Howard’s garden city is one example. The amazing practice of the Green Bans in Sydney during the 1970s that stopped the demolition of the atmospherically rich working class district of Woolloomooloo is another; and the visit of German politician Petra Kelly who came to Australia to study the Green movement led to the naming of the German Green Party in Germany is another (Coleman 2016).

Back to the basic theme; drawing inspiration from international models of urban design may conceivably make particular sense for a ‘young’ country with a relatively small population size such as Australia. But even Britain with its long and rich tradition of planning has repeatedly discovered that it may be useful to look for orientation abroad – to ‘Europe’. Saying this, I am obviously accepting a definition of ‘Europe’ which is common in the UK, but is met with a degree of amused bewilderment on ‘the continent’ or the European mainland. If Britain sees itself as a separate continent, then the Brexit decision has certainly underscored that sentiment.

Shortly after the turn of the millennium, the experience that countries can learn from each other was expanded in Britain by another, rather drastic assumption. According to Sir Peter Hall, what Britain needed was much more than simply orientation. ‘...British planners have lost the art of urbanism’ (Hall 2013 p.306) he argued; the UK had ‘gone backwards and the current generation of planners do not possess the breadth of knowledge and skill to develop innovative world-leading places’ (McGuinness 2014).

From the late 1990s on, Sir Peter Hall and the head of URBED, Nicholas Falk as well as the RTPA had gathered groups of British architects in order to (re-)visit a number of European cities. During the first decade of the new millennium, they were working on a book which they thought they might call “Learning From Europe”. Against the background of political economy and planning the book rolls out a broad

canvas of issues in the UK and of model-type approaches on the European continent. As in Hall's previous work, the issue of dealing with regional imbalances plays a major role.

Particular attention in the work of Hall and Falk was devoted to the so-called "new urban districts" or "eco districts" ranging from large-scale projects such as Hamarby in Sweden and Almere New Town in the Netherlands via Hamburg's Harbour City to small model developments in Freiburg and Kassel. The work in and on Kassel knitted into practical work. Kassel, a city of 200.000 situated midway between Hannover and Frankfurt was at the same time exporting an innovative scheme of hybrid trams to Blackpool – a result of a co-operation with a team again headed by Peter Hall on the British side. This work garnered sufficient interest for transport planners from Australia, mainly from Melbourne to come to Kassel in the same context. For me, the experience of taking part in such processes has been raising questions such as: Which elements of such model developments can actually be implemented in a different cultural context?

The effect of studying an iconic model can result in a successful translation into a local context, it can turn into travesty and unintended parody (take the example of new urbanism and what it looks like when built for nouveau-riche New Russians); it can create myths such as the Bilbao effect; but it can also contribute to a creative process resulting in genuine innovation.

The question which lessons can actually be applied in a different cultural context is a subject matter which research on urban design and policy has been examined under the heading of path dependence. The history of the local institutional structures, the character of the building industry, the constellation of local actors and event chains may constitute, reinforce or challenge patterns of behaviour and policy approaches leading to certain outcomes, eliminating others in seemingly deterministic ways. An awareness of this kind of context can contribute to a realistic assessment of the prospects of "learning from"; it can help in the process by avoiding naïve assumptions of instant one-to-one transferability as much as the cringe of defeatist abjection.

With this in mind, and against the background of my acquaintance with the Australian context, the paper is going to put spotlights on the European scene of current urban design and planning. It is briefly going to review the experience of some 'reference cities' of urban design/regeneration, the German international building exhibitions, different phases of innovation in Barcelona, the urban renaissance in Britain, 'eco-cities' and 'Grand Projets', and then to focus on the question: Where do we stand today? i.e. how do today's models and principles deal with challenges such as globalisation, climate change and social change? And which approaches may be useful for Australia?

It is doing so with a historical perspective. Obviously, European cities have managed to transcend periods of urban blight and plight such as the dark age of the early industrial city and the stark age of the Corbusian 'City Functional' and to revive not only their historic centres with their specific texture of buildings and private and public spaces, streets, plazas and greenery, but also to foster urban villages in all parts of the urban fabric. Discussed under the heading of 'Urban Renaissance', processes of this kind have in fact been experienced by cities in all continents, albeit in very different contexts. Urban renaissance can be seen as a post-modern phenomenon - in the sense of a necessary post-Jane-Jacobs transcendence of the functional city ideal à la Corbusier and CIAM. Following the coining of the term in a campaign by the European Union and a publication by Yona Friedman in 1980, Britain gave it substance by implementing it in the form of a government program – emphatically design-led under the auspices of R. Rodgers around the beginning of the new millennium, but substantially policy-supported by planning guidance channeling the retail potential from peripheral shopping malls into the urban centres and developing integrated transport concepts.

In Germany, Urban Renaissance has been discussed in a more complex context and in controversial terms looking at winners and losers of gentrification processes, and it has been connected with the European City concept, which combines aspects of urban structure and design with the notion of socially integrative communities and governance patterns with strong municipalities. This has its roots in traditions that reach back to the cities of the middle ages and their elected councils, which were a safe harbor for migrants and run-away bondsmen ('Town air is liberating') – an important element in establishing path dependencies in the German context.

There is then of course not one European City, but a patchwork of traditions. Municipal autonomy guaranteed by the national constitution is a feature of the German political system – not, however, the English one; which is why M. Thatcher was able to disband the GLC and to reduce the task of the local councils to

roads, rates and rubbish, a division of labour not unknown in Australia, but a utterly surprising for my students in Germany. Still it is precisely this diversity of cultures within that small continent which makes the European experience particularly interesting. The sober, rationalist Dutch architecture (which has been emerging in con-stant contrast with the existence of quaint traditional neighbourhoods), the specific mixture of trams, tradition and modernity in Germany, and certainly the grand gesture of French urban design, they all have their origins in different paths of modernization and local traditions.

Britain's post-war welfare state with its sweeping visionary utopianism and often rather rigid radical roots was rather different from the social state concept pursued in Germany, which had its oldest roots in late 19th cen-tury. Rhenish capitalism, which, as has been argued appears to have changed from Rhenish or Rheinisch to a different form of capitalism under the auspices of Thatcherite neo-liberalism and the recent banking crisis. While this seems to confirm the theory of the convergence of economic and political systems, the path de-pendence engrained in local traditions and institutions, down to the ways of thinking and arguing, is always going to produce a striking diversity of political and urban realities, even in times of attempted European Un-ion harmonization.

Let us very briefly look at the sequence of 'reference cities' of European urban renaissance; a sequence which can be seen as a kind of step-by-step learning process. One by one, these cities have learnt from each other, quoting this learning process, too, in the sense of "Learning from Europe" within Europe and outside the continent, too. It began with Bologna, which took a pioneering role by placing the entire historical core under protection – including the residents' rental contracts – and by doing the opposite of what the urban renaiss-ance approach has been doing since the 1980s: In order to protect the historic centre, Bologna banned new shopping centres and businesses outside the medieval city walls. One of the major actors in this process was Leonardo Benevolo, who is well known for his "History of the City".

In step # 2, cities such as Berlin and Vienna extended the attention of urban preservation and careful renewal to the city extension areas of the 19th century. Berlin fought many a battle against the myth that the typical 19th century tenement building was supposedly inherently bad beyond salvation. And it fought many a battle against the interest blocks of political party sleaze, banks, developers, and architects driving the machinery for urban redevelopment and suburban high-rise estate construction. Their descent from the late 1970s on marked the end of large-scale clearance and the practical re-orientation of urban policy towards the rehabilita-tion of the inner urban areas.

The associated breakdown of public confidence in Berlin's municipal politics required a radical re-orientation of planning policy, which was met through the establishment of a new special authority working in parallel to the existing authorities in 1978 and culminating in the opening of Berlin's International Building Exhibition in 1987 (Fischer 2013). It served as a model for the rehabilitation of the 19th century housing stock through careful urban renewal, and for the resurrection of the perimeter block instead of the modernist rejection of the "corridor street". Crown Street in Sydney was probably the earliest development along similar lines in Australia.

The IBA also developed a method termed "critical reconstruction", which aimed for an orientation towards the historic pattern of streets and public spaces, building parcels, density, social mix as well as a mix of actors and architects. A key to the success of these developments lay in the precedence of process and structure over individual architecture.

Step # 3 in the sequence was the fundamental transformation of the industrial city and the city functional, and Barcelona was the pacemaker and model. While the transformation really came about in three phases between the late 1970s and 2004, it was mainly associated with the Olympics of 1992. Re-conquering public space from the dictates of automobile traffic, turning town squares from parking lots into centres of urban life re-connecting the city with the waterfront, re-vitalizing decaying districts through big cultural projects, the development of mix-use areas, middle-class and up-market apartments in central locations, a new appreciation of traditional buildings and structures (albeit rather selective), coupled with neo-modernist gestures signifying ostentatious futurability – these were the key themes of this approach to urban transformation, which have been influencing debate and practice in Europe, in North and South America ever since.

The darker sides of Barcelona's transformation are discussed less frequently: the architectural heritage of the Catalan city is falling victim to the overhasty realisation of projects, and social aspects are being neglected almost completely. More conspicuously, Barcelona has created a brand in its own right, a new

icon for “Learning From” introduced as a point of reference in planning reports including Roger’s big yellow book on the urban renaissance in the UK. The Barcelona Model is referred to in professional circles when distinguishing small-scale design programmes in public space as a central component of neighbourhood development. It has become a model for a kind of “living city” people have found desirable anywhere between Sydney and Lyon. And each city has found its own approaches for turning it into reality; Lyon with its public spaces strategy banning the cars into luxurious underground garages, and with turning waterfront parking into waterfront parks. The Barcelona model also serves as a point of reference when implementing large-scale infrastructure projects using an integrated design approach. The reasons underlying the special status of urban planning in Barcelona no doubt lie in a specific connection between tradition and the avant-garde, as well as in a mix of cosmopolitan openness and individualistic originality. These are specific aspects of a fertile path dependence.

The other cult cities of urban transformation of the 1980s pursued this new programme as well: Paris with its Grand Projets in a carefully cultivated traditional city and London with its projects of transforming the railway station districts such as that around Liverpool Street.

A major field in which Europeans are trying to learn from each other is at the level of the local nuclei, at the level of the planning principles for what in Europe and also in the US is called eco-districts, and which German planning policy called more modestly “new urban districts” in the tradition of the urban village idea.

They come in different sizes, and the crew around Peter Hall and Nicholas Falk even included big ones like Almere New Town, Hamarby in Stockholm and Hamburg’s Hafen City under that heading. In fact, a German government report listed more than a hundred of them in Germany alone, including the Hafen City and the “Water Cities” in Berlin.

They are compact urban places, designed for walking and cycling and public transport; with densities to support that objective; there is a high proportion of apartments around mixed uses, especially in and around centres. They follow traditional urban designs with sidewalks and street blocks.

Looking back we can see that the opportunity for large-scale urban regeneration had arisen in many cities following the closure of urban docks and railway freight yards, and, particularly in Germany, of army barracks in the 1980s and 1990s. This has led to the creation of new urban quarters, often inner city districts close to city centres, where the ideas of the urban village, have come into play. The location of the new developments was significant. They happened to be in parts of the city that either had an existing infrastructure of public transport, or could fairly easily have it injected. This, plus the fact that the land was accessible and potentially valuable, meant that higher densities were a logical and accepted consequence. Add to this the fact of a new niche market for apartments arising from socio-demographic change (students, dual-career households), the reaction against suburban lifestyles on the part of so many who had experienced growing up in suburbia unexciting as adolescents – then it was perhaps logical that these quarters should become the location of the new urban lifestyles. This kind of urban renaissance was easier to forge in Europe and Australia as inner city 19th century suburbs including Paddington or Carlton demonstrate than in the US, where urban decay following industrial decline had proceeded much further.

Let’s look at a range of European examples, which Peter Hall and colleagues have been examining, and ask the same question Nicholas Falk was asking in an article: “Why not here?” (Falk 2009b) In the context of their first wave of research on what they chose to call eco-districts, and which is going to result in the book I mentioned, “Learning from Europe”, they looked at a number of districts that were very different indeed in size and composition.

Each of these examples has a variety of lessons to learn from. But on the occasions such as those of the conferences of RUDI (Resource for Urban Design Initiatives) in London, where I reported on them, I found no example which had attracted more attention than those of the Vauban district in Freiburg and the French Quarter in Tuebingen. Both have been developed on former military grounds.

When the army barracks in Freiburg closed down in 1992, the city bought 80 acres for a politically negotiated price; the rest was divided between the university students’ union and a self-organized, independent housing initiative that converted several of the earlier barracks into student housing and inexpensive living space for single occupants and apartment sharers.

The city developed Vauban into a neighbourhood with a distinctive ecological profile and planned living and working in small subdivisions. The individual lot is at the core of a development which has been carried out by groups of developers in balance of coordinated urban development and individual design.

Tuebingen has developed its French Quarter, formerly occupied by the military, into an internationally renowned new neighbourhood. The short distances concept has been taken seriously here: a mix of uses in small subdivisions and the integration of work give the area a high practical value in everyday life. The re-urbanizing of space, projects carried out by small investors and joint building groups, who purchase their aesthetic diversity but also its social mix all go to make up this neighbourhood's special qualities.

In Kassel, it was initiatives coming from the university which have initiated a process of re-developing a large area "on the other side of the river", which had not been reconstructed after the war but had been left as a parking space. This was in municipal ownership. In 1992, a joint initiative of university, city council and housing associations started a process which they called the "re-founding of the Unter-Neu-Stadt" (the lower new town). Just as in medieval times, when individuals had played a significant role in founding the city, it was now to be individual house builders, co-housing groups, co-operatives plus a carefully balanced set of activities by banks and by housing associations who would all act as "Stadt-Gruender", as city founding fathers and mothers.

The development method was to follow a principle invented at the IBA Berlin in 1987, the method of the "critical reconstruction". While employing new architecture, the urban design of the district follows the structural principles of what had been in place before war time destruction in 1943: The street network, the pattern of building parcels and house blocks, the building height and density and aspects of the functional and social mix as it had once existed.

In each of these cases, it is the principles of participation, process planning and sustained local leadership, the mixture of municipal encouragement and community initiative which have accounted for the success.

In most of the new neighbourhoods it is a number of niche markets which have made up a development patchwork not well suited for the classic volume house builders whose interest is focused on a rapid turnover, and who, it has to be said, play a bigger role in the UK as well as in Australia than in Germany. In order to collect information on these markets, niche and otherwise, German market research has developed interesting as well as curious methods of modeling the demand of house builders, renters and other actors on the scene. Moving away from the classic models of social classes and stratifications, the German Sinus Institute has made extensive surveys of life style characteristics, and they have produced graphics of social milieus which are supposed to provide a closer approximation of social reality and for predicting people's needs and requirements.

The milieu approach examines not only socio-demographic variables, such as age, gender,

income and education, but also a range of aspects of modern, individual lifestyle such as cultural

activities and preferences of residential location. These two directions are shown in this milieu-diagram:

The vertical axis is related to social structure and the horizontal axis displays varying degrees of modern lifestyle. We recognize for instance, the milieu of the conservatives on the upper left hand side, the milieu of the classical middle class in the centre and the milieu of the hedonists on the lower right hand side.

Each of these various milieus has specific preferences for residential location. These preferences are important indicators of how each household of the corresponding milieu would behave in terms of effort made for the relocation. And we can link other categories with this including household size, preference for housing typologies ranging from individual houses to dense apartments. Linking census data with thousands of telephone interviews, the market researchers have produced these diagrams for various segments of the European market. Here's the English diagram, in which I particularly like the category "quiet peaceful Britain". I wonder what the Australian map would look like if they were to produce one, or the map of Sydneysiders. It would probably include a long drawn-out bubble of hedonists and modern performers lapping into the post-materialist milieu, similar to the composition of people who are supposed to have contributed to the Freiburg Vauban success. A couple of questions arise of this: One is: does the German researcher take his own theory serious? I'll be coming back to this in a moment with Johan Galtung's help. The other question is: Can this be sensibly translated into urban design categories? Here,

Kassel Unter-Neu-Stadt is an interesting case. In the development process, a typology of developers and house builders was linked to a typology of building blocks and parcels ranging from garden lots for terrace houses via court parcels to compact blocks with high to very high densities (for the commercial buildings near the big arterial road in the north). Each house is then designed by a different architect, modern, but with typological reference to the historic precedent. Competitions are held for the major buildings including the “urban villa”, a housing type that had been “invented” at the Berlin IBA.

All of these examples have led to enthusiastic reactions by quite a number of British teams. The desire of learning from their experience has imposed an atmosphere of a museum or a zoo on some of them teeming with visitors. “Why not here?” was Nick Falk asking (Falk 2009b), and the model lingo of eco-sustainability has been propagated wildly in the UK.

But so far, the UK sustainable housing programme, which came as part of the Urban Renaissance Programme, has neither been sustainable nor community based. The term is a misnomer for the major housebuilding initiative in the South East. The focus on the economic competitiveness of the volume house builders has ignored the question of design quality, and the poor quality apartment housing has produced shocking results leading to broad-based public disenchantment.

Unfortunately, the next wave of eco-towns that have appeared on the UK horizon, do not seem to have learnt sufficiently from the mistakes. While the design quality promises to be better, the flashy label of carbon-neutrality and the ecological house design are to distract from the essential greenwash nature of the exercise. Worse, a number of the so-called eco-villages are employed as a vehicle to finally gobble up the greenbelts around Oxford, Plymouth and elsewhere.

To overcome deep-ingrained structures of path dependence, a lot has to happen. A special, new relationship has to be developed between the private sector, which still has to build the new communities, and the public sector, which will have to help fund the necessary infrastructure, i.e. from capturing the resultant rise in value for the community. There are challenges here for planners at every scale of planning, from the strategic to the local, and in every kind of specialization, from architectural and urban design to transport engineering to financial. Trying to learn from Europe may help, if the complexity of the processes is taken into account in this sense, and if long-term leadership alliances can be forged and maintained. Another important role is played in the UK by the institutions ranging from CABI and English Heritage to the National Agencies.

Australia is well behind in this respect, and possibly the initiative for a national urban policy has great potential. Within each planning culture the specific path dependencies have to be explored and checked for their potential as well as their bog-down effects.

What are the path dependencies in Australia? To an extent, they are similar to the British situation, as might be expected; slightly more complicated as a consequence of the State/Local Council contradictions and without the benefit of substantial national government funding and guidance; similar constellation of volume house builders without any serious architectural guidance; a tradition of too many broken promises, of watered-down competition results alienated by secret back-room deals. No wonder then that my Australian colleagues throw up their hands in disbelief when I tell them that I have written an essay entitled “Learning from Australia” (Fischer 1999). Only an alien from outer European space could do such a thing. But the point is that among everything that has gone wrong, excellent bits of urban design have remained, and at least fragments of interesting development processes, and yes, that they have sometimes even survived; examples we in Europe can learn from too, even if in the long run, a great deal of the achievements may go down the drain as a rule.

This is understandably more painful for those involved in the local scene than for this here distant observer, who can hold up for instance the Green Games as a fascinating process with long-term benefits – in spite of bitter details, and who can find positive elements even in what is often considered as an icon of a design disaster, Pyrmont/Ultimo.

There are a number of explanations for the episodic manifestation of achievements of planning politics and their subsequent frequent disintegration. I’d like to propose one in the form of the image of Australia as a desert country; a metaphor with correlations at the physical as well as the cultural level. Down under, specifically Australian aspects of the path dependence can be seen in the prevailing, let us call it: ‘liberal’ nature of the economic climate of the ‘desert continent’ and the occasional rainy season brought about by

politics rising beyond the horizon of short term gains, which has repeatedly led to a flowering of blossoms in the desert (ranging from national planning programs to broader cultural achievements including the film industry) - followed, unfortunately, of course, by their withering in the next long drought season. One reason for this lies in the existence of a high-quality discourse and design practice, which have their roots in traditions of social and cultural reform dating back to the 19th century.

Australia was then characterized by a social climate in which a strong will for democracy and egalitarianism led to the creation of legislation for women's rights bills, manhood suffrage, minimum wage regulations and the beginnings of a trade union system. It was a period in which Australian legislation was ahead of that of many older nations, and became known as "The Social Continent".

In an important instance, this political situation permitted Australia to learn from its bitter experience with a land-speculating 'squattocracy' of graziers and consequently to create a system of public ownership of land for its capital, but also to develop the most extensive tram networks in the Commonwealth. The strong pluralist tradition, which was at the back of these developments, was marginalized following World War I in the after-math of the trauma of the Australian and New Zealand Army Corps (ANZAC) in the First World War. But it has been surviving within a minority culture, which mainly shows up in the centres of Australia's capital cities, sometimes in exurbia, too.

Just as rain in the desert suddenly makes the flowers bloom (because the ground is fertile and the seeds are there) a favourable constellation in Australian planning politics will once in a while divert resources from their usual purpose of just oiling the big-money machine in the direction of planning in the public interest.

And then, like the flowers in the desert, ideas for Australian cities can come to fruition and exceptional results spring up. There are plenty of examples between the foundation of Canberra and achievements in the other capitals. Why? Because the ground is fertile and the seeds are there. The seeds lie in a sophisticated, far-sighted, globally aware Australian planning discourse of high quality providing solutions ready for implementation.

2 ON DELEUZE AND GUATTARI ONTOLOGY

One of the main concepts of Deleuze-Guattari ontology relates to connectivity. Connectivity involves a mode of reasoning that understands the world (urban space) as system of meaning, affinity, multiplicity and performativity. Such way of thinking presupposes an inherent process of change and transformation in which difference and diversity is the rule. In this understanding, the world is in continual process of change and adjustment while fixed and stable structures are only exceptions. They propose a “theory of change” that focuses on movement, flux, and transformation rather than in stability, order or permanence. In this theory, change and movement are the objects of investigation. Movement is the general rule and it relates to emergences, flux and contingencies. Structures, patterns, fixities or orders are incidental events in the flux of change and movement (Deleuze and Guattari, 1980).

Another fundamental concept of Deleuze - Guattari (1987) work relates to the idea of immanence. By immanence, they mean an ever-moving material and immanent space and society. This paper takes this concept and argues that in order to understand the world’s ongoing change, planners should pursue the immanent dimension of reality, a dimension concerned with the unrealized, possible realities that unfolds behind the transcendent/organized world (of structures and orders). Deleuze and Guattari (1977) argues that this immanent dimension is like a latent surface of possible realities that are in process of “becoming”, although not yet fully realized or turned real. This text argues that planning frequently confronts with latent/immanent virtual realities, and in order to go through that it should learn to deal with the unfolding of improbable likelihoods. The aim of planning in this formulation is not to play a schizophrenic role of seeking governability in an unforeseeable and ungovernable context of immanent becoming, but to understand and work with the dynamic and complex contingencies of a transforming realities and act to facilitate the unfolding of changes through multiple and participative processes .

According to Deleuze-Guattari (1980, 1991) ontology, concepts should do something very specific and the objective of theorizing is not explain what something is, but to elucidate what it does. More fundamentally, it should inform what and how it might affect what others things do. With regard to planning, we should ask what a concept does for or affect planning practice. This approach has been understood as non-essentialist (De Landa 2002) or as a post-structuralist ontology of difference (Hillier 2008). This ontology is concerned with the new, with change and transformation. It points to continual creation a recreation of reality. Nevertheless, it recognizes the importance of structures, systems and orders, in defining the agency power, the power relations between agents, and agents’ networks. (De Landa, 2006)

Deleuze/Guattari work presents a new empiricist constructivist conception to the relation between theory and practice. Their contribution emphasizes the importance of praxis in the transformations of the structures and the role of “bodies” in that process. According to them, reality has three different dimensions: The Actual, the Process of Actualization and the Virtual. The actual is the world around us and it is comprised of many participants (humans and non-human): people, houses, trees, animals, forests. That dimension of reality displays the actual/observed entities in a continuous and frenetic process of interaction to each other in a complex and diverse ways. However, reality is not limited to what can be seen or observed in the outside world. According to Deleuze-Guattari (1977), an observation is only part of reality: that which displays “images” that our senses can grasp. That (actual) “reality” does not offer an understanding of how “things” come into being, how they affect, how they might be affected by other entities and how these affects affect what other entities can do.

In order to understand how the world unfolds or emerge, Deleuze/Guattari (1980) proposes another dimension of reality - the virtual. The real-virtual is defined as the reality that precedes the real-actual, and therefore is not visible. The real-virtual can be understood as a field of many possible/parallel realities that can be actualized (turned visible). The real- actual is one among many virtual realities which is actualized along with the process actualization. In fact, many concurrent worlds (virtual realities) may result in different realities, and often we cannot anticipate the unexpected along the process. For Deleuze (1980) we can only perceive a small part of the real-virtual (which comprises those entities in the process of becoming actual), which in general, surrounds the real-actual entities, and which we identify as important. The virtual is therefore, that part of part of the actual that cannot be seen. It is beyond the visible actual. This dimension is formed of becomings, which are entities that have not yet started their movement toward the actual. They are formless, latent realities to become, with no apparent sign of what they might become and how they might become. Clusters of becomings (virtual diagrams) and lines of potentials (planes of immanence) form this real-virtual world.

According to Jean Hillier (2006), planning should approach the world from the ontology of becoming, rather than from that of being. While in the latter¹ the world is made up of objects with transcendental and fixed essences, the former² approaches the world from the ontology of becoming. That ontology contends that real objects are in a perpetual process of becoming something else and that the real world is a continual unfolding of events that do not necessarily move toward a specific end or final destiny. Planning working with 'the world of becoming' does not search for stability, certainty or fixed patterns, but seeks to cope with and manage unpredictable futures and moves by improvisation and creativeness, seeking to identify trends or scenarios from "disparate flows, energies, events, entities and spaces in more or less temporary alignments" (Hillier 2007). Planning according to Hillier (2007) "have had a pervasive commitment to an ontology of being which privileges end-states and outcomes, rather than an ontology of becoming which emphasizes movement, process and emergence." Planning that privileges processes and movements deals with a continually emerging world in a fluid course of becoming.

In this perspective planning deals with the world as it actually is, instead of working with idealist prescriptions on what it should be. This approach is neither prescriptive nor normative, but intends to devise most effective practices that enable planning to help bringing about the future and facilitate the process of

change³. Planning as practice direct to setting off the future does not prescribe a particular (or desirable) future because it is just that which is the object and target of planning as a practice of seeking new futures. In fact that practice emerges from the conflict of ideas and political views, through the movements along the lines of flight, through the process of deterritorialization and the courses of fleeing to new lands (Banville and Torres 2016). It is working with and through these movements, that planning as process of bringing about the future can help to produce the (desired) new world. This "desired" new world will probably be product of some rhizomatic process of many competing desires, and perhaps, it might never epitomize the truly desired outcome of any particular vision.

According to Deleuze and Guattari (1980), this approach implies a political agenda. There is a clear compromise with the process, with change and transformation of whatever political, social or economic structure. This planning does not advocate for preservation of any institutional order, practice or rule, it has no compromise with old conventions or traditional habits, but instead it seeks the new, the different, and the diverse in order to create multiple ways of producing a free and more just mode of doing and living together in the world.

2.1 LINES OF FLIGHT, BECOMING AND BORDERS

Lines of flight" are one of the most important concepts of Deleuze and Guattari's ontology (Deleuze & Guattari, 1986; 1987). The notion of flight brings about the idea of escape from the apparatus of capture. Instead of using the notion of "point", Deleuze-Guattari employs the concept of "line" in order to indicate motion through the points. While points are fixed in the space lines are associated to the notion of movement and the idea of becoming⁴.

Apparatuses of capture work to imprison the bodies to a fixed point. Escaping from the apparatus means start moving along a line: a line of flight. This movement away from the fixed rules gives rise to a process of becoming different, becoming something else and new. Similarly, the concept of deterritorialization is also used to imply a process of escaping from the apparatuses of capture. To deterritorialize means to start a movement of liberation, detached from the rules of the territory (Deleuze & Guattari, 1986). Although deterritorialization and flight are hopeful movements, they may turn however extremely risky. In

¹ This approach is taken from Plato and Kant ontology.

² Rooted in Aristotle, developed by Nietzsche, and embraced by Deleuze and Guattari,

³ This position is, associated to Michel Foucault. Foucault argues that the role of the intellectual is not to propose any fully formed political agenda, but to analyze the political terrain and to participate of political struggle, as member of any popular or social movement. (Foucault, 2012).

⁴ Instead of adopting the concept of contradiction as a methodological axis, the authors work with the idea of Lines of flight. Lines of flight seek to explain the constituent movements of each society beyond the legal and institutional regimes aimed at normalize and control of social life.

fact, the common outcome of deterritorialized bodies pursuing a line of flight is to be recaptured and reterritorialized according to the rules of an apparatus¹ (Deleuze & Guattari, 1977).

The process of fleeing and recapture is a cyclical one. However, this is not an endless mechanical process since each movement of escape lead to some “piece of the system to get lost in the shuffle.” Along the historical process, the repeated flights and recaptures will affect and marginally change the apparatus. This continuous process, they hope, scars the system and deteriorates the apparatuses of capture (Deleuze & Guattari, 1986).

Deleuze & Guattari find a way out of this limiting cycle of flight and recapture, by turning to concept of “revolutionary connections” (Deleuze & Guattari, 1987, p. 473). When a deterritorialized body that succeeds to escape from an apparatus of capture and begins to move through its line of flight, it does not have to do so alone. It can link up with other deterritorialized bodies combine with other lines of flight, and form flows, aggregates, collective multiplicities moving together in a shared project to elude recapture. According to Deleuze and Guattari (1987), these associative behaviors are in the nature of desiring production: to produce connections. One of the most important characteristics of desiring bodies is to connect with other bodies and together produce larger assemblages (Guattari, 2002). Desiring-production relentlessly unsettles the apparatuses of capture, it sets elements in motion along lines of flight, and at the same time, it induces those lines of flight to seek connection with other lines (Deleuze & Guattari, 1987). They argue that bodies in movement of flight connecting with other fleeing bodies will be able to construct a larger and stead and continuously growing network of escape. The process of “connection indicates the way in which decoded and deterritorialized flows boost one another, accelerate their shared escape, and augment or stoke their quanta” (Deleuze & Guattari, 1987). According to our earlier example, the Land less Movement in Brazil encompasses many cells of land less movement linked to a bigger movement. The larger the network grows, the more it is empowered psychologically and materially, and the easier it is to ward off recapture by the apparatuses of the state or the capitalist economy.

2.2 RHIZOME

The network of fleeing bodies/entities is not an organized and striated process, but instead it grows and evolves in a rhizomatic manner². The Rhizome is a disjoined, a centered, non-hierarchical network of entities communicating horizontally with any other entities. (Deleuze & Guattari, 1987) Deleuze and Guattari contrast the rhizome to an arboreal structure in which all flows must pass through a single connection, in which all relations are hierarchical. In an arboreal structure, all communication must pass first through a single coordinating “trunk” before it flows out to the limbs and branches. Rhizomes, by contrast, are a centered; they have no trunk, no general command, and no central committee that coordinates the whole. Rather, organization and coordination emerge naturally, on its own, without any intentional or purposeful action. The network organizes itself. It is only through rhizome, Deleuze and Guattari argue, desire can operate, that it can follow its inclinations, that it can move and produce in the way that is proper to it (1987, p. 14)

Deleuze and Guattari insist that rhizomes must operate this way. In order to form properly revolutionary connections, the lines of flight must associate with each other in rhizomes without leaders, where coordination emerges spontaneously. Deleuze and Guattari suggest that rhizomes will never come to rest, but will relentlessly grow and spread by sending out new stems, any one of which can connect with any other in the rhizome, or with deterritorialized elements that are not yet part of the rhizome (1987). That is

¹ This can parallel the events of land occupation promoted by social movements in Brazil. A particular plot of the urban land is occupied by low-income (land less) population, producing a temporary outcome, but eventually the police arrive to and enforce the private property rights of the owner.

² Rhizome is an epistemological model in the philosophical theory of Gilles Deleuze and Felix Guattari. The concept of rhizome was borrowed from botany and indicates the structure of some plants whose shoots can branch out at any point, as well as thicken and turn into a bulb or tuber. It can function as root, stem or branch, regardless of their location in the figure of the plant. For Deleuze and Guattari the rhizome exemplifies an epistemological system where there are no roots - i.e. propositions that are more fundamental than others are - which ramify under strict dichotomies. Deleuze and Guattari contend that according to the Anglo-Saxon tradition of philosophy of science, the structure of knowledge does not evolve by logical means through fundamental principles, but it is drawn up simultaneously from all points under the influence of different observations and conceptualizations. This does not imply that a rhizome is necessarily a flexible or unstable structure, but requires that any order model can be modified. There are in the rhizome, solid lines and organization determined by groups or sets of related concepts. These sets define a relatively stable 'territories' within the rhizome.

why Deleuze and Guattari ask us to “make rhizome everywhere”, to free up escapes that “dismantle the strata in their wake, break through the walls of significance, pour out of the holes of subjectivity, fell trees in favor of veritable rhizomes, and steer the flows down lines of positive deterritorialization or creative flight” (1987). The more successfully we can do this, the more likely we are to create a runaway effect in which deterritorialized flows of desire “become parts and cogs of one another in the flow that feeds one and the same desiring-machine, so many local fires patiently kindled for a generalized explosion” (Deleuze and Guattari, 1987).

2.3 NEW LAND

Deleuze and Guattari use the image of lines of flight connected to each other in a rhizomatic way, to explain that the purpose of these lines is to help de-territorialized bodies to remain in flight, and keep flowing, away from the apparatuses of capture by continuing to move. If these lines can manage to flow together, progressively forming a large enough mass, they begin to trace out a plane, a fluid and yet substantially consistent two-dimensional space. They form what Deleuze and Guattari eventually call “a new land”, a generalized condition for humanity in which becoming, flow, and desire pervade the community and choke or occlude being, fixity, and capture – a coherent but always growing and spreading rhizomatic multiplicity (Deleuze & Guattari, 1977).

This process of flight-and-connection may become revolutionary, since it is pushed “to a point where the process cannot extricate itself, continue on, and reach fulfillment, except insofar as it is capable of creating – a new land” (Deleuze and Guattari, 1977). The line of flight as a schizophrenic escape has the potential to become revolutionary and this involves a process by which a body withdraws from the apparatuses of capture and start to live on the fringe.

The new land brought about by this transformation implies the collapse of the system and of apparatuses of capture. In the resulting disorder, some regularity can emerge and some form of coordination among the elements will come to exist. However, that coordination, as in a rhizome, must always be immanent or emergent. Regularity and coordination must arise spontaneously out of the collective will and of the activity of the rhizomic network. This network is not a planned framework or managed by a leadership, nor does it emerge from a central or more important node in the rhizome. However, liberated desires will not simply live free and undisturbed in the new land. According to Deleuze and Guattari (1977) it is likely, that in the new land new institutions will emerge and new centralized apparatuses of management take control. Hence, as Deleuze and Guattari warn, desire must continuously flee. It must remain in motion, always on the line flight, permanently escaping and resisting the new apparatuses (Purcell, 2013).

That is why the new land is something like a contradiction, since it is in fact, made up of flights. The movement of escaping desire traces its topography. The fleeing elements can never come to rest because the apparatuses are never eradicated once and for all. Capture will continually reaffirm itself in forms like state agencies, private property, party organizations, corporations, planning departments. Fleeing agents of desire will always continue the process of fighting off these apparatuses, preventing the formation of institutions that will try to regulate desiring-production, organize it into organs, and assemble it into machines directed to perform restricted functions. Like desires, planning in this new land will be in an endless in movement, acting along the flux desires to promote change and transform the world into a new, and possibly a better land (Porter, 2011).

2.4 SELF-GOVERNMENT. NO CENTRALITY

The debate about whether humans are capable of self-organization has a long history in political thought, one that I certainly cannot resolve definitively here (Purcell, 2013). Advocates of self-organization often point to natural examples: the anthill, the beehive, the bird flock. Michael Hardt (2004) and Antonio Negri (1999) like the metaphor of swarm intelligence, where decisions emerge from the whole instead of being issued by a central power. Deleuze and Guattari, talk of rhizomes, trees, and wolf packs. Perhaps the prime example is that of a flock of starlings. They rise together into the air, a black mass of perhaps 50,000 birds, to hunt insects. The flocks are cohesive, but they are constantly changing shape, undulating purposefully as the birds move about in pursuit of prey. Everybody knows the flock is an assemblage of individual birds, but it seems we are watching a single coherent thing, a pulsing life form with an obvious

intelligence, efficiently carrying out the task of finding, catching, and ingesting food. Scientists explain that there is no leader, that the flock makes decisions without any centralized system of command (Hayes, 2011). The flocks do not take flight, turn, or change shape gradually. Despite the great quantity of birds, they can change direction suddenly. The flocks operate as a collective mind and are able to change that mind promptly. Throughout their movements, the collective of 50,000 birds, can suddenly disappear, before you can process what you see. They seem to rematerialize as fast as they fade.

2.5 (DE) TERRITORIALITY AND THE BORDERING

Deleuze and Guattari understand the concept of flight (flee) and the process of fleeing to the border as an event of becoming. As dispersed events of flight, the process of fleeing virtually generates and opposes all institutionalized structures and established rules of organization. The process of flight encompasses a large number of affective and transformative accomplishments through which social and spatial orders are continuously reconstructed.

For Deleuze-Guattari fleeing to the border means, an escape from institutionalization (1980). This is accomplished by producing affects that operate outside of the influence of existing organized assemblages. Such lines of escape produce new frames, which in turn produce new affects. The process of fleeing to the border involves evading the limits of established structures and /or disabling archaic moorings. By this is a rhizomatic course, entities fleeing through a process of heterogenesis¹, assert their uniqueness and heterogeneity in opposition to a transcendent, universalizing homogenization. Heterogeneity manifests desire; it expresses a process of becoming that is always in the course of changing, adapting, transforming and modifying.

To deterritorialize a body means to transform it into a body without organs. That is a process of recovering its various affective capacities rather than breaking it up into functions and categories. The body becomes a multiplicity supporting new connections, affects, assemblages, etc., with other bodies, a process of infinite possibilities. It is worth note that for Deleuze-Guattari the deterritorialized body does not mean reducing its actual territorial complexity, but rather the deterritorialization and heterogenesis it experiences, creates socio-spatial complexity which, in fact was kept concealed by the functional and definite compartments of the establishment. (Guattari, 1994)

Lines of flight and deterritorialization are developments that help in the escape from the instituted body (Marks, 1998, p. 31). Nevertheless, Deleuze and Guattari warn that there are always forces of stratification seeking to capture deterritorialized bodies in order to re-organize and reabsorb (reterritorialize) them into transcendental orders of homogenized bodies. Deterritorialized bodies are always at risk of being caught by the magnetism of the organization and fall back into the territory of institutions. These are like mechanisms of repression and capture that works to attract the external into a system of interiority. That system is made of identities, which are abstracted from actually existing bodies and transposed onto another dimension: the world of transcendental structures.

The concepts of territory and flight (to the border) advanced in this paper does not convey the idea of a stable, permanent, definite or inexorable spaces and events, but rather. 'At the limit, all that counts is the constantly shifting borderline' (Deleuze and Guattari, 1987, p. 367). The movement toward the borderline that marks the process becoming diverse and heterogeneous is perhaps a movement toward the borderlands of established states, which are territories marked by profound nonconformity and creativity. The smooth spaces generated by resistance assemblages like "shelter or land movements" (in São Paulo) that resist both the striating forces of the state and the reterritorialization of capital are themselves constituted through the bordering activity of becoming.

Assemblages such as Land and home movements take their lines of flight from what they are struggling against striations, organizations, institutions that want to close the escape points and fold these fleeing aberrations back into the order of things. The group's strategy seems to speak to the solution proposed by Deleuze and Guattari: 'it is by leaving the plan(e) of capital, and never ceasing to leave it, that a mass becomes increasingly revolutionary and destroys the dominant equilibrium of the denumerable sets' (1987, p. 472). If capital has indeed erased international borders, leaving the plan (e) of capital requires

¹ An active, immanent process of singularization of subjectivity.

something that Massumi (1992) has encouraged from the outset: that you carry your bordering with you. The erasure of national borders (which is itself always an imperfect concept and an incomplete project: would not mean the end of borders.

Following Deleuze-Guattari (1994), we can problematize the concept of border as a fixed place, and understand it as distributed across diverse spaces, and not simply constituted by capital or state striations, but emerging from the assemblages of bodies becoming-other upon it. The urban movements for home, land, health, education are movements of fleeing to the border a process that embraces the perpetual end point proposed by Massumi (1992): 'To achieve the goal that has no end means ceasing to seem to be what you are ['legal'] in order to become what you cannot be: supermolecular forever.'

The goal is a limit approached, never reached'. The practice of reappropriation of space by the multitude, the minor (Katz, 1996), manifests becomings-other by assembling in and with space, by bordering against the surrounding smooth spaces of capital. But even the term 'reappropriation' may be problematic: becomings can never really re-appropriate, they cannot return ownership, capture, or repossess a space. Rather, these moments of becoming merely revival of what was always there: the ever-existing capacity for mutual transformativity and inter-affectivity. It is through the assemblage concept that Deleuze starts to build his conception of difference and change.

2.6 ASSEMBLAGE

Deleuze develops its theory of assemblage (agencement) from Hume. Accordingly, Hume solved the problem of subjectivity by developing the concepts of association, belief and exteriority of relations. Association is a natural principle that works by producing relations between things. Belief is a human reflexive sense based on habit, which allows the individual to transcend a given reality. It allows the subject to be creative and to go beyond the given by means of connecting habits. The relations of exteriority mean that each component is more or less autonomous, that is it does depend of the whole to exist. In this type of relation (external), the relation may change without changing the component.

An Assemblage is any number of heterogeneous components (parts, or things) gathered into a single context. In the assemblage, components keep certain autonomy from the whole from which it is part. A component in an assemblage has the ability to establish relations with other components and to form as many assemblages at the same time. This ability to connect in various directions, allows the component to affect and to be affected by other components, and this double affect (interaction) determines which interactions are possible.¹

Each assemblage is made of components of immediate lower scale. What is Macro (Molar) in one scale is that which plays the role of the whole (the assemblage), in turn, what is Micro (Molecular) is that which plays the role of component (part). The Molar is a statistical result of a Molecular population at any given scale and not a causal product. There is no causal relation between molecular and molar, because there is no linear relation between them. Since the relation between them are not coherently (but contingently) produced, there is no unity in assemblage theory.²

An assemblage can be regarded as an unintended and not totally determined product. Therefore, an assemblage at a higher level is not self-determined but a result of lower level connections. However, a larger scale assemblage acts as a source of resources and limitations for lower level components. An assemblage molar lines enable as well constrain the parts in specific ways. In this context, both parts and the whole are historically produced. This means that the parts of an assemblage retain a kind of autonomy from the whole.

¹ Assemblage in Deleuze and Guattari sense is a mode of thinking the social reality: a relational process of composition and a methodology directed to practice. Assemblage intends to mean the processes of bringing heterogeneous elements together.

² Assemblages are made of two vectors: the actual and the virtual. The first is oriented toward the plane of transcendence or molar or strata. This vector produces a relative de/re-territorialization. The second vector is oriented toward the plane of immanence and produces absolute movements of de/re-territorialization. Movements on a plane of immanence are seen as virtual. The absolute and thus virtual movement of de-territorialization is called as a Line of Flight.

An important aspect of an assemblage is that it does not lose its identity when it is connected to a larger assemblage. The assemblage ontology is open to any connections and these connections have relations of exteriority with those that are already included. According to Deleuze-Guattari (1987), there are three ways of approaching the concept of assemblage. The first takes assemblage as a mode of thinking. Assemblage thinking is mode of thought whereby reasoning goes through a 'rhizomatic or nomadic process' forging 'linkages or connections between different systems of knowledge'. This growing connection with different modes of thinking, rearticulate the way we see, understand and thus live the world. This paper is an exhibition of that by setting out the problem and moving towards an expression of it.

The second way of approaching the concept of assemblage is by focusing on how entities are connected and organized (humans, for example). They are then understood through the variety of capabilities they develop to make connections and the capacities they have 'to form assemblages with other individuals, organic or inorganic' (DeLanda 2002, 63). For Deleuze and Guattari (1987), the main characteristic of the assemblage is its tetravalency¹. This means that an assemblage has four (tetra) means of combining elements: machinic content, collective expression, territoriality and deterritorialization.

The concept of truth applies to problems (in general). It does not apply to actualizations because it is only a temporary solution to the problem (in the process of difference and repetition). Problems maintain certain autonomy from their particular solution. The capacity to affect is the potential to form connections with diverse elements in an assemblage.

The third way of thinking on assemblage operates at the level of matter itself in its molecular and temporal dimensions and is directly related to the concept of plastic habits. The defining distinction of the Deleuze-Guattari assemblage is that its aim is not a totalization, a definitive tracing of limits, or a final theory of everything. Rather, assemblage is an expansion of possibilities, an invention of new methods and new perspectives, an active 'entertainment' of things, feelings, ideas, and propositions that were previously unavailable to us.

2.7 VIRTUAL – ACTUAL

An assemblage refers both to a virtual space (of pure potential on the plane of immanence) and to actual space, (an actualized form on the actual/transcendental plane). Thus, a Real assemblage has both a virtual an actual dimension. Abstract machines belong to the virtual (immanent) space, and they are actualized as assemblages. The virtual is accessed through a diagram which maps (1) the unactualized tendencies (singularities) and (2) the unactualized capacities to affect and to be affected².

Everything that exists in the actual is a response to a problem. Each actual thing is a solution to a problem that is posed. Each solution however, is not the only solution to that problem. A liberal state or an autocratic state is different responses (solutions) to the problem of how to organize society. The 'real' consists of two planes, one correspond to the ACTUAL (form) and the other to VIRTUAL (formless). They are both two different parts of the REAL.

2.8 CHANGE

Since the assemblage is made of heterogeneous parts it does not dissolve into the next larger scale, but evolves through a creative process and thus remains open and active for new and different connections and therefore for (immanent) change. The identity of an assemblage is always unstable, uncertain because other processes act to destabilize or decode it. The identity of an assemblage is that of a unique singular individual. Its properties are not given; they are merely potential if not exercised.

De-territorialization may be understood as a movement that produces change. It expresses the creative potential of an assemblage to become to connect differently and to grow in a disorganized way. To de-territorialize means to loosen, release, disconnect from fixed connections of an assemblage, while

¹ Taken from chemistry and biology, valency here means the combining power of an element or molecule.

² Singularities are seen as attractors that allow many actualizations to a problem. Actualization is a temporary solution to a problem and is derived from processes of individuation. Real problems are defined by singularities.

reconnecting into new organizations is understood as re-territorialization. De-territorialization is not the opposite of re-territorialization. De-territorialization is the territory intrinsic/natural process of transformation; it is linked to the process of change, which is immanent to a territory. Thus in order to know how an event emerges and advances, it is not enough to trace its developments from actual events, but instead, to map it, which implies (1) to embrace the space of potential, and (2) to counter-actualize the becoming of the setting.

The focus of this work is in the becoming of entities rather than in their beings. Instead of examining points or fixed properties of an assemblage, this work focuses on the different kind of lines that frame it which are related to the two vectors that make up the process of transformation. This work regards an assemblage as composed by actual molar and molecular lines in the plane of transcendence /molar/strata, and by virtual lines of flight on the plane of immanence. Molar lines portray a hierarchical system that displays centers of significance and subjectification (command and decision). The molecular lines are fluid in its principles of organization. (Guattari, 1977, 1995)

3 EXPERIMENTS: A RHIZOMIC PROCESS OF PLANNING THE UNFORESEEN

This sub-section discusses some experiments with planning in which participatory practices are carried out by a diversified range of informal participants, advocate groups and local movements. These experiments evaluate the rhizomic working of these groups in dealing with specific and concrete situations. The focus of research is to evaluate the range of small and intertwined real problems the community faces every day and how it solves them by adopting a sequence of creative and unexpected solutions. The distinctive aspect of these experiments is the collaborative and networked effort accomplished by the participants. The recurrent feature of these networks is the absence of any kind of formal (institutionalized) apparatus, be it public or private (Nyseth, 2011),

The history of local planning in Brazil has been mostly conservative. For the most part planning institutions only served the private interest of some groups (elites). In fact, these groups always dominated the local institutions, and as such, most of the administrative procedures only produced outcomes to promote those interests, mainly in detriment of the majority of the population. Only recently, changes introduced in administrative practices—mainly under the impact of democratic governments—endorsed popular involvement in public planning activities. The first innovations starting in Lages and Boa Esperança during the seventies, pointed out to the emergence of local and popular groups such as neighbor associations, rural organizations, housing and land-tenure defense movements, etc. These early associative experiences and their participative practices open the way for new experiments and that requires new institutional arrangements for the management of urban realm. That entails the construction of a new political culture, which may involve the assemblage of new relations between formal institutions and the public.

Nevertheless, what are the direction these experiences points out? Are they innovative? What kind of political project or utopia they carry on? Innovations by themselves do not tell us anything about the direction of change. It is important to be aware that democratic processes of deliberation may conceal their meanings. Anyway, these societal movements, according to Deleuze and Guattari, can be seen as lines of flight seeking to construct new spaces and new modes doing and dealing with the real world problems and distresses. However, as Deleuze-Guattari warns us these flights may be recaptured by the institutional apparatus and indeed dominant interests may seize them, and use them to deceive, co-opt, and control the political power. In fact, lines of flight recouped may be used as an instrument of manipulation of people's dreams and expectations and work to disarticulate any possibility for genuine popular action.

The experiences described in the following lines are part of experiments under way in Brazil, and they are connected to many aspects of the urban or rural life. These experiments take place in many spheres of informal governance system and counts with the involvement of different kind of individuals, informal groups and associations, participating and articulating the construction of Deleuze-Guattari "new lands". These experiments are mostly present outside the formal institutions and in many cases may even be carried out independently of any formal government participation.

The next section describes some experiences we call rhizomatic collaborative planning. These experiences differs in scope, objectives and results, and are taken from an array of informal, low profile,

practical experiences of local communities, seeking to solve their real problems. The main features of these experiences are the informal, non-hierarchical, a centered and collaborative work the participants perform along and within the process. Actors interact freely and collaboratively with no central control and actions are taken with no need for bureaucratic intermediation or formal regulation. Decisions are not a formal top-down process, instead they are based on open dialogue among participants and solutions are not definitive—an ultimate and fixed point—but emerge as flow of possibilities, that is built along the way from the diverse of views, opinions and interests.

3.1 HULHA NEGRA TOWNSHIP EXPERIMENT

Hulha Negra is a small community of the Rio Grande do Sul State, where a remarkable experience of collaborative and rhizomic work has taken place. The interaction of two local councils dealing with different issues (economic development and scholar meals) introduced a new perspective for local rural producers and improved the quality of local student's meals, by changing the logic food supply of local schools.

Several small producers (local farmers) participated in the council of school meals since their children belonged the local education system, but they were also members of the economic development council seeking alternatives to improve the local economy (and local producers revenues). Initially, they thought that they needed to increase demand for their local commodities in order get increases in income, lately they discovered that the local administration used local resources to buy food for the school meals outside the town – from foreign dealers and/or producers. They also discovered that the quality of the meal was poor and inappropriate. The collaborative work of the councils, the farmers and of the local administration resulted in changes in the school meals policy: the local farmers organized a cooperative and began to provide the meals to the local public schools. This allowed public resources to remain within the local economy and the children meals improved considerably.

The disjoined multi-connected (rhizomic) relations between agents opened up many ways for participants to solve their concrete, real problems through an evolving assemblage of horizontal (non-hierarchical) network of community collaboration.

3.2 MONSENHOR TABOSA EXPERIMENT

Monsenhor Tabosa is a small town in Ceara State, in the northeast of Brazil, a poor and depressed region in the country. In Monsenhor Tabosa initiate the Programa Arco Iris (Rainbow Program) a very interesting collaborative work among the local government, a local NGO (Conselho de Segurança do Bairro de Fátima) and Abrinq Foundation (a Nationwide NGO sponsored by the Toys Industry Federation). The main target of the program was the students of primary education. After many discussions among the parts representatives and the local community, it was decided that the program should start by improving the capacity of the local teacher in order to enhance the quality of the teaching, and by that to improve the child school performance. Pedagogical workshops on a variety of subjects (ethics, art, history, citizenship, bio-dance, etc) were implemented with the objective of persuading the professor on the need to revise and change their old educational practices. Abrinq Foundation covered the main costs of the program, and the local government paid for travel expenses and meals of professors. Some years later, the municipality of Monsenhor Tabosa shows a dramatic change in their education patterns with a noticeable improvement of the entire school system performance as indicated by the figures showing a drop on student's academic failure or school abandonment. In fact, this collaborative work shows important and interesting aspects. First, it started in a small town far from any significant urban or information center. Second, it also started outside formal government, through the informal action of a local NGO and the community. Third, these local groups were able to seize important connections not only with local public institutions but also with institutions at the national level. No decree or hierarchical decision-making mediated the collaborative process, but on the contrary, people were able to sew of an informal assemblage of horizontal cooperative work.

3.3 WOMEN IN ACTION PROGRAM

This program starts in Leme, a medium size town of Sao Paulo State. It is directed to the low-income families and unemployed people. The main objective of the program is to increase the professional capacity of the women by means of educative courses, events, workshops, and meetings and active social work. The local chapter of Lyons Club and the Solidarity Social Fund (private NGOs) handled the program in cooperation some branches of local government.

With the partial contribution of each of these partners, Leme city was able to create a very powerful social program directed to, on the one hand, help woman emancipation and, on the other, to face problems of poverty and unemployment. What really matters in this case is the informal alliances and non-hierarchical work between the participants – government, private groups, population. The program achievements soon became clear. It has contributed to, on the one hand, reduce poverty and unemployment, and, on the other, to generate income and self-confidence for poor families. Some of the women who participated in the courses of dressmaker and cloth painting are now working by themselves, at home and trading their products. Other women created a cooperative and are now producing bed-sheets and uniforms for the Public Health and Education departments of the local administration.

3.4 COMMUNITY GARDEN PROGRAM

In 1995 slum dwellers in Sao Bernardo do Campo– a median size town of 400.000 inhabitants situated at Sao Paulo metropolitan area – starts a program called Community Garden, directed to increase the quality of the food consumed by the low-income population. The program had several partners/sponsors: slum residents, local government, the Methodist University Alumni Association, local firms, and other interested citizens. In addition to assure the food supply for poor people, the program also sought to increase family income. Each participant worked in collaboration with the other. There was no central coordination, or rules for participating. The local administration¹ and the private firms provided the land for cultivation, the low-income people worked on the land with the technical supervision of university professors (agronomy engineers), and the Alumni Association offered technical and legal support and undertake the project management.

In this experiment, all the members participate and deliberate together on how to distribute the land, how to prepare the land for plantation and who does the infrastructure work. Once the land is cultivated, new meetings are held to decide on how to share the production and to whom the new plots for cultivation will be assigned. After the harvest and distribution of the yields, the surplus is commercialized. During the whole process, the alumni association in connection with the local university carries out an education program.

The vegetable garden experiment achieved an enormous success all over the country, and soon other municipalities started a similar program. The program success is mainly due to its ability to assemble the target population, solve the food problem of low-income families, and create an alternative for increasing the earnings of people with no formal employment.

This is a relatively cheap collaborative program. The local administration gain by alleviating poverty, the private firms gain by improving their image in the city, the university and the alumni association gain by providing an opportunity for students and alumni to apply their knowledge, and the low-income families gain twice as they have their food quality and family income improved. At this moment, many municipalities over country have adopted programs like this mainly as a real alternative policy against unemployment.

4 CONCLUSION

The history of social struggles in Brazil is a history of struggle for citizenship and social justice, which can be summarized as the pursuit for democratization of the public sphere. In the case of planning, such democratization involves access to arenas of collective deliberation. For this reason, movements and associations of civil society carries previously incorporated into their practices, a strong ability of working

¹ São Bernardo do Campo local government was at that time fleeing political project from the mainstream political system.

together, of sharing and collaboration: a history of network organization, solidarity and mutual strengthening. (Freire, 1994) These movements are carriers of a new social ethics: the ethics of respect, brotherhood, justice and freedom—an ethics that seeks equality of opportunities in a world of diversity and differences.

These participatory social action experiences do not appear anywhere. They are the product of specific circumstances, of real political actors and of tangible action social groups. Often, experiences emerge of informal, isolated actions; other times, they are part of larger movements of transformation of civil society institutions. In most cases the current decline of political forces and the decay of conservative governance institutions nowadays, result from their inability to build a political pact that paves the way for new discourses to manifest and new political actors to emerge. In contexts of change and transformation, new social agents materialize as political actors constituting movements and practices that will seed new forms of political and social regulation.

economic ideas of neo-liberalism have become deeply entrenched in the public sector administration of countries in most parts of the world, affecting planners in a number of ways”.

The neoliberalised cities compete to attract a greater portion of the international investors and skilled immigrants through the production of new desires for greater enjoyment by affluent consumers. Under the hegemony of global neoliberalism, decision makers, including planners, are primarily concerned with generating further economic opportunities (Olds, 1995, p. 1714) by directing the flows of capital to their cities. To reveal the way in which contemporary planning practice operates to maximise international investment flows and lure the creative class, a variety of concepts have been proposed, including ‘urban-entrepreneurialism’ (Brenner (Brenner & Theodore, 2005; Jessop, 2002), ‘city marketing’ (Doel & Hubbard, 2002) and ‘place branding’ (Govers & Go, 2003). These concepts emphasise the competition between globalised cities for luring a greater share of global capital flows. Outside judgment and international perceptions are important for raising the profile of cities (Ong, 2007, p. 89). Thus, planners as the workers in an entrepreneurial apparatus, deploy and legitimise market-oriented policies including city promotion. Gotham (2002, p. 1735) states that “[m]arketing is the use of sophisticated advertising techniques aimed at promoting fantasy, manipulating consumer needs, producing desirable tourist experiences and simulating images of place to attract capital and consumers”. Planning policies such as city branding are largely implemented to assist market operation and also to lure flows of capital, skilled workers, cheap labour, if required, to a neoliberalised city. Sager (2011, p. 153) mentions that “these policies, for example, gentrification and city marketing, are nevertheless included, as they fit hand in glove with neo-liberal ideology and have taken on new importance as policy instruments under neoliberal urban regimes”. These market-driven policies tend to create conditions conducive to capital accumulation in neoliberal cities (Peck et al., 2009).

Concurrently, multiculturalism, as another consequence of flow of people (human capital), has recently been the subject of extensive research across a range of disciplines such as sociology, political studies and economics (Benhabib, 2002). Neoliberal globalism promotes multiculturalism, many cities have become more culturally diverse. Friedmann (2002, p. 157) indicates that cultural diversity is a defining characteristic of globalised cities. Florida’s (2002) investigation of American cities reveals that cultural diversity effectively generates new economic opportunities in globalised cities by attracting more foreign investment (capital) and talented migrants (human capital). Further, Sassen’s (2009) global city research further supports the role of cultural diversity as a key factor in economic growth. Sassen (2002) points out that the ranking of global cities in the universal trade network, as global trading hubs, corresponds with their socio-cultural heterogeneity. Vijver et al. (2008) stress that multiculturalism, as a market driven policy, has been globally deployed for stimulating the process of economic growth. The implementation of city marketing as a strategic policy lures the creative class in response to market demands in global cities (Storper & Scott, 2009). The next section will investigate a post-structural understanding how the implementation of city marketing policies attracts both human and non-human capitals to the neoliberalised cities.

3 NEOLIBERALISED CITY AS THE PLACE OF ENJOYMENT

A number of scholars such as Lacan (2006), Deleuze and Guattari (2009), and Žižek (2011a) have indicated that desire is the key driver in contemporary capitalism. According to Deleuze and Guattari (2009), the flows of desire are the sine qua non of a city-machine’s operations: first and foremost, cities are desiring-machines. Dovey (2005, p. 20) stated that “the city is an immanent flow of desires”. The existence of the city-machine is reliant on the generation of new desires, imperative for attracting capital and labour flows. Dovey (2005, p. 20) added “[f]lows of desire are the life force of the fluid city” such as Auckland.

Stavrakakis (2008a, p. 84) argues that “the emerging hegemony of consumerism, [as a dominant global value], cannot be explained without taking seriously the dimensions of desire and enjoyment”. Similarly, Žižek (1989, p. 5) identifies ‘surplus-enjoyment’ as a main driver of global neoliberalism, which promises happiness through material consumption. Dovey (2005, p. 20) postulated that “[t]he world is not a collection of subjects who have desires, rather desires construct the subject”. The flows of desire fabricate the identity of the city as the assemblage of an urban built environment and everyday life. The type of desires that are produced for profit, investment, privilege, consumption and power generally promise increased enjoyment, and significantly affect contemporary urban image and transformation. In the words

of Wood (2009, p. 204), “[f]rom this account of desire, flows of capital must, of necessity, be parasitic upon flows of desire; the basic argument which follows is ‘before’ the market can play a determining role in urban development, flows of desire must be made tantamount to, and seemingly derivative from, flows of capital.”

Globalised cities are places in which regulated desires erupt into the production of flows of both material and sign values- symbolic images (Dovey, 2005; Ong, 2007). Cities across the western and non-western world have followed in an effort to materialise ‘utopic images’ based on market constructed desire (Kaika & Thielen, 2006). These utopic images reproduce and also reinforce to the flows of capital (human and money). In the neoliberal global context, first, the qualitative values such as quality of built/natural environment or quality of life are converting into purely quantitative values of money, investment, and profit. Secondly, the promised profit is actualised through consumption by generating a set of new regulated desires based on new qualitative values – advanced enjoyment (Wood, 2009).

City marketing policies include several policies such as encouraging cultural diversity (Florida, 2002; Ong, 2008), establishing iconic architectural buildings such a Skytower (Dovey, 2008), socio-cultural events such as festivals and mega events like the Rugby World Cup (Pløger, 2010), and creating an utopic images such as “making the most world’s liveable city” (Mohammadzadeh, Meares, & Owen, 2015). These city marketing policies can be interpreted within the process of generation of new qualitative values. The new qualitative values generate new desires for more consumption and promise greater enjoyment. “All cities believe that, if they have the best socio-cultural amenities and creative milieus, architectural heritage, and cultural events, they have a reliable strategy to get the maximum in return, in consumption and image turnover” (Pløger, 2010, p. 848).

In Anti-Oedipus, “Deleuze and Guattari argue that capitalism functions by simultaneously producing two different kinds of surplus values: a quantitative, capitalistic surplus value, and a qualitative, subjectifying surplus value” (Wood, 2009, p. 204). Massumi (2002, pp. 200-201) defines subjectifying surplus value based on Deleuze and Guattari’s notion of flows: “This implies the existence, in fact the predominance, of a kind of surplus value that is created in the process of circulation itself. The value of commodity-images (defined broadly this time, to encompass objects, bodies, representations and information: decoded sites of force conversion) is attached more to their exchange and inclusive disjunction (the production of recording accompanying the singular acts of consumption made possible by the inclusive conjunctions of the capitalist axiomatic) than to their material production. Deleuze and Guattari call this form of surplus value the ‘surplus value of flow’. It has two aspects, corresponding to the consumer/capitalist dense points of the capitalist relation: it continues to feed into capital accumulation in the hands of the capitalist, but wherever capital surplus value is extracted in an act of purchase, an evanescent double of, what accrues for the capitalist is deposited in the hand of the consumer. This ghost surplus value has a non-capital form; it is even reminiscent of the surplus value of pre-capitalism. It is more on the ‘other’ of prestige, an ‘aura’ – style, ‘cool,’ the glow of self-worth, personality. The process of shaping surplus subjective value operates simultaneously with the process of production and consumption, rather than before or after this process.

Desires for a green city, a sustainable city or being the world’s most liveable city are representative examples that actuate the neoliberalised planning. Both capitalistic surplus value and subjectifying surplus value are produced through the process of the implementation of urban policies and plans, including city marketing policies. First, planning fantasises the desirable images for cities, such as being the most liveable, multicultural, and greenest city in the world. At length, these fantasies are used to attract a greater share of the global flows of finance and immigration, in competition with other cities. Second, these urban policies and plans synchronously generate subjective forms of surplus value such as political praise for local government, civic prestige for residents and acclaim for visitors (Dovey, 2005).

Outside judgment and international perceptions are important for raising the profile of cities in the market (Ong, 2007, p. 89). Thus, decision-makers as the leaders of the apparatus, constantly deploy the new visions, e.g. Len Brown’s vision to make Auckland the world’s most liveable city. Gotham (2002, p. 1735) states that “[m]arketing is the use of sophisticated advertising techniques aimed at promoting fantasy, manipulating consumer needs, producing desirable tourist experiences and simulating images of the place to attract capital and consumers”. “The reputation of a city, its image, is perhaps the most visible sign of promotional efforts” (Short et al., 2000). Thus, one of the primary objectives of local decision-makers and

planners is to construct favourable images of their city via place branding or city marketing in terms of investment, living and visiting. The production and promotion of desirable images are imperative for the operation of the neoliberalised city, and these images are produced through the process of urban planning and design. “The best of cities have always been a curious mix of economic engine and seductive surface; places of work and play; producing wealth and desire in abundance” (Dovey, 2005, p. 1). The entrepreneurial images of cities are not generated based only on urban projects such as waterfront development projects, iconic architectural buildings and emporia; rather, cities also create allure through their rhetorical policies, such as liveability. Through the process of planning, interests are produced (Wood, 2009). Desiring-production generates a fantasy that persuades non-residents to invest, live in or visit a city. The connection of the city to the global networks within the capitalist mechanism is central in shaping this fantasy. In this context, the Auckland Council's vision has been used as a tool for reinforcing the economic power and competitiveness of New Zealand's primate city. Auckland Council promises advance enjoyment (non-capital surplus value) to its residents, foreign expats and visitors by living and investing in the world's most liveable city.

4 AUCKLAND AS THE WORLD MOST LIVEABLE CITY

Historically, Auckland has been the primate city, the city of migrants, and the dominant business and finance hub in New Zealand. Auckland is New Zealand's largest city-region, home to more than 1.5 million people, a third of New Zealand's total population, and contributes more than 37 per cent of New Zealand's GDP (Auckland Council, 2012).

Horton (1995) observed that since the 1990s neoliberal globalism toward an urban entrepreneurialism had impacted New Zealand's urban policy. Neoliberal globalism perceives cities as economic entities in themselves which can leverage their competitive advantage (Porter, 1995). The competitive cities strategy utilises land-use policy to foster spatial agglomeration and greater economic performance. Since 2000, the central government showed greater interest in Auckland's contribution to the national economy, as the region showed strong economic growth (Lewis & Murphy, 2015). The central government's initiative for “competitive cities” formed a key component of the economic agenda to support prosperity and future growth (Ministry for Local Government, 2009). Auckland was characterised as the “engine room” for New Zealand's economic growth (Ministry for Local Government, 2009). This shows the strategic role of Auckland for the central government, not primarily as a population centre, but a vehicle to support the national economic strategy. Governance reforms were justified by imperatives for international competitiveness, Auckland's significance to the national economy, and the desire to better serve interdependent needs for social, environmental, cultural and economic well-being (P. Salmon, Bazley, & Shand, 2009).

In 2002 the Auckland Regional Economic Development Strategy as an initiative was shaped to increase New Zealand's GDP earnings, to expand export markets and attract foreign investment (Rowe, 2004). Supporting the international competitiveness of New Zealand cities is now a primary component of the central government's economic agenda (Ministry for the Environment, 2010). In 2007, the central government assigned a Royal Commission of Inquiry into Auckland Governance to address ongoing problems in the region, to identify the issues facing Auckland in future, and to resolve them. The Royal Commission identified the lack of an integrated decision-making mechanism, including planning, as one of the main reasons for on-going problems in the Auckland region (McKinlay, 2011). The report suggested a fundamental governance reform to shape a unitary authority for the region with a mandate to develop an integrated planning mechanism. The first bill, the Local Government (Tamaki Makaurau Reorganisation) Act 2009, which provided for the merger of the eight pre-existing councils into a single unitary council and the establishment of the Auckland Transition Agency, was passed through all stages under urgency in 2009. The legislative reform termed the new Auckland region as the ‘super-city’. The term of ‘super city’ reflected the scale of the integrated authority (1.5 million people) compared with the scale of New Zealand's other large local authorities such as Christchurch City with a population of approximately 350,000.

In 2010, the Auckland Council was shaped an inclusive and united organisation to take over the functions of the Auckland Regional Council and the region's seven city and district councils, including Auckland City Council, Manukau City Council, Waitakere City Council, North Shore City Council, Papakura District Council, Rodney District Council and most of Franklin District Council (Rowan, 2011). According to the

legislation, Auckland Council has aimed to provide integrated actions, plans, strategies and policies for the future of the Auckland region. Shaping Auckland Council can be perceived as a result of New Zealand's national agenda for international competitiveness (McArthur, 2017). Ministry of the Environment (2010) led an initiative for "competitive cities" as a key component of the national economic agenda to support prosperity and future growth.

Auckland Council a new amalgamated organisation has subsequently enabled a new local agenda oriented toward liveability. Lewis and Murphy (2015) identified the shift from sustainability to liveability as a guiding spatial imaginary and a governmentality as a consequence of shaping Auckland Council. They observed that the shift in urban policy has attributed greater economic significance to the city as the pre-eminent spatial form to support both quality of life and economic growth. However the city competitiveness agenda has been introduced and then led by the central government, the first elected Mayor of Auckland, Len Brown, outlined his vision to transform Auckland into the world's most liveable city. His vision set the newly amalgamated Auckland Council's goal to make Auckland as the world's most liveable city that deployed as a vision for the Auckland Plan, released in 2012.

The vision guides and shapes the agency of Auckland Council as a new organisation (Gunder, 2014). Thus, the Mayor's vision has significantly informed Auckland Council's strategies, plans and policies such as the Auckland Plan and the Auckland Unitary Plan. However, Auckland has been one of the most liveable cities in the world. The new integrated Council aims to improve the liveability of Auckland and, subsequently, to increase its ranks among other competitor cities such as Melbourne and Vancouver.

Auckland Council (2012) defines its vision, making Auckland as the world's most liveable city, in the Auckland Plan as an aim to "create a strong, inclusive and equitable society that ensures opportunity for all Aucklanders". Nonetheless, the Auckland Council vision that significantly has informed its plans and policy that can be perceived as a city marketing and branding exercise. Ranking highly in the Economist Intelligence Unit's Global Liveability Ranking, Mercer's Quality of Living Survey, and Monocle magazine's Quality of Life Survey is used as an imaginary tool to attract foreign investment, skilled workers and cheap labour (Mohammadzadeh et al., 2015).

The Auckland Council's vision to make it as the most liveable city ranking is an illustrative example of how a vision as a city marketing policy generates an utopic image of the city that produces new desires for both domestic and international actors that inherently functions as an economic driver for a city in the global market. The vision is promoted globally as a lucrative model for city development in media. Thus, several cities across the world have followed in an effort to materialise this globally accepted vision. The contemporary city should continually produce new desires; one of the new functions of local government is the facilitation and legitimization of the production of new desires, by promoting the image of the city within global market as the world's most liveable. To reveal the way in which the local government operates to maximise international investment flows and lure the creative class. Decision makers, including planners, endeavour to project a desirable image of the city by implementing appropriate city-marketing policies. In brief, "[p]romoting the right image [largely focused on advanced enjoyment] is central to city-marketing" (Boland, 2007, p. 1027). Auckland Council's vision and its city marketing policy promise Auckland residents, immigrants, investors both objective and subjective capital values through living in the city and their contributions to its economic growth.

5 THE PRODUCTION OF URBAN DISCONTENT

The neoliberalised cities are inherently unable to materialise their promises at least for a large number of their residents and new arrivals. Based on Lacan's works, this paper claims that the Auckland Council's vision to make "Auckland the world's most liveable city", (Auckland Council, 2012) has intensified of urban discontent.

For Lacan, although the symbolic order restricts enjoyment, it simultaneously allows for the fantasy of the attainment of complete future enjoyment, so as to make the restrictions endurable. This mechanism is complicated in the neoliberalised society, which promises "advanced enjoyment" (Stavarakakis, 2008a) or "surplus-enjoyment" (Žižek, 1989) as the core of the market operation. Accordingly, McGowan (2012) conceptualises neoliberalised society as the "society of commanded enjoyment".

Under the hegemony of neoliberal globalism, city marketing promotes advanced enjoyment to the people through investing, living, working, and even visiting the city. Nonetheless, at least two main reasons can be identified for the failure of the neoliberalised state to materialize its promises in city marketing policies: first, as Freud (2002, p. 81) stated that “the programme of becoming happy cannot be fulfilled”. Second, neoliberalism largely operates based on increasing social, economic and geographic inequality (Harvey, 2007). In this context, the promises cannot be delivered to a large number of the neoliberalised city’s residents and new arrivals.

Lacan deployed the notion of lack to formulate the mechanism of capitalism and its promised enjoyment (Evans, 2010). Based on Freud’s works, Lacan argued that enjoyment is incomplete because desire can never be fully satisfied; instead, desire is continually being replaced by new desire. “Desire can only be sustained by dialectic of lack and excess; in order to remain attractive, the promise of excess relies on the continuous renewal of lack” (Stavrakakis, 2008b, p. 94). “Desire and lack always go together, overdetermining the dialectic aporia of human life” (Stavrakakis, 2008b, p. 90). This dichotomy between lack and desire perpetuates the contemporary city in late capitalism (Baudrillard, 2016).

Gunder (2009, p. 287) observes that “[b]eyond the traditional employment and investment opportunities, the quality of life available, including amenity, life and range of leisure opportunities are necessary elements for the city-region to attract businesses and talented people”. City-marketing policies are also constituted around lack, the liveability or the quality of life; the attainment of full enjoyment is fantasised through living in the city (Haines, 2011). Despite the fact, the promises made, satisfaction cannot be achieved due to an inherent lack.

We desire because we don’t find the sacrifice of our enjoyment entirely satisfying, but desire, unfortunately, does nothing to overcome that dissatisfaction. In fact, desire is sustained dissatisfaction (McGowan, 2012). The neoliberal utopia as fantasised by the city marketing policies is predominantly a virtual utopia; its promised enjoyment, by advertising fantasy, that cannot be actualised (Stavrakakis, 2008b). Desire is constructed through fantasy – and it is through the fantasy we learn how to desire. As far as the final satisfaction of our desire is concerned this is postponed from discourse to discourse, from fantasy to fantasy, from product to product, from the most sustainable city to the world’s most liveable city. It is this continuous displacement that constitutes the essence of consumer culture (Stavrakakis, 2000, p. 89). If the disruption of replacing desires intensifies urban discontent.

Žižek (1989, 1993), Stavrakakis (2006) and Laclau (2005), among others, conceptualise socio-political antagonisms, such as xenophobia or racist movements, as fantasies embedded in this same impossibility of full enjoyment that results in intensification of urban discontent. In this context, since fantasies can seldom be realised and full enjoyment is unattainable, some people misidentify the source of their dissatisfaction in external agents such as immigrants or ethnic groups. New fantasies, often of a racist nature, are replaced with market-based fantasies. These fantasies demonise others as the cause of one’s lack of attainment of full enjoyment. The recent Global financial Crisis (GFC) shows the failures of neoliberal globalism. It has brought an increase in socio-political conflict in late capitalism. Critical thinkers, such as Žižek (2009, 2011a), Laclau (2005), Stavrakakis (2002, 2007) and Mouffe (2007), among others, have extensively deployed Lacanian concepts to investigate these socio-political conflicts.

5.1 AUCKLAND AS THE PLACE OF URBAN DISCONTENT

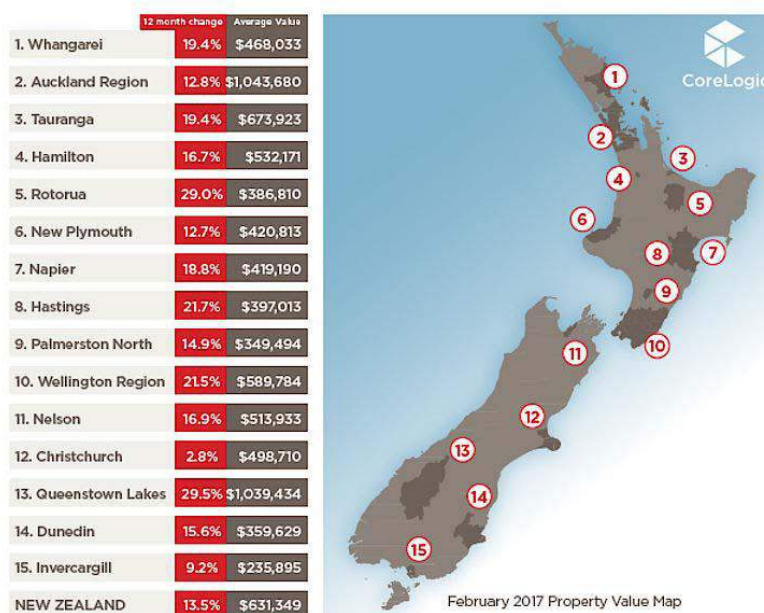

Since the 1980s, the New Zealand economy was opened up to competition from imports and foreign investors through economic liberalisation and reform. The liberalisation, or neoliberalisation, of the economy has significantly influenced on Auckland as the main commercial and industrial hub of New Zealand. The neoliberalisation has facilitated flows of foreign investment in commercial, property retail and private real estate. The flows of foreign investment have boosted property development in Auckland, particularly in its CBD (Moricz & Murphy, 1997). “The city’s role as a major hub for the inward and outward flow of goods, services and people continued to expand as did its designation as the dominant centre for the retail and service industry sectors as well as the portal for overseas companies in New Zealand” (Neill & Shirley, 2013). Following the facilitation of flow of capital through neoliberalisation of the economy, the government has changed immigration policies in the late of 1980s to attract individuals who could contribute business expertise, or make a capital investment in New Zealand (flows of human capital) (Simon-Kumar, 2015).

"Between 1981 and 2006, the number of overseas-born people usually resident in New Zealand rose from approximately 450,000 to 920,000, an increase of more than 100 per cent" (Law, Genç, & Bryant, 2013). Auckland has attracted the large number of the new arrivals (Bedford & Spoonley, 2014; Spoonley, 2015). Flow of people increased the demand for housing that subsequently fuelled pre-existing housing inflation. Housing inflation among other factors made the cost of living in Auckland higher than other places in New Zealand (Neill & Shirley, 2013). The amalgamation of Auckland Council and, then, implementation of the new vision for making Auckland as the world's most liveable city have reinforced the flows of capital and people required for the city's economic growth. Concurrently, the central government changed the immigration policies to attract individuals to the country in 2009. However, several occupations were removed from the long-term skills shortage list and rules around sponsorship were tightened. New investor and entrepreneur categories, including "Investor/Entrepreneur" and "Investor/Entrepreneur Plus", were introduced to attract business migrants. According to Minister of Health, and Minister for Sport and Recreation, Jonathan Coleman, these schemes has facilitated entry criteria and fast-track applications for large investors (Coleman 2011). In 2013, the new immigration policy let students working full time in New Zealand; this policy increased the number of foreign students in Auckland as the primary education hub of the country.

Murphy (2011, 2016) observed that the Global Financial Crisis (GFC) has significantly decreased construction activities in New Zealand, particularly in the Auckland region. According to New Zealand Stats, building consents for new dwellings declined by 30 per cent from 2007 to 2008 and consents for all residential developments in 2009 were down 54 per cent from the peak of 2004. The shortage of supply in the market alongside the increasing the flows of international capital investment and people have rocketed up the price of housing in Auckland region. The 13th annual Demographia International Housing Affordability Survey (2017) classified Auckland as the fourth worst housing affordability, with a Median Multiple of 10.0 among the major investigated cities in the world. The current housing inflation is one of the causes for the Auckland's unaffordability. The latest monthly house price index published by QV shows that Auckland values are quickly increasing. In the three months to January 2015, housing price increased

5.1 per cent which equates to over 20 per cent annually (QV, 2015). The growth is considerably higher than the 1 per cent to 2.5 per cent rate of increase per three months during 2014. It is the highest since 2003 at the start of the previous boom. The following map illustrates the housing price changes in Auckland compared with other major cities of New Zealand in 2017.

5.2 FIGURE 1 –HOUSING PRICE INFLATION

According to the CoreLogic NZ (2017), there are unique things about Auckland that set it apart from the rest of the country namely: Strong net migration, consumer confidence and low-interest rates.

These factors are increasing demand in Auckland's housing market, while a shortage of housing stock and a relatively low percentage of properties for sale are holding back supply to meet the increasing demands.

The housing market is the main driver of the New Zealand economy growth, and the value of housing represents almost three quarters of total household assets in New Zealand (The Reserve Bank of New Zealand, 2017). The amalgamation of Auckland Council and then the implementation of its vision as a neoliberal city marketing is one of the drivers of housing price inflation in Auckland (Lewis & Murphy, 2015; Wetzstein & Le Heron, 2010). Investment in Auckland real-estate market seems promising for both domestic and international investors (objectifying surplus-value) (Kelsey, 2015). Based on Lacan's works, Žižek (1989, 2011) stated that there is correlation between the production of 'surplus-value' and 'surplus-enjoyment'. He (1989, p. 53) argued that "surplus value is the cause which sets in motion the capitalist process of production and surplus enjoyment is the object-cause of desire".

In addition, the Auckland Council's vision as one of the world's most liveable cities offers, or at least promises, the high quality life-style to its residents (subjectifying surplus value), if they can afford it. Thus, affluent people who can afford to pay the cost of living in Auckland, particularly accommodation, may attain the quality of life that is suggested. The flows of investors and affluent migrants have remarkably exacerbated urban problems such as unaffordability, gentrification and social inequality in Auckland (McArthur, 2017; Mohammadzadeh & Bahmanteymouri, 2015).

Auckland Council as the local government has been successful in attracting flows of capital and people, required for the city's economic growth. The amalgamation of Auckland Council and implementation of appropriate vision has assisted the council to compete effectively with other cities in the global market. Nonetheless, the fluxes also generated some side effects such as housing inflation and unaffordability (Mohammadzadeh & Bahmanteymouri, 2015).

In recent years, there has been a great deal of concern expressed by various parties about the decline of affordability of residential housing in New Zealand; bringing into question as it does the possible end for many, of the kiwi dream of near universal home ownership (Bourassa & Shi, 2017). The decline in affordability has been particularly apparent in Auckland, where the surge in housing prices in recent years has been particularly strong. A range of causes has been put forward for the decline in affordability, including such things as the impact of overseas buyers, high immigration, low interest rates that over stimulate demand and a sluggish supply side response. Coleman and Landon-Lane (2007) investigated the relationship between migration, residential construction and house prices in New Zealand between 1962 and 2006. They found that a net migrant flow of one percent results in house price change of 8 to 12 percent. Using regression modelling, they concluded that migration flows do impact housing prices, explaining that this is possibly caused by shifting local demand coinciding with migration flows or that migration flows effect housing value expectations. Ge (2009) investigated New Zealand houses prices between 1980 and 2007. He argued that the main cause of New Zealand house price variations identified was migration, followed by mortgage rates, the number of building permits and the level of unemployment, which are also found to be important factors.

Ley's investigation on Vancouver Housing market (2017) shows that "House prices have risen rapidly and the detached housing market is now unaffordable to most Vancouver residents. Despite public discontent about the likely role of investors in boosting prices, provincial and local governments, who value the revenues of high property prices and BIP fees, have shown little desire to intervene." In New Zealand, foreign investors and flows of immigrants are often recognised as the main causes of the housing price inflation in Auckland. In other words, the new arrivals are used as the scapegoats and are demonised as the people who steal enjoyment of the host society. Moreover, the production of urban discontent as a malfunction of neoliberal-globalism is largely misinterpreted or overlooked.

6 CONCLUSION

The regulated desires embedded in the subjectifying surplus-values shift public interest from crucial socio-cultural challenges, such as the increase in social inequality or lack of affordable housing, towards

superficial demands, such as making the world's most liveable city. As Dovey (2005, p. 210) argued, "[t]he interests and identities of social classes can be seen as the end-products of processes of new modes of production, the production of desire". In this context, the global neoliberalism as the hegemonic ideology shapes public interest and determines the planning process for considering the regulation of desires for prestigious architectural buildings, place or city marketing. Planners, urban designers and decision-makers are thus misguided in their recognition of existing urban challenges that produce urban discontent. In this context, one should ask who gains and who loses through the implementation of city marketing?

ID 1696 - PROTOTYPES AS OPEN-ENDED ARTEFACTS IN URBAN DESIGN

Kalis Gregoris¹

¹Frederick University, Department of Architecture, School of Engineering
gkalis@yahoo.co.uk

1 INTRODUCTION

When dealing with the quality of an urban space the criticism sets, almost without exemption, the end product of the urban design process as the main object of judgment. However, the product of urban design, in contrast to other consumer products, is more than a cohesive product of aesthetics and function. On the contrary, the design of space is a complex system of multiple individual products (open spaces, buildings etc.), each one with its own functions and needs. Moreover, due to the fact that each one of these individual products follows a unique path of development through time, it appears that the orchestration of this multitude of individual activities is difficult to accomplish.

Following the reasoning mentioned above, it becomes clear that the shaping of physical space is rarely under the full control of the designer and that most of the times the formulation of a physical space becomes the design of an overall framework of development. The latter highlights the importance to consider urban design not only as an object of design, but more importantly as a process of design. If we assume that participatory design, self-organizing, user-centered design and open source design are considered to be bottom-up processes, the hypothesis here is that open-ended design is a process that can either be initiated as a top-down or a bottom-up approach, but nevertheless, requires the participation of more than one person, in order to be successful. This implies that a set of rules must be negotiated and tested among all the actors participating in the process for any open-ended project to be implemented.

This research paper aims to present a discourse regarding the notion of open-ended in urban design and builds on the hypothesis that the notion of open-ended cannot be detached from the 'process'. This does not necessarily concern prescribed rules of actions but the act of defining the relations between possible actors as well as that a specific outcome of the design is not the main concern of the design process. According to this argument, design should be considered as an 'infrastructural' rather than a 'projecting' process.

The paper demonstrates that in order for the actors involved in a design process to develop or maintain relations towards an open-ended process, they need mediating devices, which are used both as representations for the evolving object of design and as means for aligning the different resources of a project. The paper focuses on 'prototypes' as important mediating devices and the process of 'prototyping' as an inseparable process for open-ended design approaches. It furthermore demonstrates that the prototypes' open-endedness extends beyond the lab's environment and scientific research, from the everyday inventiveness of people through Lévi-Strauss's bricolage process, to Alexander's 'patterns', to Habraken's concept of 'supports' or even to real life urban projects.

2 FROM PARTICIPATORY DESIGN TO OPEN-ENDED

Participatory design at first emerged as an important social movement around the 1960s and immediately gathered momentum. Participatory design was not merely a reaction to the ill-defined problems of societal nature, but it was essentially linked to the political and moral based issues of society with a primary focus on the empowerment of the people and the democratization of views. Participatory design usually refers to a process by which the communities involved, reach an identified outcome which resulted from the pluralism of the different 'voices' involved. It might as well be that one of the fundamental characteristics of open-ended, which is being discussed in this paper, and compared to participatory design approaches, is that of 'emergent', which is linked to the notions of sustainability and adaptability. The aforementioned notion is crucial for design, especially for urban design and planning practices, where the different phases may be implemented within considerably long periods of time, and where the existing conditions are quite subject to change.

2.1 SUPPORTS

One of the concepts that take into serious consideration time and change is that developed by J. Habraken. Laying emphasis on habitation, the work of the architect and academic Habraken, developed influential theoretical contributions specifically addressing the matters of mass housing and the integration of users and residents in the design process (Teerds & Havik, 2011). Habraken describes the relation between inhabiting and built form as a 'natural relationship', in which the close and continuous interaction of the users with the forms they inhabit defines their built environment. In particular, Habraken mentions that "dwelling is the result of a process..." and that "... dwelling is first and foremost a relationship between people and environment, and because the relationship arises from the most common actions of daily life it is rooted in the foundations of our existence" (1999, p. 18). For Habraken, architecture should concentrate on three significant questions (Habraken, 2006, reprint of the 2003 publication): i) how values are shared in the design of our environment, ii) how change and permanence make the environment alive and iii) how the distribution of design responsibilities can produce a more adaptable environment. Habraken refers to successful urban environments of the recent past and attributes their qualities to the sharing of common assets of the same locality. He also considers the factor of time an important aspect for the shaping of our environment. More specifically, Habraken notes that change and permanence go very much hand in hand, and therefore he lays great emphasis on the different timescales, by which the different elements that constitute our built environment function. The latter, becomes increasingly important concerning the scale of a project. As a reflection to the questions posed, Habraken developed the theory of 'supports', described in his 1961 book 'Supports: an Alternative to Mass Housing' (1999). What he did was to suggest a structure and an infill system by which the structure that is provided by the architect is more permanent and predictable than the short-lived and unexpected infill which is defined by the users. Furthermore, his theory on change and permanence of the elements that constitute the urban environment, regarding the levels of control and the distribution of design responsibilities, is described in detail in his article 'The uses of Levels' (Habraken, 1988). In his theory, the minimum material element of the built environment, for

example the house unit, is related and controlled accordingly by the smallest social unit in a society. Indeed, this possibility for individual control regarding the different levels of design provides Habraken's system with the capacity to act as a living cell and adapt dynamically to any changes over time.

2.2 PATTERNS

Alexander, on the other hand suggested a different approach for an open-ended design system; the mathematician, architect and academic, based his theoretical and practical work on his observation that old city centers¹ present a complexity and liveliness, which cannot be found in any of the contemporary new city centers² (1965). As with Habraken, he found that these assets cannot be credited to individuals and are basically the result of a collective effort. Alexander tried to understand the principles of vernacular architecture by documenting specific 'rules' that people have been using for thousands of years in design and have resulted from gradual adjustments on peoples' lifestyles over time. Alexander categorized these rules in 253 interrelated patterns that are hierarchically organized by scale, in order to structure 'A pattern Language' (Alexander et al., 1977); a model that would potentially offer a generative grammar for 'The Timeless way of Building' (1979). This pattern language intended to offer everyone the possibility to be practically involved in design. Moreover, what is extremely interesting is that the proposed language was structured with the provision to be modified by its users in order to be adapted to the different cultural aspects of a place and to the changing needs of people over time. Alexander's patterns were based on his assumption that the structure of the built environment is the process of a non-masterplan approach, by which the individual units are subject to local rules according to a timeless way of building. What is indeed suggested by Alexander is that the built environment should relate to a living world, which defines the city as the collective outcome of several interconnected forces. The author finds that Alexander's contribution of a pattern language builds on existing knowledge and uses an open-ended and self-organizing mechanism to collectively extend this knowledge.

2.3 DESIGN AFTER DESIGN

In other disciplines, such as in Information Technology or in Social Sciences, the management of complexity appears likely to be resolved by the users themselves, by embracing several models of collective processes, such as open source, p2p, crowdsourcing, etc., which promote a kind of sharing that is much more direct to the end user. Although the models mentioned above cannot be directly applied in the discipline of architecture and urban design, there are nevertheless some theoretical approaches that take into consideration several principles of the aforementioned models. Towards this direction is Bjögvinnsson's et al. (2012) research, which indeed gives great emphasis to the end user and their capacity for acting as future designers. Specifically, Bjögvinnsson, et al., take a step further towards an 'infrastructuring' process and argue about 'design after design' as a contemporary form of collective processes in contrast to 'use before actual use'. They argue that a new challenge is presented in designing "beyond the specific project and toward future stakeholders as designers".

All the aforementioned design approaches, make obvious the fact that despite the perseverance of a design process which is much focused on the end-product of the design, the process of moving from the initial framing of the problem to the final end-product, whether it is the final proposal or even its implementation, is equally important and undoubtedly more challenging to comprehend, criticize, map or reuse as a methodology of a process.

2.4 THE NEED FOR INTERESSEMENTS

Participatory design has basically emerged from the need for the democratization of design, manifested in some cases as a process in which all affected actors should have the right to be involved in the design. Apparently, in such cases controversy is an anticipated outcome of the design process that affects the

¹ Alexander named them natural cities

² Alexander named them artificial cities

consensual result. Star Leigh & Griesemer (1989) state about what is mentioned above that consensus is not always required in order to successfully complete a cooperative work; thus, they argue that the creation of both new scientific knowledge and of new solutions to the problems faced each time, depends on the communication of the different actors involved and on the understanding of the different problems that emerge from several social situations. Since these potential new findings, whether they are objects or methods have a different meaning for each of the actors involved in the design process, these actors would have to get involved in continuous negotiations, debates, etc. in order for the process to move on. In a similar way and in an attempt to conceptualize participatory design, Ehn (1988) refers to Wittgenstein, an Austrian-British philosopher and to his language-game philosophy. Wittgenstein (1958) suggests that language is inseparable from the everyday actions of life and argues that there are several forms of language (language games), which may be simpler than the entirety of a language itself but are nevertheless interwoven in the everyday activities of life. Ehn argues that while design can be understood as a significant participation “in intertwined language-games of design and use” (Björgvinsson et al., 2012), for example between professional designers and users, design artefacts such as models, mock-ups, etc., can act as ‘boundary objects’ that can bind these different language-games together. Boundary objects are “both adaptable to different viewpoints and robust enough to maintain identity across them” (Star Leigh & Griesemer, 1989). The importance of these boundary objects is also considered in Buchanan’s (1985) ‘Declaration by Design: Rhetoric, Argument, and Demonstration in Design Practice’, where the product of design plays a very important role regarding communication as rhetoric and argument regarding the communication between the designer of a product and its user. According to this argument, Buchanan mentions that “the designer, instead of simply making an object or a thing, is actually creating a persuasive argument that comes to life whenever a user considers or uses a product as a means to some end.” (pp. 8-9).

In the same manner and adding to this argument, Callon (1986) argues that in order to establish scientific authority, scientists recruit ‘allies’ both human and non-human, after which they try to understand their allies’ needs, and finally they connect these needs with their own goals establishing through the allies a mediating structure, of ‘obligatory points of passage’, concerning the different interests of the involved actors. The actions and devices incorporated for the success of the goals mentioned above, namely the translation of the non-scientific concerns into scientific, was named ‘interessement’ (1986). By this, as the etymology of the word ‘inter-esse’ implies, to be in-between, to be interposed, is achieved by the use of mediating devices. These mediating devices in fact relate to what Björgvinsson (2012) also calls ‘material presenters’, that is the representations for the evolving object of design and the means for co-ordinating the different resources associated to the project; Björgvinsson characteristically mentions: “We might also view these “presenters” as boundary objects in participatory design Things” (p. 106), which exemplifies their role as prototypical mechanisms for both the evolution of the design process and the design product.

By considering a design project not only as a series of consecutive stages of design, but mainly as collectives of human and non-human actors (Latour, 2007), we may also consider and focus on several inquiries concerning their possible relations. In that sense, a design project can be considered as a socio-material Thing (Björgvinsson et al., 2012), where several boundary objects are necessary in order to align the different resources that relate to it, such as project briefs, sketches, drawings, buildings, project reports, users, engineers, architects, designers, developers, politicians, administration, researchers, and other stakeholders. But when can a project be considered a prototype, capable enough of being applied in different urban situations?

2.5 PROTOTYPES AS INTERESSEMENTS

Prototyping has always been an integral part of human history; nevertheless the recent differentiation of the functional system of science and art in addition to the differentiation of experts and lay people has led to the obscuring of current forms of prototyping (Guggenheim, 2010). The French anthropologist and ethnologist Lévi-Strauss, used the term ‘bricolage’ and ‘bricoleur’ to refer respectively to the processes of ‘prior’ science and to the person who still “works with his hands and uses devious means compared to those of a craftsman” (1966, p. 11). Nevertheless, by referring to the savage mind Lévi-Strauss actually describes not the thought of primitive people but the primitive foundation of thought, the process that explains the transition from nature to civilization (Scalbert, 2011). What is important to note is that the process of bricolage, regardless of it having a ‘pre-constrained’ set of tools and materials, remains open-

ended due to the fact that what were the ends in previous projects become the means to another end in the next.

As mentioned beforehand, Alexander believes that dwellers and dwelling should be heavily interdependent, which means that methods of making cannot be disconnected from the act of making. This, which is a significant aspect of a bricoleur, is also evident in the case of Habraken who emphasizes through his theoretical work his position that construction should not be seen as an end by itself but as a means to an end, thus giving prominence specifically to the direct and inseparable relation of the end product to the process. Indeed, what both Habraken and Alexander discuss is the loss of an inherent common understanding among the architects, which previously used to enable them to improve and transform the built environment and sustain environmental consistency. Both Alexander and Habraken refer to the role of the prototype from a 'Straussian' and 'Latourian' (2011) perspective, where prototyping can be perceived as an experimental design means that may lead to the production of knowledge -that is not at our disposal yet, not in the sense of a lab's experimental output but as a process of collective participation. The latter is also evident in the way other disciplines appreciate the role of the prototype; indeed the great importance and prominence that prototypes have gained in our time is mainly attributed to the development of free and open source software, whose release of the work-in-progress versions (beta) is a tactic used by software developers who seek for feedback and possible contributions of others for the improvement of their 'beta'. Consequently, emphasizing the cultural importance and social coherence of prototyping, Jiménez (2013) argues that "whereas the open-endedness and haziness of the experimental is oriented towards the production of epistemic things, the work of prototyping employs such openendedness to deliberate political effect" (p. 7), enabling the prototype to work both as an epistemic object and as a critical tool. Additionally, Jiménez (2013) argues that the prototype reflects possibility and expectation, both expressed at the same time as material and social form.

3 A CASE OF OPEN-ENDED APPROACH

In order to test the relation of the prototype to the open-endedness in urban design approaches, a specific urban site has been selected as a case study. The selected case study is the winning project of European 9 competition from a Spanish team for the city of Selb, Germany. The 'Catalogue for Dwelling on the Time' project was selected by the author because it clearly demonstrated a design approach that not only called for collaborative practices but most importantly set those as a prerequisite for the design process and furthermore promoted design concepts that according to the author seek for an open-ended design approach.

3.1 THE URBAN SITUATION

Selb, a small German town¹ in East Germany, took part in European 9 session seeking a radical approach to the problems that it was facing, including demographic decline, aging population, and decrease in industrial activities among others. These problems were primarily due to the crisis in industry that the local economy was based on (Fuente Martínez, Gutiérrez Sánchez, Fidalgo, & Ozaeta, 2008).

3.2 THE PROPOSAL'S RESPONSE: THE CONCEPT OF STRIPS AS INTERESSEMENT

Taking into consideration the aforementioned problems of the city, the managing director of the Building Department of the city of Selb which was also the site's representative in the competition, states² that in a town that is diminishing, it is the most important thing to pay attention to quality and for him entering in an architectural competition was a means to get the best ideas for implementation. He nevertheless, mentions

¹ Selb is a town in Upper Franconia, in north-east Bavaria, standing on the border with the former East Germany and with the Czech Republic. Selb grew through its single industry structure, of porcelain industry, that made it world-famous and led to the rapid growth of its population. This condition started to decline after the crisis in the porcelain industry in the mid-1990s and as a result many people moved away to find jobs in other cities. Today Selb's remaining residents consist mainly of older people.

² In an interview conducted by the author

that Selb's expectations from Europan were limited to a gain of a collection of ideas on their problems but certainly did not expect anything more than that.

Surprisingly for the site's representatives, the incorporation of Selb's participating site under a specific thematic of Europan¹, under which another 10 European cities were also incorporated, and the simultaneous comparative analysis of their problems, aimed at exposing Selb's local problems to a European major matter of concern, that of the cities' need for intensification. Surprise also for the site's representatives was the winning project's concept; according to the designers of the project 'Catalogue for Dwelling on the Time', the user's way of life, dwelling, as well as any everyday mundane situation, can obtain flexibility through small add-ons (programmatic strips) that can reprogram space and add value to what already exists there. Thus, through a typo-programmatical plug in module, they proposed a flexible and feasible means (in terms of scale, budget, etc.) for testing the impact of the addition to the existing situation in the near future. More specifically, the proposal opposed the creation of a definite masterplan to be imposed on the area by suggesting a system of interconnected strips, which can be arranged in different ways and still be part of the larger system (e.g., city). Further to its application regarding flexibility in space and time, this generative system was also meant to become a powerful tool to initiate debates across the different stakeholders since it could easily represent in a tangible way -kind of a 'game'- the different possibilities that can be generated. The latter, in conjunction with the ease of rearranging the set of strips that will be needed for each intervention, preserves the morphological identity of the whole city and at the same time provides users and stakeholders with a design tool that can be flexible in time, supporting 'design after design' as well as other means which can be shaped by collective decisions.

3.2.1 PROVIDING AN INFRASTRUCTURAL LOGIC

According to the architects of the project, the robustness of their plan allowed for maximum flexibility during the implementation stage. Specifically, whilst the competition proposal was dealing with the negative demographic trends of a shrinking city focusing on elderly people (healing acupuncture therapy), the implemented strategy focused on the lower part of the demographic pyramid namely children and young people (preventing acupuncture therapy). The architects of the project claim that this change was easily adapted in their proposal which exhibits the flexibility of the architects' design approach to switch from a reactive to a proactive strategy by integrating the emergent. Furthermore, the architects add that even though their tool of strips was originally destined for a residential addition, it was easily adapted to the emergent needs of a new program focused on youth (youth hostel and kindergarten). A member of the competition's jury (Metz) argues that the project acted as an intelligent mechanism that proposed a process instead of an object that could be easily applied and adapted, with slight adjustments, to other similar situations.

3.2.2 ESTABLISHING A COMMON LANGUAGE AMONG DIFFERENT ACTORS

Additionally, their system of strips not only could adapt to different architectural programs, but it could also be flexible enough to integrate several actors in the design process. The architects of 'Catalogue for Dwelling on the Time' argue, what is also confirmed by other actors involved in the implementation stage, that their idea of the strip system, turned into a really powerful tool in terms of communication among different cultures or languages because it served as a technical, structural and even topological language among people. The concept was flexible enough to also involve users in the design process; the city Architect of Selb clarifies that user participation would not be possible in earlier stages of the project (e.g., brief), giving emphasis to the role of the submitted project as argument in a negotiating process. Indeed, the concept of strips, which acted as an ally for the development of the project, has been the most important asset of the 'Catalogue for Dwelling on the Time' project; the fact that this system was clear and simple to follow and construct had a major effect on the project's appropriation and implementation.

¹ 'Local Mutations – Intensifying'

3.2.3 PROPOSING LEVELS OF RESPONSIBILITY & APPLICABILITY

The flexibility of the project 'Catalogue for Dwelling on the Time' that was organized on the idea of the strips, was also based very much on the ability of the project's parametricism; the strips were codified in accordance to parameters such as space, section, use, colors, materials etc. Specifically, the architects stress that the significance of their project was that they developed a parametric system that could work on a very small scale as an acupunctural tactic (e.g. additional private space, shared spaces & facilities etc.), as well as on a larger scale of a master planning (e.g., connections between public & private spaces, continuous facades on the public street etc.) without making any compromise on its initial concept. The latter reveals that even though the concept of the strips focuses primarily on the local problems of the city and particularly on the small scale of the city's block, the project did not only suggest a specific solution applicable to the given problems of Selb. In fact, the project can adapt to several levels of intervention and assign different responsibilities to the actors involved in urban design.

3.3 THE HUMAN INTERESSEMENTS

The 'Catalogue for Dwelling on the Time' uses the concept of strips as an interessement to connect the different actors involved in the project. Nevertheless, it is also a project that owes its realization to the actions of specific human actors as well.

- i. the local administration body & the political decision makers - More specifically, a jury member (Metz) states¹ that for the city of Selb one of the main factors of success was the involvement of the city Architect in the project and the fact that 'SelbWERK' the local housing company carried out the work of a planning office. The architects also highlight the catalytic role of the city Architect for the implementation of their project. Indeed, the city Architect of Selb (Resch) was so much convinced about the potentials of the project's concept that became himself an interessement between the winning project and the political decision makers. He (Resch) points out an important matter that is the political interests often create an unstable environment for the projects' development and therefore it is sometimes necessary to convince more than one government for the merits of a project. Specifically, he refers to the way of communicating the project's financial matters to the stakeholders who are active in the political arena or have a strong connection with political decisions. Indeed, the city Architect's (Resch) tactic to use the article in the Spanish journal AV Arquitectura as a non-human 'ally' helped him to initiate the implementation process; not only did the journal act as an ally for the implementation of the project but also all later publications acted in the same manner. In fact, more than 34 national and international publications in books, journals and architectural magazines and more than 18 articles in local press, mentioning the 'Catalogue for Dwelling on the Time' project, were retrieved for the scope of this study.
- ii. the Governmental bodies - Another significant actor was the governmental agents that played an important role by offering essential support to the project. Usually, these kinds of agents are responsible for providing subsidies that may prove crucial for the implementation of the project. However, in Selb's case it appears that the governmental bodies did not only offer financial support but were also actively involved from the beginning in the project's process. Indeed, the governmental representatives participated in European forums, juries and other European session processes. The architects not only confirm the presence of the governmental bodies during the competition's processes but also highlight that they worked together with them as a team.
- iii. the architects - Finally, an important catalyst responsible for the implementation of the project was the architects themselves. One of the winning project's architects (Fidalgo) states² their team's role as mediators of the negotiation process for their open-ended project in Selb. Another one of the architects (De la Fuente) also argues that the team was able to create a hybrid situation between the eagerness to implement their 'not yet tested' ideas and the experience of their local partners. Moreover, both architects comment on their success in blending the more improvised approach of a southern culture (Spain) and the more standardized approach of a northern culture (Germany). Specifically, the workshop which is organized by the cities after the announcement of the competition's results acted as an interessement for the architects, since it

¹ In an interview conducted by the author

² In an interview conducted by the author

support them in a negotiated process among themselves, the city and even the users of the place.

4 CONCLUSIONS

Returning to the processual property of open-ended approaches, a first important finding that comes out of this paper is that in order for the actors involved in a design process to develop or maintain relations towards an open-ended process, they need mediating devices, which are used both as representations for the evolving object of design and as means for aligning the different resources of a project; these mediating devices are defined as 'intersements' (Callon, 1986), 'boundary objects' (Star Leigh & Griesemer, 1989), or 'material presenters' (Björgvinsson et al., 2012). Indeed, the project 'Catalogue for Dwelling on the Time' provided a tool that both in a processual manner and in terms of its representational techniques leaves space for personal interpretations in a way that could easily be adopted and appropriated by different stakeholders that do not necessarily come from the architectural and construction domain. An interrelated second finding is that a mediating device that supports open-ended processes can be considered as 'prototype' and can consequently support the process of 'prototyping'. Actually, the project 'Catalogue for Dwelling on the Time' can be considered as prototype because it succeeded in producing knowledge that was not yet at our disposal and managed to work both as an epistemic object, on which knowledge collectively and methodically builds and as a critical tool, by which innovation occurs in the design process. In fact, the project managed to constitute a prototype for a number of different reasons; firstly it succeeded in gaining the trust of the city of Selb and in convincing the involved stakeholders that it was worth their support, regardless of the many difficulties¹. Secondly, for its applicability on a wide range of urban situations, different programmatic needs or scales and this can be seen on several instances in the city (e.g., kindergarten, youth hostel). Thirdly, for its cognitive outcomes by opening up the established way of planning the city and furthermore for educating the inhabitants on the built environment, as the specific project proposes a design process as well as a way of life that are quite different from what the large developments and the market currently offer. Finally, it became an important case model for the European competition whose successful implementation and 'good practice' has been presented through several international publications and awards. On these grounds, it is revealed that the concept of the strips' system entails a prototype for an open-ended design approach, flexible enough to adopt or integrate the idea of the emergent as a creative element of the design approach.

ID 1721 | GLOBAL SOUTH PLANNING: FROM WAR TO WARS

Frederico Canuto¹

¹Federal University of Minas Gerais
fredcanuto@gmail.com

1 INTRODUCTION

Not because of the various number of armed conflicts that are happening in Brazil related to land distribution, indigenous rights, social justice or many others issues, nor because European refugees, financial and democratic crisis nor because USA intervention on Middle East and north american racial struggles that created the Black Lives Matters Movement nor because another similar issues in countries around the world, nor even because protests in city streets in Cairo, Athens, Madrid, etc since 2008 financial crisis; war is the politics that became the paradigm of internal and external relations by nation states around the globe because war is a *modus operandi* that always has been used as a politic since the beginning of the foundations of these very own nations and states. Disguised and/or underestimated by media and even theoretical and political thought as just “conflicts”, what is visible is that a war keeps continuing as the exercise of politics. And when this concept of war and politics is thought in an urban planning context, it serves to maintain the political dimension of everyday life impenetrable to disruptive and constitutional forces.

But if war is thought not as a colonization force as it is considered in history produced inside Europe and from Europe to the rest of the world, the perspective changes and the idea of war and how it can be a disruptive force to the creation of life arises. In a Global South context characterized by the emergence of others forms of experience the world, narrate the world and produce even new worlds like

Brazilian anthropologist Eduardo Viveiros de Castro discusses when asked about the relationship between nature and culture, a decolonizing energy surges and open imaginaries regarding war as a positive and immanent force of life. Understanding the conflicts, collectives and multitudes forces through the prism of war and disputed space in 2008-2016 conflicts, occupations and manifestations in Middle East, Spain and specially in Brazil, and relating it to historical urban uprisings, modes of organization in a economical and political sphere and aesthetical affects, a war engaged and capable of create new forms of urban planning, one between top-bottom and bottom-up perspectives, surges. In this paper, after a discussion on how western thought thinks war as a political paradigm, it will be presented how the french anthropologist Pierre Clastres interpretations of conflict and wars in Amerindian societies will be used to open that perspective about war as a vital force to renew and create new people, producing new spatialities and a specific manner to think and act, serving as basis to an urban planning interest in produce difference and multiply worlds.

2 WAR AND POLITICS: CONTEXTS

In political studies, the theme of war gained central place on discussion since at the seventies the French philosopher Michel Foucault brought back the axiom of General Carl Von Clausewitz made in XIXth century and put it in the political arena: the war is the continuation of politics by others means (CLAUSEWITZ, 2014).

If Clausewitz discuss the relationship between war and politics in a rapid manner in his work *On War*, it is not coincidence. For him war is another state of things, opposed to Politics. It has consequences on politics but it is not related to it in an intense and imbricated manner. War in the Nineteenth century was not a political force, but an option that wipe out politics. In a century where new lands are not just discovered but colonized as well, and Nation States were created by unification disregarding race or ethnics questions, war is an instrument of conquer and pacification to install politics, inside and outside, transforming everything in inside.

Foucault brought the theme of War back due its relation to another key concept in his discourse that is Power. To the French philosopher, it is the inverse: Politics is the continuation of war by others means. And when he said that, it is not metaphor or a connection that has no ties. Continuation because thenationalists wars – 1st and 2nd world war among other colonizing ones – unfold themselves into bureaucracy and institutionalization. So, politics is the continuation of war because war is reshaped and reintroduced into State as politics. Power is exercised by the state as politics and war in a complex and intricate manner.

Two courses given in College de France transformed into books – *Society must be defended* (1997) and *Security, Territory and Population* (2007) – affirms the intense relation between Power, Force and Rationality. War is appropriated by the State and transformed into politics by rationality (biopower), by management of risks, by the introduction of population as a key concept to understand the masses and territory.

From the politics of silence – biopower and disciplinary power – to the politics of noise – using police as an instrument of coercion – what Foucault realized was the state transform the sensibility employed in war in a disorganized, violent, caotic and, specially, visible manner, producing traumas and psychological traces of anxiety into a rationalized machine of indifference and boredom.

It is not new such assertions by Foucault if we look back to Kracauer, Benjamin or many other writings regarding the relationship between the city and the sensitivity produced in its dwellers. But what is new it is Foucault desire to expose from the state point of view how the war is produced and how the state created its own form of politics from war. Moreover, what the French philosopher presents to political and social studies is an intelligibility scheme of how state politics is exercised in an everyday life but according to a war agenda.

If war is a key concept to understand the colonization of bodies and the formation of state apparatus, such concept is used in countries and cities all over the world. It is not a political frame that was used only in colonization periods or in a certain time, but that is continued used creating centers and an hegemonical thread in all urbanized territory.

Anderson (2006) in his 1983 book *Imagined Communities*, when analyzing how European countries during colonization of countries in South Asia implanted the idea of nationality, despite read or not Foucault, impressively used a very similar foucaultian approach to understand how war became politics. In order to conquer territories (to absorb them and create one nation), destroy singularities (or the adversary, transforming it into national diversity) and erase a prior history – all main objectives of any war – the english author analyse how three mechanisms created a basis for political institutions on Modernity and colonization of these territories as well. A basis that builds up new images of itself, a colonized itself. Using the MAPS, the MUSEUM and CENSUS as state mechanisms of produced a nation, what Anderson showed is how it is formed images of a nation and its border, its history, its people. And that images and imaginaries constructed in that period were destroyed in a very minimum scale and reorganized in a very and disproportional large scale beginning in 2008.

Despite Anderson use such apparatus to discuss colonization methods in colonizing times, it is sure that this same frame is used inside central countries. It is not a question of which country was colonized by another one, but a political geography that creates centers and peripheries inside and outside itself.

3 2008-2016

The relation between politics and war gains visibility and is brought back to the central discussion after the end of Cold War in the new century after a peace period.

After 1989, all urban and not urban conflicts (a softer word to describe a War) disappeared of the News. Such peace is celebrated as the end of conflicts but it is the end of politics as well, since Socialism lost as an alternative to Capitalism. All questions and wars caused by ethnic differences, or due ideological colonization or pure colonization are indifferent to the occidental peace of mind, and specially to the Liberal Agenda that takes over. Rather than peace, it was and it has been a repression state, like Foucault argues about the Disciplinary Power in Modernity. But since 2000 with the emergence of a new cycle of global struggles against globalization initiating in Seattle, such war gained another dimension. And the disruptive power liberated since 2008 with the financial crisis and its diverse and at the same time, similar, consequences to nations, people and the idea of state. It is not like before such struggle cycles never existed. They did in almost every country. What is different is that it has never been so worldly connected, exposing similarities.

Since 2008, in Spain, Egypt, Brazil and other countries and cities around the world, the paradigm of Capitalism as the only logical possibility of live since socialism fail is redimensioned. Protests in city streets put in discussion not only economical and financial management of 2008 crisis, but the western democratic modern political system and a mode of social life. Protests against dictatorship in Egypt, against austerity management in Spain and Greece, against democratic representation in all cities gained visibility in social networks and then, in streets, live. The unifying MAPS of a united world based in the idea of humanity where destroyed by dissensus and the remembrance of what French-argelian philosopher Jacques Derrida stated as the not-human. The MUSEUM that points out history always as a movement ahead like an arrow, promising development and growth to all, curved that same arrow to affirms the history as repetition. The pretentious indifference among individuals certified in CENSUS were erased by the diversity of people that went to the streets, putting in check identities and old forms of understand population, masses and specially the people.

In Brazil, such protests were impulsionated by the realization of Confederation Cup in 2013 in a time when a new progressist economical cycle that started in 2003 and continued until 2013 by Lula and Dilma presidency collapsed. Violent collisions between multitudinary forces and police due 20 cents regarding bus transportation ticket transformed into a questioning about democracy, corruption and other themes regarding a new image of what is Brazil, putting in question the Brazil and its unity into discussion. During the month of June of 2013, initially the streets of Brazil biggest city, São Paulo were invaded by people mobilized by Social Movements like MPL (Movimento Passe Livre) in order to reclaim the cancellation of the 20 cents raise of tickets transportation. With the negative response by the mayor and government of the city and state, the pressure on streets just raised and became a movement not just related to ticket transportation. People from others places of the city gather around, first, due the tickets issues, and then others agendas like corruption, environment, economical discontent and many others.

From this first multitudinal invasion of public space in June, another big and medium cities like Campinas, Belo Horizonte and Rio de Janeiro, for example, had their streets occupied too. Using cardboard with phrases regarding a serious question related to political issues, people invaded representative spaces like Belo Horizonte Town Hall, occupied streets near houses of mayor, like in Rio de Janeiro. And beyond June, four months later, garbage collectors of Rio de Janeiro went on a strike, against the mayor and syndicate advices and threats (MARICATO et al, 2013).

But more than the occupation itself, what was inaugurated by these social movements not just on Brazil but around the globe is the opening and remembrance of new ways of doing politics.

4 POLITICS AND POLITICAL = MOVEMENT AND POSITION: MOUFFE AND GRAMSCI TO LEFEBVRE

The Belgian political scientist Chantal Mouffe makes a distinction between politics and political that is very necessary for the present argument. To her, politics "(...) would be characterized by a set of practices and discourses that seek, on an institutional level, to establish a certain order and organize human coexistence (MOUFFE 2005)". This means that politics tends to maintain a certain consensus produced in a contingency context by the state. Politics is a constituent exercise. Politics is an exercise performed by representatives in spaces of representation like congresses, presidents, law makers and others. The political is not related with representations, but with direct action. The political emerges to put in discussion such representations and their limits through appropriation and use directly in space. The democratic paradox is that politics and political are not contradictory terms, in which one (politics) excludes another (political), but paradoxical because they are exercised together and the relationship between protests on streets and the necessity of occupy by agreements and arrangements prove that.

The potential constituent power of the political is the desire to be a new kind of politics: the power capable to produce a context in which arrangements and agreements are made in order to establish a (re)newed hegemony based in less representation and more direct action. The power to not only dismantle or deconstruct models and forms of state organization, but to create new social, political, cultural and economical forms of produce collectivities and to discuss dissent. Dissent here is the key word: democracy as an exercise of many others.

The French philosopher Jacques Rancière already discussed the question of dissent in terms very similar to Mouffe (1996), but in his book dedicated to democracy entitled *Hatred of Democracy* (2006) he discusses the model of democracy created in Greek society. The etymology of the word democracy is "government – cracy" of the "demon – people". So, democracy was born by the desire of give freedom to the people and not to the elected by the people. The election is a lottery process which anyone can be chosen to be elected. That kind of voting mechanism had the objective to keep politics an activity performed by nonprofessionals, which it guaranteed that the elected would do what people command and not what they think is the best. The power is not in the representation but in the people that elect such representation. Despite nowadays in which congress men have their own agenda, these representation in Greek terms according to Rancière means that their agenda should be formed in assemblies and encounters with the people who vote.

Despite this lottery methodology, what is at stake in democracy is the possibility of the people rule the society through public assemblies and encounters. It is a democracy that is based in a very short institutional distance between the people and their representative and the fact that the very own democratic exercise is made not just by representation, but by direct action either.

Antonio Gramsci, Italian political scientist makes an interesting approach between war and politics/ political using the concepts of war of movement and war of position. Using the context of political struggles in Russia pre-1917 and post-1917 revolution, Gramsci tries to explain such revolution using these two concepts. The revolution, the struggle with firearms, the civil war he called war of movement (LIGUORI, VOZA, 2017). So, this is the exercise of the political: the dispute to act, to have power to act. It is a struggle against old forms of regime and it is characterized by the fact that it is a passage from one mode of production to another. The war of position is another political struggle. If the first is to take state power, the second is once the state power was taken, it is the struggle to create and exercise democratic

forms of build a new democratic state (LIGUORI, VOZA, 2017). Such passage from movement to position is the very own relation between political to politics. They are two phases of the same movement: from the status quo to the protest and then, to the invention of a new manner to produce social relations in the production of space.

The French philosopher Henri Lefebvre in 1973 wrote an underestimated book that is central to understand a passage from politics to political and to politics again: *The Survival of Capitalism*. That book, that preceded *The Production of Space*, is central because it brings to the discussion the relation between the production of space and the political / politics question. According to the author, everyday life is the sphere where politics and the status quo are reinforced and reproduced endlessly. It is that cycle that makes possible to capitalism understood as a political, social, cultural and economical system to reproduce itself. But it is the political – and having in mind that this book was written after May of 1968, where French students went to street to reclaim a more meaningful life and strikes happened all over France, organized by French factory workers – that makes possible to envision new forms of space, new forms of produce social relations of space production (LEFEBVRE, 1976). If the space and its social content are inseparable (LEFEBVRE, 1991), the political puts a war movement inside the very own core of capitalism.

5 STASIS, THE POLITICAL AND A OTHER WAR

Giorgio Agamben – reader of Michel Foucault – in *Stasis. Civil War as a Political Paradigm* discusses the relationship between civil war and citizenship in ancient Greek society. Citizenship is not a sentiment or a legal document that attests nationality. Citizenship is action, it is the individual that discusses and act thinking about the common good of the society, of what is public, instead of keeping at its individual residence.

Citizenship relates to a responsibility regarding the public and the exercise of the Mouffe's political. It is a war of movements. "Not taking part in the civil war amounts to being expelled from the polis and confined to the oikos, to lose citizenship by being reduced to the unpolitical condition of a private person" (AGAMBEN, 2015, 13).

So, to the Italian philosopher, between the family (more of the same, oikos) and the city (the others, polis), what is formed is a movement between politics and political. And that movement of differentiation is the war: "(...) politics as a field of forces (...) civil war marks the threshold through which the unpolitical in politicized and the political is 'economized'" (AGAMBEN, 2015, 17).

When a multitude of people invades the streets declaring war against state and its modus operandi, what is in dispute is the manners of how the state controls, manage, regulates and dominates population. In Brazil in 2013, when people went to the streets demanding the annulment of the 20 cents raise of ticket transportation, they were defying bus companies, transportation secretary BHTRANS, Townhall, democratically elected representatives. They were discussing an entire political, economical and social system. But it is not just a war of movement. There is inside such war a constituent component. However, such war seems to change from one hegemonic context to another.

In an urban planning sphere, such citizenship movements are autonomous cells that produce and discuss their own strategies and tactics regarding urban planning. As SOUZA (2006) states, urban planning is not a exclusive activity of any power, specially the State. Organized groups and social movements that occupy streets or empty buildings, for example, make their own urban planning. Urban planning is not a exclusive activity of the State, although the State has the power to make it in a more complex and broader scope. This means that this others social-spatial actors acts as urban planners, but they are not interested in constitute a central power. They battle for spaces, for representation, for inches in streets but they are not interested in replace the state. So, they are another kind of war.

6 THE AMERINDIAN WAR AND THE MULTITUDE: FRACTALIZATION OF URBAN PLANNING

The French anthropologist Pierre Clastres gives images of what war can produce in terms of life. While he was studying amerindian societies in Latin America, they noticed that the traces of violence repeatedly considered by others anthropologists as a traces of primitivism and savagery were not that at all. Putting into scrutiny anthropological analysis of the violence of these societies, he realized that they were always considered as traces of peoples who are not capable of live together. Even more, the violence were considered as a distinctive trace of a immanent incapacity to be civilized (naturalist discourse), or result of the fight among tribes for the resources in nature (economist discourse), or as a intrinsic part of commercial activities that can not be resolved in a pacific manner (commercial discourse) (CLASTRES, 2011).

Instead of viewing such violence as a trace of anti-social behavior because different from the white man manners, he saw as a trace of a very specific social relationship. He understood that such behavior was not anti-social, but the amerindian societies manner to maintain a sociability. Violence is a sociability mediation between themselves (CLASTRES, 2011).

The war among tribes was a sociological mechanism, according Clastres, to maintain an identity through a differentiation from the others. Indigenous from different places fight in order to differentiate themselves from the other tribes. Violence is a mechanism that prevent one to become the other. Tribes make agreements and alliances that lasts just until it is necessary. They are not made to last because if one tribes gets too close to another, a tendency to fusion has to be denied and it is done by war. Deleuze and Guattari understanding of war machines as a productivity movement of differentiation (2004) came from Clastres perception of Amerindian societies.

If the western war is a war to dominate and eliminate the adversary in order to conquer the other and annulate him as such, the Amerindian war is a sociological mechanism that guarantees difference. It is not interesting to eliminate the other because it is its existence that affirms itself.

When we transfer such diverse rationality to the description of social movements, urban planning, participation and so on, it seems disconnected from western reality. However the protests from 2008 until now are all manifestations against homogenization, against the prevalence of the idea of one nation, one people, one identity. Such protest and the movements created due it are formation and affirmation of new identities – economical, cultural, gender and/or social ones. The Amerindian war is a war against the one in favor of the many, so the protest.

One can say that good practices of urban planning are agreements made among many socio-spatial agents – alliance – regarding an issue and not the disagreement or a war. But what was the positive and disruptive force that came from the protest if not a desire to agree that everybody disagree. On many streets around the globe, there was not a phrase or a word that could resume all the reinvidications made by the people. The words were many, so the people were many.

And after the disruptive force liberated on streets, what followed were alliances among new political forces and social movements together with the hope of many voters: in Spain, municipalist candidatures to cities town hall incredulously won the election; in Greece, Syriza reached the presidency; in Iceland, the people voted against austerity and in favor of a new constitution that limits the market forces (CAVA, BELTRAN, 2015). But others multiplicities arised too: in Brazil, the movements presented in 2013's streets of the big and medium cities transformed into new movements (Free Pass Movement in São Paulo are now in others cities, for example), occupations broke out all over brazilian schools, citizens movements disputing city elections. A whole new panorama never seen in Brazil emerged – to the left and to the right – and are repeating old forms of make politics instead of the political.

7 A PROPOSAL: GLOBAL SOUTH PLANNING

It has been presented here two kinds of war: one that is related to the dispute of the cultural hegemony and other, related to the production of new forms of life endlessly. A Global South Planning that is discussed here is not just a strategy or a tactical manner to absorb minorities and transform them into a new majority. And it is not just the understanding of war processes inside the society as a dispute over the production of

a new or renewed hegemony. It is not a question of dispute the State and its hegemonical power, but to dispute the power to act despite the state, with the State or against the State.

Such Global South urban planning should consider that are other ways of doing politics and exercise power, considering the political as an instance of negotiation and alliances that does not reduce multitude to the will of occupy the State. It does not mean the occupy the State is not an objective: it is. But occupy it should not mean just to replace one group for another. The question is how to occupy the State and organize it in such a manner in which others forms of democracy can appear not as adversaries, but as other kinds of Urban Planning. It means reduce the power of the State in order to give it to the people. It is to occupy the State not to make it into a liberal one, but reinforce it by making it more anarchic. It is necessary to give force to the State in order to be repassed to people.

So, the theme of war, when discussed not as an extent of politics as Foucault read it, but of political, opens possibilities of emergence of new strategies of planning and manage social spaces.

ID 1738 | PLANNING THEORY, A 'DECONSTRUCTIONIST-TURN': ARE WE THERE YET?

Mona Abdelwahab^{1,2}

¹Arab Academy for Science and Technology - Cairo Branch, Egypt; ²Newcastle University
mona.abdelwahab@ncl.ac.uk

1 INTRODUCTION

Deconstruction' is the attractive Derridean project, which he describes as 'the opening of the future itself...'. Deconstruction destabilizes inherited concepts and traditions, towards '...what remains to be thought ...[that]... cannot be thought within the present'. Interestingly, it has established an 'awkward' interaction with the city design and planning through architecture theory and practice. It has simultaneously flirted with planning theory in reflection to the institution: 'dark side' of practice and the design-process: the planning model (see Allmendinger and Gunder 2005). However, it remained on the periphery of the developed debate.

But, like the question raised in architecture, 'what is there to deconstruct in Planning?'

Deconstruction is not a method, a critique, an analysis or a reading; there are no steps, rules or criteria to be applied to a content: theory, practice, institution etc. It essentially works from inside the content; totally dependent on the nature of this content (planning theory), author/ reader (involved actors, planner, citizen, government etc.), and contextual reality embedded in time. Deconstruction thus literally, turn things –a theory, interpretation, an object–, upside-down or the other way around by searching for a conflict in representation. They identify the structure, the inconsistencies, and the weak and missing points within the content. The content is exposed and deconstructed from inside; i.e. deconstruction hold the potential to allow planning theory deconstruct itself, to destabilize the inherited frameworks and opens the way to new interpretations and traditions.

Are we there yet?

The planning debate is literally going through a turnabout with an unidentified exist. The debate involves the disciplinary knowledge: the role of space/place, geographies and social construction; the design-process/ product: the liberal/ agonistic becoming of the city and involved citizens/ consumers; and the institution of public/ private space and the relational power within. It simultaneously, questions the city author/ reader, the role of the planner, the citizen, the institution. Furthermore, the debate is co-dependent on contextual temporality.

This paper thus explores the development of the planning model drawing on deconstruction strategies. It particularly questions the role of the city author/ reader: planner, citizen and government. This reading aims to destabilize the previous established debate, as a primary step towards a new exist.

2 DECONSTRUCTION

'Deconstruction ... In French, it has both a grammatical and mechanical meaning. It means both to disarrange the construction of words in a sentence and to disassemble a machine and transport it elsewhere. It also, forms a reflexive verb [se deconstuire] meaning to lose one's own construction' (McQuillan, 2001:1)

The reading strategies of deconstruction in this paper are based on the 'five strategies' introduced by McQuillan's (2001) in 'deconstruction: a reader'. Firstly, deconstruction is not a method, or a set of rules, applied to interpretation (Lucy, 2004). These reading strategies essentially work from inside the text content. Secondly, deconstruction is totally dependent on the nature of this content. It is also, dependent on the author/ reader as they acknowledge the multiplicities of meaning and truth. Thirdly, this dependence on the content represents a trace of contextual reality and history of both content and context. The fourth strategy, deconstruction of binary oppositions, is referred to by many authors as the stages of deconstruction in general, see (Alvesson & Skoldberg, 2000; Collins et al., 2005). Binary opposition

divides 'conceptual material' into a pair of binary terms, e.g. west/ east, masculine/ feminine. These binary pairs are dependent on each other for meaning through 'difference': a fixed 'either/ or' relation (Collins et al., 2005; McQuillan, 2001). However, these binary pairs are not opposites in reality; they are not equal; the first term is usually 'privileged', which is traditionally associated with masculinity (McQuillan, 2001). The deconstruction of this binary thus involves two steps; reversing the binary and displacing the binary oppositions so as not to 'involve binary logic at all' through 'this thing called *différance*' (McQuillan, 2001:13, 19). *Différance* displaces the stable either/ or relation with the dynamic oscillation between neither/ nor and both/ and relations. Accordingly, it deconstructs this hierarchy through the simultaneous presence of two conflicting ideas, thus destabilising the notion of 'fixed' meaning and creating potential for alternative interpretations (Alvesson & Skoldberg, 2000). The fifth strategy embraces the margin, which denies the proposed representation and brings the marginal to be the centre. Deconstruction is thus interested in the marginalised set of binary oppositions, which is called the cornerstone. The cornerstone is considered the first stone, which is not at the centre and upon which the whole structure of a representation is built. However, it is defective and that makes it unstable. The reader's task is thus to find the cornerstone which will readily deconstruct the structure of the proposed representation (McQuillan, 2001). At the same time, the subversion of the hierarchy between centre and margin blurs the peripheries of the content. The centre escapes the boundaries and is thus located both inside and outside the content, which further destabilises the established representations (Derrida, 2001 [1978]; McQuillan, 2001:20).

In summary, deconstruction reading strategies literally, turn things –a theory, interpretation, an object–, upside-down or the other way around by searching for a conflict in representation. They identify the structure, the inconsistencies, and the weak and missing points within the content. The content is exposed

and deconstructed from inside. A visual metaphor of deconstruction using a flipping coin is presented in Figure 1. A coin has two faces a head and a tail. The head usually carries an image, a national representation e.g. the queen's head and the tail carries the coin value e.g. £1. In this figure, a coin with head up is turned over, so the tail is face-up. Simultaneously, head and tail are displaced in a search for a conflict and potential new representation of a coin (Abdelwahab, 2013)

Figure 1 The coin as a metaphor for deconstruction

Subsequently, by reflecting on the deconstruction strategies as a reading event, a number of themes can be identified, which are working in the background of these strategies and which help to relate them together. These themes are represented in three sets.

The first set constitutes:

- A rejection of a transcendental truth which exists outside the discourse
- Reading the discourse as a reality, a representation of reality, and beyond this reality
- A rejection of the obvious or the expected reading (the traditional) which denies the potential differential reading, the unexpected
- Deconstruction is already inscribed inside the discourse
- Deconstruction is ascribed to 'the experience of the impossible'; the impossible is that which opposes the expected potential, rather than the possible. Deconstruction is impossible in a sense; it is yet to happen unexpectedly, differing from the tradition.

The second set considers the (construction) of the discourse:

- The discourse is inscribed in the context, and vice versa through the concept of 'trace', every term holds a trace of the reality, its representation and what is beyond
- The discourse is constructed through sets of binary oppositions,
- Centre/ margin of the discourse which highlights the centre and excludes the margin
- Binary representations are included in the discourse

- The discourse revolves around centre/ margin; while metaphysics considers the centre and its de-centring; deconstruction is more interested in the margin
- Binary opposition representations follow the discourse, reality, representation and beyond reality; metaphysics is concerned with the representation of the reality, 'facts of life'; deconstruction is concerned with binary opposition which metaphysics missed, beyond the reality representation and which is disguised through binary opposition

The third set considers the deconstruction of the discourse, embracing the margin, the cornerstone, différance and the trace:

- The centre/ margin hierarchy is deconstructed
- The centre is displaced through the supplement; it escapes the discourse and simultaneously is inscribed inside the discourse to demonstrate the impossibility of its construction
- The margin is displaced through the cornerstone; the defective stone on the margin of the discourse which is responsible for the construction and deconstruction of the discourse
- Deconstructing the discourse binary oppositions through différance and trace
- Différance promotes ambiguity over the well-defined; it implies a continuous change of the binary terms through time and space; once you define a term it changes;
- The trace blurs the boundaries between the binary opposition sets; each a term holds a trace of the other, as well as all the other terms it is not (Abdelwahab, 2010, forthcoming).

...My deconstruction can only happen once because it is unique to the singular moment of affirmation, which is the event of my reading...So, my reading (or deconstruction) is nothing more than a matter of placing myself within the operation of the text and being part of that operation (the text's own self-deconstruction) for the singular duration of my reading (McQuillan, 2001:26-7).

3 MODE(S) OF PLANNING

'Derrida (1981, 1997) reminds us that one trouble with Western thought is its propensity to privilege one side of a binary opposition, when in effect most things are not absolutely black or white, but somewhere in between an 'undecidable' grey' (Allmendinger and Gunder 2005, p.88)

The reading of the different modes of planning in this paper draws on Walter Schonwandt's book (2008), 'Planning in Crisis? Theoretical Orientations for Architecture and Planning'. I am particularly interested in the concept of 'constructs' introduced in his book that addresses the gap between theory and practice in planning. 'Constructs' thus represents a third term in between the binary 'theory/ practice'. The latter thus dominated the debate on planning as a widely-accepted representation of an inherited conflict. However, the concept of 'constructs' involves another binary beyond the representation of 'theory/ practice'. Schonwandt (2008, p.x) introduces two constructs, 'constructs Of planning' and 'constructs In planning'. The first informs us 'of' 'concepts, propositions, contexts, conceptual coredescriptions' of planning; whereas the latter informs and directs the process in planning. Constructs are thus 'bearers of our knowledge', 'the conceptual core' of planning that simultaneously 'guide our actions in planning'. Accordingly, the binary 'theory/ practice' in planning is displaced through the concept of 'constructs' of/ in planning. It is worth noting that he rejected the idea of 'ready-made constructs' to be applied to planning, these constructs are rather dependent on the planning context. He thus continues to identify the various aspects of planning through the concept of 'constructs' as: the role of the planner; the public interest – citizen; politicians – governance; power and resources distribution; knowledge and content; and lastly the planning process or procedure for action.

In this instance, the 'obvious representation' of planning through the binary theory/ practice is rejected in favour of the 'other' representation, constructs of/ in planning. Deconstruction is thus questions the new binary, is this binary a cornerstone on the margin that opens-up the planning debate for deconstruction, or is it simply another binary representation at the centre.

'The rational model of planning is the source and inspiration for most of the other models, which are either a modification of the rational model or a reaction to (or against)'
(Schonwandt, 2008, p.3)

Furthermore, Schonwandt (2008) introduced seven modes of planning: the rational, the advocacy, neo-marxist, equity, social learning and communicative action, the radical, and the liberalistic model of planning. He thus emphasises the dependency between these models and the rationalist model. This helps to raise the question, is the rationalist model the logo-centre of the planning debate? '...logo-centrism constructs or centres, sense and meaning, around the identity of these terms [binary oppositions] while disguising un-resolvable tension between them' (McQuillan, 2001, p.12). Accordingly, these models represent a series of binary oppositions; where in each the rational model is the privileged term: rational/ advocate; rational/ radical and so on. Significantly, the planning debate has reflected this interest in the rationalist model as a privileged term, for example see (Kunzmann 2014, Mantysalo 2014, Albrechts and Balducci 2014, and Abdelwahab and Serag, 2017).

At the same time, deconstruction is totally dependent on the nature of this content, author/ reader, and context. This dependency thus acknowledges the multiplicities of meaning and truth in this content. Consequently, our argument – deconstruction reading – works from within planning, the rational model logo-centrism, content, author/ reader and context (Abdelwahab and Serag 2017). Significantly, this interest in the 'rational model' reflects an inherited 'tension' between the various involved actors in planning: planner, citizen, and government, involving power relations and resources limitations. We shall thus explore the development of the role of these actors as authors/ readers in planning.

Whose vision is created remains a basic question to be asked?'
(Albrechts and Balducci, 2014: 18, 21).

To start with, in the 'rational planner' is the '... the expert who relies on the objectivity of 'professional expertise' to do what is in the Public's best interest' (Schonwandt, 2008, p.5). They worked directly with the government, and were expected to 'hold' the power to implement their 'rational' designs. Although, they worked on behalf of the citizen; the citizen was 'marginalised' from the planning process. Accordingly, we can recognise the first binary that considered the planners' affiliation towards government/ citizen, and the government is the privileged term. The 'advocate planner' thus turned this affiliation binary upside-down. The planners work for the citizen, offering their expertise, to support the citizen's needs, particularly the 'disadvantaged' groups who lack 'power'. Furthermore, the advocate creates a conflict in the presence of the planning affiliation to the government. The advocate planner works within the government; however, they escape this boundary, and operate from outside to reach out to the citizen. At the same, the planning debate recognised the heterogeneity of groups of interests, 'social, ethical', and so on.

Significantly, the neo-Marxist planner lost their power to become 'a handmaiden' of the government. The planners held a rather 'ambiguous' role as 'mediators' between the different groups of interests. The government/ citizen binary is thus displaced through the government/ planner binary. The 'equity planner' thus re-instated themselves inside the government, to work with 'like-minded' personnel, to approach the 'disadvantaged' groups. The government/ planner's binary was further reinforced through the radical model. Not only the planner stepped outside the government presence, they joined the 'other' side, the citizen groups. The planner thus lost their 'power' of expertise, and re-instated the government/ citizen binary, '... a particular us, who are not them' (Verran, 2001, p.38). The planner's loss of power was further emphasised in the liberal model; 'the use of resources in the service of planning is thus seen as a necessary evil, to be avoided whenever is possible' (Schonwandt, 2008, p.17). Simultaneously, it became evident that the different citizen groups, particularly the 'disadvantaged' lacked 'power' rather than expertise. The planner's role no longer involved the protection of these 'disadvantaged' social or physical settings, but rather the protection of the citizen's 'freedom of action' as well as 'undesirable consequences produced'. In summary, the liberalistic model thus supported two binaries: citizen/ government, and citizen/ planner. Later, Schonwandt (2008) highlighted three main theories in planning today: the communicative/ collaborative, the post-modern and the post-structuralist. The difference between these three theories and the seven models of planning is a significant transformation in the content and knowledge from the technical and positivist rational model to the post-structuralist, post-positivist theories today. It is worth noting the recurrence of the communicative-turn in both classification, which is simultaneously 'a model of communicative rationality' in place of the 'rational model' in planning. This raises another question about the displacement of the logo-centre of the planning debate as the communicative-turn.

This brings about the post-positivist planning the shift towards ‘...co-productive form of governance’ (Albrechts and Balducci, 2014:22). Co-productive governance recognises ‘power struggles and missed opportunities’ in the previous models (Van den Broeck et al. 2013: 326); and thus, both involves and empowers the citizen in the process; it basically constitutes the citizen, government, and the power-relations between them. However, co-productive governance doesn’t transfer the government power to the citizen. Power is recognised as a relational value that shapes the institutional practices and processes, and is simultaneously shaped by the perception of the citizen’s role in the institution. Furthermore, the citizen is not identified an independent point in the city, they are being constructed in space and time; ‘...certain bodies, certain gestures, certain discourses and certain desires [in the city] come to be constituted as ... [citizens]’ (Foucault, 1980: 98). And the government is not a ‘political institution’ but the processes and practices – the relations – to the citizen; how the institution perceives and instantaneously shapes the governed, citizen and city (Townley, 1993).

The preliminary binary citizen/ government is thus, displaced by citizen-government relations (involved actors); and two binaries are introduced actor/ content, and actor/ context. The boundaries of these binaries are instantly blurred through the concept of the trace that recognises the inscription of each term in all others, as discussed in the previous section. Simultaneously, it recognises ‘... the fragmentation and multiplicities of the actors’. (Albrechts and Balducci, 2014:17).

4 DECONSTRUCTION IS ALREADY THERE? ARE WE?

‘The very condition of a deconstruction may be at work, within the system to be deconstructed; it may be already located there, already at work, not at the centre but in an excentre, in a corner whose eccentricity assures the solid concentration of the system, participating in the construction of what at the same time threatens to deconstruct’ (Derrida and De Man, 1989:73)

Deconstruction, is not a defined framework of analysis or interpretation to be applied to a text, theory, any content. Simultaneously, is already at work in the text, not in its centre but on the margin; i.e. deconstruction is already there in ‘planning’ theory and/ or practice, working on the margin, deconstructing the content, its inherited ‘ideas and practices and its traditions of debate’ (Healey, 1997, p.7). Our task, as deconstructionist reader, is thus to ‘trace’ the work of deconstruction in the content of planning. In this paper, we have reflected on a few instances of deconstruction at work, through the binaries of government/ citizen, government/ planner, planner/ citizen, and so on. Simultaneously, we traced a few ‘displacements’ in the discourse of the planning. However, this is yet an early stage-exploration that opens-up the way to further explore deconstruction and planning. It would be of a highly-added value to explore the development of the various planning aspects, approach their deconstruction reading. This should thus be complemented by a deconstruction reading of planning theory that recognised the displacement of the rational model through the communicative-turn.

I would wholeheartedly embrace Wigely’s (1989) conviction that not only architecture is intrinsically influenced by deconstruction, but also deconstruction, and resonate in planning.

‘Consequently, deconstruction does not simple survive architecture [planning]’ (Wigely, 1989)

T02 | PLANNING EDUCATION: BUILDING UP SPACES OF DIALOGUE FOR PLACES OF DIGNITY

CO-CHAIRS: KRISTINA NILLSON; ANDREA FRANK; ARTUR ROSA PIRES

The recent years of economic decline and uncertainty, and growing migrant and refugee streams are leaving their mark in today's society. Municipalities and public service provision are afflicted by government imposed austerity measures. Moreover, the often unexpected influx of considerable numbers of new inhabitants (migrants/refugees) in many European cities creates growing conflicts in land use planning, discontent of existing residents and often increased social segregation. Effects are touching both rural villages and sprawling metropolitan agglomerations alike and are becoming visible in many respects. The task of planning in such circumstances is extremely challenging. With scarce resources, political pressures and often limited time for decision-making and solution development, how can and should planners for example steer the creation of or protect truly public, safe open spaces with high quality amenities for all, and accessible and affordable housing? New strategies, practices and approaches will need to be explored and developed, and planning educators will have to prepare students for working in a dynamic, contested, and uncertain environment where actions need to be negotiated amongst affected stakeholder groups and their interests. How are educators integrating issues of space, dialogue and self-respect, pride, and respect into their teaching? Planning need to be able to develop innovative and locally responsive (economic) development strategies without however, losing sight of issues and opportunities provided by global societal challenges (healthy food, climate and environmental challenges, etc).

This track invites papers and presentations reporting on:

- innovations in planning education, e.g., working collaboratively with communities, NGOs, vulnerable groups and practitioners;
- cutting-edge, experimental pedagogies involving technology-assisted, interdisciplinary and/or international teaching aimed at preparing students for today's and tomorrow's planning challenges;
- innovative planning modules, short courses, programs, particularly focusing on space/place, dialogue and dignity in a variety of contexts;
- planning modules that prepare students to wider European and global planning challenges while keeping local interests and conditions in mind, i.e. modules that "marry" local context-specific planning with global awareness and foster international and multicultural competencies;
- planning modules that focus on innovative economic development strategies in the context of economic austerity / decline.

All authors and presenters are expected to take a critical, reflective stance relating their work to pedagogical and/or social & planning theories.

ID 1350 | DEALING WITH OPPOSITION IN PARTNERSHIP DEVELOPMENT PROCESSES

Kolbein Halkjelsvik¹

¹Volda University College, Norway

kha@hivolda.no

ABSTRACT: This article reflects findings from an action research approached PhD case study, that highlights the need for legitimate planning and leadership functions to succeed in partnership development processes. The study focuses on a particular case of partnership development among actors from the public, private, and volunteer sectors. This case initially concerned a 9-year-longitudinal process of developing a community arts center in a rural region of Western Norway. One of the main findings of this research identifies the political oppositional challenges such a process faces through its different stages, actual challenges that threaten the vital legitimacy of planning and leadership functions all the way. The paper contributes important knowledge, insights and awareness to those dealing with related partnership development processes.

1 PLANNING AND LEGITIMATE LEADERSHIP FUNCTIONS; INTERWOVEN ISSUES OF A PARTNERSHIP DEVELOPMENT PROCESS

Of all the presumptions of this action research case, the most important was the one of a better outcome due to its partnership focus; the actual actors anticipated the outcome to be larger than the participants would have been able to achieve individually. As years went by, the case grew enormously to become a project with a much broader focus. Planning and Leadership functions of innovative projects must be flexible and are challenging due to changing contexts along the way. How to legitimize such innovative projects became essential to keep the innovational forces on their desired track.

The theoretical point of departure is within the field of planning, partnership-based local and regional community development, and some approaches within the field of leadership. This actual case mirrors action research and planning practice as being similar to development processes. Theoretically, this research is linked to planning theorists, partnership theorists, and a few leadership functions theorists that are relevant in the contexts of this particular case.

2 A VARIETY OF INTERPLAYING GOVERNANCE NETWORKS

The case is an innovative project. The definition of innovation has an implication also toward the definition of the term partnership as it is used here. The embryonic steps of innovative-based partnership processes and the visions and goal creation that justify the existence of both the partners and the processes are constantly dependent on context conditions, or on the social structures of the civil society that fosters these processes. During initial development of ideas and goals and their inherent needs for implementation, networks change and develop also, and...loose coupling within networks affords favorable conditions for interactive learning and innovation. Networks open access to various sources of information and thus offer a considerably broader learning interface than is the case with hierarchical firms... (Grabher, 1993: 10.)

This underlines the approach to the term partnership to be similar to the term network as a more or less constantly changing element of the partnership process.

The non-linear interactive process of developing a future innovative partnership can be characterized as a first step in a mobilization process that matches John Friedmann's four last steps (of five in all) of such a mobilization process (Table A); 1. Local Action Group, 2. Networking, 3. Coalitions, and 4. Formal Organization (1987: 274-276):

Friedmann's terms (4 of 5) of social mobilization	Adequate characteristics of Friedmann's terms
Local Action Group	<ul style="list-style-type: none"> -informal first organization -firsthand local knowledge -reliance on personal interaction -reliance on commitment -face-to-face dialogue -comrades and friends -flexibility
Networking	<ul style="list-style-type: none"> -increasing movement -easy conditions of entry and exit -few demands -locally based -efforts of enlarging the network
Coalitions	<ul style="list-style-type: none"> -joint undertakings -other groups or formal organizations are recruited -more complicated leadership -struggles of power and control might occur
Formal Organizations	<ul style="list-style-type: none"> -formal -professionals at play -political weight -legitimate standing

Table A: The Partnership Development Stages Based on Friedmann

Networks, then, are continually more loosely-coupled elements than the partnership itself. In the early development phases, it is more relevant not to talk of a partnership at all as such. It is more a case of open loosely-coupled innovation networks that come and go in order to keep the process dynamic and to avoid it stopping. It is a type of start-up of a potentially formalized organizational work, but without locking the process up at too early a stage.

Elvira Uyarra talks of initial mobilizations such as these as being elements of a democratization process, where unelected local and regional bodies are organized in order to develop themselves as bottom-up 'growth coalitions' (Uyarra, 2007: 243). Such developments may be based on a reinforcement of specific local competitive advantages wherein relevant actors have to develop partnerships in order to be able to materialize their goals. Local identities along with local learning processes might be one of the central factors and drivers for success (2007: 244-245). This learning process is relationally-based; it is a non-physical resource. Uyarra talks of a relational capital released by know-how formation ...relationships based on cooperation and competition between players, and the knowledge and ability of the 'players' to identify opportunities for interaction and relationships with the external environment... (Uyarra, E. 2007: 245).

Local identities that initialize the innovative partnership development are also carriers of tacit knowledge that might be essential as a basis for the initiative itself. According to Uyarra (2007: 246), such knowledge is geographically immobile because of its nature of being carried within persons, a fact that makes local identities a precondition for developing local and regional innovation. It could not have taken place in any other place. In order to allow such tacit knowledge and corresponding actual localized resources to bloom, networking and partnership development should be nourished. Uyarra refers to Lawson (1999) when she talks of this "recipe" of creating a necessary "institutional thickness" that can bring forward a "regional competence" ...ensembles of competences that emerge from social interaction...(Lawson, 1999: 158). She also underlines that many other authors focus on these bases, ...of developing location-specific competitive advantage, i.e. one that is embedded in regional and local cultures, and thus impossible to copy or replicate... (1999: 246). Thereby, Uyarra contributes important perspectives on the four research factors of this particular case: actors, relationships, structures and levels of formality.

According to Amdam (2008 B), regional development policy in Norway has changed from being based on a top-down distribution system to partly becoming a bottom-up initialized development regime. Often, these bottom-up initiatives are based on voluntary partnerships (2007: 4). Frequently, an innovative partnership building process as such is a voluntary based initiative. Bukve and Amdam characterize this phenomenon as being a change from government to governance (2004). Definitions of governance are manifold. One is Rhodes'. The partnership process referred to in this article includes the public, private, and voluntary sectors. In this specific context, governance means self-organizing and interdependent

networks that exchange resources, partly based on own rules of the game involving a certain autonomy from the state (Rhodes, R.A.W., 1997: 15).

The constantly changing networks of such processes are all more or less necessary in handling the innovative stages that occur in some cases unexpectedly on the way to goal achievement. It is very much the planning and leadership functions' responsibility to try to foresee them and suggest, or take, action steps to make them constructive and positive contributions to the overall purpose. The networks, then, are inevitable construction elements of the partnership process. Initially they are loosely coupled and without formal obligations for the actors involved. All of the three sectors, public, private, and/or voluntary, might be represented in these networks, but also just one or two of them might be engaged in an interaction with other purpose-based "visitors" for shorter or longer periods. The intercommunication is continuous among these networks as efforts are made to allocate resources with a view to procuring an outcome that is hoped will be larger than that which the participants would have been able to achieve individually. Often non-linear interactive processes are interplays among inhabitants, organizations, and private companies engaging players from all the three sectors; public, private, and voluntary. Basic here are the networks and partnership processes that take care of the knowledge production the project needs to achieve success. These networks are unelected bodies (Uyarra, 2007) making governance. Uyarra underlines that this is ...knowledge sharing being aided by face-to-face, collaborative relationships at the local level, based on high levels of trust and common values... (2007: 248). However, she also focuses on the fact that social networks are often too narrow or locked to be able to collect all the knowledge that is essential to the purposes in question :

...However, 'social networks are never as wide as to include all members of a community, and in many cases, (they are) not even a significant minority of them' and knowledge is often 'far from accessible to most of those located nearby' (Breschi&Lissoni, 2001:262).....More attention needs also to be given to the relationship between knowledge and different cultural environments (Bryson et al., 2000)...

(Uyarra, 2007: 249).

According to Stoker, ...Governance is about governmental and non-governmental organizations working together... (1997: 10), and, literally, autonomous networks of actors (1998). Uyarra quotes Hudson (1999) when she states that it is ...the 'milieu' that learns and innovates, rather than the firms or individuals (2007: 249). Governance initiatives might be such milieus. Like Uyarra (2007), E. Swyngedouw (2005) talks of such networks acting as a reinforcement of democracy, a type of oppositional, anti-bureaucratic way to action organized by those who, for different reasons, want to get things done. This he holds to be a reaction to the 20th century's ...sclerotic, hierarchical and bureaucratic state forms that conducted the art of governing... (2005: 1992). Governance networks such as these are often those of initial interest groups in partnership development processes. According to Swyngedouw, they can take the shape of formal or informal stakeholder-based associations, ad hoc committees or different development coalitions. They are organized horizontally, often based at local/urban level, including ...private market actors, civil society groups and parts of the 'traditional' state apparatus... (2005: 1992).

Often, these networks grow out of innovative social movements and might be the first steps in a partnership process. However, one of the big democratic challenges, Swyngedouw states, is that these innovative governance forms are ...both actively encouraged and supported by agencies pursuing a neo-liberal agenda... (2005: 1993), and it is ...this interplay between the empowering gestalt of such new governance arrangements on the one hand and their position within a broadly neo-liberal political-economic order on the other hand... that is his concern when it comes to the democratic issue and participation. Because of this neo-liberal agenda, some actors are empowered and others are disempowered within such networks. Procedures of governing might be formally codified. They might also be transparent and legible. On the other hand, the workings of governance networks might be dominated by an internal power choreography often led by economic, socio-cultural and/or political elites (Swyngedouw et al., 2002 in Swyngedouw, 2005: 1999).

In the process of legitimizing such innovative governance networks, the state has then to play a central role. Then, the governance networks' most important democratic legitimizing arena becomes the formal system state government. In fact, the state takes center stage in the formation of the new institutional and

regulatory configurations associated with governance.....the result is a complex hybrid form of government/governance...(Bellamy and Warleigh, 2001 in Swyngedouw, 2005: 2002). It is this phenomenon Swyngedouw calls the Janus Face of Governance-beyond-the-State: The Contradictions of Social Innovation in Governance (2005). According to Uyarra (2007), this might be regarded as types of 'institutional configurations' in order to secure 'regional competitiveness..'. Such a development ...'advocates a type of regional economic governance, which is associational, and network-based, allowing for 'bottom-up,' region-specific, longer-term, and plural-actor based policy actions' (Amin, 1999)...(2007: 254). She identifies three preconditions for successful government/governance projects, or innovation development, such as these:

...first, that policy actions should aim to mobilize networks of association and clusters. Second, emphasis is placed on creating partnerships between the public and the private sector and on the legitimization of intermediate associations or forms of governance, such as regional development agencies (Halkier et al., 1998; Morgan, 1997), seen as better suited to act in the interest of and forge stable relationships with actors at the local level. Thirdly, the public sector adopts a different role under this perspective, acting as one of the institutions of the collective order working in collaboration with other organizations. Therefore, policy action takes the form of facilitation rather than direct intervention. Finally, a key axiom is that solutions have to be 'context-specific and sensitive to local path-dependencies' (Amin, 1999: 368)...

(Uyarra, 2007: 254).

Often, initial groups that start processes of partnership development are created from scratch, a fact that Uyarra states might lead to "institutions of inefficacy". Reasons for this are the lack of being embedded in existing routines and ...about the expectation that they will induce institutional change and enhance cooperation ...(2007: 255). In order to become successful, the long-term spans of such developments are frequently not taken into consideration; and neither is the fact ...that they have to deal with 'complex, instituted processes and barriers' surrounding their design and implementation (Howells, 2005). The risk of governing complexity and the likelihood of governance failure (Jessop, 1997) are often overlooked... (Uyarra, 2007: 255).

3 WHO WERE THE GOVERNANCE NETWORKS HOLDERS?

Another challenge in getting innovative network and partnership processes to develop in the desired direction is avoiding that policy made suggestions/results do not only focus on ...the views of those who have vested interests in verifying the claims being made, and thus limiting critical value and policy relevance (Lovering, 1999 / Markussen, 1999 / Uyarra, 2007: 255). This could legitimize and support the efforts of 'elite groups' when they eventually have a goal of constructing and promoting ...regional agendas which mask the unequal power relationships between particular interests (MacKinnon et al., 2002: 304; see also Phelps et al., 1997)... (Uyarra, 2007: 255).

Thereby, the non-linear interactive network processes within the development of partnerships, with their inherent increasing focuses on commitments for their partners, in order to try to establish their functional formal structures, are processes dependent on and originated by communicative governance networks. Rhodes states that ...governance refers to self-organizing, inter-organizational networks...(1997:53). These networks are interdependent and include non-state actors. This might mean that partnerships between public, private and voluntary sectors become erratic and opaque. Exchanging resources and constantly negotiating shared purposes cultivates continual interactions between network members. Agreements are regulated by rules of the game based on an atmosphere of trust. These networks are not accountable to the state on a daily basis. A certain degree of autonomy is present because they are self-organizing networks. Despite this, the state indirectly and imperfectly can steer these networks (Rhodes, R.A.W., 1997: 53).

Networks of this type are in fact not organizations themselves as such, but they have many organizational-like elements, e.g.:

1. Contexts that more or less influence the network and which the network itself can influence and even control.
2. Goals formulated as purposes, visions, and concrete working aims that express tasks the network wants to realize.
3. Actors, or members, who pull together in the desire to fulfil mutually developed goals.
4. Relationships among people. These relationships can be dominated by common values and opinions, by disagreements and conflicts, and by trust and distrust.
5. A structure that makes possible a specialization and a division of labor add a hierarchy that distributes power among the specialized parts.
6. A production of products and/or services that have effects and consequences for both the network and the contexts.

(Mostly based on Amdam, 2008 B, my translation.)

The interactive process towards a formalized partnership is being continuously formed by the relevant actors, the relationships that were made all along, the different structures that occurred out of necessity along the way, and the levels of formality by which the entire operation was dominated. Elements 1 and 2 above, those of shifting contexts and goals, permeate the entire process and constantly affect the four chosen research factors: actors, relationships, structure, and levels of formality.

Regarding the term 'actors' above, this group of individuals or institutions might be regarded as being 'stakeholders,' defining their interests in their various engagements. According to Newman (2001), the term "stakeholder" has in recent years been linked to governance processes as an explanation of members of networks and what "stakes" these members hold in the respective networks during their different development stages. Schmitter (2000) states that the shift from traditional forms of government by 'political citizenship' to governance dominated 'stakeholder'-based polity ...does not go far enough...regarding this 'holder' issue. Therefore, he proposes many new approaches to this term by introducing different types of relationships according to the reasons these might have, or the rights these might carry or represent, in order to become participants in actual governance proceedings of such partnership development processes (Table B).

He calls them holders. He shows his definitions of the holders in the two columns on the left in this matrix. The column on the right suggests who these holders might be in a relevant partnership development process:

<i>Right-holders</i>	Participate because they are members of a national political community	Members of the public government system, municipality, county and/or state authorities
<i>Space-holders</i>	Participate because they live somewhere affected by the policy	Ordinary people living in the area, the inhabitants affected
<i>Knowledge-holders</i>	Participate because they have particular knowledge about the matter concerned	Skilled hands, experts, specialists and professionals
<i>Share-holders</i>	Participate because they own part of the assets that are going to be affected	Money investment people, members of investment companies
<i>Stake-holders</i>	Participate because, regardless of their location or nationality, they might be affected by change	External resource persons, external legitimating persons
<i>Interest-holders</i>	Participate on behalf of other people because they understand the issues	The carriers of the visions
<i>Status-holders</i>	Participate on behalf of other people because they are given a specific representative role by the authorities	The carriers of formal given status, status given by the authorities

Table B: Holders, Based on Schmitter (2000).

4 MUTUAL INTERESTS, TRUST, INTERDEPENDENCE AND LEGITIMACY

The development line of the interaction stages that all the networks go through in such processes is continually influenced by the actors, some stable, some unstable, and their behaviors and degrees of commitment and eagerness. A partnership might be the result of ...a network coordination in which formally independent actors cooperate long-term based on a mutual dependence... (Halkier, 2000 / Gjertsen og Halkier, 2004, my translation). Just as important are all the continuing relationships among the participants in question. Governance partnership revolves around a combination of public-, private-, and civil-society interests, which, voluntarily based, involve mutual benefits (Amdam, 2008 B). The number of networks is due to the numerous structuring efforts. Most often it is a necessity to try to formalize the network into a more committed partnership in order to be able to reach the goals. The different loosely coupled networks are a challenge throughout the various processes. The partners have to understand that the progress of the development towards a formalized alliance is conditional upon an understanding that the partners are mutually dependent on each other in order to materialize the goals that cannot be reached individually. Trust is essential here, and the structure must have enough inherent authority to be able to handle conflicts, e.g. those concerning localization of projects, or those involving various potential oppositional involvements.

In this continuous interplay of partnership development, the different levels of formality are essential all the time. According to Veggeland (2003), partnership is defined as a bounded cooperation among independent partners in a negotiated community of interests. Cooperation in governance partnerships is dependent on formal mutually developed authorizations and funding in order to be able to materialize goals and actions (Amdam, 2008 B).

More or less loosely coupled networks come into play as elements in the efforts to legitimize the entire project and establish the degree of formalization that is needed to get a functional partnership going. Thereby, the governance partnership's existence is dependent on a well-functioning and complete legitimizing process. On their ways to becoming formal alliances, strategic, tactical, and operational networks have to come more or less into play. All of these networks, or different types of governance partnerships, are development stages, some repetitive, on the road towards a long-term working, and, thereby, institutionalized, partnership. The strategic partnership is a necessary phase to secure a defined mutual understanding of reality and organize actions to make the purpose or the thoughts of a goal visible on the actual political agenda. Visionary leadership functions are essential here. These partnerships are known and defined by their lack of formalization and the absence of hierarchy. The activity is uneven and the number of members is uncertain and fluctuating (Amdam, 2008 B). Often, such partnerships function because nucleus members mobilize others due to the actual needs. Initial efforts and the networks connected to those innovative in their start-up-periods might be defined as being strategic partnerships.

Tactical partnerships arise in order to find solutions between visions and dreams and the realistic and the practical. According to Amdam (2008 A+B), these partnerships are characterized by their levels of formalization, limited numbers of members, a strong need for trust, and a marked need for acceptance and legitimacy regarding the jointly developed program for action. All the project groups involved in the innovative processes offer relevant contributions at such stages of tactical partnerships.

Operational partnerships define the periods of instrumentality wherein decisions on actions are taken. Amdam underlines the necessity of a successful legitimizing process as a basis for the operational stage where the realization of goals is essential. Typical of operational partnerships are their high levels of formalization, externally given legitimacy, a limited number of members, a clearly defined division of labor, a marked hierarchy, and a focus on production. The road towards a partnership development might end up with a shareholding company with its board, members, a precisely defined agenda and goals, and mutually accepted time limits; long-term cooperation and contracts are formalized among committed and defined partners. Every stage of such a process is accompanied by accordingly changing 'institutional partnerships'.

These institutional partnerships are the framing terms-giving-institutions that occur/are established throughout such processes. They might take the form of different 'bodies' dependent on the actual situations/needs or what development stages the processes are going through. New institutional partnerships might be the result of such governance development, such as the one cycle initiating similar cycles or purely contradictory politically dominated cycles; in plain words opposition.

5 A POLITICAL OPPOSITIONAL PLAYGROUND

When the public sector takes part and is an essential actor in longitudinal development partnership processes like the one studied in this case, particular challenges may occur when the process lasts for more than four years (a Norwegian democratic election period). There is a risk of the project losing its already established legitimacy, due to the result of the local public democratic election. A supportive local political party group before the election might turn into a destructive oppositional party group after the election, a fact that can destroy such processes through the loss of legitimate leadership functions.

6 OPPOSITIONAL CHALLENGES

In this case studied there are four main findings related to how the character of the partnership development contributed to the challenges faced by the project in taking the final steps towards its completion:

1. The Initial Period / The Strategic Partnership Development Period was blinded by dreams and visions.
2. The Period of Turning Points / The Tactical Partnership Period lacked an awareness of, and a plan to tackle, repetitive negative patterns of opposition.
3. The Company Period / The Operational Partnership Period was a very confusing development period due to the enforced adjustments to the constantly changing oppositional demands.
4. Recruiting The Actors of the Partnership led to unforeseen consequences due to over-motivational blindness and inherent unconscious and unsustainable excitement.

7 THE INITIAL PERIOD; A STRATEGIC PARTNERSHIP DEVELOPMENT PERIOD

The Initial Period represented a very self-propelled development period. Retrospectively, though, the lack of process expertise in this strategic period was not acknowledged as being essential to the later stages. The initial Interest Group had only one focus in this particular process: to engage the interest of the municipal council in order to obtain the fundamental permission to initiate the process. Actually, at the start, nobody saw any potential need for the future partnership development. Rather, it was a modest request to the municipal council to allow The Interest Group to initiate and organize a relatively limited process. Initially, the potential future complexity of this rather modest initiative was not foreseen. The positive reception that this request was given blinded the initiators, the action research approach included. Within a couple of years new and pertinent actors just rushed to join the project which, then, very rapidly grew out of proportion and outside the scope of the initiators' inherent competence.

The recruitment of new actors, bringing with it the inherent need for sustainable relationship building, the continual adjustment of structures, and finding convenient levels of formality, constantly challenged the unforeseen partnership development. This did not happen based on carefully thought-out plans, but seen in retrospect as the result of cogenerated situational data between the new actors and the initiators. Viewed at the time, the action research approach functioned very well. Retrospectively, it was actually a well-functioning partnership mobilizing process. Many problems or challenges were avoided, and those that did occur were easily solved by way of dialogues and collaborative actions in which the most deeply involved actors were included. A bottom-up growth coalition was born to systemize specific local competitive advantages in order to enable the on-coming partnership to accomplish its goals (Uyarra).

The enthusiasm and positive attitudes of the actors involved created a spiral effect that lead to the recruitment of new potential actors. The whole initiative itself depended entirely on the municipal council's answer to The Interest Group's initial application. Also in hindsight, it is clear that the initial standing ovation of the municipal council blinded the initiators, who, rather naively at the time, thought of and handled the project as if it in fact had already been accepted and implemented by the project's most important actor, the municipal council. Thereby, a rather naive approach led those involved into thinking and believing that it was already legitimized.

Seen in retrospect, what stand out as being the real reasons for contemporary blinders grew out of a perception that everything went off too smoothly. Actually, the process of this particular initial phase was free from any seriously felt obstacles. This was the stage for securing a clearly defined mutual understanding of reality. A fact that was necessary to make the purpose or the thoughts related to a mutually developed goal visible on actual and relevant political agendas (Rhodes / Amdam).

The strategic first steps of what later, by Norwegian standards, developed into a huge partnership, originated in a local action group that started processes of networking (The Strategic Partnership Period). Later this networking consisted of more or less loose coalitions (The Tactical Partnership Period), and finally led to a formalized organization (The Operational Partnership Period) (Friedmann / Amdam).

Viewed in an historical perspective, this was a location-specific bottom-up initiative embedded in regional and local cultures (Uyarra / Amdam). It was the voluntarily based start of a gradually more clearly defined innovative governance project: self-organizing, interdependent networks for exchanging resources for mutual benefit (Rhodes). At this strategic stage, the early organizing steps were loosely coupled without specific formal obligations for the actors involved. In a contemporary state of excitement, too little attention was given to the development of the particular governance networks and their respective internal power choreographies. This also included the intervened performed action research approach through the researcher's role as the formally elected leader (Swyngedouw).

Mostly, at these early stages, the actual networks were unelected bodies in which knowledge-sharing took place face-to-face (Friedmann). Initially, the governance networks were collaborative relationships at a local level (Healey). What bound them together were high levels of trust and commonly felt values. According to Uyarra, networks like these might turn out to be too narrow, thus not enabling them to collect all the knowledge necessary to handle the contemporary challenges. Swyngedouw states that within innovative networks, some actors in such initial processes might be empowered while others might be disempowered, including perhaps precisely those actors that in fact should not be. The exaggerated, almost euphoric enthusiasm of the partnership's start-up period blinded the central actors. More attention given to the relationship between the different cultures of the actors and the knowledge produced would probably have made it possible to avoid such blinders. Preferably, the cultural cognitive pillar (Scott) and its inherent meaning construction elements represented by the social reality should have been more firmly established early in the process. The long timespan of such an innovative governance partnership development was not taken into consideration due to the actors' assumptions and contemporary experiences. It was impossible to relate to the meaning construction elements because of these blinders.

8 THE PERIOD OF TURNING POINTS; THE TACTICAL PARTNERSHIP PERIOD

The start of this research period of turning points, The Tactical Partnership Period, was felt to be equally as uncontroversial as the former strategic period regarding the lack of awareness of future potential oppositional challenges. Actually, such an attitude, displayed by both the participating actors and the contemporary action research approach, prolonged some of the blinders. Dreams, and vested interests, partly unintended as such, dominated the processes. Retrospectively, they could have worked as counterforces that reinforced the gap between the initiators and the opposition. In the view of the initiators and most of the other actors, the partnership development process ran really smoothly and stayed on track, only slightly disturbed by some bends and bumps in the road now and then. Gradually, though, the opposition more and more revealed their true tactics. Their suspensory double-communication demeanor and its appearance of the rationalized exercise of power eventually dictated the course of the partnership when formal final decisions were to be taken (Friedmann). Actually, two parallel partnership development processes took place: one by the initiators and most of the other actors, one by the opposition.

Especially, towards the end of this partnership development period of turning points / tactical period, the pressure on the actors to adhere to formal commitments increased greatly. Formal deals, distribution of formal responsibilities, plans and binding timetables, and economic commitments had to be established. Not least the most important actor, the municipality represented by its council, was heavily challenged during this stage. This growing complexity, towards the end of this period, also challenged the action research approach: what advice to give, and what cogenerated elements were worthwhile following up, due to the fact that the hidden opposition caused surprises all along. The play of the opposition came more easy, e.g. casting doubt and uncertainty about details of the partnership project to the extent that they step

by step obstructed the formal decisions necessary to realize it. In practical terms, this involved rather small adjustments and/or small changes of direction in ways that kept the project alive as such, but which also prevented it from accomplishing its preferred objective.

Actually, at the end of the tactical period, the most central actor of the partnership, the municipality represented by its municipal council, developed to become a kind of two-headed actor. The partnership project, and, thereby, also the action research approach, focused on their relationship with the formal democratic heads of the municipality, the mayor and the chief municipal executive. All along, these formal representatives supported and took an active part in the positively focused development of the project, always presenting positive propositions as a basis for the formal decisions to be taken, both by the municipal executive board and in the municipal council. Thereby, these two institutions were the key players in the public meaning-construction processes between the partnership development and the actual political agendas, at least from a formal point of view. Regarding these facts, the action research approach all the way obtained legitimacy vis-à-vis the formal face of this particular decisive actor. This manifested itself in the communicative and collaborative atmosphere developed between the leadership functions, the mayor and the chief municipal executive. The most important data cogeneration processes also took place in this particular interplay. Formally, these were the representatives in what were regarded as being the preparatory phases of the process. Communication and collaboration within the partnership functioned very well and the action research approach saw to it that practical problem-solving took place in local and holistic ways in which challenges were jointly reflected upon by problem owners, including the researcher.

On the other side stood the opposition, the other representatives of this municipal council's double-headed actor. In regard to them, the action research approach fell short. A milieu for joint debates, informational attitudes, and negotiations was never established. From the perspective of emotional and political engagement in the case studied, the reflective cogenerated processes that took place all along without doubt safeguard the prerequisite for successful action research. So did the analytical process. It created a distance for the researcher to the actual actions, the present political strategizing, and the emotional involvement (Levin). But this action research based analytical process did not contribute the problem-solving answers, e.g. by bringing the opposition to the negotiation table, nor in any way did it create any kind of communicative atmosphere at any level regarding this rationalization of power by the opposition within the municipal council. The action research approach never succeeded in establishing a continuous communicative atmosphere with the opposition. The repetitive negative spiraling patterns of the oppositional behavior represented and contained unbreakable codes, due to what was felt to be the arrogant and distance-creating oppositional platform of power rationalizing. For the partnership development project, the codes were unbreakable due to the double-faced oppositional behavior: The opposition supported the project, but were against it. They supported it, but presented "better" solutions all along. They supported it, but changed the formal propositions adopted by the municipal executive board before the decisive final votes in the municipal council. They supported some basic features, but sowed doubt about others. They pretended to be conducting democratic processes, but they were working in secret and stolidly. During the tactical period of this particular partnership development, the extent of the vital parts of the opposition's strategy was not understood by the action researcher. The same applied to the other centrally placed developers. Due to this ambivalence, everything was in a way unreal and it did not seem possible that the opposition could stay powerful over time.

At the end of The Turning Point Period, a new municipal election was held. Actually, the result finally simplified the work of the opposition, since its leaders were given a free rein regarding leadership of their respective local party groups in the municipal council. They succeeded in establishing a stable majority coalition, though the slimmest one possible, with 14 (15) representatives out of a total of 27. This newly obtained and unthreatened opposition majority placed them in a position whereby they were completely free to implement their own game plan during the final development period of the partnership project.

9 THE COMPANY PERIOD; THE OPERATIONAL PARTNERSHIP PERIOD

Operationally, this was a period of developmental ups and downs, but mostly a journey from one failure to the next one, best described as a botched and confusing wandering around in a quagmire. The formation of the partnership shareholding company represented the main element of this particular period, in which all the actors of the partnership had to take on formal commitments, not least financial ones (Friedmann / Amdam). In this particular process, a private investment company entered the scene and complemented a

full worthy three-sector private, public, and voluntary partnership. The shareholding actors appointed a board due to their holdings in the new company. A project office was established, and a hired part-time project leader and a hired project secretary started taking care of the daily activities of the company. The action researcher roles of formal leadership and formal board relations ended, a fact that also limited the action research approach as such.

During the Operational Partnership Period, the governance process became more closed, less democratic, less transparent. This development aspect was challenging, and affected the motivation of both the initiators and of those actors who were not directly involved at the control levels of the board. The action research approach tried to put a focus on these challenges by striving for reflective distance and rigorous analysis (Levin). But this failed, due to the fact that the empathic and political involvement were distanced from the communicative and collaborative heart of the partnership by the opposition's successful rationalization of power. The action research approach could not counteract these tactics. The challenges simply increased as a result of the arrogant exercise of its power by the opposition, which finally ended the partnership by putting forward a series of concrete formal demands, most of which were, of course, impossible to accommodate.

10 OVER-MOTIVATIONAL BLINDNESS AND UNSUSTAINABLE EXITEMENT

Actually, what was strongly felt to be successful initial development periods of the partnership blinded the chosen action. It did not manage to recognize the likelihood of the need to establish or consider alternative ways forward. A culturally-based and defined idea among equals, all of them local citizens who shared a joint vision of a certain field, was the partnership's point of departure. At the starting point, none of the participants, all of whom were rather randomly included, was able to foresee or predict the future dimensions of the project nor how demanding it would become with regard to time and resources. According to Bob Jessop, the actors of such governance processes are involved in complex relationships of reciprocal interdependence. Furthermore, Jessop defines governance as also being a self-organizing process based ...on continuing dialogue and resource-sharing to develop mutually beneficial joint projects and to manage the contradictions and the dilemmas inevitably involved in such situations... (Jessop, 2003: 1, Chpt. 6.5). Often, despite the interdependency between the actors involved, some of the specific dilemmas and developmental challenges are based on the fact that the actors in question operationally were autonomous actors. According to Friedmann, such a networking process is strongly colored by easy conditions of entry and exit, involving just a few bindings.

There was an inherent excitement stemming from the way the very central and decisive local authorities received the project initially. This fact, coupled with the early and rather enthusiastic recruitment of actors, fostered a blindness that prevented a cool and oriented evaluation of eventual later consequences, or of upcoming challenges (Friedmann). Additionally, no one involved was able to predict the fact that this was the start of a 9-year-longitudinal development process that would involve huge challenges. The randomly democratic-based challenges related to the local election results of the various municipal four-year election periods was one of these. Actually, the initiators did not expect the project to last for more than one, at the most two, election periods. "For sure, it will be realized faster than that," was the conviction of everyone involved all along.

11 CONCLUSIONS

The public sector actor of the partnership case studied, the municipal council, was the most important actor of the project. This was the case even though the municipality's share of the total room space program was only about 21%. In addition, this project developed to become an unforeseen longitudinal one spanning as many as four consecutive municipal council periods. The governance arrangement's red thread was very challenging to hold, and, thereby, also the leadership functions accepted by every central actor at vital moments in time.

Over time, such legitimate leadership functions were almost impossible to maintain. An eventual unidentified meta-perspective of the governance function was almost impossible to prolong. It had to be continually renewed and revitalized. Due to these challenges, these secondary criterions of failure, the

governance arrangement's historic facts became rather vague. In fact, now and then they almost disappeared from view, which prepared the ground for an easy oppositional play all along. This was the play of new, unforeseen, undemocratically made "new truths", which even today, seen in the light of history, stated as being the real truth by the representatives of the opposition.

As a governance enterprise, the partnership development project lacked a stable and firm approach. It lacked its meta-governance perspective, which constantly should have guaranteed both the legitimate leadership functions, every actor's ownership of the project, and the overall aspects framing it. Throughout all these years, the absence of such a perspective allowed room for the opposition's particular political strategy. Neither the normative nor the cultural-cognitive pillars ever became strong enough to really sustain the complete partnership project and to combat the opposition's political designs. The essential communicative process between all the actors in position and those of the opposition was never established, and, thereby, neither were the legitimate leadership functions that were vital in order to accomplish the final goal.

1 INTRODUCTION

The year 1978, when China initiated its policy of reform and opening-up, marks a distinct turning point in the history of urban planning in modern China. A new Chinese urban planning system, with its values, ethics, approaches, laws, regulations and so on, has gradually formed since that time. A set of Chinese planning theory also emerges within this system development. This set of theory 'is interpreted as the values, principles and working procedures which conduct planning practices' (Zhang, 2008) by Chinese planners. This paper will mainly discuss Chinese planning theory.

Different academics have different views when categorizing planning theories. As known to all, Faludi (1970) categorizes planning theories in substantive theory (theory in planning) and procedural theory (theory of planning). Based on his classification concept, other scholars develop varied ways of classification of planning theories. In Hendler (1995)'s opinion for example, besides 'theory in planning' and 'theory of planning', she further identifies a third category, namely 'theory for planning', or definitional theory. Subject-oriented theory provides the knowledge base to inform the planning process. To her, definitional theory is the body of theory that describes what planning actually is and how it fits into the social context, and procedural theory deals with the process of planning, with issues related to determining the 'best' approaches for transferring knowledge into action. Wolfe (1989) categories planning theories the same way as Hendler's, but calls definitional theory as 'explanation' theory. Focusing on definitional theory and procedural theory, this article aims to shed light on the development of Chinese planning theory since 1978.

2 DEFINITIONAL PLANNING THEORY

Definitional theory deals with the nature of planning. The Chinese definitional planning theory study began in the early 1980s when Chinese were eager to shake off the legacy of the USSR and to form a 'new' urban planning system partially based on the European and North American planning system. It is inspired from three origins or Perspectives, namely, practices of the socialist market economy, inspirations from traditional Chinese philosophy, and lessons from Western positivist philosophy. Prior to 1978, when China was in the time of planned economy, planning was perceived as a technique to embody the economic plans of central government. One of the main activities of planning was painting blueprints that are were directly used to guide city development. However, in the process of economic reform since the 1980s, it was recognized that the perception of planning as a technical activity hinders China from developing the market economy and participating in the global economic system. Simultaneously, the Western planning thoughts started to exert influence on Chinese planning theory. All kinds of 'Western' planning thoughts and theories poured into China and acted as important enlightenments for developing 'Chinese' planning theory. Against such background, Chinese planning scholars began to rethink the nature of planning. The theory debate articles at this time mainly focused on the 'scientific nature', 'soft scientific nature', 'rationality', and 'sociality' of planning, with some high-frequency terms like 'philosophy', 'basis', 'nature', 'characteristics', etc. These were Chinese kind of 'definitional planning theory.'

2.1 THE NATURE OF CITY PLANNING

Sun (1993), for example, conceived of city planning as an applied science. In his opinion, planning was about making arrangements of land use and formulating development guidelines based on city development goals and overall studies of the city. The construction activities guided by planning were to change city space so that an orderly city development could be achieved. Thus, turning planning thoughts

into practice was what planning should be about. Meanwhile, different from natural science, according to Sun's point of view, the application of city planning requires the acceptance of social communities.

Wang (1989) holds the opinion that during the period of planned economy, planning activities in China were narrowly perceived as technical activities. But from the year 1978 on, as commodity economy replaces product economy, planning became an activity that required a wide social support. Hence, city planning was both physical and social, and by nature it was more social than physical.

In Tong's (1997) view, the ideological basis of planning theory should return to rationality. Planning activities on one hand depend on scientific studies, on the other hand cannot be divorced from social environment. The leading academic journal about urban studies and planning issues in China - City Planning Review - once organized a special discussion on issues like 'scientific mode of planning', 'soft science' and posed the question 'is city planning a soft science?' (Vol. 11, Issue 3 and 4, 1987). This discussion provided a formal platform for Chinese scholars to explore the nature of planning. Chen (2007) argues 'if we link the core definition of city planning to the strict definition of science, we cannot draw the conclusion that "city planning is a science"'.

Thus it can be seen that concerning the nature of planning, Chinese scholars have been very aware of the dual attributes of planning. Just as Zhao (2005) describes, planning is neither entirely a 'technology' of 'scientific rationality', nor completely a passive 'coordination and cooperation', but 'a combination of the two'.

2.2 THE SOCIAL ASPECTS OF PLANNING

With the development of market economy in China, the social aspects of planning are increasingly emphasized by Chinese theorists. For example, Wang (2003) pointed out that current theoretical study of Chinese planning stayed in the 'instrumental rationality' stage, and economic and social considerations were quite lacking. He held the opinion that planning was an activity that falls in between natural science and social science, and it should be realized that planning should be more considered as a public policy. Zhang and Legates (2009) held the viewpoint that in the post neo-liberalism era (post-crisis era), social learning and social reform should become the direction of Chinese planning theory. To them, city planning should help establish a balanced interest distribution.

Although the social features of planning have been recognized since 1978 at the theoretical level, however in practice, planning is still perceived as a scientific technical activity. According to the viewpoints of Zhang (2008), urban development became the primary goal of China in its socialism construction process since the 1980s' economic reform. As an important means of implementing the central policy and allocating resources, planning was mainly employed to promote urban economy growth, enlarge city scale and improve production efficiency. Influenced by the central government's message 'development is the absolute truth,' the pursuit of economic efficiency rather than social equity became the first priority of local governments. Hence, planning turned into a productive force, a rational tool used to accelerate economic growth.

2.3 THE LOCALIZATION OF PLANNING THEORY

It is worth mentioning that during a certain period (approximately from the late 1980s or the early 1990s onwards), Chinese scholars start to explore localized planning theory and try to investigate the nature of planning based on traditional Chinese philosophy. Qian Xuesen, a renowned Chinese scientist, advocated for the study and construction of the "shan-shui" city from the traditional Chinese nature view in the 1990s. Shan and shui refer to mountains and water or rivers, and actually mean the nature. The essence of his advocacy is to pursue the co-existence of the human and nature or the non-human. Base on the theory of "shan-shui" city, Liu and Li (2006) proposed the idea of "planning of poetry conception". They considered the process of planning a process of pursuing and creating a poetic city. Planner should "Grasp the truth of the ecological environment, create a good man-made living condition, and achieve a beautiful poetic world so that people can 'live poetically'". Nevertheless, such explorations are purely conceptual analysis and not aimed at directing planning behaviors in practice.

3 PROCEDURAL PLANNING THEORY

Apart from the exploration of planning nature, the definitional planning theory, theoretical debate on planning process in China is also very essential in Chinese planning theory development. In the time of planned economy, the understanding towards planning process was relatively narrow. The view that planning process referred exclusively to the process of plan formulation, namely a linear process, including steps like 'data collection – data analysis – scheme formulation' was dominant. After the economic reform, new ideas influenced by the western planning thoughts concerning planning process started to emerge. Among all the thoughts, rational planning theory was most influential. In the framework of rational planning theory, planning was a means to find the best solutions, and planners should act like engineers who rationally sought for the optimal answers based on external conditions and requirements (Faludi, 1973). Through learning rational theory from the West, Chinese scholars started to emphasize the necessity of planning cities in a 'scientific' and 'objective' way, and divide planning process into the following 5 steps: (1) definition of problem and/or goals; (2) identification of alternative plans/policies; (3) evaluation of alternative plans/policies; (4) implementation of plans/policies; (5) monitoring of effects of plans/policies.

3.1 PLANNING PROCESS UNDER A SOCIAL PERSPECTIVE

From the 1970s on, influenced by the idea of humanism, new ideas like advocacy planning, transactive planning, and communicative planning arose in the western world. While in China, with the sociality of planning being recognized, Chinese scholars also started to think the process of planning from a social perspective. They advocated that the general public is supposed to play a role in the planning process, and the planning process should be cyclic rather than linear. In other words, the public should participate in each step of the process and between each step a feedback mechanism ought to be established. As with what happened to planning nature, despite the changing cognition of planning process, the gap between theory and practice was evident. According to Zhang (2008), the planning process in most Chinese cities was not transparent enough. Public participation was superficially organized in the form of plan information education and plan consultation such as organizing the public to visit urban planning exhibition hall, soliciting public opinions of plans or projects through questionnaires. Substantive public participation, such as establishing public planning committees with veto right, was absent. For such superficial public participation, citizens might show their passions at the very beginning out of curiosity. Once they find they cannot genuinely participate in the decision-making process but were only accepting the results passively, they started to feel bored and unsatisfied. In addition to examining planning process at the operational level, He (2005) also defines planning process from the perspective of the relationship between participating actors. In his viewpoint, planning process is "an active process where the administrative bodies and other actors (such as legislative bodies, interest groups, social media, citizens, etc.) exercise their power and rights, and a process where different actors interact with each other to set up and achieve city development goal."

3.2 THE ROLE OF PLANNERS

The role of planners is a permanent topic in the discussion of planning process. While in the period of the planned economy, planners are exclusively perceived as technicians who organize urban space strictly according to government's economic plans and then draw the blueprints, a diverse understanding towards planners' role can be identified in the time of socialist market economy. As a Chinese-American, inspired by Western planning thoughts, Zhang (1993) takes the leading role in the discussion of planners' role in socialist market economy. From his viewpoint, against the backdrop where the emphasis of planning is slowly changed from 'efficiency' to 'equity,' planners should give more attention to people instead of plan itself in order to ensure the long-term interests of the whole public, and spend more time on studying human activities. Planners should focus on the public interest, and show no discrimination and favor to any actor in the process. He also argues for the transformation of planners' career training. In his opinion, planning process influenced by market economy is supposed to include more components like legislative procedure, laws and regulations analysis, economic analysis, policy analysis, etc. Hence, planners should be trained to learn the hearing procedure, methods of negotiation, and ways of making a compromise. After Zhang's paper is published, the topic - planner's role along with planners' values – starts to receive

more attention from local Chinese scholars. Tong (1997) argues planners should not be scientists or people who only focus on painting blueprints. Instead, planners should be formal or informal technocrats. The mission of planners is to apply the scientific technology to the social public behaviors. Simultaneously, Chinese academics even organized several formal discussions on this topic. For example, the leading planning journal *Planners* (Vol. 14, Issue 1, 1998) published the draft of '21st Century City Planner Declaration' and emphasized that planners should "plan, design and construct cities in the spirit of humanism, highlight the social harmony between different cultures and different social groups; avoid social segregation and conflicts, serve citizens without bias, not sacrifice and harm public interest, keep updating professional knowledge and skills [...]".

Planners (Vol 16, Issue 4, 2000) also organized the discussion on the issue of 'speak truth to the power', which again brought Chinese scholars' attention on planners' role. Chen (2001) suggests three directions for planners' career development: state planners, registered planners and community planners. In particular, state planners are technical officers who serve the government planning management institution. Their duties include: (1) to speak truth to the power; (2) to endeavor to participate in the decision-making process; (3) to make overall and long-term guidelines for social, economic and environmental development in cities; and (4) to defend public interest and stand up for the weak groups. In contrast, registered planners are planners employed by engineering survey or design institutes. They are technical planning professionals who provide plan, design and consulting services according to the market demand. The career goal of them is to maximize the benefits of project owners without violating laws, regulations and technical specifications. Community planners are devoted to affairs like community management, renewal and renaissance. They are state planners at the community level. Their objective is to seek for long-term and maximal benefits for communities they work for while not infringing the interest of other communities and the whole city.

Zhang (2002) holds the opinion that planning must ensure a balance between the state, market and civil society. In principle, planners are civil servants who represent the interests of all citizens. With the support from communities and social groups, they make suggestions for land and spatial arrangements based on market orientations, and ultimately help achieve the goal of promoting social progress. It should be recognized that the interrelationships between planners and the state, planners and market, planners and civil society are complicated. Although planning is a government activity, planners are supposed to act as professionals who work hard to correct the mistakes of government decisions. Planners must rely on the market when implementing plans on one hand but they are also required to direct the market, and supervise the market on the other hand. Planners should encourage public participation to balance the power in the decision-making process, but they also have the responsibility of educating public and helping improve communities' competence.

He (2003) argues civil society in China is embodied in the flourishing development of non-government organizations (NGOs) and communities. Against such background, planners are supposed to collaborate with citizens and NGOs, and form an organic trinity to promote community development.

4 CONCLUSION

It can be concluded that the development of Chinese planning theory is still in its infancy, and theorists in China give their primary attention to the nature of planning, in particular how to define Chinese planning in the unique context of socialist market economy. Simultaneously, they are concerned about the role of planners as well as the professional ethics that planners should comply with. The focus on definitional theory and procedural planning theory demonstrates that Chinese scholars and practitioners are still confused about the ontology of planning and have not been able to go further in theory debate. They have attempted to get involved into the international discussion on planning theory, yet the differences in contexts and cultures makes a common discussion at the same theoretical level between China and the West difficult. This might be the directions of Chinese planning theory development in the future.

FUNDING

This paper is funded by the National Natural Science Foundation of China (NSFC) (5167851), the project of high education educational and pedagogical reform of Zhejiang Province (jg2015002), and the project of postgraduate student education study of Zhejiang University (20170307).

1 INTRODUCTION

In 1st January 2016, more than 150 world leaders signed a historical pact towards the Sustainable Development of all the countries in the world. The “United Nations’ 2030 Agenda for Sustainable Development” is a document composed by 17 Goals and 169 Targets, which aims to put the entire world in a sustainable development in three different dimensions: economic, social and environmental.

The seventeen goals are related to people and eradication of poverty; planet and the sustainable usage of natural resources; prosperity and citizens access to economic, social and technology progress; peace and the end of violence in all forms; and global partnership, strengthening solidarity intra and inter nations.

Since this paper concerns about the play architects and urban designers have in the society, it will focus on the topics which reach us the most and can be practiced within our career:

- Goal 1 - End poverty in all its forms everywhere: the document ensures that, by 2030, all genders and especially vulnerable groups will have access to basic services, equal rights to economic resources and control over land and property. As urban designers, our actions generate impacts both in land access and social development, making us indirect but important actors in the achievement of this goal.
- Goal 4 - Ensure inclusive and equitable quality education and promote lifelong learning opportunities for all: the document guarantees the access to affordable and qualified education. As urban planners, we have a play in ensuring all children have a learning place next to their residences and that they are able to commute there safely.
- Goal 6 - Ensure availability and sustainable management of water and sanitation for all: the Agenda ensures the access to safe and affordable drinkable water, the improvement on wastewater treatment and recycling. Besides, it wishes to promote more efficiency in water use and protection to ecosystems related to the water cycle. Strictly related to land ownership issues and city spread over environment protected areas, architects and urban designers are directly responsible for the success of this goal.
- Goal 11 - Make cities and human settlements inclusive, safe, resilient and sustainable: the document ensures the access to safe and affordable housing and services, as well as the upgrade of slums to formal residences. It also brings attention to the importance of integrated planning and management, and participatory decision making.
- Goal 17 - Strengthen the means of implementation and revitalize the Global Partnership for Sustainable Development: this is the most important goal, since it is not an actual aim but the main method to achieve all the sixteen commitments made before. Through the Global Partnership in all levels (finance, technology, building, trade, accountability) and with all actors (governments, private sector, civil society, academia, philanthropic organizations, volunteer groups, the United Nation), the accomplishment of this Agenda is directly related to this globalized commitment and help.

The document is very embracing and gives more emphasis on international mobilization and finance support in order to help poorer countries to reach the goals. Even though, it leaves space for interventions in all levels, evoking groups from different scales and backgrounds to be responsible and make their part: “Our journey will involve Governments as well as parliaments, the United Nations system and other international institutions, local authorities, indigenous peoples, civil society, business and the private sector, the scientific and academic community – and all people.” (United Nation, 2015, p. 12)

Seven days after this agreement, a much smaller group, formed by less than 30 students of the School of Architecture and Urbanism from the University of São Paulo, was also making a commitment with a document with more similarities with the UN's Agenda than they could imagine. January, 7th 2016 is the date of the foundation of FAU Social, a new model of academic extension, created by undergrad students, with no links to professors or university staff, aiming to contribute with society, raising accessibility to architecture and technical support to needy communities, through partnerships and mutual collaboration.

2 THE EMERGENCE OF FAU SOCIAL

In the past decade, Brazil saw the rise of several groups called "coletivos urbanos". They are usually a group of people with common interests, united by social medias and with no internal hierarchy, who want to interfere in the city somehow, bringing more awareness of public spaces to general people, through small interventions such as painting streets, planting trees and improvising urban gardens, promoting free "walking tours".

Following this tendency, similar groups started to grow inside universities, intending to combine this desire of improving the city with the knowledge learned in classroom. In the University of São Paulo, where FAU Social was conceived, several other coletivos arose, such as FEA Social and Poli Social, created respectively in the School of Economics and Administration and School of Engineering.

The idea of FAU Social emerged in the beginning of 2015 and one year was necessary to fortify it, define goals and principles, research and organize its structure, call for new members and accomplish the pilot project. According to Lucas Piaia, one of the cofounders, in an interview to Jornal da USP (USP Newspaper), the concretization of the idea was inspired in this already existing coletivos. "We got in contact with other social entities from USP, who already existed, and started the work of adapting this knowledge and applying it to FAU's reality" (Gomes, 2016).

FAU Social main objectives are to put into practice the knowledge obtained in the classroom, reinforcing the social role of the university, informing and promoting the right to the city, fomenting local appropriation, and promoting exchange of knowledge. Besides, its central way of acting is through partnerships, much in agreement with UN's 2030 Agenda.

These goals and values are compiled in its statute, where eleven objectives are enumerated: (i) Put in practice the university's social role through the student's organization; (ii) Develop the project through a joint construction by members of the entity and its target group; (iii) promote the requalification of spaces; (iv) inform citizens of their rights; (v) promote well-being activities in communities; (vi) promote the right to the city; (vii) promote actions in agreement with real demands, among our assignments; (viii) promote autonomy and empowerment inside the groups we act; (ix) promote the intermediation with other urban agents; (x) promote the exchange of knowledge, experience and technique; (xi) act directly or via partnerships with NGOs, civil associations, through an analysis, selection and definition of a strategic plan. (FAU Social, 2016)

I joined the group in March 2016, in the first call for new members, participated for two semesters, being part of the Project Group working in the Jardim Jaqueline Project, as will be explained further on. In 2017, I had to end my active participation and today I am part of the counselor board.

3 THE FAU SOCIAL ACTION WAYS AND STRUCTURE

The organization, or entity, as we call it, acts in two different types of projects, the One Time Actions and the Project Groups:

- One time Actions are activities where everyone is invited to participate, members of the entity or not, and their objective is to revitalize, in one day, a place that impacts in a vulnerable group life. One example was the Aplicação, a two days' intervention (in this case, two days were needed, but people participated in just one day or in both) held in September 2016, that revitalized the open areas of the public school Aplicação, located inside USP campus, in São Paulo, Brazil.

Much more than qualifying a space, this type of intervention has the objective of connecting users of the space, empowering them and creating a sense of belonging.

- Project Groups have the purpose of making deep intervention in spaces where more technical knowledge is required. They are held by groups of around 10 people and last one semester (four months), with the possibility of extension for another one, through the approval of all members. In 2016, first years of activity, three projects were conducted at a time; in 2017, with the entrance of new members, this number could be increased to four. The entity is organized in a horizontal structure, with no president or hierarchical relationship.

Instead, there are five administration areas (macro areas) responsible for specific subjects, with two to three sittings each, that are rotated among all members. The macro areas are:

- Public Relations (PR) – responsible for seeking new projects, representing the entity in formal events, communication with other organizations, and settling practical subjects with university's staff.
- Creation and Branding (C&B) – responsible for creating visual communication material, publishing in the Facebook page, compiling and keeping the photography bank and editing flyers and presentations.
- Human Resources (HR) – they organize the General Reunions (as will be explained further ahead), give feedbacks, organize calls for new members, and concern about motivation and commitment of all members.
- Resources Management (Resources) – responsible for developing tools to raise funds, such as selling lunch in special events in the university, and keeping transparency in accountability.
- Events – They organize the One Time Actions and promote internal confraternization parties, such as picnics and meetings.

Due to its absence of hierarchy, all decisions are taken in the General Reunions, held every fifteen days regularly and in extraordinary sessions when needed. Before the meetings, the topics to be discussed are published in one of the used medias (usually Facebook), so members can come prepared.

Today the group has 53 active members, some working only in the macro areas, others just in project groups and a few in both functions. Since the workload in the architecture bachelor is large, having FAU Social as an extra activity requires a lot from students. Even though, most of them show real commitment to the proposed projects and sacrifices leisure hours and weekends.

In its third semester of activity, FAU Social already delivered, besides the One Time Activities, five projects and have four more ongoing. The projects concluded until now are: (FAU Social, 2017)

- Casa do Estudante (Students' house) – The house receives students with low income who study at USP Law School. The building is in very poor condition and students are requesting its renovation. FAU Social participation was to make a diagnostic of the renovations needed and make a conceptual project, empowering students to claim for the renovation.
- Cairbar Schutel Assistencial Center – The main effort of the project group was to make the Asbuilt of the center, allowing the staff to regularize the edification. The non-profit organization, that receives vulnerable children, was now preparing itself to also welcome elderly. For this reason, the team also made the design for a new kitchen.
- Vila Capriotti Missionary Project – This NGO, situated inside the slum Murão (Carapicuíba, SP, Brazil) works with 80 children, from 3 to 12 years old, organizing cultural, learning and sports activity. The Project consisted in the redesign of their leisure area, concerning the water drainage in the patio, the necessity of a storage room and the optimization of the patio.
- Education Week – Project organized in partnership with the School of Education from USP, the goal was to develop the Visual Communication to the academic event Education Week, organized by students from that institution.
- Jardim Jaqueline – The Project Group entered to add forces in a team fighting to transform a vacant lot in a park, inside the slum Jardim Jaqueline (São Paulo, SP – Brazil). This project will be our object to deepen this analysis in the following sections.

4 THE JARDIM JAQUELINE PROJECT

Jardim Jaqueline is a slum of approximately 111.000m² (Zamoner, 2013, p. 39) that housed, according to the Public Defense, 2.867 families in 2012. (Zamoner, 2013, p. 20) Its occupation started in the decade of 1960 and had the most significant expansion in the 70's and 80's, period when São Paulo passed through a large industrialization and migration process. Today it is politically organized through the association Associação União dos Moradores do Jardim Jaqueline (Jardim Jaqueline's Union of Residents Association), with the leadership of the community members Nivea and Bete, both very respected among residents and well-articulated with local politicians.

In 2010, the public defender and former student of FAU USP Tatiana Zamoner started leading a pioneer project: the land regularization of the entire neighborhood. The work started with a vast research and the registration of all constructions in the area. The data and experience collected is synthesized and problematized in her Master's thesis, developed in 2013.

Through Tatiana's relationship with the Jardim Jaqueline leaders, the university approached the community, in order to develop ideas to the urbanization of the slum. The first approach was in the course Urban Design, in which students proposed a requalification for the area, intervening in the most vulnerable lands. This project was held in 2013 and the design of the student Daniel Collaço evolved to an extension project, with supervision of the professor Dr. Karina Leitão and the other bachelor student Willian Valério.

By this point, four years have passed from the start of the regularization process and no apparent progress had occurred. The community has lost belief in the power of governances and university in helping them and, in this context, the extension team, with the advice of Tatiana, decided to change their project focus and work in a much smaller area, designing a park in a public terrain with approximately 2,400.00 m² in the entrance of the neighborhood. This project could work as a starting point, giving the community something easier to visualize and accomplish, keeping the mood to fight for the bigger steps.

The project, realized in one year inside the Laboratory for Housing and Human Settlements LABHAB and discussed with the community leaders, delivered a conception plan of the park to the association, who used the design to make pressure among local politicians to finance its construction. (Figure 1 and 2)

FAU Social joined this partnership in 2016, when Nivea (the community leader) got in contact with the old extension group signaling she got interested people inside the local government, who could sponsor part of the construction. Because the extension program was over, and Daniel and Willian would continue this work as volunteers, they and LABHAB made a partnership with FAU Social in order to add forces and help making the park feasible.

5 FAU SOCIAL GOALS AND ROLE IN THE PROJECT

Initially FAU Social Project Group had a workforce of 11 people and one semester to help in the construction of the park. Our internal goals (FAU Social members only) were to be able to conclude the implementation, through the support of stakeholders; and to apply concepts of participatory project learned in classroom, connecting and exchanging experience with the community. Quickly we realized that our goals were very ambitious and both process would need much more than four months.

In practice, we extended the project for one extra semester, working for almost one year with LABHAB, the teacher Karina, Daniel and Willian, as "the university group", with no clear distinction for the other parts involved. Our participation can be divided in three work fronts:

5.1 THE PROPOSAL REVIEW

Two circumstances forced us to review Daniel and Willian's project: the method of construction, through sponsors; and the aim to broaden the community's contribution to the design.

The first job made by the team was to budget the costs of implementation (first knowledge obtained, since academic projects usually don't take price into consideration). We reached a number of approximately R\$500,000.00 (€137,000.00). So far, the community had obtained a budget of R\$50,000.00 (€13,700.00),

mobilized by a councilman to install fitness equipment, that would be implemented by the construction department of the local government. Luckily, one of the architects responsible for the department, Ana Paula Pereira, was also a former student from FAU and related to the project. At this point, we were already four parts involved: the community association, the academy (FAU Social + LABHAB + Daniel and Willian), the construction department and the councilman.

With no money to complete the project, Ana Paula and Nivea's idea was to raise funds from private stakeholders. Jardim Jaqueline is well situated, having a bid from a shopping mall and a unit of a home improvement retail store as neighbors, who showed interest in financing parts of the park.

Our play was then to revisit the project and divide it in different parts, that could be budgeted and constructed separately. We had to redraw the park several times, making it smaller and using cheaper materials, trying to fit it in the available budget. When this article was written, only one private stakeholder had actually contributed to the project: the Bimbo Group, a company from the food industry, had financed the construction of the sports court and a leisure benches area.

The second reason to rethink the project was to contemplate the community's wishes, collected during the approximation activities, as we called the meeting realized with residents. As we will see, both the activities and the possibility to make a joined designed were not as we expected. Due to the lack of money, the only desire we could add to the plan was the sports court; other important equipment, such as toilets, were not included.

The final design was divided in five parts: (i) the entrance square, where the topography is very complicated; (ii) the playground and fitness equipment, the first part constructed and sponsored by the government; (iii) the leisure area and sports court, constructed in 2016 and sponsored by the private company; (iv) the arena theater, which terrain was disfigured during the construction of other parts; (v) and the vegetable garden, situated in the steepest terrain.

5.2. DIALOGUE WITH COMMUNITY AND THE IMPLEMENTATION OF THE PARTICIPATORY PROJECT:

The main goal of FAU Social team was to approximate the community, who would actually use the park, put them in the design process and create an affective connection with the area, creating the sense of responsibility towards the project and its maintenance. Our initial idea was to create a series of activities regarding not only the project but important issues such as garbage control, the use of the public spaces and healthy food (part of the park project is a common vegetable garden).

In a conversation with the Prof. Dr. Catharina Pinheiro, who has a lot of experience in participatory project, she suggested us to realize playful activities using humanized designs and drawings of what the square could become, make a party to choose the name of the park and baptize it. She also suggested us to contact with local schools and other entities, an easier way to approach the residents.

At this point we understood the difficulties of making a participatory project. It was really hard to combine everyone's agenda: the team, the community leaders, the politician involved. Besides, the bidding process takes time and the construction would not start in the first semester of 2016, as we wanted.

Another complication was the diversity of interests of each part. We, as academia, were trying to implement a research and wanted to hold the approximation activities preferably before the beginning of the construction. The leaders, on the other hand, ground their recognition in the community through accomplishing the ideas they are involved with. Therefore, they did not want to start advertising the park with no guarantee that it would be finalized. They were not wrong, though, considering the number of unfulfilled promises they receive. Still, this disconnection forced us to summarize our activity in a one-day breakfast, before the construction started.

Despite the lack of time to advertise it, just one week, our group and the leaders leafleted and announced the event. The consequence was a number of participants not as large as we wished, around 30 came to the breakfast. Even so, we classified it as positive, since important things happened: it was the first step to show some parents the possibility of having a new leisure area for their kinds; people sang local songs; we

could make an activity with the kids where they give ideas; and, the most important part, we met two coletivos which worked inside the community, who helped us a lot (and are still helping) to foment the use of the area. The groups Progueto and Batukaí teach music to children inside the community and held with us the second proposed integration activity. (Figure 3 and 4)

With the beginning of the second semester, the construction started. As part of our appropriation plan, we wanted to organize a second event, to show the residents what was being done in the terrain. Once again, the difficulties in combining agendas, the uncertainty of the exact construction date and, a last aggravating, the arrival of a rainy period, forced us to change our plans and simplify the activities. At the same time, we started contacting the surrounding schools, following the suggestion given from the teacher Catharina.

Combining all these elements, the solution was to realize the activity in the municipal school EMEF Viana Moog, in November 2016. The concretization of the event was a real lesson of commitment, organization and improvising for all students. We organized three activities: the Affective Mapping was made with a giant Google Earth picture of the neighborhood where the kids had to identify their school, the land of the future park, the main landmarks of the neighborhood and their houses. This game was a real success, with children surrounding the map, wanting to find the proposed spots. (Figure 5)

The second activity was a music workshop given by the Batukaí group. They brought several different instruments and taught notions of rhythm and sheet music.

We had problems with the third activity and, in the day before the event, we knew it would not happen. At this point, the group learned a great improvising lesson and organized a Muay Thai workshop, held by one of FAU Social members. He explained the philosophy of the sport and taught a few techniques.

In conclusion, this second event had a much broader purpose, to show children how architects and urban designs work, who were we and what was our university, what are maps and blue prints and how to look at them, besides presenting the project of the park.

The last event was much more organized by the community leaders than by us. Following teacher Catharina's advice, they made an election to choose the name of the new park. The winner name was Praça Só Alegria (Only Joy Park). The event was then the inauguration of the park – the two parts constructed so far - and its baptism, with a cake and beverages also sponsored by Bimbo.

5.3 DIALOGUE WITH THE LOCAL MUNICIPALITY AND MONITORING THE CONSTRUCTION:

The construction of the park was made by two different private companies, one hired by the construction department and in responsibility of Ana Paula and other contracted by Bimbo, which responded to both Ana Paula and the private company. To our group remained the responsibility of monitoring the work made by the companies, because Ana Paula could not stay in the site all the required moments. Since we could not make an executive project, we were responsible for ensuring that the project was being done as we imagine and giving instant solutions for elements not explained in the blue prints. (Figure 6 and 7)

Several hindrances made this task more difficult than we imagine. First, the tractor entered the area and excavated the plateaus in different locations, not following the project. We got very frustrated, but later on we understood the reason: our topographic survey was not accurate and our propose would not work. Ana Paula, with much more experienced eyes than ours, saw that and asked the men to change equipment locations.

The second hindrance: we were supposed to give advice for workers from a private company, that had no idea who we were and had no connection with the entire process. In consequence, everything that we saw in disagreement with the project had to be discussed with Ana Paula, who would communicate it to the coordinator of the project inside the contracted company, who would talk to the workers; all very busy people. It meant that our requests would become an action in weeks or, what most frequently happened, were never contemplated.

Still a third problem made this process harder: most of the students did not have enough experience or knowledge to decide things instantly or even to see problems in the construction site. Ideally, less experienced colleagues should always monitor the site following more experienced peers. However, the lack of time and our rotation scheme to visit the park made some unexperienced students go by themselves to monitor the construction.

Even though the dialogue with sponsors and local municipality was not as wide and harmonious as we dreamed, the experience put everybody's feet in the ground and showed us the real possibilities of working in partnerships. Besides, everyone learned more about the day-by-day in construction sites and the real concerns needed when designing. One good example was the space needed to the tractor to move around. Not planned, he had to open a new plateau, which was later used to the leisure benches area.

6 THE LESSONS LEARNED

All projects held by FAU Social had the purpose of complementing the knowledge obtained in the university and approximating the higher education to people who cannot access it. In the particular case of the Praça Só Alegria, lessons were learned through the success and failure of ideas.

The first taught to be highlighted is the shift in the relationship with the architectural project, especially in urban design. Vitor Miceli, one of the members in this project, told us his impression, in an interview given to this research:

"The project works as a tool to reunite people with different visions and different ways of acting towards a final ideal, that not necessarily is the same to everyone, but that walks in the same direction (through the project). It becomes a type of marketing material, not in a bad sense, but a method to 'sell' and idea, a purpose. (...) The project won't be constructed to the letter and we have to detach ourselves from the drawing we made."

Everyone broadened their understanding of a Master Plan: much more than the final project to be constructed, it is an instrument of discussion, advertisement and learning. We revisited the plan so many times that, when going to the construction site, we had it in mind and could make the necessary changes. For example, when the plateaus changed and we had to decide how to relocate the equipment, we could do it, because we had previously studied each part of the terrain and the necessities for each equipment.

Another important lesson was the challenge in implementing a participatory project. In the university, we study the concept and the tools to develop it, but in practice, everything happens different than expected. Specially talking about students' intervention, as it is one of the proposals of FAU Social, the first hindrances were our lack of money and time to maintain the planned activities. In order to really implement the concept, we wished to go to different schools in the neighborhood, distribute flyers about the project, advertise the events several weeks in advance, have tools, games and gifts to call people's attention. Instead, each member had around two to four hours in the week to attend the meetings, do field survey, redesign the project, create the activities and make the advertisement material.

In relation to financial support, the partnership with LABHAB was crucial, since they sponsored most of the materials needed and some food for the activity. If the university had some program to finance this new group's formation, maybe we could put in practice many more of our ideas. Having the second activity day in a public school was also a great way to enable it, because they gave all needed support: the roof, teacher's supervision to the children and the meal.

To Vitor Miceli, the interaction with the general people from the community was weaker than he expected and he attributes this to the lack of time and difficulties in combining agendas. "If maybe we had split the group in two and one on them had worked only immersed in the community, seeking demands and legitimizing our acts, there is no doubt that the project would be much better, both in its acceptance and its maintenance, what is missing now."

Most of the students were, for the first time, acting in a construction site, doing data survey, studying different material and caring about construction methods. The project was then a first approach to all these

aspects, combined with the experience of dealing with construction workers. Since FAU Social's idea is to always act in real situations and generate a product, working with more experienced people, such as Daniel and Ana Paula, was an important step, considering that in future projects these students might be expected to be the ones with the technical knowledge.

7 FINAL CONSIDERATIONS

The usage of the park was intense since its inaugurations. People from all ages started to exercising when the first sunbeams appeared and, even at night, people would use lanterns to illuminate the equipment (the park still does not have public lighting) and enjoy the park. Some residents even reunited themselves to paint the wooden toys from the playgroup. (Figure 8 and 9)

Six months passed from the inauguration, however, we do not see the park we were expecting. It is still widely used, but the maintenance is very poor. Benches are graffitied, some equipment in the playground are broken and the court's fence is partially in the ground. This situation makes us question what did we do wrong, what could have been done better. (Figure 10)

Firstly, we attribute the situation to the bad quality of materials and construction methods used. From the beginning, we questioned the chosen techniques, such as the use of non-framed concrete and not welding the iron structure of the fence. Since sponsors did not have much money, they selected cheaper materials, to purchase more equipment.

The second possible reason, more related to our participation, was the inefficiency of the participatory project. It did work as an advertisement, but did not take the next step: create the sense of responsibility towards the space. It was also not effective in clarifying our role in that process. For the residents, we were related to the government and responsible for the maintenance of area. We attribute this fault to the lack of time and knowledge in both sides. The appropriation of an area takes time and the participatory project should be something continuous, where both the community and us – the technical support team – learn to establish goals, methods and limits.

I would like to highlight that none of these setbacks are reasons to avoid this type of partnership. They are all elements to be studied in order to improve these actions. The union of all actors was a pioneering project, which enabled the construction of a park desired by the community and allowed the exchange of experiences in many levels.

Even though the final form was not what we dreamed, it was something inside everybody's expectations, teaching us what an urban project really is, with several interests and hands working together. In the end, all parts benefitted from the results: The community earned a leisure area, gained new mood to fight for their bigger cause – the land regularization gave a big step in 2016 – and learned more about the role of urban planners. The university could work for the public good, as it is expected to. The local government made possible the construction of a new park and experimented a new working model; and us, the students, got in contact with a real project, with real demands, and real problems, being challenged in so many ways and learned from so many sources. (Figure 11)

ID 1436 | PLANNING EDUCATION IN THE CASE STUDY OF THE COURSE OF METROPOLITAN PLANNING IN ISTANBUL

Ekin Erkan Nihal,
¹Marmara University
nihal.ekin@gmail.com

1 INTRODUCTION: TO FORGET BEING A CITY PLANNER

After completing my urban planning degree in early 1990's, I started to work in local government. It did not take me long at all to notice the great gap between education and practice, just like Tasan-Kok et al. (2016) pointed out recently. Every day, drawing cities anew that were never approved of as they are anyway and putting my signature under urban failures were all I was doing in the municipality. But the person who kept writing minutes and petitions in the Chamber of Turkish Urban Planners in opposition to practice meetings; that was also me. Besides, the same person was editing theoretical articles of academicians for a local governments journal. Despite their value, the signatures put under documents of the municipality kept losing effect once they entered the city, making them resemble drops in the ocean. They were being imprisoned within the limits of the role planning was able to play in urbanization (Campbell and Fainstein, 2005). And what is more, that same pen used blood as ink most of the time. The production of inequality never slowed down in the process of capitalized urbanization (Harvey, 2016). The meetings of the Chamber amounted to beating the air, with the rare exception of a concrete outcome: a petition. Because filing charges against a planning project, without even knowing if you will win the case or not, could be described as participation in urban planning back in those days in Turkey. The journal's range and hinterland, on the other hand, was limited like that of an "island", just as its name suggested. I was educated to be a planner, I wished to plan cities, I believed that I was able to change cities, that I was able to change the world. However, I was weak. So I returned to the academy, as a field of power, because the educational environment could give me a chance to forget that I was a planner myself. At that point of my life, I was far away from and oblivious of using reflexivity tools like Bourdieu did in *Homo Academicus* (1988).

It has been 25 years since I graduated as a city planner. By writing this article in 2017, the 25th anniversary of my graduation, I aim to contribute to the improvement of planning education. I have picked my own educational activities as a research topic and in this paper I present the background, the theoretical framework, the methodology for my research, the data I obtained and the conclusion I came to in the end.

2 RESEARCH BACKGROUND, JUSTIFICATION, RELEVANCE AND OBJECTIVES: DIFFICULTIES AND POSSIBILITIES IN PLANNING EDUCATION

In general, planning education has three main components: spatial planning education, expertise-oriented planning education, professional competence (Gülersoy, 2007). Planners are at the centre of this categorization, which causes a major question in planning theory to be missed: "Who plans/makes cities?" Over the course of hundred years, planners have been a minority among those who plan/make the cities and have had limited influence on the result as well. This situation shows how important it is for planning education to involve a broader part of the society.

The shifting role of planners within the urbanization process and with related professions can be described as follows: From the proclamation of the Republic (1923) until the rapid urbanization phase which took place after the Second World War (1945), the exposed face of Turkey's modernization process, namely the cities were planned for the most part by foreign masters of architecture and planning. Then, planning entered a phase of institutionalization especially starting from the 1960's until the 1980's. While planners were busy with performing scientific activities in collaboration with demographers and sociologists in the newly-established educational and governmental institutions, cities got built by squatters. Following the year 1980, planners either had to resort to the skills of cartographers or, more often than not, became bankers while they tried to draft the improvement plans for these already constructed cities (in accordance

with the new construction repentance laws). In the 2000's, the number of graduates with the title of "planner" have increased in parallel with the also increasing number of city planning departments in universities. Additionally, jobs (types of labour) became varied in Turkey for planners: They can be employed as technicians, project directors, realty experts, academicians, city councillors, or maybe even as planners in private or public sector. In the end, they take their place among those who plan/make the cities. Well then who are those who plan (make) the cities? Uncertain. If you are an educator in a university, regardless of the program you teach, the student you are facing is definitely one of those "makers". Either with a little, or a big influence.

But who are you? Who is the educator? If you are licensed to teach planning, you are supposed to provide the students with the characteristics of a good planning program. The Royal Town Planning Institute specifies more than ten (10) characteristic features for a planning program to be considered good. Improvement of forecast and creativity in spatial planning, development of guiding strategies for implementation, as well as instructions on how to acquire skills for decision-making, mediation and efficient sourcing are among the criteria highlighted by the institute. The students get equipped with abilities to make spaces based on public interest. The educators, on the other hand, try to transfer these skills, values and knowledge to their students.

After completing their education, planners begin their duty where they are going to do their best. But as Kristina Nillson, Andrea Frank and Artur Rosa Pires point out, the conditions in today's European cities contradict with this duty, since the economic uncertainties combined with the problems caused by growing migrant and refugee influx are taking their toll on both the urban residents and administration, where public services keep failing and land use plans result in conflicts. In addition to this, social segregation tends to increase as a consequence. Further to that, owing to its social and economical texture and also the political processes it has been through, compared to European cities, Istanbul presents much more severe conditions that could be described as penal servitude for planners.

This text discusses the possibilities and the hidden hardships of teaching planning, using the Istanbul Metropolitan Planning course as a case study.

3 THEORETICAL/CONCEPTUAL FRAMEWORK/HYPOTHESES: GUIDANCE OF URBAN PLANNING THEORY IN PLANNING EDUCATION

Since the beginning of 2000's, I have been teaching in the Local Governments and Decentralization Master's and PhD Program, Institute of Social Sciences, at Marmara University. I also have been giving lectures on urban planning as part of the Global Cities and Istanbul Studies Master's Program since its launch. In the first years, abiding the course's place in the curriculum, I used to prepare a standard annual plan under the title of "urban planning theory and practice". The students taking part in the program formed a both demographically and professionally heterogeneous group consisting of graduates of various disciplines from engineering to political sciences. Professionals, experts, bureaucrats working in central and local government, politicians, the unemployed, who were elected or pursue academic careers, and even planners here and there, were among them. In the class, I was expected to introduce urban planning education to these makers of cities. The unit list of the class started with descriptions of fundamental urban and planning concepts and concluded with current debates on the agenda of planning in Istanbul. I was talking about the city as the subject and about decision-making mechanisms as the method of planning. The development of planning theory in a nutshell and what had to be done in order to solve urban problems mainly based on comprehensive planning were also included in my schedule. After all, if urban plans could be realized, we would have livable, sustainable and equitable cities. My aim was clearly "good urbanism" and I had my "tools of urban planning". All I had to do was to use these tools according to the rules I was teaching (and had been taught). As a result, my students agreed on asking "why are these plans not being/can these plans not be implemented, what a relief it would be if they were!", within academic limits and under my authority. This point of view involved theory taking on the role of rule-making for the practice: If practice would conform to theory, the problems would be gone.

However, it was generally accepted that theory and practice were disconnected. There were heated debates going on about planning theory, the development of planning as a discipline, its relations with other disciplines, the legitimacy of the action of planning, the field's boundaries/limitations and its ideal and

actional foundations (its values). While theory was taking on the role of rule-making and leading for practice most of the time, it also could be its echo occasionally. The disconnection between theory and practice was usually defined as a difficulty to overcome, but was also examined in terms of its functionality for educational purposes (Campbell and Fainstein, 2005).

In Sandercock's words, "In the late 1990's the world of planning education and practice uneasily straddles an old planning paradigm, and one that is struggling to be born, in a way that is evocative of Matthew Arnold's great mid-nineteenth-century image of wandering between worlds, one lost, the other yet to be found." (Sandercock, 1998). Those were the years how planning, that had removed the differences of the postwar era, was abandoned and the transition of cities from being metropolises to cosmopolises were talked about. Arguments were starting about how the space of flows could be included as a part of planning. Jane Manning Thomas had made the call for educating planners for unified diversity for social action back in 1996. In the world of postmodern era, theories of planning were diversifying and developing based especially on the communicative action approach by Habermas (Allmendinger, 2009).

The differentiation of discourses in planning education were triggered by the changes in the field of planning theory. As a planning teacher, I was following how planning theory was evolving. Adopting the communicative rationality paradigm was an appealing idea as well, but I had my doubts about types of participatory planning (communicative planning, argumentative planning, collaborative planning, ...), because the reason I came back to the academia was how all the participatory planning experiences I had "outside" left me disappointed, after all. The notion of being a "planner worth her salt" triggered wandering away from participatory practice and the "public interest" basis, while being capable of, "having command" of theory triggered desperation in practice. As I was swaying from one side to the other, planning education conferred the inefficacy and disgrace of being a planner on me rather than the opportunity and strength of a "thinking practitioner" or "practical scientist" (Campbell and Fainstein, 2005).

For my educational activities, I had two basic presuppositions, that were derived from theories of planning and education. "If a capable (group of) planner(s) have adequate background information about what a city is, they are able (supposed) to plan a good city" was the first one, while the second went like "If the educator has adequate knowledge (has a good grasp of the subject), they can (should be able to) answer the students' questions in class." While the first aims to improve the notion of the "good and wished-for city as we know it", the second aims to do the same for the "good and wished-for subject". The responsibility and the authority belongs to the planner and educator. If you have the adequate knowledge and skills, you will (might) be able to attain the aims (imposed on you). In other words, if you have the adequate knowledge and skills, the problem might be solved "in the way that it is demanded from you".

Adhering to these presuppositions, I experienced that the fuller my luggage was packed with knowledge, the more prepared I was to give quick answers. Both the questions and their prepared answers increased in number over the years. I knew and gave the answers to students' questions; I was teaching them, and they were learning. However, the answers would not solve the problems. I have not been able to reach the high level of "adequately knowing the subject of urban planning" then, and I still am not able today. Istanbul is being regenerated day by day. Every day, urban studies are being developed. But I do not, cannot have adequate knowledge. I will repeat this in the ontological, epistemological and methodological contexts: I cannot know. This research is the result of a planning educator confronting the state of not being able to know. It is the product of the acceptance of uncertainty.

Along with this acceptance, I reviewed my theoretical orientation and restructured my educational activities accordingly over the years, which was not something that happened overnight and is actually still going on. I tried to read Habermas in company with its criticism. Among theories of planning, I adopted the idea of turning my classes into laboratory in order to functionalize Haley's inclusive approach which improves multicultural communication and learning capacity, based on collaboration that strengthens mutual understanding and trust. I looked through Collaborative Learning, a topic included in the pedagogical formation course I took in 2004. I brought Thomas Gordon's effective communication approach into class with me, whom I was introduced to during my formation, but actually internalized thanks to the Effective Parenting courses I took (Gordon, 2001, 2002, Birsén, 2015).

I entered the classroom not to convey what I know, but to discover, to understand, to find meaning and to explain what I did not. I was there to research. I chose to be a researcher planner.

4 METHODOLOGY: THE CASE STUDY OF THE COURSE “METROPOLITAN PLANNING IN ISTANBUL”

While keeping track of my educational activities by the way of participant objectivation suggested by Bourdieu (not to be confused with participant observation) during the last years, “I have always seen myself as an object, but in the meaning of representing a category, not of narcissism,” in his own words (2003, 205). I cared about his promise of the possibility of finding places of real freedom (which are already very scarce) and generating a modest, practical morality if we carry reflexive sociology into action. I turned my classes into a research topic and submitted a research project suggestion to the Scientific Research Projects Committee of Marmara University. This first attempt of mine was completed with a paper entitled “How Has the Problem of Research Evolved in Urban Studies?” (Marmara University, Scientific Research Projects Committee, project no SOS-D-130416-0151). Even if interrupted every now and then, I continued with the necessary systematic work for my research, while planning my two master’s classes and teaching the others.

As part of this research, I collected data under the categories of students, instructors, pre-class preparations, contents of the course, teaching method, class discipline, teaching activities, students’ reactions and questions and student & instructor assessment & evaluation, using the participant objectivation method. My techniques for compiling data were varied, such as standard forms, surveys and interviews. Then, using these data, I reached some conclusions.

Data on students were collected over time: The documents they submitted for the master’s program application and their performances before the jury were the initial source of data. The second source was the forms I prepared according to Vygotsky’s (1998) conceptualization of cognitive readiness, which they had filled out at the beginning of the term. There were five sections in these forms: 1. The student’s demographical information and address. 2. Their relation to the program and the course. 3. Their experience of spaces and places. 4. Association game about their knowledge of fundamental urban and planning concepts. 5. Foreknowledge of scientists and sources in the field of urban planning. And my third source of data was the documents from various classes, where the students took notes or drew about the current agenda, their spatial experiences and conceptualization in spontaneous exams. Additionally, written and oral term papers and examination documents were basic sources of data on students.

Information about the instructor and the class was collected from the instructor evaluation forms students had filled out, the class evaluation surveys of the department, the comments delivered to fellow instructors or to the administration and from the instructor’s diary. In addition to the above-mentioned material, lecture notes used by the instructor, forms given to the students, the course plan submitted to the institute and the class project report by a student who compiled their and their friends’ notes were used to acquire data on the contents of the course, the educational activities and class discipline.

While techniques for data varied, a case study has been done methodologically based on participant objectivation. By comparative evaluation, data were turned into findings. Due to the qualitative approach of the study, the findings are presented in the end, in the form of potential hypotheses. A critical and reflective stance was adopted throughout the whole study.

5 ANALYSIS AND DISCUSSION OF RESULTS/FINDINGS: WHAT A RESEARCHING CITY PLANNER HAS LEARNED

The Metropolitan Planning in Istanbul lectures subject to this case study are part of the curriculum of the Global Cities and Istanbul Studies Master’s Program of the Institute of Social Sciences. The program offers both options of completion with or without thesis. Among the students who receive acceptance to the program without thesis, the ones who are permanent or temporary employees of municipalities or subsidiaries and participations receive automatically 75% scholarship according to the protocol signed by the Turkish Association of Municipalities and Marmara University. This collaboration of the university and the association of local governments was able to activate the program to guide the city makers of Istanbul, who are in charge in local governments.

The History of Istanbul, The Administration Structure and Governance Process in Istanbul, The Economic Structure and Development of Istanbul, Metropolitan Planning in Istanbul, Comparative Metropolitan Governments, Scientific Research Methods are the classes of the first term. The class schedule of the second term constitute of Istanbul's Culture and Aesthetics, Istanbul and Environmental Management, The Demographic Structure of Istanbul, Strategical Management and Strategical Planning in Istanbul and Metropolitan Financial Management. The teaching staff includes sociologists, political scientists, environmental scientists, financiers and experts of public administration and international relations. The instructor of the course in question is one of the three urban planner educators in the staff. 39 students took part in the two Metropolitan Planning in Istanbul classes (one each in the programs with and without thesis) during the 2016-2017 school year. All of them approximately were practitioners; 28 students had been working on different levels of management in several municipalities of Istanbul, two of them were deputy mayors and one student was an alderman. 9 students had been working in NGOs in Istanbul. Only two of the students were unemployed.

While occupational origins varied from engineer to firefighter, gathered data on students show that senior manager municipal employees were the majority of the group. Students who never went abroad and who form the elite layer of the space of flows (Castells, 2005) coexist within the classes, where the ages ranged from 22 to 51. On one hand, there are ones who preserved strong attachment to their hometowns and fellow townsmen; on the other, there are "villagers without a village" (Erder, 1998) who came to Istanbul as a result of forced migration and lost all connection with their hometown. Squatters and villa residents seem to have met in the same classroom as students. Being members of different urban groups, they are also scattered to various districts of Istanbul due to the city's labor and housing markets. Among the students working in Istanbul's municipalities that belong to the political party in power and the opposition parties, the number of them working for the party in power is dominating. Additionally, it can be deduced that the class profiles represents the segregation that has been debated to have increased in Istanbul's social texture in the last years.

Each course contains 10 units of presentation and discussion. Each unit is to be taught during one lecture a day of the week. Each lesson is between one and three hours long, depending on the topic. A new topic is presented with a catchy question. Students' criticism and comments are received by the educator in manageable quantities, with free-flowing conversation following right after. The lessons were formulated according to two models that have been interwoven: the simulation of the planning process and the black box model. The classical planning process diagram was utilized as well, while the lessons were configured based on planning theory. As is known, basic steps of the planning process are a common key for planners: It is possible to list them with reference to Friedman (1987), show them in a diagram like APA (2006) does or copy them from the Habitat report (2015). As for the lessons, the starting point was to see the class as an arena of debate as Healey (1996) suggests as part of the spatial strategy formulation and then follow the steps of flow as follows: the scope and style of discussion, sorting through the arguments, creating new discourse, agreement and critique.

Figure 1 - The Planning Process

During each class (in other words, black box), we constructed the topic using the participants' questions and answers which were "derived" from each other and then knowledge was processed and became shared. (After first week's class) each day we repeated/copied the residue of the previous class and also multiplied it. While the classes kept going on (in a cycle), the residues of knowledge kept accumulating in layers and formed an iceberg.³ Regardless of the fact that I had flexibly mapped out the topics forming the iceberg in the beginning of the term, the class contents evolved with the students' questions and my following of their interests and knowledge during the term. Each week, I brought forth a caption, a suggestion for a question. These captions expanded and transformed by the debates in the class. The classes were stylistically conforming to the standardization requested by the university, but they flowed with the students' knowledge and were constructed accordingly. Some question (caption) examples and what kind of research questions (topic of study) these correspond to for the instructor are as follows:

1. Introduction to the field of urban planning: description and development of knowledge, science and urban studies.
 - 1.1 Activity of "locating" Istanbul in 2016 and in the universe as a built environment
 - 1.2 As a member of the homo sapiens, the instructor's attempt of "participant objectivation" in the academy
2. What are the essential elements of cities? What are the similarities and differences between the first cities and the contemporary cities? Describing the evolution of cities as historical and geographical contingencies.
 - 2.1. Discussing the elements and sequence of urban DNA and designing questions for the patterns of the dynamics of transformation.
3. How do we experience, perceive and represent (a city) Istanbul? (The students describe the way they take to school with drawings. These drawings are discussed with Lefevbre's (2014) triad, also using input from Harvey (1999) and Castell (1997, 2005).
 - 3.1 Re-deciphering the capitalist and global character of (a city) Istanbul from various aspects.
4. What are the main questions of planning theory? How can the relation between urban politics and planning be described?
 - 4.1 Relating the object of planning, namely the city to the method of planning, namely decision-making mechanisms: Moving away from the distinction of object and method in planning theory. Examination of decision-making mechanisms in Istanbul's construction/ development process.
5. How was Istanbul urbanized? What kind of role did planning play in this process?
 - 4.2 Realizing the interdependence between the socioeconomic and political-governmental structures and that planning is located within this interdependence. Analysis of the structural background of problems caused by conjuncture. Examining the planning of Istanbul from various aspects historically and pluralistically.
6. Keeping track of Istanbul's planning agenda: What are the mega projects, relevant organizations, plans in force, new demands?
 - 6.1 To perceive the existence and the role of alternative realities in understanding, explaining and designing Istanbul, becoming aware of the choices and the variety of them.
 - 6.2 Examining the "preference falsification" (Kuran, 1997).
7. Discussing the urban transformation practices and their results, the fact of gentrification and evolving publicity in Istanbul.
 - 7.1 Expanding the boundaries of generating alternatives.
 - 7.2 Utilizing the planning classes as an alternative space for dialogue and a public place.
8. What are the main foundations of urban planning? What are the planning principles specified in the constitution and international documents? Bringing the principles of urban planning up for discussion.
 - 8.1 Paning the references.
 - 8.2 Seeking and discovering shared values (the "communals")
 - 8.3 Casting and playing out roles in Istanbul's planning; right now right here.
 - 8.4 Discovering the plurivocality of the conceptualization of public interest (all over again).

The list above is the knowledge formed by the subjects in the classroom and dissected by the instructor who used the method of participative objectification. Below follows the evaluation of the course and instructor by the students.

Some of the questions that were included in the survey that includes closed ended, ordered alternative questions (I don't agree at all, I don't agree, No comment, I agree, I completely agree) anonymously filled out by the students with the purpose of evaluating the course and the instructor, were about: the suitability of the course's reading material, the intensity of the necessary amount of study for the class compared to other classes, the encouragement the class provides for thinking and creativity, the benefits of the course compared to other courses. On the other hand, questions about the instructor included: the level of the instructor's knowledge about the subject, the level of the instructor's encouragement for asking questions, discussion and class participation, if s/he evaluates the students' work fairly, if s/he is reachable out of class, if the students would like to take another class from the same instructor and the instructor's overall situation (from poor to excellent). The majority of answers in both of the surveys were either "I agree" or "I completely agree". The questions where the "I don't agree" and "I don't agree at all" were marked, were those about comparing the class to others. Two among the total of thirty nine students marked "I don't agree" for the statement "the class is more beneficial compared to other classes". Six students marked "No comment" for the same question. Also the students stated that they studied less for other classes.

In the class improvement survey including three open ended questions, students specified the positive aspects of the class, the points where they think it should improve and three adjectives they would use to describe the instructor. Considering its content and style, the most significant feature of the class appeared as "full participation". While this particular style usually is approved of, it apparently had disadvantages for some of them such as "The class is so interactive that I sometimes forgot what we were talking about", in a student's words.

The need for clearer and more concrete share of knowledge was a concern generally expressed. In addition, the surveys revealed a warning for the instructor to care about the students' profile, as can be seen in some student comments below:

"I think that the course should be simplified and include more visual material for people with different undergraduate degrees to understand better."

"Students who were not sufficiently equipped for the class would benefit from short reading texts on the topics or similar material which would be helpful for them to reach the same level as others. The subjects can be discussed in a more clear and concrete way."

"The definitions of scientists such as Harvey and Castells were not internalized by the class. The current issues of people, institutions, history and lawsuits in metropolitan practice that we had in the last days attracted our interest a lot more. Concrete concepts could be included more."

"Every essential aspect has been dwelled on here. In addition, there could be more examples. There could be more bad examples which are more concrete, to compare with what should have been instead."

The positive evaluations of the course indicate some really important outputs. A student who worked as administrator said that the class "raised awareness. It put it in my mind that I have the duty of planning cities for future generations."

Another student who was an alderman stated "I know that I am not alone in my worries for Istanbul, where my children are going to live in the future. I will have a louder voice from now on."

The students' comments highlighted that the instructor had an "unbiased" attitude towards all, despite most of them were working in municipalities which belong to the political party in power and their arguments tended to favor the power:

"No project was aggrandized just because it was made by the power. There was not even a doubt about that in the class."

"The students' point of view and way of thinking have shown resistance to accept a new one. There could be different strategies to overcome this. But in the end, the instructor's strategy worked as well."

Ultimately, these courses were "thought-provoking and informative, provided motivation to do research" in a student's words and have also been guiding and expanding horizons for the instructor.

6 CONCLUSIONS: THE JOURNEY OF BEING A CITY PLANNER

I am one of the instructors who has been trying to bring the possibilities of participative planning into class with my urban planning courses that I have been giving since years. I am utilizing effective communication in generating collaboration with my students. I am carrying out my experience keeping in mind that "Experience can be reversely educative", as Dewey advised. Still contemplating about if my classes should be a topic for research, I am trying to find out what benefits could come from analyzing the classes as case studies. What could planning education gain from the comparative analyses of instructor's experiences with city makers as students from various disciplines, all over the world? Planning theory and practice, or cities, students, educators... I am not sure...

Examining the findings of case studies from the Istanbul Metropolitan Planning classes, the outcomes, the challenges confronted... Can these really act as guides?

In classes, when the topics were presented in form of open ended questions which we sought answers for together, the doors to possibilities for collective reflexivity opened up slightly. Now and then, our synergy and our flow generated some kind of public interest. One day, when I was thinking that particular class was an example of relationality for public interest, I was not expecting it at all when suddenly a student told me "to give them the 'right' information (notes) and dismiss the class instead of wearing myself out for nothing". I wanted to quit and leave the class, but I didn't. I realized that planners are in quest for power to generate public interest, as planners. Planners are the ones authorizing public interest in their city. But at the same time, I was able to observe that the motto of "Public interest means solving the citizens' problems, to protect their property and to maximize their profit" were reflected on my students' actions who were aldermen, deputy mayors and advisors. Together, we looked for ways to regard public interest and also building it as a "win-win" situation as matters of creating common interest ("A single zero leads the whole multiplication to zero." Stefano Zamagni quoted by Archer, 2015, 249), rather than creating total benefit. I realized that two variables stood out in the way my students participated in this pursuit. One of these is the student's aim in enrolling in the program (obtain diploma, acquire status, curiosity) and the second is if the student was able to generate a sense of belonging to the class or not. The symptoms for their levels of belonging could be observed in their positive or negative reactions to each other during class, the seats they chose to sit, their conversations and arguments during breaks and (partially) in their friendships after class. The stronger their relations became, the more they wanted to defend the common grounds they had and the more they resisted to opposite ways of thought. Additionally, I noticed that factors such as the students' personal development level, their knowledge in the field and political preferences were affecting their performance of class participation in an indirect way.

While playing out my role as an instructor in taking part in discussions, listing arguments and forming a new and common discourse, the part both most difficult and helpful for me was to attain intellectual and emotional acceptance; in other words, to understand the other(s) (the antithesis). Regardless of how unfavorable the idea sounds, I realized that I was able to understand the other and as a result to become independent and flexible, as long as I kept accepting them intellectually and emotionally. Accepting a disagreeable idea or action was not the same with approving it; in fact it was a prerequisite to change it or play a part in the change. For freedom, the connection with the opposite had to be severed. Thus flexibility could arise. Apparently, in the instructor evaluation forms students described these efforts with adjectives such as questioning, question-provoking, fair and unbiased. During the whole term, I was able to reach neither the sufficient flexibility nor the sufficient concreteness to solve the problems. My efforts in dealing with issues in dual languages of both theory and practice did not satisfy my students. While they kept demanding more concrete and ready solutions, I, as a planner educator, was busy looking for ways to decipher/solve the formula for the pattern in practice together with them. Very often, I reminded myself Crick's warning against blind faith in democracy and about how much should be expected from science in discovering the objective truth, who also describes politics as reconciliation (Heywood, 2013). I kept repeating that our demand for "democracy" and "truth" (which is perhaps out of place) in Istanbul's aggravated circumstances also came with the obligation and opportunity of finding creative ways for Istanbul. As a consequence, the findings of these case studies in class revealed my dependence on methodical generation of knowledge (research) in planning, while they pulled me into the boundaries of critical pedagogy as an academician.

In the end, as participants of the course of Metropolitan Planning in Istanbul during the 2016-2017 term in Marmara University, we tried to create a humble and temporary space of dialogue and an alternative public area. Even if we did not succeed yet, not having consented to the existing, having enough courage

to try to change; are these not “planning” itself? As stated by Aesop 2017 under the title of Urban Futures: Challenges and Vision, “Inspired by Harvey (2012, X) and Lefebvre, the track invites you to envision “an alternative urban life that is less alienated, more meaningful and playful but ... conflictual and dialectical, open to becoming, to encounters (both fearful and pleasurable), and to the perpetual pursuit of the unknowable novelty”. I am aware that we have possibility of making comparative analyses with educators who respond to this invitation and wish to open their classes to participant objectivation. With this paper (this beginning), I am gathering my pride as a planner instead of my embarrassment as one, as I celebrate the 30th year of my start to planning education and my journey of becoming a planner.

ID 1449 | PROCESS-ORIENTATED LEARNING AS KEY ASPECT IN HANDLING UNCERTAINTY. EXPERIMENTAL TEACHING METHODS IN CONTINUING EDUCATION IN SPATIAL PLANNING

Anita Grams¹
1ETH Zurich, Switzerland
grams@ethz.ch

1 INTRODUCTION

Understanding spatial planning as an action-oriented discipline allows planning to concern itself with the exploration, clarification, and resolution of difficult, unsolved tasks. The starting points for this are both spatially relevant conflicts and desirable spatial developments, as the latter too can likewise lead to future difficult and unsolved tasks. Due to the fact that solutions to spatial planning problems always lie in the long- term future, clarification processes must be able to adroitly handle circumstantial changes linked to uncertainties, such as changing political priorities or shrinking financial resources. Employing model calculations and perfecting forecasting methods alone is insufficient for appropriately dealing with the degree of uncertainty in a planning process. On the contrary, what is needed are methods that take into account the uncertainties, as well as desired and undesired effects of decisions in solution-finding processes. A universally valid approach for exploring, clarifying, and solving future spatially relevant problems cannot be prescribed; this depends on the given tasks, and must be tailored to the respective problem situation (SCHOLL 2011: 279). Moreover, what underlies most difficult, unsolved tasks is a decision-making problem (BEHN/VAUPEL 1982: 40 f.), which in turn triggers subsequent action. As such, approaches for laying the groundwork for decision-making and actions take centre-stage in research and teaching on spatial planning.

In Switzerland in particular, being a small country in the heart of Europe, with its topographically determined, limited availability of settlement areas, and its landscape as principal bearer of identity, problems of coordination in spatial planning tend to appear sooner in Switzerland than in other countries. Moreover, due to the small territorial extent of the country, most challenging planning problems are transnational tasks. As such, Swiss spatial planning is - to a greater extent than in other countries - dependent on applying methods for clarification processes which don't rely on formal procedures but rather place informal problem exploration at the start of a planning task. These special conditions make Switzerland's main settlement area a fruitful laboratory space for examinations in research and teaching.

1.1 PROBLEM ORIENTATION AS PREREQUISITE FOR HANDLING UNCERTAINTY IN SPATIAL PLANNING

In the field of spatial planning, there are few helpful theories which specific research questions can build on, and which can be transferred to any given spaces (SCHÖNWANDT, JUNG 2005: 790). Moreover, they are only partially good for exploring, clarifying, and solving new types of problems, which are, for example, emerging due to the primacy of inward development in Switzerland (GRAMS 2017: 43). The planning theoretician Horst Rittel had already in 1972 criticised that a rational planning model is ill-suited for future spatial planning tasks and developed the “planning model of the 2nd generation” (RITTEL 1972: 392). According to this model, planning doesn’t involve “tame problems” but almost always “wicked problems”. “Wicked” planning problems are characterised by their uniqueness and lack of a conclusive definition. Moreover, there are no demonstrable, conclusively quantifiable sets of solutions and measures for such planning problems. Therefore, solutions to “wicked problems” are not classifiable as either “right” or “wrong”, but only as “plausible” or “less plausible” according to the current level of knowledge.

What has proven to be of much greater help for solving problems than the discussion on spatial planning theories, has been the disclosure of approaches adopted by participants in a clarification process. Every planner consciously or unconsciously adheres to a system of values with regard to how he/she perceives and attempts to solve planning problems. Spatial solutions that lie in the future are highly dependent on assumptions made in the present. It is therefore essential that planners disclose their approaches at the start of a problem-solving process, including the assumptions they make, and how they intend to handle uncertainties. Without explicit formulation of approaches, solution variants cannot be compared and the process cannot be improved. Such an approach comprises problem orientation in the “planning model of the 3rd generation” (SCHÖNWANDT 2011: 295). Precise exploration of the initial problem of a planning task is the essential point in handling uncertainties. For if the problem is not formulated in a precise manner, the chain of reasoning cannot be developed, simply because the problem to be solved is unknown (SCHÖNWANDT 2011: 300).

The realisation of what exactly constitutes the basic problem in a specific planning task grows out of a structured clarification process. This must permit the conception as well as rejection of solution variants alike. When transferred to teaching, this means that students are, above all, given methodological guidance in the problem-solving process. To this end, a teaching concept has developed in the continuing education programme in spatial planning at the ETH Zurich in Switzerland², which focuses on problem orientation and process expertise.

1.2 PROBLEM-ORIENTATED TEACHING

Action-orientated spatial planning develops recommendations for decision-makers acting in space on how invariably limited resources should be usefully applied to solve a current or future problem. To implement them, formal instruments and procedures are necessary whose regulation by law is different depending on the territory. Therefore, in teaching spatial planning, it hardly makes sense to exclusively focus on imparting expertise on which formal instruments and procedures are to be applied in different administrative units. Rather, teaching is directed towards methodological expertise on how problems can be solved in a limited time. To this end, first and foremost, study projects must be mentioned here (see 2.1) which are to be prepared and guided by experts with practical experience. Moreover, lectures and seminars also assist in defining problems from the perspective of different disciplines. Table 1 gives an overview of the learning units in the continuing education programme in spatial planning.

Learning unit	Problem-orientated learning objectives
Spatial Planning: Function and Methods	Familiarisation with and comprehension of the tasks of spatial planning. Methodologically important elements of spatial planning processes (assessment of the situation, focus decree, conception, decision-taking, reasoning).
Urban Planning and Urban Development	Methods and tools for urban design and working out urban development strategies.
Landscape Architecture	Impartation of a landscape-based approach to a given urban development project; critical consideration and review of landscape and tools; impartation of basic principles for a well-considered design understanding.
Landscape Planning and Environmental Planning	Understanding landscape development using system-dynamic analysis; methods for weighing of interests.
Transport Systems	Understanding the effects of infrastructure on space as accessibility-producing, vital network industries.
Communication and Conduct of Negotiations	Simulations of typical presentation and negotiation scenarios; introspection on one's own presentation style; reasoning.
Spatial Economics	Understanding spatially relevant economic relationships and driving forces of spatial development. Understanding and assessing existing spatial concepts, policies, and measures. Development of new concepts for spatial development policy.
Spatial Sociology	Understanding socially relevant relationships in spatial planning; methods of participation.
Planning and Policy	Familiarisation with, comprehension of, and structured discussion on the political science-based view of planning.
Spatial Planning: Theory and Methodology	Impartation of approaches and active application of basic principles of planning theory and methodology; plausibility and rigour in planning-related chains of reasoning; problem determination; analysis of the causes of problems.
Academic Work in Spatial Planning	Procedures for clarification processes; basic principles of academic working and writing.
Law	Understanding the relationships between law and space. Understanding juridical thought and methods.

Table 1 – Overview of learning units in the MAS programme in spatial planning at the ETH Zurich

1.3 PROCESS-ORIENTATED LEARNING

Study projects form the core of teaching in the continuing education programme in spatial planning at the ETH Zurich (SCHOLL 2012). With this focus on the impartation of methodological knowledge, the continuing education programme corresponds to the needs of Swiss planning practice which, in the course of the paradigm shift from inward to outward development, especially requires experts who understand planning primarily as a problem-solving and formative process. By orienting continuing education in spatial planning in this way, Switzerland occupies a unique position compared to the rest of Europe (FRANK ET AL. 2014).

Implementing several study projects within the framework of continuing education of professionals in spatial planning basically simulates the method of test planning (SCHOLL 2011: 330). Competing, interdisciplinary teams work on a task within a limited time period while being regularly subjected to criticism by a circle of experts from the project field. Working on problem-solving in three cycles with different foci (see Fig. 1) leads to robust reasoning, which finally culminates in a recommendation to the stakeholders acting in space. In a first cycle, an overview of the main influencing factors and an assessment of the situation is made. At the end of this “opening and narrowing down” phase, a focus decree determines which problem is to be solved from the viewpoint of the students. In a subsequent procedure, the focus decree is examined and expanded into a concept. In conjunction with temporal structuring which divides the individual elements of the problem-solving process into short-term, medium-term, and long-term measures, the concept turns into a strategy. This forms the core of the clarification process. The last cycle serves to deepen and adjust the results, culminating in a draft proposal to the relevant actors in space.

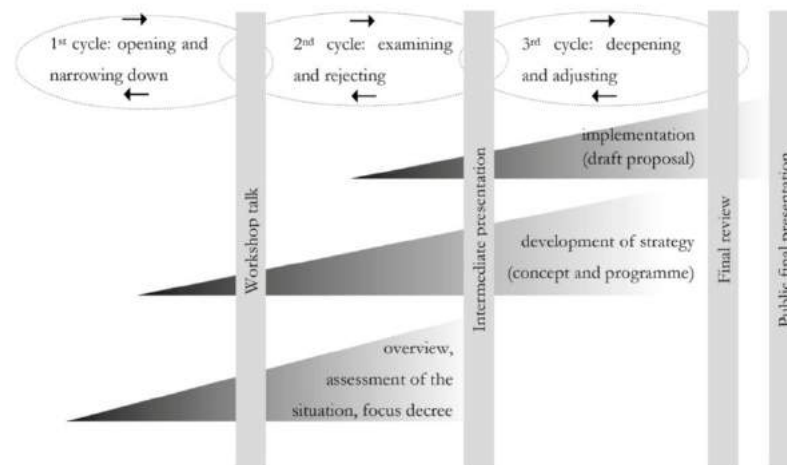

Figure 1 – Phases of the clarification process in process-orientated learning

Process orientation, in contrast to product orientation, is unfamiliar to most students at the start of continuing education. Only by an intensive engagement with the phases of the problem-solving process do they achieve sure-footed reasoning, partly leading to surprising results, especially when starting positions are uncertain.

2 EXPERIMENTAL SIMULATIONS OF PLANNING PROCESSES IN CONTINUING EDUCATION IN SPATIAL PLANNING

Handling uncertainty in a planning process can be trained in education. In the continuing education programme in spatial planning at the ETH Zurich, various interdisciplinary teaching methods have been continuously developed and extended since 1965. Essentially, they consist of simulation experiments of actions and decisions.

In this context, a most precise distinction between the terms ‘simulation’ and ‘model’ must be made. A simulation allows a scientist to simulate a process by means of another process (HEGSELMANN ET AL. 1996: 77). In doing so, the process is divided into various useful sequences, and is always tailored to a specific problem to be solved. Simulation results are open-ended. A model, by contrast, targets a mathematically backed up final condition of a process, which may lead to questionable results in the social sciences. The Process-orientated learning as key aspect in handling uncertainty philosopher of science, Mario Bunge, insofar warns of the irrelevance of mathematical models in the social sciences: “Some of these models are just intellectual games.” (BUNGE 1996: 64). In this context, he warns against viewing the computer as a substitute for theories: “Computing without theory is mere data processing devoid of explanatory power” (BUNGE 1996: 65). For problem-oriented spatial planning, simulations in the learning process are useful. The application of models can well be seen as a component in the clarification process, though they are far from replacing it.

2.1 REGIONAL AND SUPRA-REGIONAL STUDY PROJECTS

In academic continuing education, teaching and learning based on unsolved tasks is accomplished by working on study projects. Here, in contrast to basic training, participants can fall back on experiential knowledge from daily planning practice. Elementary knowledge in fields such as project management, as well as knowledge of formal procedures and instruments or skills such as the application of programmes for processing large amounts of geo-data are expected at the start of studies.

In the MAS programme in spatial planning at the ETH Zurich, a regionally oriented and a supra-regional study project primarily serve didactic purposes, though the task is based on actual planning problems. Solutions to complex tasks in spatial development must be drafted in a clarification process on the basis of

the given and respectively different spatial, factual, and operative conditions. As such, the MAS students are to be given opportunities to apply and bring together, as well as to supplement and deepen the knowledge and skills acquired during the MAS programme and in their own professional training on the basis of real spatial planning problems. Moreover, this also serves to address questions in the study projects which are interesting from a professional and practical viewpoint. Conversely, current information and new knowledge from scholarship and practice should, finally, also flow into the study projects as directly as possible.

The organisation of project studies presupposes only a few albeit important rules, such as division of students into groups, limited time for implementation, and a clear structure of the learning process (Table 2).

	Regional Project	Supra-regional Project	Project abroad
Scope of consideration	City and its agglomeration	Functional space	City and its agglomeration
Work parameters	As given in the assignment	Freely selectable, based on thematic focus decree	As given in the assignment
Focus decree	Spatial	Theme-specific	Spatial
Process time	10 months	8 months	1 week
Number of students	20 - 24	20 - 24	30 - 40
Number of teams	4	4	6-7
Number of students per team	5 - 6	5 - 6	7 - 10
Number of teaching staff	6	8	10-12
Language of instruction	German	German	English

Table 2 – Features of study projects in university-based continuing education in spatial planning

Though the groups simultaneously work on the same assignment, each of them focuses on a specific component deemed primary by the group on the basis of its selected strategy, in order to examine the feasibility of the selected approach, also with respect to costs, time constraints, and other important parameters. Projects are also especially suitable to establish and maintain links to practice. To this end, experts are consulted to supervise project work and to explain especially important aspects of a given task.

2.2 STUDY PROJECTS ABROAD

Methodological knowledge is acquired and trained in study projects. After successfully completing two projects, the students are ready to work on a third study project under more difficult terms. This serves to examine whether they have internalised problem orientation as an approach.

The project task is prepared during the course of one year in cooperation with teaching staff from abroad, and focuses on a city and its agglomeration (Table 2). Thematically, the main focus lies on coordination problems such as between urban development and railway development. Students face a demanding challenge insofar as, firstly, the project abroad is processed in only a week; secondly, the groups are interdisciplinary and intercultural; and thirdly, the procedural work takes place in English. Moreover, the students have to organise themselves into larger groups.

As the experiences over the last few years have shown, this type of process-orientated learning is a major challenge for students. Skills are trained to maintain an overview even under difficult conditions, while reasoning skills in different cultural contexts are also exercised. This project concludes the two-year continuing education programme in spatial planning, and especially supports students who intend to handle difficult, unsolved tasks in an international context in their subsequent career and to take on leadership roles.

2.3 EXERCISE: EXPERIMENTAL SIMULATION OF A TEST PLANNING PROCEDURE

The continuing education programme in spatial planning at the ETH Zurich in Switzerland incorporates a learning unit on “experimental simulation”. Experimental simulations are thought experiments in which students assume the roles of different actors and stakeholders of a planning procedure in role plays, representing their respective aims and reasoning. The learning objective is to explore possible decisions and actions in general. Over the course of several role-playing cycles, the students take on various roles in different settings. By combining their own daily work experiences with the presumed aims of the respective actors, they learn reasoning skills, and how to respond in messy situations where a given problem isn’t at all clear yet. For this reason, experimental simulations are only successful as a teaching method in continuing education where students already have a certain professional background.

The experimental simulation exercise is used to simulate the clarification and decision-making process of a test planning procedure (SCHOLL 2011: 330). The exercise follows the organisational and operational structure common for this procedure in a shortened time frame. As such, groups of students take on different roles and responsibilities (Table 3).

Role	Task	Group size
Assessment body, incl. chairperson	<ul style="list-style-type: none"> Responsibility for correct implementation of the test planning procedure Assessment of team contributions on the basis of the task formulation and assessment criteria Conduct of dialogue with the teams Proposal with recommendations addressed to the executive committee for the next procedural step 	5-7
Executive committee	<ul style="list-style-type: none"> Overall supervision of the procedure Responsible for strategic decisions Appraisal of drafts of teams 	3-5
4-5 Teams	<ul style="list-style-type: none"> Preparation of drafts Presentation of findings Revision of drafts on the basis of the recommendations of the assessment body 	16 -20
Observers	<ul style="list-style-type: none"> Continuous process observation Regular report to the assessment body 	3-4
General public	<ul style="list-style-type: none"> Critique of final recommendations from the viewpoint of the general public 	4-5
TOTAL		30 – 40 Students

Table 3 – Roles and tasks of actors in a process simulation

The assessment body provides quality assurance in the test planning procedure. It strives for decisions by consensus, and is led by a unanimously elected chairperson. The following representatives constitute the assessment body: representation of property owners; experts from the fields of urban development, transportation, economics, open space and green space planning, and social issues.

The organisers are represented by an executive committee. This constitutes the commissioning authority, having oversight of the test planning procedure. It is informed of the work status by the chairperson of the assessment body subsequent to the presentations, and has the opportunity to ask questions to this end. The teams are composed in an interdisciplinary manner, consisting of experts in urban development, open space planning, transportation, and economics. The teams are led by the urban development representative (an architect or spatial planner). A group of observers takes part in all activities. They analyse the learning process, giving their feedback at the concluding discussion at the end of the exercise. This ensures that the didactic objective is met. The general public too must be represented within the framework of the simulation, including representatives of associations, organisations, owners of adjacent properties, and potential investors. Likewise, representatives of the media are to be included in this group.

The operational structure of the experimental simulation exercise follows the actual course of the procedure and must encompass several cycles. Three cycles on three consecutive days have proven themselves. On the fourth day, the simulation is concluded with a media conference. At this occasion, subject matters which have not yet been discussed can be addressed, also by teaching staff. The following illustration shows the operational sequence of the exercise (Fig. 2):

This thought experiment has to be prepared, performed, and assessed very carefully. It is based on an actual planning process, and active participation by the key actors is expected. By confronting the students with actual planning problems in combination with their own passive knowledge and intuition, they are able to simulate problem-solving. This leads to a hitherto underestimated intensification of teaching practice.

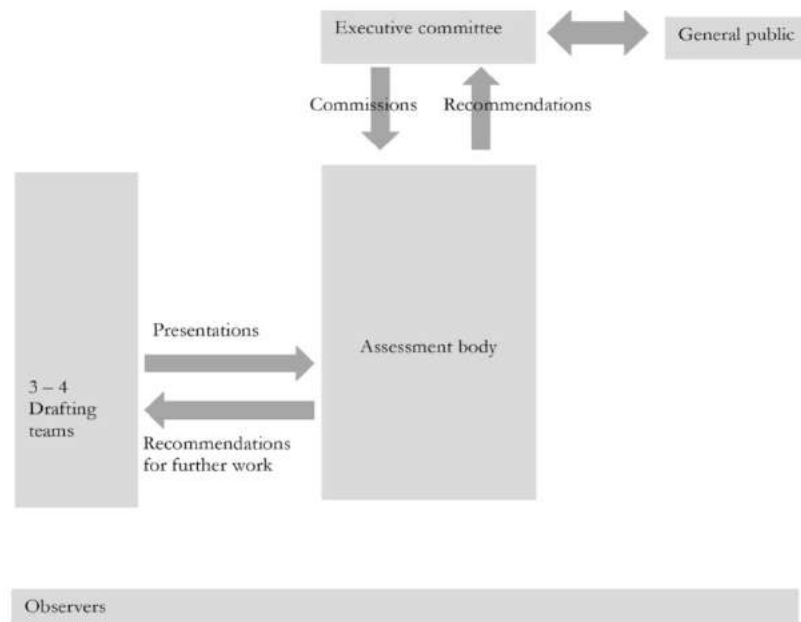

Figure 2 – Role differentiation of actors in the clarification process

3 SPATIAL SIMULATIONS AS A TEACHING METHOD IN CONTINUING EDUCATION IN SPATIAL PLANNING

With action orientation as the underlying basic conception of problem-based teaching, simulations and study projects become central to continuing education in spatial planning. As such, interdisciplinary work on difficult, unsolved tasks can be understood as a method to sensitise students with respect to uncertainties in the planning process. By internalising a three-phased problem-solving process graduates are conditioned to take on leadership roles for difficult clarification processes. The experience gathered in the continuing education programme in spatial planning at the ETH Zurich is leading to the emergence of several factors determining the success and failure of simulations as a teaching method.

3.1 FACTORS FOR SUCCESS

The impartation of methodological knowledge by means of difficult, unsolved tasks in the continuing education programme also requires teachers to come up with more than the usual forms of instruction in elementary studies. Firstly, lecturers must have accompanied an actual procedural process which is being used as an example for the simulation. This means that the professorship responsible for the course is participating in cooperation projects in practice, and has preferably even developed and led them. Practice orientation in spatial planning at university level cannot be taken for granted in Switzerland, though future problems in planning demonstrate that it is precisely problem orientation that is needed to attain new knowledge in research and teaching. Secondly, the application of simulations in teaching requires more preparation time than is usually available for conventional teaching methods in a daily teaching routine. It is useful to start drafting the task formulation already during an actual procedure in order to identify critical milestones in the procedural process at an early stage and to productively imbibe them in teaching. Moreover, a study trip to the site of a completed or ongoing test planning procedure following the simulation has proven itself. As such, students can get an idea of the circumstances on site, and look back on the procedure while being engaged in discussion with important process-specific actors. Questions which may have come up during the simulation, can be originally answered by the actual actors. This

dramatically enhances the learning achievement in continuing education in spatial planning. Another success factor has proven to be a clear rhythm during the implementation of simulations. Individual steps by students in the clarification process must follow the actual procedural sequence. Study projects carried out over two semesters and in sequences of about 3 months have proven their worth. An experimental simulation of a clarification process can be carried out during a week, whereby as much time should be devoted to self-study as to group work. This leaves sufficient time for a thorough familiarisation with a given role in the simulation, and for practicing adherence to temporal sequences. This also demonstrates the great responsibility of the role of the chairperson of the assessment body. This role should be taken on by practically experienced students.

3.2 STUMBLING BLOCKS

The basic precondition for learning on the basis of specific projects is a certain individual experience in handling problem-solving processes in practice. Therefore, continuing education in spatial planning is predestined for applying experimental simulations as a learning method. Students come from various spatially relevant disciplines, such as geography, architecture, construction engineering, etc., and must have at least 2 years of professional experience following their graduation. If such a first experience of real planning processes is lacking, an experimental simulation risks sliding off into a simple role play, which fails to lead to a satisfactory learning effect. Therefore, this method is hardly suitable for application during elementary studies in spatial planning. Another difficulty has proven to be allocation of too less time for role differentiation in the exercise schedule. Students must be able to come to grips with their role in the planning process as they ideally change their roles thrice during the exercise. This also necessitates that the individual cycles of an exercise take place on 4 consecutive days, with a new distribution of roles at the start of each day. It also requires the possibility for block instruction during a week, which is rather difficult to organise in elementary study instruction and its semester programmes. In conclusion, it must be stated that the preparation, implementation, and follow-up (study trip) of such a problem-orientated learning method requires more teaching staff than is the case for conventional exercises and lectures. It has proven to be beneficial to have 2-3 research assistants for formulating the task, of which at least one must have participated in an actual procedure. This requires specialists in teaching who ideally are at the doctorate or post-doctorate level.

4 RECOMMENDATIONS FOR FURTHER DEVELOPMENT OF TEACHING METHODS IN CONTINUING EDUCATION IN SPATIAL PLANNING

Spatial planning in Switzerland, with its more than 2,000 autonomous municipalities, requires extensive coordination and is a major challenge for planning practice. In continuing education in spatial planning, it is therefore useful to focus on imparting methodological knowledge on how difficult tasks can be brought into a clarification process. A spatial planner is not only responsible for supplying ideas at a very early stage of a planning process, but also for balancing interests and initiating interactions. This constitutes a major challenge, all the more so, considering that planning is also political consulting. In this field, planners must carefully assess ideas, interests, and interactions. As such, planners are also exposed to social and economic constraints, making planning - especially the teaching of spatial planning - extremely demanding. Handling uncertainty and understanding the various mechanisms in a planning process when it comes to negotiations can be trained in education. The most important element for coping with complex problems in teaching is illustrative clarity, bringing vitality and pragmatism to the process. Visualising a planning process by means of experimental simulations can most aptly be described by the term "enactment". This also makes clear that careful adherence to role differentiation in the exercise is the essential factor for successful learning.

This results in the recommendation to focus more on the simulation of processes in continuing education in spatial planning. Designing and testing arguments in a negotiation process that feels "real" can greatly enhance personal motivation and sense of discovery in students. They are able to strengthen their judgement ability by learning to cope with opposition and criticism. At the same time, this method fosters an enthusiasm and a fascination for planning problems, which is important since the results of planning efforts often only become apparent decades or even generations later. A fascination for testing, experimenting, and of course solving problems should be a basic requirement for future planners. Training

these skills is highly stimulated by illustrative clarity. Teaching by means of discussions of case studies, experimental simulations, and on-site explorations is extremely demanding, confirming that teaching professionals require a certain practical background. This ensures that the concept of illustrative clarity and its teaching methods become a central aspect of learning and teaching spatial planning.

ID 1468 | TEACHING-IN-THE-FIELD IN A “HUB” ACCOMODATING MIGRANTS IN TRANSIT IN MILAN. CHALLENGES AND OPPORTUNITIES FOR A “SOCIAL AND URBAN ANALYSIS” COURSE

Paola Briata¹, Ida Castlenuovo¹, Giuliana Costa¹

¹DASTU - Politecnico di Milano

paola.briata@polimi.it ; ida.castlenuovo@polimi.it ; giuliana.costa@polimi.it

1 INTRODUCTION

The paper reflects on a teaching-in-the-field experience carried out in the context of the course of “Social and Urban Analysis” for students at the third year of bachelor in Planning at Politecnico di Milano. The course integrates the competences of two professors who are experts in urban sociology with a particular

attention to inequalities and welfare provision, and in urban planning with a particular attention to immigration issues and multi-ethnic contexts.

For this specific course, a collaboration was established with Fondazione Arca, a big third sector agency that assists homeless, drug addicted, vulnerable and deprived groups in Milan and in other cities.

Arca currently runs the main centre -called “hub”- destined to accommodate refugees and migrants in transit arriving at Milan’s Central Station, where they receive basic services like food, short term accommodation, medical advice, orientation towards other existing services. Arca started to work on this issue in October 2013, in a first instance intervening in more “emergential” ways inside the station, and then finding new spaces to offer more structured services. The hub was opened in May 2016 thanks also to the significant support of the Municipality of Milan. Other public, third sector and voluntary bodies contribute to deliver different services inside the hub. This centre has been able to integrate the work of different public and third sector actors, becoming a best practice of “welcoming” migrants in transit in Europe.

It is important to underline that, after more than twenty years of centre-right governments in the Municipality of Milan, including Mayors coming from the xenophobic North League party, in 2011 the election of Giuliano Pisapia supported by a centre-left coalition marked an important shift towards a less aggressive public debate on immigration and refugees (Marzorati and Quassoli, 2015). A particular role was played by the Sector in the Municipality dealing with “Social Policies, Welfare and Rights” and, in particular, by the Councillor in Charge for this Sector Pier Francesco Majorino who devoted a lot of attention both to issues arising in different neighbourhoods due to the presence of more established immigrant populations as well as to welcoming refugees and immigrants in transit (Majorino and Sarfatti, 2015). This position was basically confirmed after the recent election of the new Mayor Giuseppe Sala in 2016. Majorino was confirmed in his role, and the change in the construction of the public debate on “strangers” could be measured by the success of multi-ethnic and multicultural parade “Together without walls” held in Milan the 20th of May 2017, registering 100.000 participants.

The paper will unpack a series of issues that emerged during and after the teaching-in-the-field experience from the pedagogical, the social analysis and the planning theory’s sides. Globalization and the challenges of dealing with diversity had to be framed in a way that allowed critical thinking on the impacts on urban management of the arrival of a huge amount of people mainly “transiting” in a city without settling there. The specificities of knowledge and skills that students in planning can gain working in the field will be developed, focusing on how this teaching environment can contribute to train more responsible and aware future practitioners. Given the high vulnerability of groups involved in this project – people coming from different countries, most of them escaping from violence and war – a core reflection was related not only to opportunities and challenges for such a type of teaching experience, but also to ethical issues.

The paper is structured as follows: § 2 describes the more general framework of Polisocial, the public engagement program of Politecnico di Milano whose experts supported also the specific experience discussed here; § 3 introduces to the context of immigration in Milan with a particular focus on migrants in transit and refugees, and gives some information about the field where the teaching experience was developed; § 4 describes the didactic activity and its results, then some reflections on this experience are proposed in § 5.

2 TEACHING IN THE FIELD URBAN AND SOCIAL ANALYSIS

The course “Social and Urban Analysis” was framed in the context of Polisocial, the public engagement program of Politecnico di Milano supporting action-research and action-learning experiences, with the purpose of experimenting a new active role of the university within the civil society. Polisocial’s vision is grounded on the idea that universities should be leading institutions directly involved in addressing social changes, producing collective learning, and taking on new social responsibilities to refocus the “missing” link between the university and the city (Balducci, 2013). The perspective is to fill the gap and strengthen the connection between the university and territories, operating towards the reinforcement of an academic institution more and more able to serve communities, produce “usable knowledge” (Lindblom and Cohen, 1979) and face emerging social challenges. To reach this goal, Polisocial actively promotes and develops socially oriented teaching and research activities.

Concerning the educational practice, one of the initiative promoted by the programme is called “Teaching in-the-field”. This is an experimental programme aimed at fostering engagement with communities through a number of teaching activities where students and teachers work together with local partners, addressing challenges or problems the city/community is facing. The idea is to establish an interplay between teaching activity developed within the University and experience in the field, opening the perimeter of the classrooms and bringing students and teachers on the ground, involving them with the complexities of real-life situations and concrete issues, cooperating with social actors, questioning the social utility of teaching and research practice.

In this framework, “Teaching-in-the-field” proposals are innovative experiences of action/active-learning. Learning environments in which students, teachers and community partners work together, sharing ideas, producing knowledge and strategic thinking to contribute to the development of more just cities and equal societies. The process of design and implementation of teaching activities is characterized by an approach of co-design and co-sharing, in which all the parts are actively involved in a dialogue inside and outside the university, and they all contribute to the development of the collaborative process.

The design and development process of a teaching in-the-field project consist in different activities and operations, which can be described through the following stages: the first one entails a dialogue with civil society partners to align their requirements to the didactic work, aiming at matching the need of community to the educational goals of teaching practice. Teachers and partners try to understand how the didactic work can be useful for facing communities’ challenges, expectations and desires. In this stage, the brief of work is developed together in order to establish and share the purpose of the project work.

The second stage concerns the development of the teaching activity. External partners are actively involved as they have a leading role to make students understand specific topics, issues and local dynamics. Moments of interaction and discussion with community partners are planned, and they take place both inside the university and outside, in the field, by experimenting an innovative and open teaching approach intended as a “public” practice of mutual learning. Students, coordinated by teachers, should cultivate relationships in close contact with partners, using meetings and group work as tools of interplay, even beyond the time and the possibilities of classwork. Surveys, interviews, field visits, observation, involvement and participation in partners’ activities are important tools to interact with them. Working moments with community partners are constituent activities in the development process of a “live” teaching activity. This kind of interaction shapes firsthand collaborative abilities and new types of knowledge and perspectives. At the same time, it stimulates the development of green relational skills and new ways of approaching complex issues; in this perspective, conventional teaching methods and tools are called into question.

A third stage has to do with reporting the work and sharing the results with partners involved in the process. Students, guided by teachers, deliver the outcomes to the partners and involve them in a public moment of debate and presentation of the work. The public presentation is also intended as a reflective moment upon the entire process, to assess outcomes and activities in order to reflect upon the “lessons learned”. Teachers and students hand outputs over to the partners, giving special attention to the formats and the contents of the design work, making sure they can be accessible and reasonably usable by partners. Final outputs, indeed, have to be usable tools for community: for stimulating new visions for the future, supporting the daily action of partners, enhancing both their empowerment and awareness, and contributing to the progress of their projects and practices. They are tangible and intangible results, through which also the university learns how to generate and share usable knowledge, questioning its role in/for the city.

The setting-up of a teaching in-the-field proposal is always addressed by a set of principles, which guides both the contents of the teaching activity and the collaborative work with partners, underlining the social-engaged attitude of this teaching practice. These principles start from the idea we have to assume a “twofold responsibility” (Castelnuovo & Cognetti, 2013). For “responsibility” we intend the recognition of the role that one plays both as a practitioner and an individual in coping with others’ requests. In these terms, assuming a responsible behavior entails the development of a sense of social commitment and ethical intent which arise from the direct engagement with concrete real-life situations. The responsibility is twofold whereas is primarily tailored towards students and the academic community, and implies the thorough revision of forms and methods of education and research. Secondly, it is addressed towards civil society, presuming an important dimension of reciprocity and questioning the usability of academic

knowledge as well as the way in which it can be made more reachable and useful to face social challenges.

In this sense, the purpose of a live teaching context is to set up a learning environment in which teachers, students and community partners are committed in the enhancement of an innovative learning process, testing approaches and tools in a “live” teaching and learning perspective. This also means encouraging students and teachers to rethink the way we learn: sharing competences, exchanging knowledge and different kinds of know how (local and expert) to reach a common outcome (Castelnuovo & Cognetti, 2014). Through interaction and commitment, individual and collective abilities can be developed and tested on the ground, into reality; individuals can gain a new critical perception and awareness of the world where we all live and operate. These capabilities, developed within a situated learning practice, are complementary to the competences acquired in the traditional teaching practice, and become increasingly necessary to face complex and multiple social needs (Gronsky & Pigg, 2000).

Active learning environments instill the ethical value of public commitment and contribute to build a social environment, in which we are collectively involved in contributing to the co-production of public goods. Experimenting such a learning environment, new generations can be educated to develop a new ethic of responsibility and social commitment, being more aware and responsible citizens and practitioners in the future. In this perspective, city and communities are not just a field in which applying and experimenting competences, but primarily a complex environment within which university is an actor among others actors, increasingly engaged and attentive to urban, social and economic development.

3 THE CONTEXT

Italy is at the forefront of the migration flows of recent years. It is clear that we are facing an epochal phenomenon. The resident foreign population reached 5.026.153 thanks to new regular entries, births and asylum seekers (Idos, 2016). The closure of many internal borders and the agreements with Turkey turned the Central Mediterranean the main route to access Europe, though dangerous and costly in terms of human lives for those who run away from wars and fierce dictatorships. In addition, for the same reasons Italy has been transformed from a “transit land”, a “land of permanence”, a place where to seek shelter, help and international protection. The data in Table 1 show to what extent this transformation is evident: The number of hosted migrants grew much more than arrivals (with also increased in absolute numbers).

	2014	2015	2016	variation 2015-2014	variation 2016-2015
Landed migrants	170.100	153.842	181.436	-9,6%	+17,94%
Hosted migrants	66.066	103.792	176.554	+57,10%	+70,10%
Asylum seekers	63.456	83.970	123.600	+32,33%	+47,20%

Table 1 - Number of migrants landed by sea in Italy, number of hosted migrants and numbers of asylum seekers by year. Source: authors' elaboration of “Dipartimento per le Libertà Civili e l'Immigrazione” data

Among those arrived by sea in 2014 and 2015 less than 50% asked asylum in Italy, in 2016 almost 70% did so. This change has put a strain on the country's reception system. As a matter of fact, “talking about immigration today means mostly how to host those who reach Europe looking for some form of protection if they not die in the sea” (Codini & D'Odorico, 2016, p. 193). The issue of providing accomodation to asylum seekers is one of the most debated in the media and is the subject of very different positions by the various political parties. The massive arrival of people has also opened up a new sector of welfare policies since migrants need to be supported in their everyday life, at least at the beginning of their new life. The numbers and facts show that Italy is gearing up to give dignified living conditions to those who apply for asylum even though much remains to be done, assuming the perspective that thousands of people will continue to arrive. Hosting is then something very different from having a roof over your head and at least a hot meal per day. In these last years, it was possible to understand what are the requirements for “doing things well” (paraphrasing the subtitle of the Catone book, by 2016): it is about welcoming and integrating, creating the conditions for people to return to a condition of normality and autonomy.

Although refugees' reception is a State competence, it is at local level that these policies are implemented. Milan hosts the highest number of refugees of Lombardy, the Region that concentrates the largest number of migrants in Italy (13%) (Anci et al. 2017) as evidenced in table 2, followed by Sicily.

	Italy	Lombardy	Province Milan	Milan Municipality
SPRAR	22983	1275	614	422
CAS	94188	15381	3395	3100*

Table 2 - Distribution of places in different kinds of facilities (absolute numbers) . Source: Anci et al. (2017), per Milan the number of people in CAS* are estimated and are represent the situation of February 2017, while the others represent the situation at mid 2017

The city of Milan and its metropolitan area saw the passage of thousands of persons over the last four years, the estimation is that 107.000 refugees have transited since 2013 till December 2016. Until the first months of 2016, the reception facilities of the city were destined to "transitanti" (see Figure 1), people who stayed in the city a few days to continue their journey to northern Europe, where to seek asylum. The closure of borders (Austria, Switzerland and France in some moments) along with the enforcement of the Dublin Treaty obliged people to remain in Italy and applying for international or humanitarian protection here.

The "wave through" policy took root in conjunction with the Syrian crisis (Majorino & Sarfatti 2014), which dictated the need to give hospitality for a short time to individuals and entire families. The Municipality of Milan, together with many and diverse third sector organizations, organized a reception system that developed over time for this type of migrants, first in the mezzanine of the Central Station (from 2013 until 2015), then on Tonale Street (2015), close to the station and, finally, in Via Sammartini, in a more peripheral space owned by "Grandi Stazioni" a private enterprise linked to the public company that runs the national railway system in Italy. This space has been named "hub", not to be confused with the regional hubs, which are much bigger centres devoted to host and distribute asylum seekers in hosting facilities within the Region. The hub occupies the more peripheral part of the "Magazzini Raccordati", a big decommissioned system of warehouses built under the tracks of the Central Station of Milan (fig. 2).

Figure 1 - Percentage of refugees hosted in Milan facilities that were in transit or where looking for asylum. Source: Milan Municipality, internal document. * These percentages are related only to people hosted in facilities organized and regulated by the Municipality there are many others by the Prefecture)

Figure 2 – Current position of the hub. Credits: Basile, Dridi, Gabriele (2017)

This hub allowed many people to “land” in a safe place, where they could find an immediate response to fundamental needs, after a long journey: Refreshment, change of clothes, hospitality for the night, meals as well as legal support and night hosting. From there transitants were sent to one of the various reception facilities made available by the Municipality of Milan where they stayed for a short time, on average 5-8 days. These is the lapse time in which they decide whether to stay and apply for international protection or leave the country.

<i>Total registered people</i>	<i>Individuals</i>		<i>Families</i>		<i>Total</i>	<i>Hosted</i>	
2015	24.695	8%	6.942	2%	31.637	27.401	7%
2016	28.848	5%	5.047	5%	33.895	32.784	7%
2017	2.590	5%	450	5%	3.040	2.938	7%
Total	53.543	2%	11.989	8%	65.532	60.185	2%

Table 3 - Registered and hosted by Via Sammartini Hubs per year and typology (individuals or families).
Source: Fondazione Progetto Arca.

Since May 2017 the hub changed its nature, losing its importance for people in transit and assuming a more “long term stay” characteristic. It has been transformed into a CAS (Centro di assistenza straordinaria), a centre for extraordinary hospitality where people will stay till the end of the asylum seeking procedure. Before it was accredited with the Municipality and the Prefecture for 150 beds. In many moments since last year there were more than 500 people sleeping there. The hub is managed by Fondazione Arca Onlus, an organization that has a multi-year experience in combating severe marginalization. It has welcomed more than 50,000 people over the two years period 2015-2016, as shown in Table 3.

It can be said that a de facto humanitarian corridor was created, facilitating the passage of many people heading North. In the space of Via Tonale and in that of Via Sammartini, lots of organizations are engaged: Fondazione Progetto Arca is the general manager; Fondazione Albero della Vita and Save the Children who develop different activities related to children’s care and needs; the local healthcare agency; and different individual and organized volunteers (doctors, pediatricians, social workers, computers specialists). Here, forces of all sorts have coagulated, with private citizens who have supported the initiative by donating goods and performing their work. Here, the value of Milanese volunteering, part of the “conscience of Europe” (Cesareo, 2016) is visible and tangible: people are supported irrespective of their legal status.

The hub has accommodated up to 700 people but has a capacity for 150 people. It worked as a buffer for very massive arrivals of migrants so as not to leave them on the street to sleep. It is divided into four large spaces, one dedicated to clothing stores and other types of goods, a daytime area where computers,

internet attacks and cell phone charging sockets, as well as an area for children; a canteen and an area with lockers and beds.

The Hub of Via Sammartini used to be a unique service for asylum seekers and refugees in Milan and in Italy. Its particularity is attached to the fact that it hosted people arriving independently to the city and not sent by the agencies of the Ministry of Interior Affairs. It is an anomaly in the Italian landscape and, it represents an innovative response to cope with the needs expressed by a huge flux of migrants (Costa 2017). Even if Milan has a strong social infrastructure, it needed a first-hand spot for people arriving in the city. It's around this hub that we asked our students to work.

The hub was and probably will continue to be a thermometer of migratory routes. The consequences of the changes in the political response to the refugee crisis here become apparent almost immediately - a matter of days (Petrillo 2016). Our field work started in a moment where the hub's function was changing: from being a place of transit, to be a place of permanence (Costa, 2017), due to the fact that newcomers searching for a better life don't transit anymore, as explained before. This change was not easy to cope with by the students' analyses.

4 THE COURSE'S DEVELOPMENT AND OUTCOMES

"Social and Urban Analysis" is a course for students at the third year of Bachelor in "Urban Planning and Policy Design" at Politecnico di Milano. Since the beginning, both the teachers agreed that students should understand methodologies, aims and scopes of urban and social analysis working "in the field", and developing a case-study on a real situation. Hence, also the decision to cooperate with Polisocial.

The "first stage" described in § 2 was thus developed taking into account the research interests of the two teachers – this experience implies the analysis of a social policy developed by the Municipality of Milan, and the social issues related both to the newcomers' situation as well as to the impact of their arrival on the urban space and on local established populations. At the same time, the hub accommodating migrants in transit was chosen for several reasons including the fact that welcoming the newcomers is a core issue in many European countries. Anyway, a core point was the clear interest expressed by Fondazione Arca in having an "external view" of the hub and of its activities, as well as on its "location" in the territory and its' functioning in the city. Some specific planning questions were posed by Fondazione Arca as the current hub occupies the more peripheral part of the "Magazzini Raccordati". Grandi Stazioni undertook a major renovation project of the Central Station before the opening of Expo 2015 in Milan, while the Magazzini Raccordati's future remains uncertain, as is the hub future.

The second stage "developing the teaching activity" was basically constituted by three strictly interrelated parts: (1) some more traditional academic lectures covering both methodological issues and the specificity of the case-study (e.g. lectures that provided a framework of the "refugee crisis" phenomenon in Italy and its related social issues; sessions on how the system to accommodate migrants in transit and refugees works in Italy, on management and spatial impacts of shelters in other Italian cities etc); (2) a series of meetings with experts from Fondazione Arca, with the Councillor in charge of Social Policies and Welfare in Milan Pier Francesco Majorino who runs the policy sector more committed in facing the migrants' arrival in the city, and with some representatives of the main associations that emerged in this area to cope with local problems and explore possible potentialities; (3) field visits organised in cooperation with Fondazione Arca to introduce the students to the reality of the hub, showing them how it works.

Students were asked to do field research using a mixed methodology, working inside or close to the hub to understand how this place works, but also the social and urban impacts of such a type of place at the neighborhood level. Spaces had to be analyzed in terms of their use, functions, story, policy development. Students were encouraged to work collaboratively with Arca as well as with local community groups, small businesses and citizens. The course's project work includes press review, photos, drawings, maps as well as policy and ethnographical analysis.

After field visits with us, students were left free to explore the place without our guide for around one month, as well as to identify possible topics for urban and social analysis. Some of them showed an immediate commitment in trying to "enter" in the hub also without our support and to conduct a sort of ethnographical analysis of the place. Other clearly started to explore a series of issues at the

neighbourhood and city level, keeping in some way the reality of the hub a bit more “distant” from their analysis. The field visits and this “reflexive month” were very useful also for us to decide which students could really be introduced into the “vulnerable” reality of the hub, and which students could work on its impact in the immediate nearby or in the broader city context. This was done not having in mind any kind of “preferential” attitude toward some “more committed” students, but on the contrary, trying to respect their preferences and sensitivity. At the same time, this also resolved in a quite “natural way” a problem that the teachers, the Polisocial experts as well as Fondazione Arca foresee since the beginning of the course: the risks and ethical issues related to introducing a group of around thirty students into a space where very weak people – including children – arrive, eat, sleep and try to recover from very hard journeys. At the end, only two groups composed respectively by four and three students worked inside the hub with the mediation of the experts of Fondazione Arca. To “minimise” the impact of the students’ presence one group started to observe the dynamics related to the clothing and goods warehouse, and the other one focused on the daytime space. The warehouse is a strategic place for the logistic organisation of Fondazione Arca as here garments and other supplies donated by enterprises and individuals arrive (fig. 3). This is also the only part of the hub opened to the public, so it constitutes a direct connection with the Milanese population. The other space is where a variety of functions are carried out – registration of the newcomers, medical care, children care (fig. 4). This space is also a particular place of socialisation thanks to internet points to connect with the families at home (fig. 5) or with the world, as well as to a very long plug that allows the mobile phones charging, being one of the more crowded corners of this space.

The group working on the warehouse adopted a twofold “entry strategy” to this place. On the one hand, they concentrated on ethnographical observation of people working here and of spaces constituting the warehouse; on the other hand, they tried to “map” the local-to-international networks and flows of goods arriving here, allowing the hub and Fondazione Arca to develop its activities. This last work was an interesting but challenging one, and students had to face the lack of time and availability of information to deal with this. This led them to get lost in the ethnographical observation, and the result was a work mainly focused on the volunteers’ role, with a particular attention to the pivotal role played by the very charismatic responsible of the warehouse. Their very simplistic conclusion was that, as the warehouse is one of the places where the volunteers and people working in the hub have their breaks, this is a relaxed place opened to everyone – and this conclusion clearly does not reflect the complex environment that the students choose to analyse.

Figure 3 – The warehouse. Credits: Basile, Dridi, Gabriele, (2017)

Figure 4 – The “line”. Credits: Basile, Dridi, Gabriele, (2017)

Figure 5 – The “internet point”. Credits: Basile, Dridi, Gabriele, (2017)

The group working on the daytime space developed a more sophisticated analysis of the spatial organisation of this multi-functional “room”, as well as of people arriving and working here. They produced a very interesting photographic and drawing essay, and a written essay that looked too much biased by a “positive prejudice” of the situation they were observing. In other words, despite long observation in the field, their preliminary view of this space seemed not to have been challenged before and after the work. Anyway, they developed an interesting view on how the migrants in transit life is characterised by a main and alienating activity that allows the access to all the primary functions that they need: queueing – for registration, for food, for dresses, for medical care – hence the title of their work: *Keep the Line* (Basile, Dridi, Gabriele, 2017).

Other works were developed in the immediate nearby of the hub. In particular, a group analysed dynamics and policy processes related to a green space close to the hub that has been and is at the centre of a significant mobilisation at the neighbourhood level. Formerly a brownfield, local citizens fought to have this space recovered by the Municipality, but when this recovery happened, the hub was opened and the green space started to be used mainly by the newcomers. This caused increasing discontent in the area. Their work focused on the policy process that led to the opening of this “contested” small park, and implied a direct relationship with the associations that were involved at the local level. The urban dynamics analysis suggested to frame this process not only at the local level, but also in a more metropolitan strategic vision, looking at this small green space not as a park, but as one of the spaces connecting different green areas along the Martesana Channel in Milan. This change of scale allowed both the observation of a change of meaning of this space, as well as to new ways to answer to their main research question: “whose park is this?”.

Two other works analysed in different ways the local commercial system trying to understand if it was or not affected by the migrants’ presence. In one case, this was more an analysis of if and how local commercial activities had changed due to the hub presence, as well as if and how they perceived it as an opportunity given the huge amount of people arriving in a peripheral area, or as a problem, given the specificity of the population arriving. Despite a huge amount of work with the local commercial activities, this group faced many problems in finding some kind of significant conclusion. As the Magazzini Raccordati constitute a very long and quite strong barrier in the urban tissue, and the hub is located only on one side of them, a last group concentrated on the differences in the commercial environment on the two sides of the structure, trying to understand if the richer commercial environment located “on the other side” was in some way affected by the presence of the hub. In general terms, all the three works focused more on an urban analysis, as well as on how the hub’s presence affected the local neighbourhood as well as the wider urban dynamics. Anyway, they tended to remain focused only on the local dynamics, capturing mainly the local complaints for the hub’s presence, and not contextualising the observed dynamics also in terms of actors and resources.

In any case, all the groups developed a press review and were asked to read book chapters and (academic) articles on migration flows in Italy, and on how the system for welcoming people works, and it is possible to say that at the end of the course almost all the students had understood these issues, as well as the specificities of this system and policies carried out in Milan.

Regarding the “third stage” of Polisocial activities (reporting the work and sharing the results with partners involved in the process), this took place only inviting representatives of Fondazione Arca and of the other associations operating at the neighbourhood level at a presentation of the students’ works that was held at the end of the course at the Politecnico di Milano. This choice represented a sort of “downgraded” third

stage, as the best way to share the results of Polisocial projects is presenting them directly in the neighbourhoods where they have been developed. This “more public” presentation was not done because both the teachers and the responsible of Polisocial agreed on the fact that the students’ work were interesting, but still not enough developed for a presentation “in the field”. This choice implies the recognition – from the teachers’ point of view – of a partial failure of the experience that will be discussed in the conclusions of this paper.

5 CONCLUSIONS

In these conclusions it’s important to unpack the bulk of issues that emerged from the pedagogical, the social analysis and the planning theory’s sides. The questions that lead our balance of the teaching in the field experience are what is the gain for the university? And for the students? And for the involved partners?

The Gain for the university and for us as teachers is connected to the possibility to cope with new research topics and issues. From the “urban side” both the direct contact with this place and the students’ difficulties in this place allowed the teachers to understand the challenges of coping with the presence of a huge amount of people transiting in a place without settling there. In any case, this is a place to face emergent situations, and from the planning side there are still not many answers on how dealing with these type of places minimizing their impact at the neighborhood and city level (Briata, 2014). If “the gain” for the city proposed also by the Municipality was clear (places like the hub allow the city not to have all these people wandering around, especially in the station area), the gain for the neighbourhoods where these places are located are less clear.

The gain for students is quite evident. They were for few months in a face to face with a situation that they were used to see only in the media. Most of them had never been at the hub, and only a minority of the class was aware of the issue we were dealing with. Before our course, they used to think at this issue as “people who land in the South of Italy”, but without thinking that this might be also an “urban issue”.

At the end of the course we interview the representatives of Fondazione Progetto Arca which is a big organization. They recognised the limits of the students’ work, but they were quite satisfied and they noted at least two positive aspects of the cooperation with us. On the one hand, they state that the teaching experience permitted them to go beyond their day to day activities. As a matter of fact this is part of their expectation because they wanted to be analysed by outsiders and to reflect about their presence in this part of the city and on themselves as an important actors in the Milanese asylum seeker hosting system. Working in an emergency regime prevents from doing what students did, to observe. Students final composition were at least a form of “restitution” of their daily work. The second positive aspect underlined by Arca is that we were perceived as a “loyal” partner. We did what we promised, non more than that. We were all aware of the limitations inscribed in the experience.

Teaching in the field implies a complex triangulation between the teachers, the students and the external bodies involved in the process. In this case, it might be said that Fondazione Progetto Arca’s expectations were in some way satisfied both in the relation with us, as well as in the relationship with the students. At the same time, the students proved to be satisfied of the relationship with Arca.

The only problematic aspect is related to the mismatch between our expectations as teachers and the final works of our students. We know that the issues proposed were very difficult to grasp as they entail the knowledge of the macro phenomena of new migrations as well as micro aspects of it. We spent a lot of time revising their writings, tables and map as well as supporting them in the ground research activities. At the end we realised that four months were insufficient to produce complete works. The outcomes were not as good as we expected. The critical aspects relates to the complexity of the issue, the lack of time of students for working on the ground and the difficulty for them to apply research tools (both methodological and conceptual ones). Everything was too new but they declared that our proposal constituted a big challenge for them. As a final word, all of us have learned a lot and we will replicate the Polisocial live teaching experience in the year to come, analysing old and new migrants lives in the social apace.

ABSTRACT: Competencies required for steering urban development sustainably are scattered among various disciplines. Most prominently, this has been acknowledged by the growing community of planners in the field of transportation and urban development promoting an integrative approach known as transit-oriented development (TOD). Disciplinary traditions including different ways of thinking and doing as well as a strong vertical organisation of public administration form major obstacles for TOD and other interdisciplinary approaches to urban development. The implementation of TOD principles in plans and planning policy is usually dependent on strong actors brokering across disciplinary and departmental boundaries (Thomas and Bertolini, 2017: 145). “Boundary objects” (Wenger 2000) can help sustaining the effort of individuals promoting integrative planning approaches against institutional and disciplinary rigidity. These objects allow practitioners of different disciplines to discuss common challenges without constant guidance of experts in multiple disciplinary fields. The development of boundary objects is therefore crucial in order to support current “brokers” (ibid.) and provide continuity when brokers are unavailable. We believe that the node-place-model (NPM) by Bertolini (1999) can be such a boundary object. We test our hypothesis as part of two design studio courses confronting urban design students with the task of developing their own design brief based on a node-place-analysis – a systematic quantification of both accessibility and activity at transit stations. We conducted the course twice while testing our approach on two scales: a city-wide node-place-analysis of the City of Munich with the goal of designing a small city quarter and a node-place-analysis of the entire metropolitan region of Munich with the goal of developing a spatial strategy for the City of Ingolstadt, a key economic node within the metropolitan region. The paper is of dialogic, discursive nature. The lecturers and the students discuss whether or not the node-place-model enables us to understand better the relationship between transit and urban development and to develop spatial strategies based upon an integrative approach. Our discussion reveals that the node-place-model, despite of or perhaps due to its compelling simplicity, cannot necessarily bridge disciplinary boundaries successfully. The model does not comprise mechanisms about how both domains are qualitatively linked. It simplifies node and place into quantitative variables without providing sufficient guidance on operationalisation. Operationalising the model is often subject to misinterpretation. The schematic quantitative nature of the model incites users to blindly apply calculated results. We therefore reject our hypothesis and conclude that the node-place-model may not be suitable as a boundary object in planning practice. Due to above mentioned shortcoming, it cannot serve as a common tool across disciplinary boundaries. However, both lecturers and students see value in the model as a didactic instrument. It initiates food for thought during a discursive process that may lead students to become brokers across domains. The model forces students to connect and integrate knowledge of multiple domains. It raises awareness for the pitfalls of interdisciplinary issues, but at the same time also enforces a critical stance on simplified quantitative implementations of multiple domains. It raises awareness for the pitfalls of interdisciplinary issues, but at the same time also enforces a critical stance on simplified quantitative implementations.

1 INTRODUCTION

Competencies required for steering urban development sustainably are scattered among various disciplines. Cities, with their multitude and complexity of actors, structures, and processes cannot be

conceived as being the domain of one particular discipline in traditional categories. Rather, they are shaped and (re-)produced by the overlapping, converging, or sometimes conflicting outcomes of a range of disciplines – in fact, there are few scientific fields without at least indirect impacts on urban environments. There are however a number of them which are explicitly connected to understanding, and in some cases ultimately influencing them. Among these are architecture, civil and transport engineering, (human) geography, urban economics, or urban sociology, to name just a few. Public administration follows the same disciplinary logic subdividing its institutions in sectoral departments and agencies. Urban planning, that already lays claim to interdisciplinarity with respect to urban space, has to conform to the same idea of vertical separation between disciplinary domains. This vertical separation comes with the distribution of responsibility and power among various stakeholders. While politicians and citizens expect planners to effectively steer urban development, planning departments have to broker between various public and private actors.

Despite the interdisciplinary nature of urban planning, teaching approaches across disciplinary boundaries are still relatively rare (Rooij and Frank, 2016: 483). Establishing planning degrees with homogeneous groups of students has led to the formation of its own unique ways of thinking and doing. However, scholars and practitioners alike are confronted with the challenge of understanding and incorporating different disciplinary backgrounds in group work. Programme administrators and lecturers are hence looking for new ways to bridge potential incomprehensibilities between students, for example in graduate programmes of urbanism which admit students with a range of different undergraduate degrees (Bertolini et al., 2012).

Interdisciplinarity has been discussed as both encouraging and underdeveloped avenue for future research and teaching for a range of subjects during the last decades. One case where this becomes clear is integrated transport and land-use planning. Sectoral technical planning and comprehensive land use planning both exert a strong influence on our built environment, which is not always aligned. Planning practice and academia has now long acknowledged the deficits that can arise for our urban environment if a single of the disciplines involved in its formation becomes prevalent over others (Jacobs, 1961; Mitscherlich, 1965; UN Habitat, 2009). The dominance of the private car in western cities can partly be attributed to the supremacy of traffic engineering in post-war urban development of the 1950s and 1960s, which is strongly connected to the modernist ideal of the functionally segregated city, in many cases to the detriment of the quality of public space. It was only in the 1970s and 1980s that other disciplines, such as heritage protection or urban design, reasserted their claim to be equally considered in urban development. This example shows that it is necessary to find methods and tasks that enable disciplinary experts to introduce their knowledge into the urban development process and put it into perspective.

Integrated transport and land-use planning today still is an area that yields potentials for interdisciplinary student group work. Often, students with a civil or transport engineering background view urban development challenges more in terms of quasi-mathematical optimisation problems while students with a background in the social sciences emphasize specific place-based qualities in need of protection or strengthening. The planning vision of transport-oriented development (TOD), which suggests a joint analysis and alignment of settlement densities and (public) transport quality, creates space for a common discourse between these disciplinary approaches (Kinigadner et al., 2016). The emergence of interdisciplinary discourses in urban planning and developments is summarised under the title of Urbanism (Wolfrum and Schöbel-Rutschmann, 2011; Olsson and Haas, 2014; Gilliard and Thierstein, 2016).

2 METHODOLOGY

The paper presents two studio courses of the last two years that employed the node-place-model (NPM) developed in the 1990s by Luca Bertolini (Bertolini and Spit, 1998) to acquaint students with the challenge of integrating land use and public transport planning. The students had to familiarise themselves with the NPM and were asked to use it as an evidence base for identifying areas for development. The students had to understand the model, to apply it as a calculation model and to interpret the results. Consequently, they developed design proposals on the scale of individual stations and their surroundings as well as for general strategies of an entire city. The learning goal was to familiarise students with an object that can span the boundaries of two disciplines: urban planning and civil (transport) engineering.

However, the studio fulfilled a second goal for us as teachers. Munich's MSc Urbanism programme is designed for graduates of various disciplines. Developing interdisciplinary methodologies that help students with different previous knowledge to communicate about urban space is crucial for the success of such a degree. Our hypothesis for the studio course as well as the paper is that the NPM is a boundary object that allows experts from two fields of transportation and urban planning to jointly develop plans for the future. Wenger (2000: 236) conceptualises boundary objects as processes, discourses or artefacts shared by multiple disciplines. They are designed "to enable multiple practices to negotiate their relationship and connect their perspectives" (ibid.).

Students of both the MSc Urbanism and the MA Architecture programme joined our studio course. Their backgrounds include bachelor's degrees in architecture, civil engineering and geography. We tested our hypothesis on two scales: once for the city of Munich and then for the metropolitan region of Munich. The hypothesis is assessed by a discursive methodology. First, both student groups talk about their application of the NPM to an integrative land-use and transportation design project. Both groups will individually reflect on their experiences before developing a structured conclusion together. The last part summarises what we as educators have learned from both projects and what we think are important implications for planning education.

3 NODE-PLACE-MODELLING AS A DIDACTIC INSTRUMENT

3.1 BERTOLINI'S NODE-PLACE-MODEL

While the general long-run impact of accessibility improvements on settlement patterns in the past is well documented (Wenner, 2017), the effect of land-uses on transport infrastructure depends more on policy decisions (Rietveld and Bruinsma, 2015: 239). The 'node-place' model (Fig. 1) is an analytical tool that enables formulating such planning guidelines. One of Bertolini's major advances for urban planning is the combination of two basic concepts of space. On the one hand, space is formed by its geographical structure and refers to the dimension of place. On the other hand, space also inheres a topological component that is addressed by the term node. Regarding didactics, the NPM enables to understand locations in a wider regional context and consider these from the position in transport networks and their physical qualities. In effect, it suggests to match densities of activities, which generally also translate into building density, with public transport service level in order to achieve a more sustainable urban development. It essentially describes a normative relationship: areas of high density of activities ('place') should be served by more frequent and more diverse public transport, and accessible locations ('node') should be surrounded by dense and diverse urban development, while for sparsely used areas a lower accessibility level is acceptable, and vice versa (Bertolini, 1999: 201). Locations where node- and place-quality are balanced are called 'accessible'. This serves two functions: On the one hand, high accessibility levels of public transport in low-density areas mean an inefficient use of public resources that should be avoided (this would be an 'unsustainable node'), while high densities with low public transport accessibility gives rise to car-dependency, which is associated with negative social and environmental consequences ('unsustainable place').

Figure 1 The node-place model.
Source: Bertolini (1999: 202)

There are, however, cases where node- and place-quality match which nevertheless can cause difficulties for urban development. First, there are situations of 'stress': "Great concentrations of flows and activities mean that there is an equally great chance of conflicts between multiple, extensive claims on a limited space. The property development ideal of maximal intensity of land use and the transport development ideal of maximal flexibility for infrastructure adaptation and expansion have to find here a difficult synthesis" (Bertolini, 1999: 201-202). Second, there are dependent locations: Here, other factors than accessibility are decisive to maintain supply of both public transport and urban activities.

3.2 EXPERIENCE OF THE FIRST STUDIO

The studio included an analysis of the city of Munich, using Bertolini's NPM as a guideline, an identification of places that stood out from the results as having potential for development and implementations of urban design projects in those places. For the analysis, a node was defined as a rail-operated public transport station (suburban rail, underground or tram) and a place was defined by the characteristics of an area within a 700 meter radius around a node. Then, calculable "sub-values" that comprised the final node and place values were defined.

The node value (Fig. 2) was calculated from two sub-values: centrality and frequency. The centrality value represents the amount of people that would travel through a certain station when going from point A to point B using the shortest path (betweenness centrality, as defined in Sevtsuk et al., 2016: 12). The values were calculated using the "Urban Network Analyst" tool developed at the MIT as plugin for ArcGIS. The frequency value represents the sum of the frequencies of all public transport lines that pass through a specific station. The frequency was calculated as the average of weekday and weekend frequencies at different times of day (7AM, 12PM, 9PM) and was given in trains per hour. The place value (Fig. 3) was also calculated from two sub-values: density and diversity. The density value comprised of population density (municipal data from the city of Munich was available by neighbourhoods and was recalculated for the 700 meter radius of each place), built density, the percentage of built area within the radius at ground floor levels (not considering the height of the buildings), density of activities, the number of businesses within the radius categorized by NACE as retail (G), gastronomy (I) or culture (R) and density of workers, taken from GIS firm data and modified to take into account small businesses as well as corporations. The diversity value was defined as the level of balance between the population density values, number of workers and number of firms. The basic assumption was that the ideal diversity exists when all three values are equal, the bigger the difference between the three values is the lower the diversity value is.

The final step of the analysis was to enter the node-place value for each station area into Bertolini's node-place-diagram, to receive a classification for each station (unsustained node, unsustained place, stressed, dependent or accessible) (Fig. 4). To calculate the node and place values, we used GIS data provided by the city of Munich, while frequency data was compiled using the online timetable of the municipal transit agency.

Figure 4: Node-Place diagram showing all analysed stations in Munich. The abundance of accessible areas is clearly visible. Source: own account using Bertolini (1999: 202)

The results of the analysis showed that Munich is mostly a balanced city with a majority of accessible station areas (Fig. 5). The stressed stations were, as expected, in the city centre, in proximity to the main station and historic centre. Most of the unstained places were found to be located in neighbourhoods close to the city centre where the population, business and activity densities are the highest. The majority of unstained nodes were found to be located along the main suburban rail line passing through the city from east to west. The stations categorized as dependent were mostly located in the periphery of the city. Within the analysis results that were mostly unsurprising, a few of the station classifications stood out and required further attention. In Schwabing, a popular neighbourhood north to the city centre, three adjacent station areas with less than 500 meters between each station received different classifications. Clemensstraße station was classified as an unstained place, Karl-Theodor-Straße as accessible and Scheidplatz as an unstained node. Scheidplatz station also stood out as one of only three unstained nodes not located on the main suburban line. A similar situation was found in Giesing, another central neighbourhood, with the adjacent Tegernseer Landstraße station and Giesing station. Finally, it was very surprising to discover a cluster of mostly dependent stations right next to the city centre in Altstadt-Lehel neighbourhood (Tivolistraße, Bundesfinanzhof and Paradiesstraße).

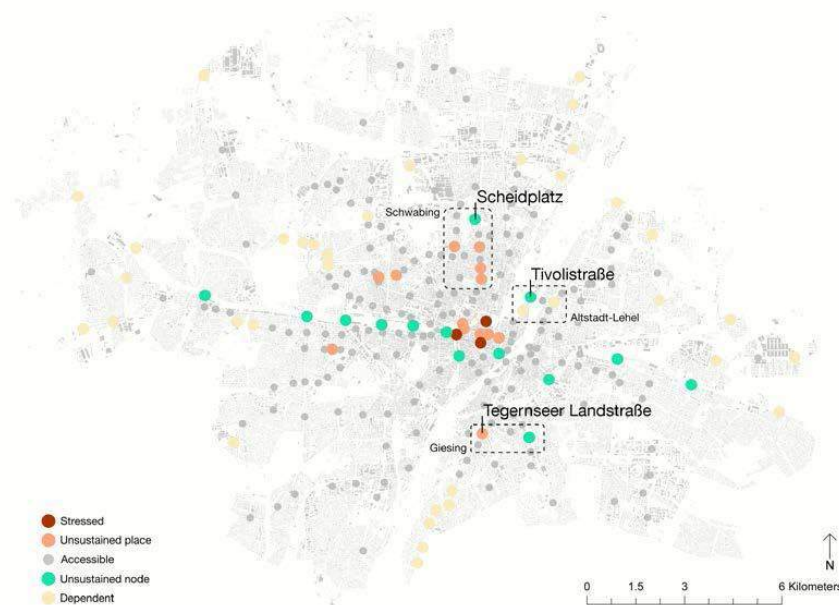

Figure 5: The five categories of the node-place model: accessible stations (grey), stressed areas (red), unstained nodes (green), unstained places (orange) and dependent areas (light brown). Source: own account

Limiting our analysis to rail-operated public transport stations meant that areas not covered by these networks were excluded. However, extensive coverage of the Munich suburban rail, underground and tram networks made this a negligible problem as virtually all relevant areas of the city were found to be within reach of such stations.

As a way of checking our results, we calculated the model with a modified radius of 400 meters instead of the previously used 700 m. This was meant to take into account that 400 m is a more realistic distance that people would actually be willing to walk. Across the majority of stations the relative place-value decreased, which produced a higher number of unsustained nodes. Although we could not with absolute certainty attribute a cause to this effect, we assume that it might be related to the often significant proportion of empty space in the vicinity of a station (street junctions, railway lands, etc.). A decrease in radius would render these areas proportionately more important. Another factor was that a decrease in radius would very often lead to a decrease in the diversity value, on account of functions not being evenly spread out across the analysed area. This was an important find, in that it clearly illustrated the inaccuracies involved. As the NPM is relative, the results can easily change, depending on the dataset that is used. Thus, a station that is categorised as an unsustained node or place could in another dataset possibly be in accessible range.

We also encountered several other shortcomings in the results of our node-place analysis. The analysis did not take the positive aspects of public open space (namely parks or the banks of the river Isar) into account. By virtue of being non-built-up areas, these areas therefore had a negative impact on the place values of nearby stations. They do however, especially during the summer months, generate significant footfall and contribute to a high quality of place.

We also found that the model could not realistically display situations where stations of different lines or modes were spaced closely together. This is especially true of many of the tram stops within the city centre which would consistently get low node values. However, many tram stops are in fact within easy walking distance of a railway or underground station and interchange is therefore possible, but is not accounted for in the model.

There have been many instances where the model could have been calculated in a much more detailed manner (e.g. by using actual walking distance instead of a predefined radius to define our areas of analysis.) Since the strengths of the model were seen in its simplistic approach, we felt that the model would not necessarily be more powerful with such an increased level of complexity.

As the design phase of the studio did not seek to develop a coherent spatial strategy for the city of Munich, it was decided to pinpoint several localized improvements across the city which were taken forward by individual students. When choosing these locations, we selected a two-phased approach. First, a shortlist was compiled from the stations that featured in the outer extremes of the node place diagram. Second, the stations from the shortlist were visited to enable an empirical analysis of the sites. During this stage it was decided to progress only with the unsustained stations as we thought they would be more interesting to develop than stressed or dependent areas and because some of them were, as has already been mentioned above, among the more surprising results of our analysis. The stations that were selected were Scheidplatz and Tivolistraße as unsustained nodes and Tegernseer Landstraße as an unsustained place.

Scheidplatz stood out as the sole unsustained node in the northern neighbourhoods of Maxvorstadt and Schwabing. Although the station is among the most important interchange nodes in the north of Munich, it is located between a quiet urban park on one side and a primarily residential area on the other. During the design process, an approach was taken to developing business and leisure in the area and to opening up the park, thereby increasing its attractiveness and usage. By relocating large allotments within the park to make room for new buildings, diversity and density values could be raised to make the area more balanced (Fig. 6&7). The tram stop Tivolistraße was found to have a similar urban setting. Being located in a thin strip of urban fabric bordered on both sides by the green spaces of Englischer Garten and the river Isar, the site is severely constrained in its development potential. A currently proposed tangential tram line across the north of Munich would pass through the station, further unbalancing its node-place values. This increase in connectivity would heighten the development potential of the area. An already existing business park immediately to the north of the station was chosen as the most suitable location for an architectural intervention. Redeveloping this area through a mixed use approach with high-rise elements enabled a significant increase in density of both residential and office space.

As the only unsustained place to be developed in our design studio, Tegernseer Landstraße required an entirely different approach. Further analysis of the site showed the results of our node-place model to be somewhat misleading in this case. While the tram stop is situated next to a dense urban neighbourhood, the immediate vicinity is characterized by one of the most congested road junctions along the urban ring road called "Mittlerer Ring". As this isolates the tram stop from its surrounding neighbourhood and two underground stations with much better connections to the city centre are located only a few hundred meters away both to the north and west of the site, we felt that to propose an increase in service to the station could not be the right way forward. The chosen proposal for the site was a pedestrian-oriented redevelopment of the public open space. This included strengthening walking connections across the entire site and between the residential/commercial areas and nearby nodes as well as improving pedestrian crossing times at the road junctions.

In the course of our design studio, we have come to understand that the first steps in the development of a certain area can be taken from the node-place-analysis. Following our basic assumption that a balanced and diverse place is best, we have tried across all three locations to take actions that increase the lowest values to receive the best results. However, in most cases the NPM could only serve as a starting point and further analysis was necessary to determine the best way forward. Nonetheless, we feel that the model did help us in our design process by offering an additional level of analysis and by bringing our attention to locations that we would not normally have looked at. While it is our belief that it cannot serve to define the qualities or shortcomings of a given site, it presented a different way of looking at a city and the way it's functioning. Whereas the place values are more of a micro look at an area, the node values are a macro look, connecting a small area to the perspective of an entire city. The NPM helped as a tool to understand the immediate needs of an area in the city and made us appreciate that there's an importance in thinking about each small area and how it functions as well as how the city works as a whole.

Figure 7: Night street view of new Business and leisure area in Scheidplatz, project by Gal Biran

3.3 EXPERIENCES OF THE SECOND STUDIO

The second studio started with the same task but for the entire metropolitan region of Munich. The project's first step was to set up a NPM for the railway network of the metropolitan region of Munich (MMR). This network consists out of the regional and long distance trains in the more rural areas on the one hand, and, on the other hand, in the main cities additionally of the underground and suburban rail infrastructure. Only trams were not respected in our analysis for reasons of data complexity. For the calculation of node values, we used betweenness and gravity measures for every railway and underground station in the MMR. The gravity measure assumes "that accessibility at [one specific station] is proportional to the attractiveness (weight) of [surrounding destinations] and inversely proportional to the distances between them" (Sevtsuk et al., 2016: 12). In contrast "the betweenness of a [station] is defined as the fraction of shortest paths between pairs of other [stations] in the network that pass by" (Sevtsuk et al., 2016: 12). With these two complex components, the calculation of the node-values could be quite standardized. To widen the node value's meaning we tried to add some extra information about the stations' inherent quality. Therefore, we analysed infrastructures and facilities of the stations like Park & Ride areas and the possibility to charge E-cars. However, adding more criteria to our analysis didn't make our analysis more accurate, so we decided to rely on the sum of gravity and betweenness.

Due to this extensive data analysis, it was easy to deduct the place values. In order to define it we examined the number of inhabitants living in the stations' catchment area, radius of 600 meters (Schwarze, 2005: 19), as well as the socio-economic services in this area, which was classified by a ranking system including all enterprises, larger concerns and educational facilities. Also, the cultural and leisure opportunities were considered. The first step was concluded by the set-up of the node-place-diagram and its interpretation.

Examining the data output of the first calculation, the results gave a consistent and argumentative overview of the railroad stations of the entire Metropolitan Region of Munich. Locations with a high frequency, line quantity and population density as well as services yield a high node and place value (each on a scale of 0 to 100), like the Munich central station (MHBF in the chart below, with Node =100, Place=88) or Marienplatz München (MMAR in the chart below, with Node=50, Place=94). Besides their high importance for commuters and travellers, these places also offer a high range of facilities such as high retail, office or housing density. Furthermore, stations with high node values and low place values in comparison like Ingolstadt central station (IHB in the chart below, with Node=68, Place=50) were identified (Fig. 8).

After a detailed reconsideration, we had a closer look at the type of the investigated cities and locations. This was reflecting the results in a new way, as you can see in the following illustrations (Fig. 9).

Figure 8: Node-Place-Diagram of the Metropolitan Region of Munich.
Source: own account

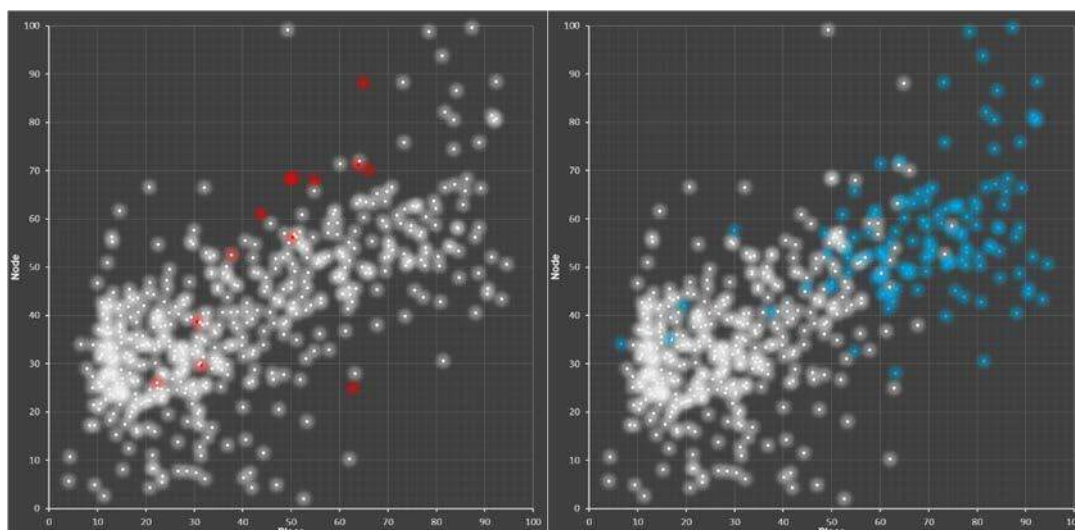

Figure 9: Munich's stations highlighted blue, other smaller cities highlighted red. Source: own account

Some problems in the understanding occurred with the interpretation of the chart. Some stations are located in unexpected positions. By closer examination, we got to the point that Betrolini's calculation model is disputable. With the metropolitan region being a very diverse area consisting out of dense city structures as well as extremely rural areas, it is questionable to compare the same data for stations, which are located in very different locations. Furthermore, in some areas the importance of the railway network is not as high as it is in other areas. For example, cities like Ingolstadt and Augsburg that are a lot smaller than the city of Munich are not covered by an urban railway system. This phenomenon is supported by our calculation of the inhabitants per railway station value. As you can see in Figure 10 a city like Ingolstadt would need 14 additional stations in its railway network to reach a coverage like Munich. Ingolstadt has fundamental problems with motorized individual traffic, but the essential information about the connection of public transport coverage and urban development could not be deducted from the previous model.

Figure 10: Inhabitants per Railway-network station in metropolitan region's cities. Source: own calculation

A new calculation is needed with adaptation in the examined public transport system and scale. The hypothesis was that a systematic adaption of the node-place model is needed for the suggestion of interventions to reduce the centrality and accessibility deficits in cities like Augsburg, Ingolstadt or Rosenheim in the MMR. These cities' public transport is highly based on their bus network. We got to the conclusion, that an adaptation was necessary since the role of the bus system in these cities was not incorporated in the prior calculation.

Figure 11: Munich Metropolitan Region, INVG area highlighted. Source: own account

The main reason to choose Ingolstadt the examined city is shown by the calculation of inhabitants per railway station (Fig. 10), which is the highest in the metropolitan region. The conclusion that there is no working public transport would be misleading. Rather it is that the public transport is organized by the bus system, a system that was completely neglected in the first step's analysis. So, in the second step this system in the city of Ingolstadt was in focus. To get the values of place and node, all stations in the bus network of the INVG (the city's public transport corporation) were analysed (Fig. 11). The place value for each bus station consisted out of the same factors as it did in the first step's calculation, but the catchment area was defined smaller with a range of 200 meters (Schwarze, 2005, p. 19). The radius of 200 meters was chosen, because it is a reasonable walking distance for users of the bus-network. The data of gravity and betweenness, in accordance to the definition described above, were calculated by a GIS Analysis for every bus station in INVG's network done by the Urban Network Analysis Tool designed by the city form lab of Harvard University. We then set up a new node-place-diagram for INVG bus system (Fig. 12).

In the third and last step of the project the applicability of this new model had to be tested. Therefore a catalogue of very different planning tools (like settlement densification, founding of new settlements, changing frequency of bus lines and much more) in the field of public transport in spatial and urban development in common were introduced. Each single intervention of this catalogue was classified by its impact on the position of a station in the node-place model, whether if it is changing the node or the place value. To validate these, in other contexts evident actions, are working in Ingolstadt as well, some example station had to be highlighted. To select, a cluster analysis of all bus stations was done. Thereby, the clusters were defined by the station's position in the node-place-diagram in relation to the 45° line. Thus 7 different kinds of stations were identified: isolated places, over-sustained places, over- and highly over-sustained periphery, over-sustained centres, unsustained centres and places. For each of these clusters one extreme example was selected. Every suitable intervention (regarding to the aspired direction of development in the model-chart) of the catalogue was taken into practice. In some cases, this approach delivered logic and working solutions. But in other cases, the outcome was indefinite and, in some parts, even illogical, because the actions demanded by the station's position in the model did not fit to the actual real place and its surrounding. It does not make sense to densify the urban structure around a station which is classified as an over-exploited place just because the chart is requesting this. Sometimes an overstated infrastructure provision has reasons far above planning mistakes. It just makes sense that, for instance a station near an attractive park, needs to have a high accessibility to open it up for the public. To claim densification here is not just illogical but even counterproductive.

Figure 12: Node-Place-Diagram of INVG area

Figure 13 + 14: Useful Instructions deduced out of the model for the station Andreas-Schmöller-Straße (over-sustained periphery, left) and questionable instructions for the station Brückenkopf (over-sustained centres, right)

To sum up, working with the NPM is on first sight a helpful tool for the analysis of the relationship between public transport and urban development. The model and especially the visualization in terms of a diagram is comprehensible and give a better understanding of the interdependency of transport and development. It offers a good base for discussion of the various participants in urban development. Urban researchers, municipalities, investors and all other actors in the development of cities have an easily discussable and understandable model.

However, there should be awareness of some problematic aspects. The diagram leads to quick and often false assumptions based on the oversimplification of a rather difficult and complex field. The simplicity of the xy-chart leads to reductionist conclusions. Another problem was identified, by expressing future strategies for the evaluated stations based on the model: The well-served station “Brückenkopf” in Ingolstadt (node=87, place=40) is a touristic place, where a museum and the nearby Klenzepark are located. The area is characterized by wide green and open spaces (Fig. 14). According to the model and the high node value a recompression was suggested to position the station in the accessibility area of the diagram. This case leads to the conclusion that the model gives first-hand a simple overview about the

stations and their future strategies, but otherwise the spatial situation of all stations needs to be considered as well.

Furthermore, the systematical thinking of the calculation of node and place values only provides the current situation. Future investment and development are not considered. The model and diagram can only be seen as an initial research and an indicator for possible interventions. Additionally, the calculation results are only relative to each other. There are no absolute values. The selection of parameters for the calculations and the quantification can be questioned as more subjective than objective. To simplify the process only one city public transportation network (Ingolstadt) was examined. The interaction between different cities was not considered. Therefore, the gravity and betweenness values were not accurate, especially on the borders of the public transportation network of the municipality.

Further critique refers to the regarded type of traffic as mentioned earlier. In the case of Ingolstadt, the main public transport is provided by the regional bus system of the Ingolstädter Verkehrsgesellschaft GmbH, INVG. Though, in the earlier analysis just the rail-bound traffic was considered. Thus, the traffic system of Ingolstadt couldn't be evaluated on a smaller spatial level. This fact does not prove the model false, but makes it harder and more time-consuming to analyse and to calculate the values and comparable to the rest of the stations in the MMR. In which exact way a different assessment should be used, isn't suggested. This makes the model in a way vulnerable and the evaluation more subjective. The evaluation of node and place values for every city consequently has to be done always for a macro and a micro based spatial standard, however which makes the model less comparable in a wider spatial scale.

Furthermore, the calculated values are specific to the public transportation system. You cannot compare node and place values across systems. Another critical point consists of the fact, that the public bus network is a flexible and small-scaled system. The system of the node-place-model is based on the transport-oriented development. On the contrary, the bus system is not particularly based on this approach. Finally, all outcome - clustering as well as indicated interventions, - need further examination and discussion.

4 CONCLUSIONS

The reflections of both the architecture as well as the urbanism students point out various issues while operationalising Bertolini's NPM. These can be categorised into three groups: issues of underlying assumptions, issues of calculation and issues of interpretation.

Bertolini (1999: 201) defines node as the "potential for physical human interaction" and place as "realisation of potential for physical human interaction". Implicitly, he argues that public transportation infrastructure is a 'given' resource, which planners can exploit by redeveloping the areas around stations. Our analysis shows that this argument is plausible as long as the majority of public transport is realised on rail infrastructure. Both the railways and its stations are long-lasting investments relatively resilient to changes in funding and planning policy. It is therefore not only in the developer's interest, but also in the interest of public authorities to utilise the potential created by infrastructure investments. The studio work on Munich demonstrates that the NPM leads us to areas that are worthwhile undergoing redevelopment.

This has unfortunately not been the case for the city of Ingolstadt. The student's first attempt to identify potentials across the entire region becomes quickly limited by the extent of rail-based transport infrastructure. An initial NPM that only included rail services rendered most areas of major cities across the Metropolitan Region of Munich as undesirable for redevelopment, although these cities itself are important economic centres. Instead redeveloping should have happened around stations in peripheral areas. This would lead to a clustered, but disperse settlements structure, while potentials of general inner-city and brownfield developments in cities without rail-based public transport are neglected.

The inclusion of bus services puts the underlying assumption of public transport as a resource into question. Bus services require very limited specific infrastructure. Transportation authorities change bus services frequently to satisfy demands. Taking the bus-service-based public transport network as a given infrastructure is therefore unjustified and led us to conclude that the premise of the studio should be adjusted to development-orientated transportation (DOT). This is obviously a fallacy, because 'DOT' is the simple adjustment of public transport according to demands and – as argued before – this is only possible

for bus services. The application of the NPM in the Ingolstadt case distracted us from the pressing main issue that the city is in desperate need of rail-based public transportation instead of ineffective optimisations of bus services.

We have to conclude that Bertolini's NPM should only be applied in regions, where rail services carry out the majority of public transit across the entire region. Even in case of the much more successful application for the city of Munich, we have to realise that despite the density of metro and tram services the calculation of the node value does not easily account for non-motorised transportation modes such as cycling and walking. An underlying problem of the NPM is that it is a mono-modal.

The second group of issues arise from applying the abstract NPM by calculating concrete node- and place-indices. Bertolini's (1999) paper implies the model's intent to be applied by citing the application as part of two master's theses at Utrecht University. He does however not provide a proven and tested way of calculation. It is suggested to use multi-criteria analysis. Contrariwise, our experience shows that it is not the case that the more criteria you use the better the calculation becomes. Choosing, collecting and weighing data requires a deep understanding of the interrelation of various criteria affecting public transit service and the traveller's behaviour. While we do not want doubt that advanced modelling could actually yield excellent results, we cannot verify our expectation for the NPM that it can be easily used by both transportation and development experts. Planners with limited expertise in modelling will quickly reach their limits and will just improve their calculations for the worse by introducing numerous criteria. Moreover, the more criteria you introduce the harder the interpretation of your values becomes. Perhaps, the success of the NPM is explicable by the intriguing nature of the most popular games that they are easy to understand but hard to master. This may be an excellent feature of a game but it makes the NPM less usable as an easy-to-use tool for planning across disciplinary fields.

Interpreting the results is the last but perhaps most important challenge while using the NPM. Both groups of students pointed out that the premise of Bertolini's model is easy to grasp. It quickly led both groups to discuss measures that could be taken to bring both node- and place-value of an area into equilibrium. A tendency to generalisation and oversimplification resonates however constantly. Almost all top-down approaches reveal that under closer inspection other criteria may play a bigger role than the ones calculated as part of the model. Obviously, it is not surprising that an area with a great potential for redevelopment according to the NPM cannot be redeveloped due to environmental, economic, social or aesthetic concerns. It would be unfair to accuse the NPM of being misleading in this case, because it does not promise to combine these domains with urban development. The NPM is however introduced as facilitating a transport-orientated development – so the interplay of transportation and development planning. As such, it delivers in many cases interesting results, but also fails in other cases. One of the Munich design projects demonstrate that the appropriate measure can be neither related to node- nor place-value but a qualitative improvement of public space.

After testing the NPM for two semesters, we have to conclude that the NPM cannot necessarily serve as the sole boundary object in order to connect the fields of transportation and development planning. We identified three reasons:

1. Using the NPM as a calculation model requires a deeper understanding of modelling to be sufficient for robust interpretation.
2. The NPM comes with inherent shortcoming, which makes it only applicable under spatial conditions of dominant rail-based transportation.
3. The NPM is prone to oversimplification. Working across the boundaries of development and transportation planning requires a multi-method boundary practice.

5 FURTHER RESEARCH AND IMPLICATIONS FOR PLANNING

Spatial planning bases upon various disciplines holding valuable conceptual and methodological knowledge. Planners are therefore constantly challenged by the need to get deeper insight into a specific discipline while keeping an overview and an interrelated understanding across various of them. It is important that educators raise awareness for this duality of knowledge in planning among students. Otherwise, planning graduates may fall into the trap of applying planning principles and concepts blindly.

Planning principles can be described as the application of various disciplinary knowledge for a typical planning case. It is well established among planning scholars that besides universal challenges local specificity plays an important role for planning practice. Basically, there is no typical planning case. Planning problems are essentially unique (Rittel and Webber 1973). Internationalisation of research and practice has led to an increase of transnational flows of ideas (Healey 2012). As such, scholars in Germany as well as other countries have picked up Bertolini's NPM. Although the contexts of the Netherlands and Germany seem to be very similar, local differences are enough to let us question some of the underlying assumption of the NPM.

The key learning outcome is perhaps not the application of the appropriate boundary object to link transport and development planning but the awareness that multi-methodological planning approaches across disciplinary boundaries need to be developed. The NPM can be a valuable didactic instrument. Its simplicity prompts us to think about the connection of transport infrastructure and land-use development, but it also reveals quickly the insufficiency as a singular tool to bridge the gap between disciplines.

Preparing students for the interdisciplinary field of planning practice requires the development of fully-fledged cross-boundary experts. Bringing together disciplinary experts such as architects and engineers in a course is a valuable exercise to raise awareness for each other's disciplines but it does not replace the planner as the mediator between the spatially relevant disciplines. Spatial development requires a boundary discipline (Gilliard and Thierstein 2016) that is able to broker between various disciplines.

Thus, we recommend that planning educators look further into two issues:

1. The core of the planning curriculum could be competencies for brokering between spatially relevant disciplines – such as boundary objects and boundary practices. We feel that these competencies are more likely of methodological nature. We should therefore shift our focus from better planning outcomes to better planning processes. It may be the built city that we should study as planner but the way this city has formed over time.
2. Planning degrees must connect to other disciplines. Learning to broker between disciplines requires disciplines to broker between. This trivial statement is easily being neglected, when planning as a discipline establishes its own unique ways of thinking and doing. Perhaps, a planning department must sit horizontally to the otherwise vertically organised universities.

ID 1506 | CHALLENGES AND INNOVATION IN THE ARCHITECTURE AND URBANISM RESIDENCY: WORKING TO OVERCOME THE GAP BETWEEN PLANNING AND IMPLEMENTATION

Maria Lucia Refinetti Martins¹, Sofia Arrias Bittencourt²

¹Professor at University of São Paulo / LabHab

²Research Assistant at University of São Paulo / LabHab

malurm@usp.br ; sofia.ab@gmail.com

1 INTRODUCTION

The Residency Program in Architecture and Urbanism: Urban Planning and Management, is a proposition of a community outreach initiative outlined in the University of São Paulo's Statute. Aimed at deepening the knowledge and social action of the architect-urbanist through a set of academically supervised practical and theoretical activities, inspired by the Healthcare Residency model.

Consists on work-education program, during one year, after completion of the graduation in Architecture and Urbanism. It allows for the young professional to act on public policy development activities that

intervenes in the social and spatial reality of Brazilian cities, with a core axis on planning and public management capacitation.

The purpose is to improve qualification amongst architect-urbanists through a closer connection to the practical word, in its design, economic and management dimensions, especially on a generous and independent space, the academia. From the public interest point-of-view, the program contributes on the formation of better qualified professionals and the development of final thesis that may be objective contributions to the formulation and management of urban policy. According to the nature of these thesis as formulated by the program's coordination, designs and proposals should be developed with an approximation to the "real city" in the search for correlating plans and designs with the perceptions, demands and real needs of social groups, in actual locations.

With the access provided through the Residency Program: Urban Planning and Management it became possible to perceive several shortcomings in the development of public urban policies in São Paulo, through the personal experiences of the residents, and develop important discussions on innovative ways we can advance as planners.

By associating an academic period to professional working hours, the program allows for a broader and independent research, as well as a perception of the interests and contingencies of the public management inside legal, administrative and financial conditions. In that sense, it differs from the professional internship, in which the practice is independent and disconnected from the academic support, and from the Professional Masters that, for the most part is restricted to the academic instance, though it provides professional and practice content.

This paper presents and discusses this experience from the view of a teacher (that coordinated and developed the program) and one resident, that experienced the program, and how this comprehensive new approach to planners' education may help overcome the gap between planning and implementation.

2 INSPIRATION AND LEGAL FRAMEWORK

The architecture and Urbanism Residency derived from the existing format of the Medical Residency, a professional qualification activity - technical, practical and theoretical. However, while the medical residency focuses on specialization of disease treatment, the formulation of the Architecture and Urbanism Residency is closer to the Public Health approach rather than Medicine properly. Relies upon the action not directed to the individual, but to society. In our residency, the laboratory is the city.

The current design of Architecture and Urbanism graduate programs is much embedded on the qualification of an able workforce mainly for the private market, with little consideration for the development of skills for handling the city. There's also a scenario of low-engagement with communities from the academic environments, as even the ones included on research projects and themes gain no return on final results of these projects. (eg. Souza, 2017)

In this setting the FAUUSP Residency was outlined, focusing on the concept of Social Interest Urban Projects, as a counterpoint to the ever-expanding idea of the city as an investment and the growth of the socio-espacial inequalities. This is how this program articulates with local governments, in the pursue of creating a professional staff with knowledge and resourcefulness to circulate in the legal and management domain and foresee alternatives for a more inclusive city.

The Architecture and Urbanism Residency - specialization in Planning and Management is referenced to the Healthcare Area Professional Residency, created by the Federal Law nº11.129/2005, that defines Residency as "category of lato sensu postgraduate program, aimed at the in service education and destined to the professional classes that integrates the healthcare area". It also disposes that "the Residency will be developed in an exclusive dedication system and performed under teaching-assistant supervision, with joint responsibility of the educational and healthcare sectors..." Defining that the Residency constitutes an intersectoral cooperation program to encourage the qualified insertion of young healthcare professional in the job market, particularly on priority areas of the Brazilian universal healthcare system (SUS), a concept that can be paralleled to the needs of the Architecture and Urbanism field.

In that sense, the proposal for the Architecture and Urbanism Residency expands the concept to the Urban Planning and Management field, creating a collaboration between the Architecture and Urbanism College of the University of São Paulo (FAUUSP) and the Municipal Urban Development Secretary (SMDU-PMSP).

Another legal document that contains guidelines regarding the residency program, is the Federal Law nº 11.888/2008, that while creating the framework for a Public and Free Technical Assistance system that not only reiterates and assures the right to housing, ordains to: optimize and qualify the use and rational handling of the constructed space and its surroundings; formalize buildings and informal settlements; avoid the occupation of high risk areas and those of environmental interest;

It also establishes that “The technical assistance services will be object of cooperation or partnership between Federal, State and Municipality instances and must be provided by professionals from the areas of architecture, urbanism and engineering that act as public technicians; non-profit NGO members; professionals included in residency programs; professors on community outreach activities;” (Federal Law nº11.888, 2008, highlight by authors)

3 PROCESS

The Residency Program at FAU-USP was approved in 2010, but the first program implemented was only in 2015. This first class, of 32 residents, was selected amongst 300 candidates from several states, within 5-years of graduation completion. They were enrolled full-time in a scholarship scheme, during the whole year, in the development of academic and practical activities, the latter being performed in agreement with the São Paulo Urban Development Secretary (SMDU-PMSP), participating in the development of São Paulo Submunicipalities’ Regional Plans

The program, that comprises theoretical and practical activities as stated before, was organized in three modules. of four months each: the first two contain classroom lectures (two full days a week) and practical fieldwork (three full days a week). The third module consisted on the finalization and presentation of the individual dissertation, based on the work developed throughout the entire time.

The disciplines offered on the 2015/16 program aimed at providing theoretical, technical and managerial sustenance for the development of the designs and plans locally, in each of the city's submunicipalities. To do so, the residents were each assigned one submunicipality.

Each module, with two disciplines, articulated the theoretical content to a specific time and type of practice in the workfield. This correlation can be seen in Table 1. The offered disciplines were: Procedures and methods of urban planning and management, Urban process, Plans and designs in São Paulo (module 1), Local Management an Urban qualification, Public Contracts and Management (module 2), The State and the public sphere, Final thesis orientation (module 3).

	1st module	2nd module	3rd module
FAU-USP	The disciplinary field: planning and urbanism	Public Management and Administration	The State and the public sphere.
Theoretical lectures	Procedures and methods of urban planning and management Urban process, Plans and designs in São Paulo	Local Management an Urban qualification Public Contracts and Management.	The State and the public sphere Final thesis orientation
Products	Dissertations on each Submunicipality	Exercises - reflection and deepening of the lecture's themes	Individual dissertations: Reflection and proposition

Table 1 - Synthesis of the Work-Education Organization.

By associating an “academic period” and a “professional period”, the Residency Program allows both a broader and looser research, and the perception of the pressures and contingencies of the public administration in its legal, administrative and financial conditions.

In the manner established in this current proposal, with the practical work in supporting the development of the Regional Plans for the submunicipalities, according to the City’s Masterplan, it encourages a multi-scale dialogue, between Plans, Public Policy, physical intervention and the local management of equipments and services;

The Regional Plans consisted on a creation of an intersectoral coordination between the city’s departments and their local counterparts, the submunicipality, creating perimeters for priority intervention in public space.

The scope was to intervene on areas that clustered public equipments, or were receiving investments in the near future, and develop the surrounding public spaces to improve accessibility and space quality. This could be done in 8 different types of intervention:

Environmental Patrimony	Preserve existing areas with dense vegetation and allowing their public use as an integral part of the neighbourhood
Housing	Improvement of housing in risk areas, specially surrounding water bodies.
Environment	Preserve water bodies in areas of environmental preservation, considering housing in risk areas.
Mobility	Assuring better crossing point for all types of transportation - buses, pedestrians, cyclists - above all water bodies and avenues
Equipments	Promoting connection between different public equipments, creating a system.
Economic Development	Consolidate the areas surrounding commercial axis.
Vacant Lots	Priority use for the implementation of public equipments.

Table 2 - Regional Plans’ Scope, source: SMDU-PMSP

This process was divided into two timelines: the technical workgroups - from August 2015 to November 2016 - and the participatory process that took place from April to August 2016, to avoid clashing with other subjects as the zoning laws and the municipal elections.

The technical workgroups comprised a set of technicians from different sectors of the central municipal government - Health, Education, Environment, Social Services, etc - and the local government appointees, usually from the Planning Sector of each Submunicipality. With the help from the residents as off-meeting mediators, this groups developed diagnosis of the area, along with marking the planned investment from each sector and finally setting initial perimeters for places of interest to intervene.

The role of the residents during this time was to properly understand the territories they were assigned and serve as a connection between the local and central governments on this decision-making process.

During the participatory process, this role as mediators was extended to the workshops with the communities, helping with the maps used and translating the needs and demands voiced by the people present into actual places and ideas.

Figure 1 - Residents and Technicians preparing for the participatory process. Source: SMDU - PMSP

Afterwards, they were also the ones to compile all the information gathered and, after validating the points made by the communities with the corresponding departments, provide all of them with responses, creating a full-circle of participation and response from the municipality. The ideas and propositions considered within the range of activities of the Regional Plans were added to the perimeters, changing their objectives and shape, and even creating new ones.

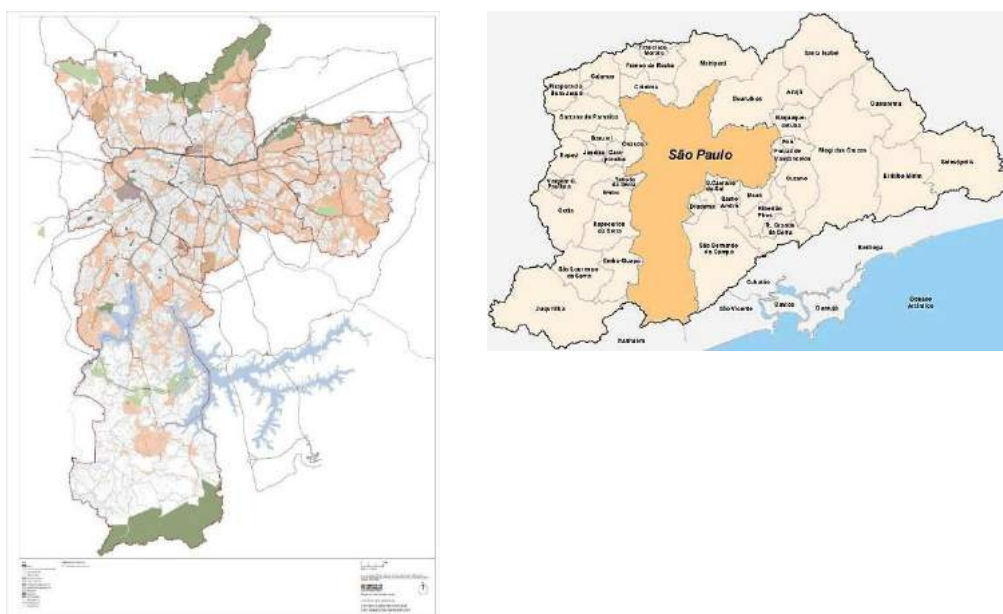

Figure 2 - Map of São Paulo with perimeters for intervention and location within the metropolitan area. Source: SMDU - PMSP

Having such a key role in the development of an actual plan for a complex city such as São Paulo led to the rise of several questions on the role of urban planners, according to each residents' experience with their submunicipality and inner questions about the profession. That combined to the different disciplines and discussion that occurred in the university, created a prolific environment for the proposition of their 32 final dissertations.

The final dissertations ranged from different topics that could be categorized in eight main axis of propositions: Social and Economic Development, Planning and Urban Instruments, Participatory Process and Institutions, Public Management, Public Budget, Urban and Housing Precariousness and Public Spaces;

While the topics are diverse in their spectrum of approach of urban planning, the dimension in which they are intertwined is that of investigating new aspects of the profession that are often overlooked or considered an afterthought in the Brazilian context, such as budget, participation, and even, management. One of the most sought after topics were the ones related to the monitoring and comprehension of the intricate public budgets, as the discipline “Public Contracts and Management” developed a new dimension that the residents had not yet been exposed. Some of the dissertations on the topic were “Urban and budgetary planning. Public participation as qualification”, “Federal financing of local urban policy: the case of São Paulo”, “Budget execution and urban planning: Case study of the submunicipalities of M’Boi Mirim and Campo Limpo”, “Decentralization of resources in São Paulo: the case of the submunicipality of Freguesia/Brasília” and “The monitoring process of public investments: an experiment in the submunicipality of Cidade Ademar”

Demonstrating the overall sensation that urban planning as a single knowledge, without combination of other subjects, has little power to overcome the severe inequalities and difficulties in the Brazilian current scenario.

4 FINDINGS AND CONCLUSIONS

“The public university has to constantly justify its existence” (eg. Salles apud Souza, 2017) and also, reconsider its stand as a vessel for creating a better dialogue with social movements and society in general, stretching the role beyond the theoretical construction of ideas and proposition, and that is the relevance of the residency model. By inserting young graduates in the job market while maintaining their connection with the academia, we can not only intervene on the process that is currently being developed, but also creating a substantial academic production that is grounded on such process.

In that manner, the Residency Program in Architecture and Urbanism: Urban Planning and Management, created a framework for innovation not only in the public sector, but also in the manner in which the university shapes their graduate and postgraduate pupils towards a social conscience and with practical insertion. It allows for the viewing of the real city, considering the local demands and creating a dialogue with the Local Councils.

Seeing firsthand the demands from the communities and exactly how and if they can be incorporated into the actual plans created a myriad of inquiries amongst the residents, and that instigated the development of several dissertations that are a contribution to the academic, public and civil scenarios if appropriated.

Moving forward, with the addition of a widespread discussion on the architect-urbanist’s profession in the corresponding class councils, the allocation of resources in these councils for Technical Assistance programs, and the propagation of these new models of community outreach programs developed within the academic universe, signal the relevance of this sphere of study and practice and launch important expectations towards the architects and urbanist presence broadening at the social practice, contributing with their knowledge in the development of better and inclusive cities.

ID 1576 | CHALLENGES FOR URBAN PLANNING TEACHING: POSSIBLE PATHS THROUGH COMMUNITY OUTREACH UNIVERSITY PROJECTS

Camila D'Ottaviano¹; João Rovati²; Jorge Bassani¹; Caio Santo Amore¹

¹FAUUSP; ²FA-UFRGS

camila.dottaviano@gmail.com

“Today, probably more than yesterday, it seems to the author that it is urgent that interdisciplinary technical assistance has to be discussed, taking the man whom it serves as the centre of the discussion. Not, however, an abstract man, but the concrete man, who does not exist but in real life, concrete life, who conditions it.

” [Hoje, provavelmente mais do que ontem, parece ao autor inadiável que se discuta, interdisciplinarmente, a assistência técnica, tomando o homem a quem serve como o centro da discussão. Não, contudo, um homem abstrato, mas o homem concreto, que não existe senão na realidade também concreta, que o condiciona.]

Paulo Freire (1983[1969]:9)

In Brazil, experts involved with urban planning -planners, architects, urbanists, economists, lawyers, etc. - have a constant challenge to confront two divergent realities: a legal city, consolidated by the implementation of official (legalized) urban settlements, generally located in central areas, designed for middle and upper classes housing; and an illegal city, with lower classes dwellings as favelas and illegal (or irregular) settlements located usually in the peripheral portions of the municipalities. In large cities and metropolises access to housing by the lower income population usually occurs through housing in favelas or through self-built residence in illegal peripheral settlements. According to the 2010 Census 84% of the Brazilian population lived in cities (161 million inhabitants), at least one third of this population lives in precariousness or irregularity conditions. In a country with continental dimension, Brazilian urban planners have the constant challenge to deal with a reality with specific and peculiar characteristics that differ widely between its various regions and metropolitan areas. In this sense this paper wants to bring to the debate the following question: how teach urban planners and urbanists to be able to face the challenges presented by an urban reality of extreme irregularity and inequality? Based on the analysis of recent community outreach experiences carried out in Porto Alegre -Faculty of Architecture of Federal University of Rio Grande do Sul (FAUFRGS), and in São Paulo -Faculty of Architecture and Urbanism of University of São Paulo (FAUUSP) this paper intends to explore the teaching potential of the urban projects operated outside the classroom. We understand that on the search for the construction of a sustainable habitat the teaching of urban planning has to pass through a knowledge based on real experiences and direct observation of the complexity of the urban phenomenon. The community outreach experiences carried out by both Universities – The Future of Self-Constructed Neighbourhoods along Waterways and Orquidea Libertária Project for Habitat Social Production Projects carried out by FAUFRGS and Lapenna

Neighbourhood Housing Upgrading and Community outreach: students autonomous experience on housing improvement in a rural settlement, projects developed by FAUUSP team – are experiences that tries to improve and change the traditional practices of design, based on the architect-client relationship. Besides these cases there is the recent innovative we have the recent experience of the Urban Practice Workshops/ Oficinas de Práticas Urbanas held at the XVII Meeting of the National Association of Postgraduate and Research in Urban and Regional Planning (XVII ENANPUR). By the practice of new pedagogical and research approaches these community outreach experiences reveal alternative paths for project design and urban planning and propose innovative tools for teaching and train young Architects and Urban Planners as professionals capable to act based on the knowledge of the social reality, challenging and questioning traditional and established routines. The discussion and dissemination of these experiences are significant in a way to show possible paths of how the urban planning under graduation courses can happen also beyond the classroom, with community outreach and social engagement from our professors and students.

1 RESEARCH PROBLEM: THE UNIVERSITY COMMUNITY OUTREACH IN BRAZIL

Public university education in Brazil, as well as the structure of our universities, is based on the teaching-research-community outreach tripod. Even considering the differences that mark the Brazilian university world, made up of public, private, confessional and community higher education institutions, the community outreach today is a relatively consolidated activity in many of them.

Brazilian experiences related to extension go back to the beginning of the 20th century, with courses and conferences held in 1911 in the faculties that would give rise to University of São Paulo (FORPROEX, 2012). After decades of isolated experiences, 1980s were an important moment for its institutional consolidation as a fundamental university axis. In 1987, in the 1st National Meeting of Pro-Rectors of Community Outreach of the Brazilian Public Universities, it was defined that:

"The University Community Outreach is the educational, cultural and scientific process that articulates Teaching and Research in an inseparable way and enables the transformative relationship between University and Society. The Community Outreach is a two-way street, with assured transit to the academic community, which will find, in society, the opportunity to elaborate the praxis of an academic knowledge. Upon returning to the University, teachers and students will bring an apprenticeship that, subject to theoretical reflection, will be added to that knowledge. This flow, which establishes the exchange of systematized, academic and popular knowledge, will have as consequence the production of knowledge resulting from the confrontation with the Brazilian and regional reality, the democratization of academic knowledge and the effective participation of the community in the work of the University. In addition to instrumentalizing this dialectical process of theory / practice, Community Outreach is an interdisciplinary work that favors the integrated view of the social." (FORPROEX, 2012: 21-22)

In 1988, the new Federal Constitution established that teaching, research and community outreach activities are indissociable (Article 207). This definition was responsible for the creation, in 1993, of the Program for the Promotion of University Community Outreach (PROEXTE) and also, within the scope of the Law on Guidelines and Bases of National Education (LDB), approved in 1996, to characterize the University Community Outreach as one of the Purpose of the University. It was then possible to provide financial support for community outreach, including scholarships (Law No. 9,394 -articles 44, 52, 53 and 77). Another important initiative, in the sense of institutionalizing university community outreach, was the creation of the National Community Outreach Plan, elaborated and approved in 1998 by the Forum of Pro-Rectors of Community Outreach of the Brazilian Public Universities. (FORUM 2001).

More recently, the National Education Plan of 2001 (PNE 2001-2010, Federal Law 10,172 / 2001) and the 2014-2024 Plan (Federal Law 13,005 / 2014) established the responsibility of universities in their teaching, Research and Outreach. Both defined that a minimum of 10% of the total credits required for undergraduate higher education must be fulfilled "in programs and projects of University Community Outreach, directing their action, primarily, to areas of great social relevance" (Federal Law 13.005 / 2014, Strategy 12.7). Since then, organizations such as the National Forum of Pro-Rectors of Community Outreach of Brazilian Public Universities -FORPROEX (which held its XXXVII National Meeting in 2015), the National Community Outreach Network (RENEX) and the Association of Universities of the Montevideo Group -AUGM, have been working to consolidate outreach policies that are not limited to cultural and local

actions. In 2012, based on the discussions and deliberations of FORPROEX, the National Policy of University Community Outreach was established. (FORPROEX, 2012)

In Brazil, therefore, university community outreach is understood today as an important instrument for bringing the University closer to society, necessarily in a two-way interaction. According to Paulo Freire, a reference for the area in the country, the outreach should assume a delivery character:

"(...) of something that is taken by a subject who is 'behind the wall' to those who are 'beyond the wall', 'outside the wall' (...). [And where,] on the contrary, to educate and educate oneself in the practice of freedom is the task of those who know that they know little -for this they know that they know something and can thus get to know more -in dialogue with those who almost always think that they know nothing, so that these, transforming their thinking they know nothing in knowing that little they know, may also know more. "(1983 [1969]: 12 and 15)

At the institutional level, FORPROEX understands that outreach activities can represent an important gain in the training of our undergraduate students:

"For all this, the University Community Outreach has the potential not only to raise awareness among students, teachers and technical-administrative staff for social problems. As an activity that also produces knowledge, it also improves the technical and theoretical capacity of these actors, thus making them more capable of offering subsidies to governments in the elaboration of public policies. Better equipped to draw, if they hold any public office, these policies, as well as to implement and evaluate them. "(FORPROEX, 2012: 35-36).

The text of the National Policy of University Community Outreach is very broad, defining guidelines, basic principles, objectives, thematic areas and areas of priority action. All these definitions should guide the performance of public universities as well as federal government funding lines. According to the document, the five essential guidelines of University Community Outreach are: (i) dialogic interaction; (ii) interdisciplinarity and interprofessionality; (iii) inseparability between Teaching, Research and Extension; (iv) impact on student training and (v) social transformation. (FORPROEX, 2012: 46). Among its basic principles are:

"The citizen action of the Universities cannot dispense with the effective diffusion and democratization of the knowledge produced in them, in such a way that the populations, whose problems become the object of academic research, are also considered subject of this knowledge, having, therefore, full right of access The information resulting from these surveys. " (FORPROEX, 2012: 59).

According to the same document, the axes integrating community outreach activities are: (i) thematic areas; (ii) territory and (iii) population groups. From these axes, and considering eight main thematic areas, activities that promote territorial and population integration should be carried out, articulating different population groups throughout the national territory, especially those in situations of social vulnerability. Among the 53 passive lines of action, we understand that our work as teachers of Architecture and Urbanism courses should prioritize activities related to regional development, urban development, individual and collective rights; To public management; Vulnerable social groups; To cultural, historical, natural and immaterial heritage; And environmental issues.

Among the objectives of extension, we understand that one of the most relevant is to contribute to interfere in the solution of the great social problems of the country, creating conditions for the participation of the University in the elaboration of public policies aimed at the majority of the population, prioritizing practices attending social demands, with emphasis on housing.

We understand that one of the ways to achieve these goals is to narrow the relationship between teaching and extension. community outreach. The problem lies in the marginal, unsystematic and fragmentary nature normally assumed by this relationship, especially in public universities where research is an absolute priority agenda. This work reveals this problem, based on experiences developed in São Paulo and Porto Alegre, by Architecture and Urbanism professors from USP and UFRGS.

2 METHODOLOGY

This paper reports experiences directly experienced by the authors. Therefore at the methodological level qualitative participant-observation and action research techniques were used (Carlos Rodrigues Brandão, 1981, 1985, and William Foote Whyte, 2005).

These well known methods and techniques will not be discussed in a more detailed manner. It is only necessary to point out that they suppose, among other conducts: deep interaction between the researcher and the respondents, relatively long periods of direct observation, use of all the senses (listening, seeing, dialog) and ability to deal with uncertainties and errors always present in the processes.

It should be noted that the authors participated in the formulation of the methodologies used in each of the case studies described below, developed specifically for each of the experiences observed. In all the experiences analysed in this paper the valorisation of the field work, interdisciplinary approach and the search for partnerships were always a goal.

3 HYPOTHESIS

In the book *Childhood and History*, Giorgio Agamben says that:

"A tale of Tieck, entitled 'The Superfluous of Life', shows us a couple of lovers in penury who gradually give up any good to all external activity, and ends up coming back to their room. Finally, when they could no longer find firewood, they warmed themselves by burning even the wooden staircase that connected their room to the rest of the house, thus being isolated from the outside world, with no other possession and no occupation but their love. This ladder, Tieck clarifies to us, is experience, which they sacrifice in the name of 'pure knowledge' "(Agamben, 2008 [1978]: 23-24)

Despite the institutional discourse, in main Brazilian universities community outreach occupies a position still relatively marginal, that value mainly the "pure knowledge". Their teachers are almost all "academics". And when they engage in "practical" activities, they usually respond to market demands. The "social", from this angle, is on the sidelines. In the case of Architecture and Urbanism courses, this picture seems obvious to us.

Our hypothesis is that extension activities directed to the "social", such as the ladder evoked by Agamben, can offer students the experience of another knowledge -a counterpoint to the "pure knowledge" aimed by the research world. The question is: how to incorporate this "ladder" into the university routine? The following cases seek answers to this question.

4 CASE STUDIES

The experiences and analyses briefly presented below refer exclusively to community outreach activities carried out at UFRGS, Campus Porto Alegre, and at USP, Campus São Paulo, both public universities highlighted mainly by the value of their research.

Based on the understanding of university community outreach as "an educational, cultural and scientific process that articulates Teaching and Research in an inseparable way and enables the transforming relationship between University and Society" (FORPROEX, 2012: 21) and, especially, investing in Potentialities of the teaching-learning experience "beyond the wall" of classrooms and the University (Freire, 1983), we believe that, in the context of Architecture and Urbanism courses, the community outreach will really happen only if closely linked to the habitat social production.

We understand Habitat as: "(...) to all those processes that generate habitable spaces, urban components and dwellings, which are carried out under the control of self-producers and other social agents operating on a non-profit basis. They can originate in individual families acting individually, in informal organized groups, in social enterprises such as cooperatives and residents' associations, or in nongovernmental organizations, professional unions and even philanthropic institutions that serve emergencies and vulnerable social groups. Self-management modalities range from spontaneous individual to collective

self-production, which implies a high organizational level of participants and, in many cases, complex processes of production and management of habitat components. " (Ortiz Flores, 2006: 3-4)

4.1 ORQUÍDEA LIBERTÁRIA -LIBERTARIAN ORCHID (FAUFRGS)

With the technical assistance of the City-in-Project [Cidade em Projeto], Research and Community Outreach Laboratory of FAUFRGS, the Orquídea Libertária residential complex project has been developed by the Cooperativa de Trabalho Mista Solidária Utopia e Luta (COOPSUL) in partnership with the Association of Carcassers and Pickers of Gravataí Recyclable Material (ATRACAR). The works are programed to be done with funds from the My Home My Life -Entities Program, managed by the federal government. Located in Gravataí, a municipality next to Porto Alegre, the land with 1.2ha belongs to the federal government all will receive 50 housing units. Between 2014 and 2015, the area urban-architectural project was supported by four undergraduate scholarship students, linked to the City-in-Project laboratory. Within FAUFRGS this experience was marked by moments of deep interaction between teachers, technicians, students, residents and popular leaders. But also by conflicts, which led to the interruption of the outreach action. The experience propitiated for the teachers and students a learning process about the specificities of the architectural project destined to the population in situation of great social vulnerability but also the difficulties to work with very diverse families and professionals. The project was supported by the Pro-Rectorry of Community Outreach of the Federal University of Rio Grande do Sul.

(ONG Cidade -Centro de Assessoria e Estudos Urbanos, 2014)

4.2 HABITAT SOCIAL PRODUCTION (FAUFRGS)

Also promoted by the City-in-Project, Research and Extension Laboratory of FAUFRGS, the Outreach Course for Social Production of Habitat -Theory and Practice was held in October 2015. Based on the fact that the teaching program of the Architecture and Urbanism undergraduation course of FAUFRGS does not offer to its students any atelier dedicated specifically to the theme of social interest housing, and taking into account the potentialities and difficulties found in the development of the project Orquídea Libertária, the course explored, in general lines, two conceptions of housing design teaching: how to teach "object design" and how to teach "habitat and city" design. From this perspective, the architect's participation in the project of social interest housing was more specifically approached. The whole course was developed based on the observation and discussion of practiced project experiences, involving visits to two housing estates financed by the Minha Casa Minha Vida Program (My Life My House Federal Program), dialogue with architects, engineers and other technicians, with public agents, community leaders and residents. Supported by the Pró-Rectorry of Community Outreach of the Federal University of Rio Grande do Sul, the course attracted a good number of students, offering them an opportunity to interact with realities rarely addressed during their studies. The visits generated heated debates. The action, in addition to achieving its most direct objectives, was also a preparatory activity for a workshop The Future of Self-Constructed Neighborhoods.

4.3 FUTURE OF THE SELFCONSTRUCTED NEIGHBORHOODS BESIDES WATER STREAMS (FAUFRGS)

The idea of organizing this workshop came from the contact with professors of the National School of Architecture of Paris La Villette (ENSAPLV), with which FAUFRGS has a cooperation agreement. Since 2006, ENSAPLV teachers have organized exchange activities on urban planning practices between France and South America, with the purpose to discuss the process of urbanization in South America, to confront different design practices through the organization of intensive workshops, to situate fieldwork as the central element of the project process, to promote the questioning of the role of the architect and other knowledge in the urbanization process.

The main objective of the Porto Alegre workshop, held between 2016 April 15 and 30, was to develop an experience of participatory elaboration of an urban project based on the urban areas located in the Mãe D'Água Basin (municipality of Viamão), together to the UFRGS Valley Campus. More specifically, its objectives were: (i) to promote the meeting between students and professors of Architecture and Engineering in Brazil and in different countries (Brazilian, French and Argentinean teachers participated) in order to develop a participatory project culture; (ii) to promote the contact between the University and urban reality of the metropolitan peripheries and their community leaders, (iii) to develop reflection on the experience and to disseminate its results, in order to deepen the debate about the outreach potentialities.

The action proved to be valuable in the pedagogical and social plans. The studio developed instigating experiments from the point of view of teaching-learning project practice. The community, through the solidarity of many residents, found an opportunity for dialogue with the technicians and also to demand solutions for the problems that reach the area, especially those related to sewage and solid waste collection and drainage problems. The workshop proposed the experimentation of innovative pedagogical practices, based on direct observation of the study area and on permanent contact with the resident population.

The results of the work were encouraging for all partners involved in the action. The atelier contributed to reduce of the distance and still existing prejudices between Architecture and Engineering as fields of knowledge. The exchanges between the different national cultural groups participating in the action were intense and very important. The workshop also contributed to the recognition of the importance of the participation of the metropolitan peripheries dwellers in the formulation of solutions to the problems that afflict them -in this case, particularly related to water (floods, sewers that are non-existent or precarious , solid waste, etc.). The project was supported by the Pro-Rector of Community Outreach of the Federal University of Rio Grande do Sul.

4.4 JARDIM LAPENNA: HOUSING IMPROVEMENTS AND MAPOGRAFIAS (FAUUSP)

The FAUUSP team, in partnership with the Tide Setubal Foundation, has worked in Jardim Lapenna on two fronts: Housing Improvement and Mapographies projects. The first aimed to subsidize a project to improve the quality of housing, construction and sanitation of the neighbourhood houses. The Mapografia Project, coordinated by Professor Jorge Bassani, was carried out with high-school students, where they were urged to understand and appropriate the neighbourhood urban environment and the public space after the discussion and preparation of daily maps of the city. The project had two more specific and equally important objectives: (i) to enable USP students to have an experience of social engagement and to coexist effectively in areas of the Eastern Zone of the city; (ii) and make feasible interventions with real improvement to the living conditions of the Lapenna population. The project had the support of the Pro-Rector of Community Outreach of the University of São Paulo.

Over the course of the 12 months of work, the greatest difficulty faced by the Housing Improvement project was the difference between university times, with specific deadlines and demands in relation to students' scholarships, and the "real world" deadlines, where Funding for the feasibility of the 2016 stage of the project only came out when the scholarships were almost over. The contribution, in fact, to the improvement projects fell far short of what was originally planned. In the Mapographies project, after a timid start, the involvement of the state school students was very good, with a great final result. With regard to the training of our undergraduate students, the contribution has been impressive, with involvement far beyond what was originally planned (D'Ottaviano 2016 and Bassani 2016).

Figure 4 -Jardim Lapenna. São Paulo-SP and Mapografia. São Paulo-SP. (Camila D'Ottaviano and Jorge Bassani)

4.5 HOUSING IMPROVEMENT IN A RURAL SETTLEMENT (FAUUSP)

Agroecological Construction Group is a very special project once it is a fully autonomous initiative from FAUUSP students, bringing together postgraduate and undergraduate students. The project is currently

coordinated by Professor Caio Santo Amore, based on previous experience of the same Group in a Rural Settlement with 28 families, organized in the municipality of Cajamar (Metropolitan Region of São Paulo) by the Landless Rural Workers Movement (MST) .

From the students mobilization work the housing needs were recognized and they started to design interventions projects and to search for public financing for the needed. Together with a teacher -an architect who already had a history of working with social movements and who had recently joined the faculty of FAUUSP -an extension project was drawn up, submitted to the official program of the University. The granting of three scholarships boosted the Group's action and its organization as a self-managed collective. The students articulated themselves to use a collective part of the obtained resources, aiming to cover expenses of displacement, food and with materials of consumption demanded for the execution of the surveys and elaboration of the projects. Decisions and technical work are shared, involving students and settled families and have a very clear purpose, which recognizes and seeks to meet individual and collective housing needs. This is experience is relevant both because of its object and the relationship established with an important social movement, but also, and perhaps most importantly, because of the students' self-organization, recovering some of principles defined by the student organizations of Architecture and Urbanism in the 1990s that interferes straight in the university education process. (Santo Amore 2016).

5 URBAN PRACTICE WORKSHOPS AT XVII ENANPUR

Last May, during the XVII Meeting of the National Association of Postgraduate and Research in Urban and Regional Planning (XVII ENANPUR), we organized for the first time a special workshop – Oficinas de Práticas Urbanas (Urban Practice Workshops) – that has as its central goal to make the researches not only study the city and territory but live the city, its problems and challenges and potentialities.

Organized in an autonomous way by professors, researchers and students, the ten workshops congregated also social movements, technical professional and work entities operating in the São Paulo Metropolitan Region. In general, they aim to develop practical activities of environmental and urban reading, planning and design in contexts that involve participatory processes of recognition of problems, decision making and elaboration of proposals associated with the landscape and the production of the city:

- Workshop 1 -Urban project in the Luz region: the city surrounding the occupation of Rua Mauá.
- Workshop 2 -Occupy, resist and build: self-managed housing in the rehabilitation of empty buildings in the central area.
- Workshop 3 -Urban ways: from the historic hill to the metropolis
- Workshop 4 -Urbanism in the defense of rights: the Observatory of Removals in the favelas of the Urban Operation Águas Espreiadas.
- Workshop 5 -Self-construction and housing improvements in consolidated precarious settlements: Diadema.
- Workshop 6 -Urbanization of favelas: Jd. Jaqueline.
- Workshop 7 -Agrarian Reform in the metropolis: political formation, infrastructure and production.
- Workshop 8 -From the modernist project to condominiumization -the case of COHAB José Bonifácio in Itaquera.
- Workshop 9 -On the shores of the city: urban expansion and the dams of the South Zone.
- Workshop 10 -Cartography affective and insurgent in Paranapiacaba.

All the workshops were held on the real city, at expansion axes, consolidated urban areas, peripheries, precarious settlements, borders, "peri-urban" areas. Various situations present in the Metropolitan Region of São Paulo. The workshops were a moment of group reflection and collective production, elaborated after the direct contact and in interaction with community leaders and residents of the visited territories.

(Camila D'Ottaviano and João Rovati 2017)

6 CONCLUSION: A OPPORTUNITY TO TH EXPERIENCE

In the search for a sustainable habitat, urban planning education must necessarily be confronted by the harsh reality of our Brazilian and South American cities, which are all marked by profound social inequalities and serious environmental problems, such as floods, absence and precariousness of sewage networks, occupation of risk and formally protected areas -themes, moreover, little valued by our curricula.

The succinctly reported community outreach actions, modest and punctual, provided the experience of the student's involvement in Architecture and Urban Planning with concrete social demands of great complexity. These experiences show the importance to explore alternative paths, new pedagogies and new project practices. The opportunity to join this experiences were important for our students, as one of the participants in these actions suggests:

"About the project, it was a very good experience, since a project was done for real people, with real problems and needs, very common throughout Brazil. And since during our Faculty we only realize pharaonic projects for millionaires." (Baumbach 2015, apud Rovati 2015: 1087)

Mello (2015) argues that the community outreach projects and experiences are a powerful moment of knowledge exchange. These are moments were the technical academy experts learn from the popular and vernacular knowledge. And in the other hand, it is the moment when the academic knowledge must be adjusted to the population real needs.

For Agamben (2008 [1978]), the destruction of experience is a striking feature of the daily life of modern man:

"Every speech about experience must start from the realization that today it is no longer something that we can do. For, as was already deprived of his biography, contemporary man has also been deprived of his experience: in fact, the inability to make and transmit experiences may be one of the few certain data he has about himself." (Agamben, 2008 [1978]: 21)

For some, the trivialization of catastrophes would be responsible for the corrosion of the experience:

"But today we know that for the destruction of experience a catastrophe is by no means necessary, and that the peaceful daily existence in a great city is, to this end, perfectly sufficient. For the day-to-day of contemporary man contains almost nothing that is still translatable in an experience: not the reading of the newspaper, so rich in news that it concerns an insurmountable distance; Not the minutes that passes, stuck behind the wheel, in a traffic jam; Not the trip to the suburbs in subway trains, nor the manifestation that suddenly blocks the street; Not the haze of tear-drops that slowly dissipates between the buildings of the center, and not even the sudden blast of pistol detonated, it is not known where; Not the queue in front of the offices of a breakdown or the visit to the country of Cocanha of the supermarket, nor the eternal moments of dumb promiscuity with strangers in the elevator or the bus. Modern man returns home in the evening exhausted by a jumble of events-fun or boring, banal or unusual, atrocious or pleasant-yet none of them has become experience." (Agamben 2008 [1978]: 8)

It is surely an exaggeration to invite Agamben to the dialogue about our routine and unpretentious project teaching practices. However, are modest and timely community outreach actions like those reported in this article, would not be finally a rare and exciting opportunity to turn trivial moments of project teaching into and knowledge exchange experience?

ID 1605 | THE CHALLENGES OF PLANNING IN THE UNEQUAL CITIES. "URBAN POVERTY WORKSHOP" FOR INNOVATING URBAN PLANNERS EDUCATION PATH

Daniela De Leo¹, Valentina Alberti¹, Miriam Bodino²

¹Dept. of Planning, Design and Technology, Sapienza University

²Dept. of Architecture and Design, Politecnico di Torino

daniela.deleo@uniroma1.it ; valenalberti@gmail.com ; miriam.bodino@polito.it

ABSTRACT: The recent shift from the Millennium Development Goals to the Sustainable Development Goals scored a point of no return in the international debate on development, stating that the separation between the rich part and the poor part of the population is no longer with the North and the South of the world, but between nearby areas in always more highly polarized contexts. In this framework, a deeper knowledge of the spatial dimension of poverty and of its spatial implications is required; especially in the Italian Faculty of Architecture where urban design and plan-making are frequently still considered "the real core" of the discipline with the general under-evaluation of the wicked problems. On the contrary, in the United States, thanks to the passionate work of Ananya Roy, this knowledge found its place, first in the university program at the Institute of Urban and Regional Development of UC Berkeley, and then in Los Angeles, being highly appreciated both by students, scholars and NGOs. According to this awareness, the first workshop "Urban Poverty. The praxis of planning in unequal cities" organized in September 2016 at the Sapienza's Faculty of Architecture in Rome, gave the opportunity for discussing and testing theory and practices of urban research and city planning with issues of poverty, in particular regards of western cities

and the city of Rome. This first experiment offered the opportunity to think about the interdisciplinary and/or international teaching aimed at preparing students for today's and tomorrow's planning challenges in the unequal cities.

1 INTRODUCTION

The impoverishment of society, the growing awareness in the importance and urgency of a "new urban question" have stimulated a more explicit attention to the social and spatial inequalities within the cities, and then, to the limits of urban design and planning theories and practices. In this framework, a strong rethinking of the social role of the planner seems inevitable in a condition of increasingly uncertain and fragmented representation and expertise. In fact, as it has been repeatedly noted, planners have too often failed to treat with the so called "wicked problems" (Rittel, Webber 1973), especially at the time in which cities were developing the growing polarization of society, and the problematic fragmentation in the urban spaces (Madanipour 1998; 2014). As it has been recently noted "spatial ordering for the construction and management of cities and territories have had (and have) significant consequences with regard to the relationship, integration or exclusion, between rich and poor" (Secchi 2013). In this context, urban planning seems to have strong and specific responsibilities with respect to the worsening of inequalities and, therefore, interventions aimed at defining new structures and new policies that may not be important starting points for their elimination and contrast. Today, the meaning of the "new poverty" can be understood in relation and in opposition to the sense of poverty more common in the past. These "old poverty" were defined, above all as the lack of economic means: they showed (and they show still today since they are not completely disappeared), duality in society and can be described as a contrast between "high" and "low".

Poor, in this sense, is one who has a "low" income statement and that, therefore, is a social condition overall "low". These "new poverty", however, are described as another form of duality like "inside" and "outside", that does not end only in the now inadequate spatial polarization between centre-peripheries. In fact, they are more properly defined in reference to the possibility of access and participation in social life: poverty means first of all "marginalization", then "exclusion" and, increasingly, "segregation".

Distinction and exclusion are inseparable aspects of the modern city (Secchi 2013, 42) that remain in the post-modern one as peculiar forms produced by the concentration of a specific unit and type of subjects, within the matching between recurrent social and spatial morphologies. In this perspective, the new urban poverty is represented, not only as a "condition," or a "status", but from "processes leading to the margins" and, then, to the exclusion from social life, while the urban life becomes inadequate. So, it's quite clear that they ask directly to the planning about their responsibility, since they are based on a duality concerning the inside and the outside, the included and the excluded, the accessible and the restricted/limited, by drawing and redrawing, more or less intentionally, the contemporary urban spaces through boundaries.

Nevertheless, according to some authors (Chiappero, Moroni, Nuvolati 2011) "studying the relationship between the territory and nowadays poverty is not only a substantive contribution to knowledge of the discipline, a contribution to the investigation about the relationship between urban design and planning's effects, and social outcomes" (considered as one of the main technical tasks of urban planning); it is also a task that can provide a useful contribution to better design the "spatial matrix" of public policies about poverty (Patriarchi 2014). Policies on which Western governments have often invested considerable resources but, certainly, with results largely unsatisfactory. In fact, at first under the influence of the major acquisitions of the Modern Movement, poverty and hardship have been considered mainly with reference to the economic aspect, responding (spatially and socially) in a rather standardized way.

Subsequently, these matters have been handled through policies or individual area (place or people-based), but rarely have been linked with positive forward-looking idea of processing and/or development (local and otherwise). Therefore, in order to think new guidelines for innovative theories but, also, for policies and urban design tools to fight urban poverty, social and spatial segregation, marginalization and exclusion, it seems necessary to restate what is widely perceived – for progressive simplifications – as a theme anchored to the "individual" size (limited to single buildings or to specific populations), in an "urban theme", absolutely crucial for this phase.

Since the late '70s the Italian and European cities face the most critical consequences of economic restructuring and related labour changes, the ongoing downsizing of national welfare systems. With the Crisis, the spread of social vulnerability and poverty have been accelerating also by intertwining: - precariousness/insecurity/uncertainty of labor and income, - increase in migration, - demographic changes, - aging population - weakening of family structures and resulting tensions on "the care" (de Leonardis 2016) On cities and their governments flock: - dynamics of social embrittlement - trend of impoverishment of the middle classes, - growing inequalities and social polarization. Within this context, the workshop was focused on the challenges of doing research, planning and design urban policies considering urban poverty and the unequal cities as crucial. In cities, inequalities are, at the same time, "within" and "among" individuals, families & social environments. Inequalities are not only about difference of income but there is a spatial dimension of poverty we have to consider as urban planner.

2 THE WORKSHOP

In 2016 took place the first workshop "Urban Poverty. The praxis of planning in unequal cities" organized within the Faculty of Architecture in the Sapienza University in Rome. The deprived urban area is one of the feature that people observe (also urban planners and architects) but they are exactly the environmental and physical aspects of poverty. Theoretical and practical implications of labelling urgent problems of our cities in terms of "urban poverty" for better intervene on them, interplay between the international debate and domestic problems seems a promising direction.

Thus, starting from the work of Ananya Roy, the workshop tried to underline theoretical and practical implications of reading/defining/labelling urgent problems of our cities in terms of "urban poverty" to understand and define new directions of development and multi-scalar actions for the city and to fight inequality in our cities. It will take advantage from the collaboration of experts in different but complementary disciplines, for:

1. Identifying a new framework for "urbanpoverty" studies;
2. Dealing with urban poverty using an interdisciplinary point of view;
3. Promoting interdisciplinary actions;
4. Putting together theory and practices for intervention;
5. Developing critical thinking in future and contemporary experts.

Courses were organised in three parts:

1. Theories – new keys/framework for interpretation of the urban poverty phenomenon Ananya Roy opened discussion about urban poverty to new meanings, points of view, research fields, encouraging new theoretical debates;
2. (Miscellaneous – tools from case-studies and experiences Case studies from Italy were illustrated by D. De Leo, S.Monni , G. Giunta , D. Esposito that focused interest on analysis and intervention tools;
3. (Field Work – proposals V Municipality of Rome was the selected area for the field work. Participants had the opportunity to explore the context and speak with associations' members, inhabitants and delegates from the Municipality, to identify specific problems and issues related to "poverty" in this area. At the end of the workshop participants presented to delegates their proposals. According to Roy, the actual reference model tends to impose "subjective concepts of development, modernization, civilization, aid and certain aesthetics of poverty". For many people the way of thinking has been influenced according to the ruling economic model and to the Western approach. Indeed, the world economy and the capitalism are ruling the global relationships. Therefore, it is necessary to take into account macro phenomena to understand local problems. Urban poverty became a global issue particularly affecting cities where more than 50% of the world population lives: poverty exists just because wealth does. "Poverty is not just about economy, is about power and about political appearance". "Capitalism and neoliberalism lead to concentration of wealth and growing inequality: just a democratic world can counterbalance and contrast the system" (Roy). While wellness and wealth increased on the whole, the benefits of this growth have not been shared homogeneously, producing or reinforcing

unequal distribution. This phenomenon is evident in the countries of the South, but is becoming alarming in the North too. This is probably another reason of the growing attention of this topic in the West. However, inequality is often considered as a problem to be solved or eradicated, without taking into account the bigger scale relationships that have caused it. Since the intensification of those inequalities could be attributed to the socio-economic model, the small-scale interventions could not be enough; and the weakest and the most marginal population are the one suffering more. For sure, as it has been underlined, "new indicators should be introduced, such as capabilities and quality of life" (Monni).

2.1. THE MAIN TOPICS

During the workshop some topics emerged from lessons and discussion. First of all, professors Roy and Monni and moreover Giunta underlined how the economic principle encourages competition between constitutional values, such as equality, liberty, dignity and so on. According to him, "to promote urban development, personalization is fundamental, along with understanding the perceived needs, expectations and capabilities". So people are the core of the question.

The goal seemed to "break the dichotomy between economic and socio-cultural dimension, between State and financial market", imagining a model with new balances and mutual advantages. In this process of metamorphosis ethic and aesthetic are strictly linked, and the concept of beauty as a privilege for wealthy has to be fought.

Moreover, another topic discussed during the workshop has been common attitudes (of power representatives) towards urban problems or considered as such: elimination, removal and exclusion are usual approaches. In doing so, just the symptoms of issues are treated, forgetting or ignoring the complex system of causes and effects. Therefore, if poverty is just a consequence of a multifaceted structure that includes space, society and economy, the focus should not be on symptoms of inequality and poverty, but on causes and effects that create those. The author Marie Huchzermeyer (Huchzermeyer 2011, 36-39) describes well the difference between a rights-based approach and the operational approach focused only on symptoms promoted by the Millennium Development Goals (MDGs). The two different methods are described and compared to explain alternative modes of treating informality in South Africa. The core of the question is the "focus on causes and complexity of poverty/informality", through the promotion of "accountability of governments to organized citizens" and treating the "poor as agents", identifying "duties for the state" and therefore creating "political implications". Moreover, issues about "colonialism of power" were discussed: all the approaches linked to it are founded on the "will and need to improve" the others. Instead the purpose should be the "will to promote justice – that is about distribution of resources" (Roy). The concept of justice is related to the right to the city promoted by Henri Lefebvre (Lefebvre 1968) and many others after him. "The right to the city is far more than the individual liberty to access urban resources: it is a right to change ourselves by changing the city. It is, moreover, a common rather than an individual right since this transformation inevitably depends upon the exercise of a collective power to reshape the processes of urbanization. The freedom to make and remake our cities and ourselves is, I want to argue, one of the most precious yet most neglected of our human rights" (Harvey 2008, 23).

Finally, poverty was assumed as a multidimensional problem of People+Place+Policies/institutions, by trying to underline the responsibility of academic and professionals since space matters in producing of social problems but also in the protection of rights and in the creation of citizenship opportunities. We assumed that, especially in the last few years, we saw poverty become more and more visible and serious in our cities in different ways. By avoiding the frequently common trap in the public debate about Absolute or Relative Poverty, recently, Lea Ypi (2016) assumed clearly:

> Absolute poverty as Poverty

> Relative poverty as inequalities

[[Rel. Pov.>> inequalities >> Abs. Poverty]]

Inequalities is not only a difference of income but a difference in the place prosperity accessibility as difference between public material fix capital and real accessibility to the material and immaterial capital of

each urban spaces. For economics statistic, inequality is a difference of income, a statistic territorially aware could emphasize the place prosperity inequalities as difference between capital public fix material and accessibility to the material and immaterial capital of urban spaces. Poverty is not only an internal problem, a problem of persons/individual income but a problem of urban conditions, availability and accessibility, and then a problem of place and space. Space matters in: producing of social problems but also protection of rights & creation of citizenship opportunities. In nineteenth-century reformers assumed the importance of place, so interpretations which treat poverty ONLY as a spatial problem run the risk of overemphasizing the causal power of concentrated poverty or residential segregation and missing the political-economic forces that produce uneven geographies. So, there is not concentration here but see it to try to deal with theoretical challenges by posing the problem of power!!!

3 LEARNING AND CONCLUSIONS

At the end of the first edition and while we are organizing the Summer School on the same subject, few learning and first conclusion can be underlined:

1. We couldn't evade the difficult questions of political economy by focusing on the promise of educational expansion and/or housing reforms, because a single solution is not available or easy to be found it BUT we could work together around the possibility to do better: to understand more and improve skills and tools in theoretical and practical work.
2. Relevance of practices: significant changes will not come about as a result of elite goodwill. Real change requires countervailing centers of power. The trade union movement/ASSOCIATIONS decimated by decades of attack, still remains vital, although weakened. Community organizing networks provide the second center. Building from the grassroots to players on the national policy scene, they have mounted some of the most effective.
3. A not exclusive but place-based (such as "people IN places") orientation.
4. Co-production of interdisciplinary knowledge: more attention in each field of studies by underline the responsibilities of each specific knowledge and a path for the co-production of a new interdisciplinary knowledge as a combination of different.
5. Finally, Definitions of poverty as a lack of resources often stop short of focusing on the sources of unequal income distribution, here we try to underline a different idea of resources, especially the relationally resources by looking at the local ASSOCIATIONS AS RESOURCES: As a matter of fact, the urban poverty complexity could be better interpreted taking into account associations like neighbourhood committee in Tor Pignattara and the Foundation of Community in Messina. The challenge now is to understand how involve those resources in the urban design process."

In conclusion we can assume that poverty is a problem of correct interpretation of the phenomenon from power representative and from planners, that should be responsible of intervention. Correct interpretation of theory but also interpretation of manifestations of inequality allow to identify meaningful phenomena and data to consider to support actions.

In few words, the workshop produced critical knowledge, helpful to analyze and discuss a real wicked problem such as the case of "Villaggio Falcone" a very deprived neighbourhood where we practically tested the utility of theories and practices coming from different context. The fragmentation and differentiation of urban space with reference to the social characteristics of the populations established, as well as the segmentation of the housing and the labour market. However, it seems possible to say that, even in European cities, urban poverty:

1. remains a significant problem, common and persistent in urban areas of different types;
2. it is a multidimensional phenomenon and not one-dimensional;
3. as many social phenomena, it is not coming out from the simple interaction between individuals, but manifests itself as a complex phenomenon to the scale of the urban areas, city regions and cities. Finally, the workshop, from one side highlighted that it is more important to guarantee proximity between administrations and citizens (control can't be considered only punishment) than to do make-up actions on problematic situations. From the other, it showed one time more that for very complex issues, the co-production of interdisciplinary knowledge is required. And it means at least the combination of researchers' attitude of:

4. statistic's researcher knowledge, that ask to themselves: how many people are involved in this or that problem?
5. sociologists, that ask to themselves: who are this people?
6. but also architects and planners that are able to understand and ask to themselves: where this people live and how are their living conditions? Since it's not a disciplinary issue we need to educate students about these issues and in the ability to coproduce knowledge and proposal with Statistics, Sociologists and Urban and social Planners with responsibility and accountability in order to change the world by promoting justice.

ID 1639 | COMMUNITY GARDENS AS TEMPORARY USES FOR VACANT LAND REVITALIZATION: THE CASE OF RIGA

Alisa Korolova¹; Sandra Treija¹

¹Riga Technical University Faculty of Architecture
alisakorolova@gmail.com

1 INTRODUCTION

As some European cities are undergoing economic and population decline, at the same time showing urban sprawl, the number of vacant land inside the city centers is rapidly growing. Under complicated construction regulations, development of vacant land inside the city center is often related to high construction costs and time investment, forcing land owners to postpone site development. Vacant land in the city center, providing space for garbage collection and even affecting increase in crime, results neighbourhood degradation.

Concerning common uncertainty regarding future development of vacant land, temporary uses appear to be good solution to outdoor space revitalization, helping to improve quality of life of local residents. As show various case studies from different European countries, community gardens appear to be common solution for the temporary use of vacant land. According to previous research data, community gardens contribute to social cohesion, promoting integration and strengthening sense of neighbourhood belonging.

Moreover, gardening positively affects people's physical health and wellbeing, reducing one of the major risk factors of noncommunicable diseases.

Nowadays, Riga, being a shrinking city is facing population decline and as a result reduction in land development investment and construction. Integration of temporary projects in particular creation of community garden, can help to promote sustainable development by creating livable outdoor, where people want to spend their free time. However, as community garden do not appear in any construction and land use legislation, as well as concerning the special status of Riga's city center included in the UNESCO World Heritage Protection list, the research focuses on possibilities of introduction of temporary uses, in particular community gardens under the legal framework.

In-depth interviews conducted with city's Construction Department representatives and representatives of city's institutions involved in development of Riga city development plan, development of land use mapping, cultural heritage and green area protection, as well as interviews with local school authorities were chosen as a tool to analyze the current situation of legal framework and possible development of new guidelines to promote introduction of community gardening in the city center.

The results of this research show which particular construction regulations and land development plans should be completed to ensure legal framework under which community garden in the city center can be developed, promoting easier and quicker temporary land use approval.

1.1 THE PROBLEM OF VACANT/UNUSED LAND

Currently facing shrinkage and economic decline, number of vacant plots in many European cities remains to grow. The vacant/underused land problems have raised already in the first part of the 20th century in the economically depressed years, however, widespread attention this fact gained in the late 70's early 80's (ed. Pacione, 1999; Martinez-Fernandez et al., 2012). So, for example, in UK concerns about the negative impact of vacant land in the inner city raised already in 1976-1977 (Home, 1983). This fact, however, proves that there is a need for new approaches and strategies to deal with this problem.

Existence of vacant undeveloped territories in the center of the city is often promoting degradation of the neighbourhood plots and even promotes crime. As according to De Biasi (De Biasi, 2017), the bad condition of undeveloped/unused lots often has negative influence on individual's social, mental and physical health. Yet, considering all the negative features, in recent years vacant land started to be perceived as a possibility, not a problem.

In order to deal with the vacant / underused land in the inner cities, various approaches are developed. Being first seen as a problem, vacant land can also offer a range of opportunities (Nemeth and Langhorst, 2013). The vacant land can work as a room for various kinds of different temporary uses, enabling community activities, positively affecting air quality, even helping to reduce crime and providing space for recreation.

1.1.1 METHODS

Combining the temporary uses and urban gardening approaches for dealing with the vacant land, the research focuses on possibilities to implement various community gardening forms under the legal framework of Riga. Being in the list of UNESCO heritage protection zones, the historical center of Riga and its protection zone/area needs specific approaches for vacant land temporary uses.

In order to find out which types and functions of community gardens would be appropriate to introduce on the vacant land in the historical center of Riga, in-depth interviews with City's Construction Department's, City's Development Department's representatives and representatives of cultural heritage and green area protection agencies were conducted (9 interviews in total). Interviews with local school authorities and authors of previous projects related to urban gardening helped to find out which inhabitant groups are interested in gardening in the center of the city (5 interviews in total).

Field studies showed the number of vacant land and land used for temporary car parking in the protection zone of the historical center of Riga.

2 THE CASE OF RIGA

Riga is a shrinking city, and this process is especially affecting the center of the city. According to the census data in 2010 number of inhabitants in Riga was 673433, shrinking to 639630 in 2016 (Census data, 2017).

As defined in various planning documents, Riga's historical center and its protection zone is a multifunctional territory, providing livable, flexible and sustainable environment. Analysis of the Riga Territory Plan shows that the chosen territory consists of various land development groups. Water bodies (17,9%), streets (16,9%) and squares (24%) are taking the largest territories in the historical center of Riga. Mixed housing and business land development groups are the most common functions in the current development plan. Distribution of these functions is unbalanced, leading to the coexistence of housing and night club buildings and so negatively affecting the quality of life.

Underused/vacant land makes 4,3% of the territory in the historical center of Riga and its protection area and includes vacant land, underused built-up territories as well as declined territories. Furthermore, these numbers do not include extensively used areas with the development which allows further construction. Some of these territories are functioning as car parking, which is defined as a temporary use. As showed field studies there are 32 vacant and 17 temporary car parking plots in the protection zone of the historical center of Riga (Fig. 1 a,b).

Figure 1 a, b – Vacant land with a temporary car parking, vacant/unused land (protection zone of the historical center of Riga)

According to the aims defined in the development strategy for the historical center of Riga and its protection zone, revitalization of degraded or underused territories is to be reached with new construction development (Riga's sustainable development strategy till 2030). This fact, however, does not support flexible and fast revitalization, on the contrary it results more complicated and slow process of revitalization. In the context of a shrinking city new construction development might cause even more fragmentation, negatively affecting residents' quality of life.

As shows the evidence from other cities in Europe, inhabitants prefer to see community gardens or other community supporting temporary uses, rather than vacant land or temporary parking. Community gardens often start as guerilla initiatives, as for example in the case of Todmorden, UK. However, in the case of the historical center of Riga unplanned actions might lead to penalties and dismantling of the garden. That is why to ensure the development of community gardens as a temporary use for vacant land, the legal garden approval process needs to be simplified.

Research on the previous urban gardening related initiatives showed that authors usually avoid development of a garden project, preferring creation of an „event” or „campaign”, which is easier to approve in planning institutions. However, it allows to set up garden only for a very short period of time, requiring also detailed „event” programme. In depth interviews with authors of urban garden related events showed that the idea of growing in the center of the city is supported by different inhabitant groups. So, the commercial urban garden, which functioned as a cafe and the advertisement point for the household

equipment, attracted attention of young families and middle-aged people (Fig. 2 a). The vertical garden located on the market place encouraged attention of children and seniors (Fig. 2 b). This evidence confirms Riga's inhabitants' interest in urban gardening and proves the necessity in development of easier, people-friendly regulations concerning installation of temporary community gardens in the center of the city (Interview data).

Figure 2 a, b – Urban gardening related events in the center of Riga

At the moment, creation of a community garden on the vacant land requires not only land owner's permit, but also a detailed project. Taking into account absence of guidelines or regulations related to development of community gardens, common regulations as for landscape design or urban amenities project are implemented. In order to introduce new guidelines or regulations, and to ensure the quality of the proposed guidelines in terms of community garden in the historical center of Riga, various institutions should be involved. In depth interviews with representatives of The City Development Department, The Construction Department (Architects), The Construction Department (Landscape Architects), Country's Cultural Heritage Protection Agency and „Riga Forests” Agency showed which particular aspects should be taken into account when creating new guidelines. Examples from different European countries show that community gardens can be introduced not only on the vacant land, but also in green areas (parks, garden squares), school or nursery school courtyards and residential housing courtyards. Location of the community garden affects also the main function, preferably introducing educational garden at schools, and promoting physical activity and social integration, as well as providing free time spending possibilities in parks and residential housing courtyards. Taking into account these differences, interviewees were asked to consider best matching function for community garden on the vacant land. As a result, representatives of different institutions reached common ground on community garden as a free time activity for seniors and as a revitalization tool for vacant/underused land. Some experts considered also promotion of physical activity and social integration (Table 1, Interview data).

As differs the function of community gardens, differs also the design or the visual appearance. Considering type of community garden on the vacant land in the historical center of Riga and it's protection zone, preferable are container and vertical garden. Creation of raised-bed garden might be supported only in protection area of the historical center. In addition, all interviewees arrived at a common view on the importance of design, considering necessity to insure visual appearance of high quality.

	The City Development Department (2 people)	The Construction Department (Architects) (2 people)	The Construction Department (Landscape Architects) (1 person)	Country's Cultural Heritage Protection Agency (2 people)	„Riga Forests” (2 people)
Vacant land for community garden	yes	yes	Yes/No	yes	yes

Container gardening	✓	✓	-	✓	✓
Vertical gardens	✓	✓	-	✓	✓
Raised-bed gardens	-	✓	-	-	
Supported function of the temporary urban garden	Free time activity for seniors Social integration As an areas revitalization tool	Free time activity for seniors Promotion of physical activity As an areas revitalization tool	-	Free time activity for seniors As an areas revitalization tool	No specific preferences
Current requirements for container gardens	-	-	Project with the detailed description, photo evidence, topography, plan and detailed description of the planned beds/containers/structures, description of the planned plants	-	-
Desired Requirements	Insured safety and maintenance. Common maintenance requirements for all gardens.	Visualisation, to ensure visual quality of the garden. Assurance of maintenance		Design and plan of the garden. When working on design local traditions should be respected, however, contemporary design solutions are welcome to be introduced. Special attention on the choice of planted species.	Visualisation, to ensure visual quality of the garden. Special attention paid on design.
Integration of community gardens in the city's development strategy	✓	✓	-	✓	✓
Separate regulations on community gardens	✓	✓	Integrated in the general construction regulations		✓

Table 1 – Interview data

3 CONCLUSION

According to in-depth interviews' data, use of community gardens as a tool to revitalize vacant/underused land is supported. Positive impact of urban gardening on people's health and well-being, and the free time spending possibilities garden gives to senior residents, has also been considered as an advantage. Considering the type of community garden, container and vertical garden were chosen as more appropriate. However, considering legal framework and creation of new guidelines all interviewees came to a common conclusion that in case of the historical center of Riga and its protection zone, special attention should be paid to garden design. It is recommended to have separate or integrated regulations which would ensure high visual quality of the community garden. In order to prevent vandalism or any other problems, the maintenance should be insured. Introduction of community gardens in the city's development strategy is advisable by all interviewees.

ID 1642 | THE LEARNING EXPERIENCE OF TRANSPORT PLANNERS: AN INTERNATIONAL SURVEY

Enrica Papa¹, António Ferreira²

¹Department of Transport and Planning, University of Westminster; ²Ferreira Solutions

e.papa@westminster.ac.uk ; a.c.f@outlook.pt

1 INTRODUCTION

The call to advance the quality of higher education should be a constant priority for academic institutions in response to the changing needs of the professions. This is particular true for transport planning, a discipline that is experiencing rapid and on-going changes due to the emerging environmental, economic, security-related and social issues that mobility is becoming increasingly more associated with. Indeed, academic institutions are faced with the challenge of ensuring that transport planning courses address the growing complexity of urban challenges (Zuylen 2000; Ramsden 2003).

Transport planning courses are typically offered in urban and regional planning or engineering departments although, in some instances, they are also offered in other institutions such as tourism, business, public policy, social science and urban studies departments. A number of studies have provided national overviews of transport planning education, such as in Australia (Mateo-Babiano et al., 2013), Switzerland (Kaspar, 1982), Canada (Ruppenthal, 1998) and USA (Krizek and Levinson, 2005). These studies have adopted different research methodologies and slightly different research questions. In any case, in these studies, it has been identified a general preference for multidisciplinary and holistic transport planning courses (see as well van Zuylen, 2000 and Ferreira et al, 2013, who confirm the same trend). In the '60s and '70s the rational technical planning model influenced the field of transport planning which led to the delivery of a technical-oriented transport-planning curriculum. With the introduction of communicative planning in the '80s and '90s, planning pedagogy was revised to capture its thrust towards policy-orientation and towards the facilitation of communicative planning processes (Handy et al 2002). This had important implications in a number of transport planning courses, which have reflected this new trend.

However, not all the transport planning courses that one can find today accommodate a broad curriculum. Moreover, only limited hours can be allocated to cover the broad and multidisciplinary field of transport planning and this means that difficult choices have to be made even when a comprehensive curriculum is

desired (AESOP, 1995). Within each course curriculum designers must then choose from amongst a diverse set of important topics what should be taught. The inevitable exclusion of many concepts and topics results in curriculum gaps that might negatively affect the professional future of the students. As an alternative to this, curriculum designers can choose to make curricula as broad and comprehensive as possible, however this can lead to shallowness and superficiality and will make it difficult for students to achieve deep learning in any given subject area (Krizek and Levinson 2005, Ferreira et al, 2013). In line with this, two key questions emerge. First, how should curriculum designers solve the tension between the comprehensive and the specialist orientation in transport planning courses? Second, which subject areas should be given priority in these courses, if any?

The aim of this article is to assist curriculum designers finding their own answers to the abovementioned questions. In order to achieve that aim, an international web-based survey was conducted where transport planning professionals across the globe were asked to give their opinions on what are the subject areas and topics that they rank as the most relevant for their work and how much coverage of these subject areas should be given in an ideal transport planning master. It was also asked the coverage given to these elements in the master course they have attended when they were still students. Through this, the paper seeks to explore the challenges associated with teaching urban transport planning today and identify the state of the art in transport education. The study also answers some questions about the future trends of the transport planning profession.

The paper is organised in the following sections. Section 2 briefly discusses the research design choices and setup of the data gathering. The relevant characteristics of the sample (survey respondents) are also presented. Section 3 discusses the research results. A discussion of significant differences found among different countries, professional roles, and age groups is included. Section 4 provides conclusions and briefly discusses the future of transport education.

2 METHODOLOGY

2.1 DATA GATHERING

The research is based on a database gathered through an international web survey. The respondents are professionals involved in transport planning that attended a master degree. The master could have been in any field. The data was gathered with a Qualtrics survey and it was available in English only. We distributed the survey and several reminders via mailing lists from national transport planning professional organizations, research groups, and via a number of LinkedIn and Facebook groups on transport, geography and urban planning. The survey's structure could be completed within fifteen to twenty minutes. The survey is divided in four main parts.

The first part of the survey consisted of five general questions concerned with the education of the respondents. It asked the field of their undergraduate bachelor degree, the field of their master degree, the country where they attended the master, the year of completion of the master, and the duration of the course.

In the second part the respondents were asked to reply to 15 questions about how much different subject areas were covered in the master degree they have attended. These questions were answered with a 5-point Likert scale. It also included questions about the extent to which they consider that given topics are important for their work. There were a total of 46 topics and these were also ranked using a 5-point Likert scale. In terms of definitions, we considered a subject area one that includes several topics. For example, the subject area Data collection and analysis included the following topics: Qualitative data collection and analysis, Quantitative data collection and analysis, and Statistics. This section included as well an open question about the themes and topics that are emerging and which ones are losing relevance in the transport planning sector.

The fourth part consisted of four questions about their personal views, including their personal planning goals and on their level of happiness in their career.

The last part consisted of nine questions about the respondents, namely the organisations they have worked for, the nationality, the country of residence, age, gender, their employment status and their key

psychological trait according to the Holland Codes (also known as the Holland Occupational Themes RIASEC (Holland 1973).

2.2 THE RESPONDENTS

A total of 254 respondents completed the survey. Their characteristics are presented in table 1. 26% of the respondents attended a master degree in Southern Europe, 18% in Central Europe, 33% in Northern Europe. Smaller percentages of respondents also cover other geographical areas, such as South America (1%), Northern America (12%), Asia (9%) and Australia (2%). The predominant field of the masters attended in the sample of all countries is transport and mobility. The respondents work mainly for academia, consultancy firms and public authorities. There is a prevalence of male respondents, which sadly reflects the male predominance in the sector. The predominant age group is of people from 23-34, which just finished their master degree.

Geographic area where the respondents attended their master	South Europe	Centre Europe	North Europe	South America	North America	Asia	Australia	Total

Table 1 Characteristics of the respondents

3 COVERAGE AND IMPORTANCE OF SUBJECT AREAS

The second part of the survey questioned the respondents about their post graduate learning experience. In practice, this means that the survey questioned the respondents about how much different subject areas were covered in the master degrees they have attended and how important the respondents perceive these subject areas for their transport planning work.

In aggregate terms the first three most important subject areas are data collection and analysis, travel planning and transport and land use interaction (see Table 2). Even though they rank as the top three in the list of subject areas, it is relevant to notice that the values of perceived importance decrease in a quite

gradual way. So there is not a clear agreement that a small number of subject areas are very important and others are considerable less important. It is also relevant to notice that, while data collection is considered well covered in the master program, this is not true for the other two most important topics. The table indicates that what is considered important for professional work is not necessarily what was most covered in the master degrees the respondents have attended. According to the survey respondents, these topics should have had more space in the master curriculum. Another quite noticeable gap is on the subject area 'soft skills for planning'. Even though this is ranked only as the tenth most important topic, the gap between the importance value and the coverage value is the highest among all subject areas. Also the subject area GIS science and spatial analysis has a quite low coverage, while it is considered important by our respondents (ranks as the fifth most important subject area).

Rank for importance	Subject areas	Perceived importance of subject area (mean normalised value from 0 to 1)	Coverage of subject area (mean normalised value from 0 to 1)
1	Data collection and analysis	0.762	0.566
2	Travel planning	0.740	0.385
3	Transport and Land Use interaction	0.734	0.454
4	Transport Project Appraisal	0.722	0.414
5	GIScience and Spatial analysis	0.680	0.364
6	Modelling	0.676	0.392
7	Participation of community members and stakeholders	0.665	0.344
8	Development of transport plans	0.648	0.354
9	The policy and regulation context	0.636	0.452
10	Soft skills for planning	0.614	0.183
11	Planning theory and planning history	0.613	0.461
12	Innovations and transition management	0.596	0.258
13	Transport Infrastructure construction	0.553	0.388
14	Design skills and creative thinking	0.515	0.309
15	Financial and operational management of transport systems	0.490	0.244

Table 2 Perceived importance and coverage of subject areas

Two key conclusions can be drawn from the analysis of Table 2. First, it seems reasonably clear that respondents support, in aggregate terms, comprehensive curricula as there is not a clear preference for a limited number of subject areas over all the remaining ones. Second, there is for sure room for improvement in terms of matching the importance the respondents attribute to given subject areas and the level of coverage these areas have in master degrees.

3.1 SPECIFIC EXPERIENCES ACCORDING TO THE FIELD OF MASTER DEGREE ATTENDED

The coverage of subject areas varies according to the field of the master degree. Planning theory and planning history has the highest coverage in planning masters with a score of 0.59, those masters also cover quite well transport and land use interaction, the policy and regulation context, GIS science and data collection and analysis. Data collection and analysis is less covered in Architecture Master (average score 0.35), compared to the average score of 0.56. GIS is more covered in geographical Master (0.61), but only marginally in Transport course (0.32) and Economics (0.25). Modelling is slightly covered in Architecture Master (0.19%); the subject are design skills and creative thinking is covered in Architecture Master with a good score (0.65) and Urban Planning Master (0.40), but only marginally in Transport Master (0.17), Geography (0.25) and Economics (0.17). Geography masters are the ones covering the most the subject area innovations and transition management compared to other masters' field, but only marginally (0.38). Soft skills for planning are generally very marginally covered in all the Master fields, with a total average of 0.18. The maximum coverage is in Geography Masters (0.27).

There are some differences of course also in terms of how people who attended different master rate subject areas. Respondents who followed a Master in Architecture rate as very important planning theory

and history, design skills and innovation and transition management, in opposition to the other groups who do not. Professionals who attended a transport master consider on the contrary design skills and creative thinking not important (average 0.43). Soft skills for planning and participation are considered important by transport planners who attained a master in Architecture, Transport and Urban planning, but not by the professionals who attained a Master in Economics, Engineering or Geography.

There are some significant differences among the different master fields also regarding the gap between the importance rate and the coverage. Innovations and transition management are rated very important and are at the same time not covered in all Master fields. This difference is higher for professional who attained a master in Architecture. The same is for soft skills for planning, especially in Architecture, Economics and Transport Masters. Modelling is another subject area that is perceived important but not enough covered in Architecture master, such as the subject areas of Transport Planning Appraisal, participation and community members and stakeholders

3.2 JOB ORGANISATION DIFFERENCES

Some differences exist also in how professionals consider important the different subject areas to be covered in a master and the organization they work for. Transport planners who work in private consultancy are the ones who rate the subject area of Modelling as the most important (average 0.80). Comparing to other groups, transport planners working in public authorities rate higher the subject area of Transport Infrastructure and construction.

There are no significant differences on how professionals working in different organization types rate some subject areas. For example Land use transport interaction, Data collection and analysis, Travel planning are the three subject areas that are rated very high and this happens among different groups of people working in different organizations. Financial operational management of transport systems are rated low by all the groups.

3.3 COUNTRY SPECIFIC PERCEPTIONS

Within the macro geographical areas of the sample, as detailed in Table 1, we noted some peculiar country differences. For example, transport planners who attended a master in Italy rated Planning Theory (0.67), Design skills and creative thinking (0.64) and Transport infrastructure and construction (0.64) as more important than professionals who achieved their masters in other countries, which achieved a mean respectively of 0.57, 0.48 and 0.52. On the other hand, for professionals who attended a course in United Kingdom, modelling is more significant than in other countries, as they rated it 0.71 over a mean value of 0.65. In Italy and USA, GIS and spatial science are rated as more important subject areas than in other countries.

There are no country specific differences for subject areas such as Land use transport interaction, Transport appraisal, Data collection and Travel planning, which are considered very important by all respondents disregarding their country of residence.

3.4 AGE, GENDER AND PERSONALITY DIFFERENCES

There are some differences on how respondents perceived the importance of different subject areas also according to gender, age, and personality.

Women rate more important than men soft skills for planning, with an average of 0.82 for women over an average of 0.74 for men. Also participation and data collection is considered more important by women, who rated this subject area with an average value of 0.73 over 0.63 for men.

Regarding age differences, transport project appraisal is considered one of the most important subject area by older generations with a score of 0.93, compared to an average value of 0.72. Also financial and operational management is rated differently by young and old transport planners. Younger generations of

transport planners consider more important other subject areas such as modelling. The increasing perceived importance of modelling grows with the younger age in an almost linear relation.

We recorded some differences also in how people perceive the importance of subject areas and their personality. People who define themselves as Artistic rate (with no surprise) design skills and creative thinking (0.75) and Participation of community members (0.74) as the most important subject areas. People who recognize themselves as Realistic rate the Modelling subject area as the most important (0.74). Classical people rate lower (0.36) than the other groups the innovations and transition management (average of 0.59).

3.5 WHERE IS THE TRANSPORT PLANNING DISCIPLINE GOING?

Looking at the coverage of the subject areas along the years, it is clear that the education offer for transport planners is changing. Professional who attended their masters in the '60s stated that some subject areas were more or less covered that what professional finishing their master in 2010 did. For example there is a linear increase of the coverage of transport land use planning (from 0.31 in the 60's to 0.57 in 2010's). Also GIS science and Spatial Analysis coverage is growing (from 0.21 in the 60's to 0.40 in 2010's). Soft skills for planning's coverage is also increasing in the last years (from 0.07 in the 60's to 0.20 in the last decade). Some subject areas coverage remains stable such as planning theory and planning history or design skills and creative thinking.

From the question asking themes that are emerging in the transport-planning sector, some topics have been cited by many respondents. Those are: 'big data' (cited 28 times), 'autonomous or automated vehicles' (cited 20 times), 'land use and transport interaction' (cited 18 times), 'technology and smart mobility' (cited 14 times), 'mobility as a service' (cited 9 times). We also asked which subjects are losing relevance. Our respondents used some common keywords, such as 'infrastructure design' (cited 10 times), road and highways construction (cited 9 times); traditional modelling (cited 5 times).

4 DISCUSSION AND CONCLUSIONS

The results presented here are preliminary and part of an on-going research. As such, we would like to invite our readers to see them as temporary and subject to revision. The survey remains open online as we write with the aim of gathering a considerable higher number of respondents so that we can better cover more countries, age groups, and educational backgrounds. However, some temporary conclusions can be sketched. First, it seems relatively clear that transport planning professionals rate a large number of topics and subject areas as important. There is a clear resistance to dismiss knowledge as irrelevant for transport planning practice. In other words, holistic and comprehensive curricula seem to be the clear preference. In our view, this is a good sign as it shows the openness and curiosity of professionals involved in transport planning. It can show as well their awareness that transport planning is an activity with deep societal and environmental implications and relationships. It is then perceived as most needed to master a wide variety of concepts and theories, tools and techniques. However, it can also be seen as a sign of a professional crisis. As argued by Bertolini and associates already in 2008, "for urban transportation planners these are the challenging times" (2008, p. 69). Among these challenges one can count great uncertainty about the future of mobility, major environmental issues such as climate change and pollution, health problems due to physical inactivity, among some others.

Second, and in terms of what kind of knowledge transport planners tend to perceive as the most important for their work, data collection and analysis, travel planning, transport and land use interaction, and transport project appraisal were the subject areas ranked the highest. This is meaningful. All these subject areas are focused on expert content and not on procedural issues (as soft skills for planning or participation of community members and stakeholders are). Even though some argue that the communicative turn has left important marks in the planning discipline, transport planners do not seem to prioritise procedural or communicative forms of knowledge. Instead, their priorities go to the hard-core content of transport planning as a spatial and social science.

Third, it is also relatively clear that there is a mismatch between what transport professionals rank as important subjects for their work and subjects that have been covered in greater detail in the master

courses they have attended. This is partially explained by the fact that only 37% of the respondents did a master on transport planning or transport studies. This can also be partially explained by the possibility that when a professional ranks something as important for work it is necessarily difficult to offer to this person enough. Indeed, the person is likely to want to receive all possible information about the subject as their professional success depends on it. Nevertheless, curriculum designers seem to have some serious work ahead, if their objective is to match better levels of coverage of subject areas and what professionals (and professional organisation) rank as important for their practice.

Fourth, and at a more conceptual level, perhaps it is time to reflect more critically about how transport planning master courses are designed. Most countries and universities still adopt a prescriptive logic to their curricula, that is, they base higher education on attendance of courses with clearly specified disciplinary orientations (e.g. transport planning, urban design, human geography). Why is that accepted so uncritically is the key question here. If transport planners recognise that holistic and comprehensive curricula is what suits them the best, why are they forced to follow pre-given modules? Maybe their best interest would be to have the freedom to choose the modules they want to attend, as is currently done in the MIT Media Lab (Ito, 2012) or some interdisciplinary graduate transportation programs also offered at MIT. However, this poses an intriguing question: how would professional associations react to this? Moreover, what would be gained and what would be lost in the world of planning if the educational background of their professionals was even more diverse? Taking into consideration that transport is a sector that has proved to be hard to change, and that private car dependence, pollution, carbon emissions, congestion, physical inactivity, among other problems, continue to be experienced at increasingly more alarming levels across the world, maybe it is time to explore new avenues of thought. Further research on these intriguing subjects is indeed most necessary.

1 INTRODUCTION

The course 'The game and the city' was offered during three consecutive semesters as an elective course to the undergraduate students of Architecture and Urbanism at the Federal University of Minas Gerais. The course was proposed as part of a research on the use of games as a participatory tool in the context of spatial production. Currently, there are a growing number of initiatives that use gamification as a resource to motivate people and increase civic engagement in matters of public interest. However, the use of this resource lacks a critical reflection in the same depth with which the participation is currently debated.

Taking into account the extensive debate about participation produced so far, we start from the challenge posed by Jeremy Till regarding the need to move the architectural participation from a placatory participation towards a transformative participation (Till, 2005). In this context, this article reflects on the educational and formative aspects involved in participation, having as a horizon the intellectual emancipation with regard to spatial issues. The games produced in the context of the course will be considered as a space for dialogue that aims to foster the spatial learning and qualify the participants for a transformative spatial practice. The experience of the course 'The game and the city' will be taken to discuss the spatial learning in two instances: one concerning the formation of the architect and planner as a producer of games; And the other, related to the spatial learning involved in the act of playing and therefore, outside the school boundaries.

Regarding the education of the architect and planner, the article questions what displacements might be possible to the practice of architecture and planning when shifting the focus of education – conventionally concerned in finding solutions to spatial problems through the practice of project – to another perspective, based on the questioning of spatial issues as means to structuring an open process for the collective construction of spatial knowledge. From a Lefebvrian understanding of the production of space (Lefebvre, 1973, 1991), the aim of the course is to approximate the practice of producing games to the concept of “spatial agency” developed by Nishat Awan, Tatjana Schneider and Jeremy Till (2011).

The second level of discussion, takes all the games produced by the students throughout the semester to discuss the spatial learning provided by the act of playing. Therefore, it brings the thought of educators such as Paulo Freire and Ivan Illich and also the philosopher Jacques Rancière to approach the educational process provided by the games from the perspective of intellectual emancipation. Then the games produced by the students are grouped in a classification that allows discussing the formative process that is established in the act of playing. The principle of equality of intelligence brought by the political thought of Jacques Rancière (2002), confers a political dimension to the game, that comes to be understood as the activator of a process of intellectual emancipation that qualifies the citizens to participate actively in the everyday production of their space and the city.

2 THE GAME AND THE CITY: DISPLACEMENTS TO THE SPATIAL PRACTICE

The theoretical assumptions that support the course will be presented in order to enable a clearer formulation of its objectives and the contextualization of the games that were produced by the students.

The course is based on the Lefebvrian perspective for the production of space. In the statement that "The (social) space is a (social) product" (1991, p.26), Henri Lefebvre expands the architectural and planning field of interest to the scope of social relations and the modes of production involved in the process of producing space. When the understanding of a space embedded in social relations is brought to the field of spatial practices, Lefebvrian theory offers a critical counterpoint to the mode of action of architects and planners who conventionally consider the space as a matter to be transformed into a product by means of technical intervention. In this model, the technically produced space becomes a product, an object to be negotiated in the form of a commodity. Beyond this notion of space as an object, the Lefebvrian concept of spatial production is amplified by the different ways in which Lefebvre understands the meaning of producing.

The double meaning of the term stems from the fact that 'men' in society produce sometimes things (products), sometimes oeuvres (everything else). Things are enumerated, counted, appreciated in money, exchanged. And the oeuvres? Hardly. To produce, in a broad sense, is to produce science, art, relations between human beings, time and space, events, history, institutions, society itself, the city, the state, in a word: everything. The production of products is impersonal; the production of oeuvres can not be understood if it does not depend on subjects. (LEFEBVRE, 1973, pp. 79-80)

This understanding of space as an object, adopted by the conventional practice of architecture and planning, claims for the professional field the monopoly of spatial knowledge. Issues relating to the everyday life of cities, such as mobility, public spaces, housing policies, or possible ways of occupying and inhabiting the city, are removed from the public debate. The alienation of everyday spatial practice in the hands of a few, supposedly qualified to decide how people should live in the city, collaborates with the reproduction of social relations of domination and the processes of exclusion and social inequality. As a product, the space is conditioned by the market. The space-object therefore tends to be a response to demands that do not always coincide with the interests of people for better living conditions in the city.

Another approach of spatial practice claims for the social role of the space through a professional practice understood as praxis towards the transformation of social reality. Some of these practices were brought together by Awan, Schneider and Till in an attempt to qualify as "spatial agency" (2011) a spatial practice that is closer to the understanding of architecture and planning as an oeuvre rather than a product. This paradigm shift is brought by the authors in Bruno Latour's terms to characterize a change in the understanding of architecture as a 'matter of fact' to architecture as a 'matter of interest' (Awan et al, 2011).

As matters of fact, buildings can be subjected to rules and methods, and they can be treated as objects on their own terms. As matters of concern, they enter into socially embedded networks, in which the consequences of architecture are of much more significance than the objects of architecture. (Spatial Agency, 2016)

The spatial agency seeks to overcome the model of action that is justified in the technical-scientific authority to build networks of collaboration in which architects and non-architects seek to collectively construct another way of producing space. The means of spatial agency action range from forms of political activism to the production of pedagogical tools to empower people to work collaboratively for the transformation of their space.

The course 'The game and the city' aims to establish games as a mode of spatial agency, contrasting to the educational model based on Project practice. As Till points out, conventional education understands design as an answer to spatial questions. "In education, the architectural study is held up as an exemplar of problem-based learning, the space where students are set to 'problem' and through the creative, and reflective, act of design as a 'solution' (Till, 2005). This may even work at scholar education, however, when confronted with reality, this logic ultimately constrains the role of architects and planners since the problems to be solved are formulated in terms of real state. In these terms, inevitably, the answer will always be that of the space-object.

In opposition to this logic of the project, the course proposes the production of games as a problematizing action. In order to construct a game, students are challenged to identify tension nodes, present in the socio-spatial reality, not as problems to be solved by the game, but rather as elements that structure a dynamic that enable an environment of negotiation and knowledge sharing. Thus, the role of these games are not to solve concrete impasses, but rather to thematize dissensus, to problematize alternatives and to construct an understanding about what would be the collective interest of the stakeholders. This also aims to broaden the perspectives of students to other possibilities of professional role beyond the heteronomous limits of conventional practice.

2.1 THE GAMES PRODUCED IN THE COURSE

The games produced by the students, as the studio practice in the three semesters in which the course was offered, will be presented in summary form. It is worth clarifying that this study does not aim at the individual analysis of each game, but of the whole of works. Therefore, we are not dedicated to explain the elements and dynamics used in each game, but rather its context and objectives. Neither is it intended to conduct an individual evaluation of the work. Thus, the fragilities and contradictions that surely exist in these games are left out, even understanding the relevance that this recognition of controversies could have for the methodological debate of a course based on the practice of producing games. It is not an omission, but rather a clear option to establish the object of the analysis in the whole of the produced games and not in the particularity of each. In this sense, it was decided to keep the totality of the works presented, although there is considerable variation regarding quality, no work was left out. It is not a matter of choosing the best examples; the twelve games presented here constitute the totality of the production over the three course terms. These are the games:

Occupy: This is a board game produced to assist dwellers of an urban occupation in the early stages of the process of producing their space. The aim of the game is to promote a reflection on other possibilities for spatial organization, as an alternative to the reproduction of spatial models of the formal city.

The cards of the game simulate everyday situations experienced in an urban occupation and the tiles allow players to experiment many different spatial configurations over the board.

What would you like to do in the school of your dreams? The game was produced in the context of the construction of a new building for the School of Architecture and Design (EAD) of the Federal University of Minas Gerais (UFMG). The change of EAD building, currently located in a central district to the university campus in the outskirts of the city, had previously been decided through a public consultation to the academic community. The proposal consists of an interface that aims to raise the demands and desires of students and staff in order to inform the design of the new building.

Treasure Hunt: The game seeks to reconfigure, even temporarily, the relationship of the residents of the Calafate neighborhood, located in the city of Belo Horizonte, with their daily space. Treasure Hunt is a session published in a local newspaper produced by the students under the name of 'Speak Calafate'. The idea is that in each issue a spatial puzzle would be published to be unraveled by the locals. The first to unravel the riddle is awarded with a voucher for purchases or services in the neighborhood commerce.

Mobiligame: It is a board game that aims to promote the awareness of the players about the implications that the modes of displacement have on the quality of life of people living in a city. The game seeks to highlight the responsibility of each citizen as part of the collective that shapes urban mobility scenario in the city. The game simulates some everyday situations for which players should move around the city-board taking into account the effects of their individual choices as well as those of other players, over the city.

Manzo Ngunzu Kaiango: also known as Manzo Game, it was designed as a translation tool between the quilombola community and the team of architects involved in the project to recover its candomblé yard. The game seeks to relate the spatial and symbolic configuration of the candomblé yard to the sacred meaning of each of their deities (Orixás).

Occupy the Allotment: The game proposes a reflection on the logic of private property through an evaluation of the effects of individual actions in the city space. The game problematizes issues such as

population density, road overload and real estate speculation as a counterpoint to actions that favor the collective use of the city as the construction of public facilities, the provision of private services of daily use and actions of urban gentleness.

#Movimenta: It is a card game that intends to introduce players to the guidelines of the main social movements in the city of Belo Horizonte. The game seeks to identify issues of the city's daily life, which are raised by the players, with the possibilities of action by each of the social movements.

Geopolitics: The Game problematizes spatial segregation in spaces of public use, whether privately owned or not. The debate promoted by the situations posed by the cards questions the spatial features that restrict or discourage the use of certain spaces by certain groups, whether these are physical elements or not. The objective is to denaturalize the barriers that are configured in the socio-spatial plane.

River: The game seeks to make players aware of how the production of the city's space affects the quality of water resources. Through a dynamic of individual actions with collective consequences, the game seeks to illustrate the responsibilities and implications of the initiatives of various agents (citizen, real estate entrepreneur and public power) over urban rivers as a resource not only for supply, but also for the conformation of urban landscape.

Glaura's Game: The game aims to trigger a reflection amongst residents of the village of Glaura about the implications of the transformation that have been taking place in the city due to the implementation of a weekend houses condominium on the outskirts of the village. The aim is to denaturalize the service bond relationships between the village residents and the new landowners that also have implications in a process of gentrification of the city center and, thus, to problematize the (in) sustainability of the growth model guided by real estate interests.

Opportunity: This game proposes a re-signification for the notion of 'opportunity' expressed in the real estate ads found throughout the city. Therefore, it takes the territory of the city as the game board. The city as a gaming opportunity contrasts with the idea of the city as a real estate market.

Tower of Memory: The game aims to rescue the memories and experiences of the residents of the village of Glaura and, from these, encourage the idealization of possibilities for the future regarding the relationship between the community and the places of the village. The structure of the game allows the memories and imaginaries to articulate spontaneously in the construction of narratives about the place. The game aims to act as a storytelling activator, as well as reinforcing the affective bonds between the community and their space.

3 GAMES AND INTELLECTUAL EMANCIPATION: EDUCATION BEYOND THE SCHOOL

In addition to the previous reflection, which points to the displacement in the proposal of an studio practice based in the production of games instead of producing projects, we intend to add another reflection, which goes beyond the limits of the school and the practice of students as game producers. The games designed by students act as tools for dialogue with society and, as such, Work towards structuring a debate that results in the collective construction of spatial knowledge. This expanded scale of education goes beyond the limits of the school in that it transfers to the city and the collective the object of learning.

The proposal of a spatial education available to society through games is aligned with the thought of Illich, whose criticism of school education intends to show that learning process does not depend of any kind of teaching or institutions that constrain and delimit the knowledge. Illich is in favor of processes of self-learning, supported in intentional social relations, but in a fluid and informal intentionality. In his project of "deschooling society" the author introduces the concept of learning networks that consist of "educational networks that increase the opportunity of each one to transform each moment of his life into another one of learning, sharing and of interest" (Illich, 1985, p.14).

It is in this sense that we intend to discuss spatial education beyond the exclusive interest in the professional training of the architect and planner. The games produced in the course were made to be played out of the school environment. Its goal is to articulate the participation of society in a collective

debate about the space produced in the community context or in the daily life of the city. The games intend to act as the educational networks proposed by Illich, having as a horizon the intellectual emancipation of the players with regard to the production of their collective space.

It is important to clarify that it is not about taking the game as a tool for the transmission of technical knowledge. It is necessary to differentiate the process of formation and subjectivation that occurs through the collective experience in the act of playing, from what Freire called "banking education" (1988). In Rancière's terms, it is necessary to differentiate "the emancipation of the men" from "instruction of the people" (Rancière, 2002). Rancière proposes a reflection on intellectual emancipation based on the experience of Joseph Jacotot, the educator, who in the nineteenth century developed a method for universal education in which he assumes the equality of the intelligences between master and disciple as a starting point for an emancipatory education (Rancière, 2002). Such a method is opposed to the conventional model of education, which aims to reduce the inequality between the knowledge of the one who teaches and that of those who learn. In this regard Rancière's thought coincides with that of Freire insofar as both understand that in the emancipatory process the man must be the subject of his own education. While Freire states that "to educate is not to transfer knowledge" (1996), Rancière contrasts Jacotot's emancipatory method with the "explanatory method" (2002) adopted in the conventional education system. Thus, a process similar to what Freire refers to as "banking education" (1988) is understood as "roughness" by Rancière (2002).

In an emancipatory game the end is not to transfer knowledge, but rather to establish a common vocabulary, which take account of the dissensus and the plurality of experiences brought by each player. Thus, the principle of equality is present in two ways: The first recognizes that any person, irrespective of his or her professional background or level of education, has a spatial experience to be considered, and the second is that which equals all participants as players. In this regard the learning process provided by the game contemplates people with the most diverse backgrounds, taking as a starting point what all of them has in common: everyone knows live and experience spaces and the city in their everyday needs. It is not intended, however, to claim that the spatial knowledge of architects and planners is equivalent to that of lay citizens, it is not a question of comparing these two spheres, but of constructing a common vocabulary, so that each one can develop and learn through the contact of the other's experience.

From the education point of view, we can understand that the goal of the games produced by the students is aligned to Illich's proposal on the intentional creation of social networks. The games are expected to act as a platform for self-education, in terms of spatial knowledge, by means of the contact with the collectivity. In this respect, the game is only the activator of a transformative process. One should not seek immediate transformation through play. The game is emancipatory not because it has the potential to transform the real, but precisely because, as a game, it can displace hierarchies, hegemonies and modes of oppression, opening cracks in the commonplace, in the naturalized certainties, and thereby giving rise to uncertainty, and to dissensus. In this sense playing is also a political action.

3.1 QUALIFYING THE COLLECTIVE LEARNING

It is therefore in the light of the notions of an emancipatory education, that we intend to resume the analysis of the games produced by the students in the course 'The Game and the city'. In order to do so, the previously presented games were organized in four groups, in order to facilitate the analysis that will be followed regarding the spatial learning activated by the action of playing. As a criterion for grouping, it was sought to identify in the general objective of each game a field of interests whereby some of them converge towards a common end. These groups of interest were thus named as follow: Tools for dialogue; Essays for autonomy in everyday practice; Games of estrangement and denaturalization, and; Building ties between players and the city.

These categories allow to approach in a same group games referring to different contexts and scales: some circumscribed to a specific location and others that takes the city as a whole; Some focusing on certain themes and others that relate the diversity of the aspects that characterize the daily space. The naming of the groups allows to bring to light issues implicit in the games that can only be perceived behind the surface of their themes or scales. The attempt to group the games by converging interests, does not intend to constrain them into rigid categories. The characteristics that give names to the groups are often present in games of another group. The names chosen for thematizing the groups are referred to spatial

agency features that are dominant in each game, but do not exclude other possibilities of reading or classification.

Tools for dialogue	Manzo Ngunzu Kaiango
	What would you like to do in the school of your dreams?
Essays for autonomy in everyday practice	Mobiligame
	River
	Occupy the Allotment
	Occupy
Games of estrangement and denaturalization	Geopolitics
	Glaura's Game
	# Movimenta
Building ties between players and the city	Opportunity
	Treasure Hunt
	Tower of Memory

Table { SEQ Table * ARABIC } - The games grouped by converging interests

The games of the first group, classified as 'tools for dialogue', have as common goal to provide communication channels to guide the exchange of information for the collective construction of knowledge. For Freire, the opposite of transferring knowledge would be a process that instigates the interlocutor so that "as cognoscent subject, he becomes capable of understanding and communicating the intelligible" (Freire, 1996, p.45). In this sense, the role of the games of this group is to activate the dialogue that can be qualified to the extent that it enables the contact to the diversity of experience of the players. In the Manzo game, dialogue is an effort whereby a translation of the symbolic imaginary of candomblé enables it to be discussed in spatial terms; whilst the interface to collect the wishes for the new building to the School of Architecture plays toward instigating a public debate. In this case, the inputs brought by the user community are developing as they are collectively discussed. In both cases the dialogical effort has more to do with the construction of a common vocabulary than with consensus building.

In this group, both games recognize listening as a knowledge-forming process. For Freire to listen means "the permanent disposition from the subject who listens to be open to the speech of the other, to the gesture of the other, to the differences of the other. This does not mean, of course, that listening demands from those who actually listen to be reduced to the speech of the other. This would not be listening, but rather self-annulment" (Freire, 1996, p.45). The idea of listening as a "permanent disposition" in Freire coincides with the idea of play from an anthropological and socio-cultural perspective in which "the act of playing can be understood as a disposition rather than an activity or behavior" (Glenn et al, 2013). Besides meaning an inclination or willingness, the term disposition adds the negative prefix 'dis' to the word 'position', also indicating the absence of a prior position. Listening as a disposition becomes a precondition to a taking stand process and therefore to the constitution of subjectivities. For Rancière, political subjectivities are constituted by means of dissensus, understood as a rupture with the status quo. For Freire, it is through listening that it becomes possible to disagree. "True listening does not diminish in me, in anything, the ability to exercise the right to disagree, to oppose, to position myself. On the contrary, it is listening well that I prepare myself to better take a stand or to better situate myself from the ideas' point of view"(Freire, 1996, p.45). In the games featured as 'tools for dialogue', listening does not represent the reduction of the listener to the other's point of view, but rather a structure whereby players can formulate their own thinking.

Another concept dear to Freire is the idea of autonomy present in the second group, named as 'Essays for autonomy in everyday practice'. The four games of this group have in common the role of providing a structure in which the player is asked to make decisions at the same time they are confronted by the consequences of his choices. For Freire autonomy is not something given a priori. "No one is autonomous first to decide later. The autonomy will be constituted in the experience of several, many decisions that are being taken "(1996, p. 41). The games of this group are based on the simulation of a certain urban context where the players are invited to act individually without losing the perspective of the whole. There the players have the opportunity to evaluate their everyday practice in the extended field of collective space. Three games have the city as a field of action whereby the balance between individual actions, and the collective interest for the quality of space, can be understood as a kind of urban ecology. The Mobiligame places the player as co-responsible for the quality of urban mobility; the River game intends to make

explicit the relation between the way of occupying the city and the available water resources; and the Occupy the Allotment highlights the dispute between individual and collective interests in view of the private property's logic. The Occupy game, on the other hand, allows the residents of an urban occupation in an initial stage of construction to evaluate the different possibilities of spatial configuration. The formative proposal that crosses the four games of this group works in the direction to find a balance between the individual autonomy and the collective space.

The games of the third group, 'Games of estrangement and denaturalization' are joined by the common goal of destabilizing the consensus around the hegemonic ways of producing and using the collective space of the city. Based on a dynamic of argumentation and sharing of experiences, these games seek to provoke the estrangement of situations of inequality and spatial segregation that are naturalized in the city space. Geopolitics questions the social barriers that manifest through space, the Glauro's Game proposes a prospective exercise by demanding players to imagine the kind of social relation that can be established in face of the real estate development that are being implanted in the neighborhood. And #Movimenta tries to relate conflictive situations in the city with the agenda of the social movements. These games seek to decolonize the spatial imaginary by means of denaturalizing social and spatial embedded practices that are consensually accepted as the only possibilities. The games of this group are based on dissensus as a process of de-identification with the status quo and also as a possibility for the formulation of other spatial imaginaries, able to considerate the range of stakeholders and plural identities that inhabit the cities.

The fourth and last group, named under the goal of 'Building ties between players and the city', brings together games that seek to activate other relations with the space. They seek to trigger the affective dimension of space as a form of resistance to the logic of the city as a product. Opportunity and Treasure Hunt - in a situationist way - take the real city as the board where an action, that involves the displacement of the body and the senses, take place. Both explore the playful nature of space in its materiality. The Tower of Memory aims to rescue the affective bonds with the space by means of the construction of a collective memory of the city. In these games, participating means an intense experience of life in the city, enabled by the joyiness of meeting the other.

4 CONCLUSIONS

Although grounded through an experience in the education of architects and planners, the above discussion is also an attempt to rescue the transformative dimension of participation. However, it is necessary to relativize the ability of games to change reality. It is not possible to state a direct relation between the participation by the game and the transformation of the socio-spatial reality. There is some possibilities for empowerment by the games, but one can not demand more than the games can offer: the transformation of socio-spatial reality is constantly crossed by multiple asymmetries, inequalities and even the difficulty of cultivating participatory and collaborative skills.

What the games are expected for is the role of a trigger to a formative process that seeks to collectively qualify the spatial knowledge of citizens. When referring to the education by means of games as an emancipatory practice, what is at stake is not any specific content. It is not intend to be an alternative method for qualitative research or a strategy of approximation to the vernacular knowledge. It does not mean that these can not happen by the game. But the great contribution, which we intend to emphasize in this study, is related to the process of learning how to learn together.

With regard to the education of the architect and planner, the substitution of the practice of producing projects by the practice of producing games proposed by the course 'The game and the city', enabled the displacement of the normative and technical education to the field of a spatial practice. This displacement of education beyond the boundaries of the school is advocated by Illich, who blames formal education for the main misconception of our time: that one that transforms basic needs into demands for scientifically produced goods.

The student is thus 'schooled' to confuse teaching with learning, obtaining degrees with education, diploma with competence, fluency in speaking with the ability to say something new. Their imagination is 'schooled' in accepting service rather than value. It wrongly identifies health care with medical treatment, improvement of community life with social assistance, security with police protection, national security with military apparatus, productive work with unfair competition. (Illich 1985, p.18)

As far as the practice of architecture and urbanism is concerned, this misconception is represented by the commodification of space. Producing games as processes instead of producing space-object, reestablish the Lefebvrian sense of production to the oeuvres rather than products. In this sense, the practice of producing games points to an opening towards the reinvention of spatial practice and the overcoming of the heteronomous order imposed by the surplus value of space.

ID 1679 | POST-GRADUATE STUDIES IN PLANNING IN LATIN AMERICA: RATIONALITY VS. DELIBERATION

Juan Ángel Demerutis-Arenas¹

¹University of Guadalajara

juan.demerutis@cuaad.udg.mx ; juan.demerutis@gmail.com

ABSTRACT: This paper describes the current academic scenario of post-graduate studies in planning in Latin American Universities by focusing on the curricula of masters and doctoral programs as well as theses produced in the last 3 years in Argentina, Brazil, Colombia, Chile, Mexico and Venezuela. The study attempts to determine the character of the programs and their orientation towards rational or deliberative models. It also develops a historical analysis of planning education in the region, and its different stages in time, and whether or not spaces of dialogue are being built. In order to determine the emphasis of the programs a survey was conducted to coordinators in planning schools in the region. Survey includes objectives and academic structures of the existing degrees as well as theses titles regarding their rational or deliberative emphasis. It also inquires about historical facts such as the first time a post-graduate program was offered in every country studied. In addition, it also explores the certification

process and standards defined by national governments for post-graduate studies in planning. Urban and regional planning was introduced to Latin America as an area of specialization for architects and engineers. Urbanismo, Planeación Urbana y Regional or Estudios Urbanos are the Spanish terms to refer to any course or degree related to the city, including urban and regional planning, and urban studies. Therefore, the survey targeted only the programs with this titles, regardless their adscription to geography, architecture, engineering or economics schools. Since the first half of the 20th century some courses on Urbanismo were inserted in undergraduate programs' curricula in Latin America; yet they were merely introductory and limited to an architectural approach. Some decades later in the 1960s, post-graduate programs in planning, as part of a rising discipline, were offered in architecture and engineering schools with a rational/ substantive model embedded, but there are reasons to believe this approach is slowly leaning towards deliberation. This study concludes with general remarks on academic structures and orientation that could help matching regional programs with planning schools around the world, including the Europeans, since faculty and students mobility between Europe and Latin America is becoming common ground.

1 A BACKGROUND OF PLANNING STUDIES IN LATIN AMERICA

Planning was introduced to Latin America as an area of specialization for architects. This was evident since the first half of the 20th Century when courses on Urbanismo were offered in several universities in architecture programs. Urbanismo courses or seminars were merely introductory and limited to an urban design approach. As a rising field not only in the region but also world wide the first graduate programs in planning were offered in Architecture Schools as early as the 1960s. Later, in the 1980s regional planning and local development became an important area of knowledge taught also at Economics Schools including an emphasis on political and economic issues. In 1949 the first graduate program was offered at the Universidad de Buenos Aires. This masters degree in Urbanism (Curso de Urbanismo) was hosted by the Facultad de Arquitectura y Urbanismo. The program focused predominantly on physical planning and urban design. Several years later some other masters degrees appeared in Latin American countries such as: Chile (1965), Colombia (1967), Mexico (1967), Venezuela (1969), and Brazil (1971). All of the post-graduate programs have similar origins, as they were proposed by Research Institutes, created during a wave of racionalist thinking in the region.

	Country	City	Institution	Post-Graduate Program	First Year Offered
1	Argentina	Buenos Aires	Universidad de Buenos Aires	Curso de Urbanismo	1949
2	Brazil	Rio de Janeiro / Sao Paulo	Universidade do Estado do Rio de Janeiro / Universidade de São Paulo	Maestria en Planificación Urbana y Regional / Maestria en Arquitectura y Urbanismo	1971
3	Colombia	Medellin	Universidad Nacional de Colombia	Maestria en Planeacion Fisica	1967
4	Chile	Santiago	Pontificia Universidad Catolica de Chile	Maestria en Desarrollo Urbano	1965
5	Mexico	Mexico City	Universidad Nacional Autónoma de México	Maestria en Arquitectura y Urbanismo	1967
6	Venezuela	Caracas	Universidad Central de Venezuela	Maestria en Urbanismo	1969

Table 1 – Post-graduate programs by country in Latin America.

After some experiences in graduate studies, another landmark in planning education in the area was the appearance of undergraduate programs such as the Bachelor of Urbanism in the Universidad Simon Bolivar in Venezuela (1974). This program was offered by the Departamento de Diseño y Estudios Urbanos (Department of Design and Urban Studies). Almost simultaneously (1975), a new program called Bachelor of Design of Human Settlements was offered in the Universidad Autónoma Metropolitana – Xochimilco. The program was offered by the Division de Ciencias y Artes para el Diseño (Division of science and arts for design). Both programs originated at design schools/ colleges; consequently the main focus was physical, particularly on urban design.

Finally, doctoral programs appeared in the 1980s. These programs aim at developing planning theory for Latin America by focusing on local contextualization and specific features found only in the area. However,

these programs started with a faculty usually trained in foreign institutions, mostly European and American, therefore are recipients of their influences.

Currently, there is an important critical mass of planning programs in Latin America. In particular, six countries are well known for having a tradition in planning studies: Argentina, Brazil, Chile, Colombia, Mexico and Venezuela, therefore, this study reviews the programs located in these countries.

The research design includes an internet search attaining only the programs with some sort of accreditation or recognition by a national association or institution. The accrediting institutions consulted were: the National Council for Evaluation and Accreditation of Universities (Argentina), the National Commission of Accreditation Chile, the National Commission of Accreditation Colombia, the National Council of Science and Technology (Mexico), the National Advisory Council of Post-graduate studies (Venezuela), and the National Association of Post-graduate Programs and Research, which is not an accreditation board, but it affiliates the planning programs in Brazil. Once detected in the accrediting institutions' web page, the programs were filtered using the following key words: planning, urban development, local development, regional development, city, territory, territorial, urban studies, habitat, socio-territorial and human settlements (Urbanismo, Planeación, Planificación, Desarrollo Urbano, Desarrollo local, Desarrollo regional, Ciudad, Territorio, Territorial, Estudios urbanos, Hábitat, Socioterritorial, y Asentamientos humanos). As a result, a total of 246 post-graduate programs were found (see Table 2).

	Country	Doctoral Programs	Master Programs	Academic Specialisation	Accreditation board/ National Association
1	Argentina	9	25	17	CONEAU- National Council for Evaluation and Accreditation of Universities
2	Brazil	70	44	4	ANPUR- National Association of Post-graduate Programs and Research
3	Chile	3	6	0	CNA- National Commission of Accreditation Chile
4	Colombia	0	4	0	CNA- National Council of Accreditation Colombia
5	Mexico	13	33	1	CONACYT- National Council of Science and Technology.
6	Venezuela	2	12	3	CCNPG - National Advisory Council of Post-graduate studies.
TOTALS		97	124	25	

Table 2 – Post-graduate programs by country in Latin America.

Post-graduate studies include: Academic Specialization, a 1-1.5 yr. program with a final work to show proficiency in specific professional skills; Master, a 2 yr. program with a thesis including a theoretical framework, methodology, and development of a case study. The admission of students in such programs is subject to the presentation of a 4-5 year bachelor degree. Finally, the highest level of post-graduate programs is the Doctorate, a minimum of 3 yr. program with a dissertation defense, an original work which contributes to enhance the discipline in a significant way.

Later, a survey targeting the schools affiliated to the Association of Latin American Schools of Planning (Asociación Latinoamericana de Escuelas de Urbanismo y Planificación – ALEUP) was conducted. This association is part of the Global Planning Education Associations Network – GPEAN, and planning schools from Mexico, Venezuela, Argentina and Chile comprise the membership. ALEUP organized the second World Planning Schools Congress, hosted by the National University of Mexico in Mexico City in 2006.

Survey helped to cross compare the web pages and the perception of programs' officials in order to avoid any possible bias in the study, particularly in the definition of programs' profiles.

The title names of the programs highlight their character, therefore, as an preliminary exercise they were fed into a word cloud creator software to define patterns in the degrees offered. Although there is a great diversity, the predominant word in them is Development, followed by Planning (Urbanismo). It is also worth to notice that Architecture is still an important component in the programs, surely due to the fact that around a 60% of the programs is hosted in a College of Architecture.

2 CURRICULAR ANALYSIS

Sustainability is also a major concern. Inter and intra generational issues are considered as a central focus of the programs. On the one hand there are programs which include sustainability in courses syllabi as a cross-cutting theme. On the other, most of them offer specific courses on sustainable urban and regional development.

Another transversal issue addressed by the post-graduate programs is housing development, a subject that is usually analysed from different angles: financial, production, environmental sustainability, among others.

Yet all of the programs require proficiency in a second language (English, French, German, Italian, Chinese, Japanese), most of them do not offer a single course entirely in a language other than Spanish or Portuguese.

2.1 THESES PRODUCED

466

defended from 2005 to 2016; and 15 candidates graduated in the Doctorate in Architecture and Urban Studies in the Pontificia Universidad Catolica de Chile from 2014 to 2016.

Conservatively, the 124 Master programs could produce around 620 theses a year, and the 25 doctoral programs, around 125 dissertations. Although most of them are forwarded by an abstract in English, theses are written in Spanish or

Portuguese, because of this, they do not reach an important number of investigators worldwide. In round figures, this is the contribution of the Latin American Region to the Planning field. It is important to notice that most of the Doctorates initiated after the year 2000, so this large volume of scientific production is relatively a new phenomenon in the region.

2.2 ACCREDITATION PROCESSES

Ministries of education have provided for accreditation commissions such as: 1) Argentina's National Commission for Evaluation and Accreditation (Comision Nacional de Evaluacion y Acreditacion Universitaria- CONEAU); 2) Brazil's Coordination for Higher Level Personal Improvement (Coordenação de Aperfeiçoamento de Pessoal de Nível Superior-CAPE); 3) Colombia's National Council of Accreditation (Consejo Nacional de Acreditacion- CNA Colombia); 4) Chile's National Commission of Accreditation (Comisión Nacional de Acreditacion- CNA Chile); 5) Mexico's National Council for Science and Technology (Consejo Nacional de Ciencia y Tecnologia- CONACYT); 6) Venezuela's National Advisory Council for Post-graduate studies (Consejo Consultivo Nacional de Postgrado- CCNPG). In the six cases, the national ministry for education, science and technology is involved, therefore national funding is required.

There are two kinds of programs for Accreditation Commissions: New and ongoing Programs. Most National Accreditation Bodies include in their assessment criteria: 1) Institutional Commitment/ Support; 2) Faculty Capacities; 3) Student Body Capacities; 4) Quality of Infrastructure and Facilities; 5) Amount of Institutional Finance and Community Relationships; and 6) Provision of a Structured Improvement Plan. In order to successfully apply for accreditation, program's coordinators are required to elaborate an initial self- assessment study including the criteria enlisted above.

Accreditation Institutions use qualitative measurements: Argentina (CONEAU, 2013) considers a scale from Excellent (A), Very good (B) or Good (C) for the programs assessed. In Mexico, CONACYT defines 4 different levels for the Padron Nacional de Posgrados de Calidad (National Register of Quality Post-graduate studies): Recently Released, Developing Program, Consolidated, and International Competencies (CONACYT, 2017).

Accreditation Bodies form subcommittees for different disciplinary areas, planning is certainly an interchangeable area as it can be included in the Humanities and Behavioural Sciences, Social Sciences, but also in Engineering; usually is allocated in the first one. These groups are comprised by academic pairs which assess the program using a set of criteria and through a process of deliberation inform publicly the results of the evaluation and agree on a final rating, which defines a benchmark in the process. The observations raised by the accreditation team are supposed to be remediated by the program's officials. By doing so, program can keep its grade or jump to the next level.

Master degrees can be professional and academic/ research oriented. Professional programs attempt to update and specialize working planners, and Academic programs train future professors and build new knowledge on applied science. Doctorates are research oriented.

3 RATIONALITY VS. DELIBERATION

In the 1960s when all of the Research Centres of Urbanismo in the Latin American countries reviewed in this study were already in place, mainstream planning was rational, and the city was approached as a "machine" which could only be addressed or fix by expert scientists. Most of the capital cities in Latin America had an operational Master Plan at the time, and planners were required to design cities of the future, therefore planning post-graduate studies considered the city as a human construct which required

4 CONCLUDING REMARKS

Traditionally, master planning has predominantly been taught in Latin American Universities. As stated before, planning programs have flourished in Architecture Colleges and still have strong Design contents. Consequently, professional practice in Latin America is still based on mainstream planning from 20th Century. Asian, and African experiences are rarely shared by faculty in the schools, a situation that precludes the three regions from benefiting of each other's contributions.

Post-graduate programs were started by individuals who studied abroad, mostly in Europe and the United States. As a result, programs were designed as one world, having context specific in mind, but not covering it thoroughly. Only recently, as doctoral programs appeared, theories on context specifics have started to be published and accepted as foundations for developing new research in the area. This recent theorization has also promoted an offer of Latin American Planning courses in post-graduate programs in Brazil, Chile and Mexico.

In terms of regional or worldwide approaches, there are issues to be considered: 1) Regional specific contexts should be an important part of planners' training; 2) International best practices develop significant knowledge in students; and 3) A combination of regional sensibility and understanding with a global approach could replicate best practices in an ethically responsible way.

A generalist approach provides planners with interdisciplinary skills, allowing practitioner students and researcher stounderstand complex problematiques, which are common grounds for planners. However, the generalist approach which undergraduate programs introduced in the Latin American region as a deductive process from general to particular issues is changing the traditional particular-general approach which planners with an architecture background had. In consequence, emergency of undergrad programs should force the post-graduate programs to reconsider contents, since lower levels of education are already addressing the issues which traditionally were the core of them, leaving room for more in depth studies and specific contents at the masters and doctorate levels.

Views and experiences in different regions of the world could help developing and replicating successful stories all over the world, this is why Planning Schools should cross compare curricular structures in a systematic basis, and the Academic Congresses are an excellent scenario for realising the task.

Finally, the turn from rationality to deliberation is a sign of our present reality, and if well conducted and nurtured by Faculty in Latin American Universities as a cross-cutting approach is very likely to promote spaces of dialogue in the region.

ID 1710 | ON THE PATH TOWARDS SMART PARTICIPATION: A CASE STUDY OF TAIWAN

Yi-Jen Tsai¹

¹University of Amsterdam

jen.tsai@student.uva.nl

ABSTRACT: Information and communication technologies (ICTs) have become wildly infused in policy making process in recent years, and it has shown its potential of bringing public participation into another level. There are numerous sorts of participatory platform that uses ICTs as a tool to enhance the quality as well as quantity of citizen participation. However, studies on the transaction mechanism from traditional participation towards e-participation is in scant. This article conducted path dependent analysis by using archived data and literature, retrospecting the evolution of e-participation in the decades in Taiwan. Result of this study shows that the development of ICTs has led citizens participation to another level in Taiwan, and the focus of public participation though ICTs has shift from quantity to quality. The path of the ICTs development are more driven by contingent events such as social movements and political incidents in Taiwan.

1 INTRODUCTION

In recent years, information and communication technologies (ICTs) have become wildly infused in the public policy-making process, especially in urban planning domains, where public participation is considered vital and the interest parties are miscellaneous. ICTs has not only created a new bridge between public and private, but also between different groups of people. Moreover, citizens who use Information Technology Equipment (ITE) to express their views on current affairs and urban policies have increased significantly, further changing their roles in political participation. In terms of an international level, the world's major countries also consider ICTs in e-participation as key indicators for the innovation application service of the government (EU, 2014). However, the speculation on whether ICTs are making the policy-making process more inclusive and democratic is still in doubt, and the systematic comparison

between different countries and societies is in scant. Therefore, it is significant to investigate the path towards smart city and the citizen participation by using ICTs in general.

The previous studies on e-participation in Taiwan mainly focus on the evaluation of certain platforms. Chen (2006), takes a specific insight into the Taipei city Mayor's E-mail box, analyzing its outcomes, limitations and how it influences the public management. Chen (2016) makes a comparison between vTaiwan and Join platform, providing governmental agencies with several suggestions. Yu (2009) researches on the bureaucrats' attitudes, organizational barriers, and other possible factors for successful implementation E-rulemaking in Taiwan. However, there is no research how it transformed from the past to present. In particular, this research tried to take a holistic view on the trajectories of change in e-participation and take a specific look at the conjunctions.

The main questions of the article are: "How are ICTs involved in citizen participation?", and "What are the crucial factors contributing to the changes in trajectories?" The structure of this paper is as follows. A theoretical background is provided to set a scene at the second chapter. Afterwards, path dependent analysis is conducted in the case of Taiwan, as it appears to capture the process of e-participation evolution in the past two decades. The analysis fully utilizes the archived data and literature, and online information. The findings are discussed in the final.

2 CONCEPTUAL FRAMWORK

2.1 DEMOCRATIC TRANSITION IN TAIWAN

Taiwanese society is considered one of the most liberal society in Asia (Wu, 2006). However, the country's historical and geopolitical factors make the democracy in the island faced tremendous challenges. In 1949, Chinese Nationalist party flee to Taiwan, the post-Japanese-colonial, due to the Chinese civil war with Chinese Communist party. After the mainland china was completely claimed by the Communist, the Nationalist took Taiwan as their frontier against Mao and communism. During 1949 to 1986, Martial law had been implemented in the whole island, which means human rights and freedom of speech were heavily suppressed by the government. Although by the time it was not allow to had freedom of speech and freedom of gathering, there were still a lot of activists fight for the democracy of the island(Wu, 2006). In 1987, the President Jian Jin Guo lifted the martial law and began to implement democratic constitutionalism, since then, Taiwan has gradually transformed into a democratic nation. Taiwanese democracy showcases specific features due to its Confucian value and history, and is considered representative among the democratic transformation in Asian countries (Zhu, 2001).

Taiwan's democratic transformation experience in the world's third wave of democratization is very prominent in the theory and practice (Zhu, 2001). According to Zhu (2001), Taiwan's polity transformation has four distinct characteristics: first, top-down. The transition of the polity is dominated by the ruling elite, not the opposition movement. Second, election-driven. The electoral process is main path towards political revolution, not social movement. Thirdly, gentle progressiveness. The political system experienced a gradual, multi-stage adjustment, rather than a comprehensive transformation in a short time. Fourth, low social cost . There is no serious political upheaval in the process of constitutional transformation, and the impact on the existing social order and economic development is relatively small (Zhu, 2001). These characteristics make the democratic transformation in Taiwan is sometimes described as the Glorious Revolution in East Asia since there was no severe military conflict between the ruling class and people. However, some scholars question that the gentle transformation also make the transitional justice harder to process, causing social division and class sodification (Wu, 2006), Some also say that Taiwanese democracy is still immature, and the civic society is fragile because people are political alienating and doesn't trust the government (Zhu, 2001).

2.2 PUBLIC PARTICIPATION

Citizen involvement in policy-making process have been an international trend in recent decades. "Participation mechanism allows citizens total part in the design, implementation, monitoring and evaluation of public policy"(Granier & Kudo, 2016). Since the landmark study by Arnstein(1969), many

scholars have been studying participatory mechanisms as well as implementation in different scales and societies. Most studies shows citizen involvement may generate numerous positive outcomes, such as deepening democracy, improving the quality of public service, social justice and social inclusion (Bovaird, 2007).

Urban planning theories have been developed in the past decades, especially that its concept has been changed from a highly technocratic practice to a respond to needs of citizens (Healey, 1996). Meanwhile, it is critical to identify every problem from particular local viewpoints, through which sufficient details and facts about the problem fields are able to be gathered (Watson, 2003). These facts indicate that public involvement and citizen participation are increasingly important in the urban planning field.

Citizen participation is the coherent concept of participatory democracy (Barber, 1984). Almond (1987) defined citizen participation as an action of participation in the formulation, adoption or implementation of urban policy. This definition broadens the categories of "citizen", whose main participant can be politicians, government officials or ordinary citizens. All citizens own equal opportunities participating in the entire processes in the democratic political system and policy contents are the response to the consensus (Lin & Wang, 1999). Citizens intend to further influence policy-making through participation (Huntington, Nelson, 1989). Meanwhile, citizen participation attempts to put democracy into practice and pursuit public interest.

In order to realize more efficient citizen participation, it is necessary to change the traditional government-led method and reconsider the relationship between government agency and citizens (King Feltey & Susel, 1998; Chen, 2016). Its success highly depends on the institutional framework that fully disclosure of information and equal participatory platform are required. Substitute methods by making use of ICTs, which can be simultaneously interactive, transparent, and democratic, are being the key focus and gateway into participation in the urban policy in recent years. The following sections explain the role of ICT in the urban policy.

2.3 ICT POTENTIAL FOR PARTICIPATION

With the increasing discussion on the development of information technology in the field of democracy, relevant topics including virtual democracy, tele-democracy, digital democracy, electronic democracy and cyber-democracy are becoming popular. Website, e-community, e-voting and e-government are utilized to assist the practice of the democratic intentions. Indeed, citizen participation is the core concept among these discussions. It is proposed to develop a participatory network through ICT to promote citizens' democratic participation in urban policy decisions (Sassen, 2015). According to the UN E-Government survey 2013, the definition of E-participation focuses on "citizen to government" (C2G) and "government to citizen" (G2C). The indicator includes three parts, E-information, E-consultation and E-decision-making, 2 in order to measure the E-participation level in each country (UN, 2014). This classification is also compatible with the "information", "consultation" and "active participation" that the OECD has put forward to strengthen the contacts between state and citizen. For example, using ICTs to enhance the quality and quantity of citizens' participation in government decision-making will be very helpful to the legitimacy, responsiveness and effectiveness of democratic governance (Chen, 2009).

ICTs play a multi-faceted role in citizen participation. On one hand, it can enhance the convenience and popularity of citizen participation. It overcomes psychological and social barriers, greatly reducing the costs of participation. On the other hand, ICTs can only be beneficial to the powerful group rather than the general public, resulting in enclave deliberation and inequality (Huang & Chen, 2004). Therefore, it is necessary to deliver multiple participatory platforms.

In the process of promoting democracy through ICTs, the role of citizens is considered as "policy shaper and participant" (Chen, 2015) instead of the group being governed. Its character has further transformed into resources and partners of urban governance (OECD, 2015). These trajectories of transformations can be better understood through path dependent analysis.

2.4 PATH DEPENDENCE

Path dependence in this paper is used to explain institutional change which being accompanies with the ICTs' development. The concept was first defined in economic field as non-ergodicity of dynamic economic processes (Arthur,1989). Different historical events and their order of development cannot achieve the same kind of market outcomes with 100% probability in a dynamic economic system. In this case, the economic system is viewed as path-dependent (Arthur,1989). North (1990) introduced the path dependence theory into institutional economics in order to explain the process of institutional changes. He suggests that path dependence is equivalent to the idea of inertia in a physical field, when individuals or systems entering into a path, it may depend on this path (North,1990). Institutions are possible to follow a path onto a positive track, as well as into an opposite state, further being locked into an inefficient state and stay stalled (North, 1990). Path dependence includes two main features: one is that path dependence emphasizes the critical impact of small historical events which sets deterministic institutional patterns. Contingent events outside the system are considered closely related to the result of trajectory changes (Mahoney, 2000). Second, path dependence emphasizes the path continuity of system development. It points out that once the system complies with a certain path, it will evolve and strengthen itself in this, which will exclude the other alternatives outside of the system (North, 2003).

3 CASE STUDY: TAIWAN'S E-PARTICIPATION IN URBAN POLICY

The case study of Taiwan's E-participation in urban policy provides not only a holistic story of its transformation, but also a distinctive view of events. The analysis teases out the institutional conditions, contingent historical events, turning points that make up the citizen participation of Taiwan. The study aims to analyze trajectories changes in the development of citizen participation and exams the contingent events that are trying to create a new path. As illustrated in Table 1, various events were closely connected to the institutional process and ICTs progress can then be identified. As a consequence, these trendsetting contingent events determine the development path of the citizen participation of Taiwan. These turning points and events describe four trajectories: (1) Complaint mechanism; (2) Diverse types of advice collection mechanism; (3) Participatory mechanism combined with social media; (4) Two-dimensional participatory mechanisms: official and private

3.1 COMPLAINT MECHANISM

The Martial Law lifted in 1987 opened a new chapter of Taiwan's democratization. After then, increasingly importance has been attached to public opinion and citizen participation. Governments at all levels have also designed mechanisms to provide citizens with direct access to the political process. As the capital city of Taiwan, Taipei City always acts as the pioneer in various government reform measures (Chen, 2006). In 1994, Taipei has experienced an unprecedented rotation. Being the first popularly elected mayor after the Kuomintang's 27years long dominance, mayor Chen took significant steps to strengthen the democratic images through Taipei City Government's effectiveness and responsiveness in handling citizens' complaints. He launched a program called 'Meeting with Citizens' right after his electoral victory. After then, he launched 'A-Bian Mailbox' in form of a bulletin board system (BBS) by taking advantage of ICTs. It

was the very first E-participation initiative in Taiwan's government agencies (Chen, 2006). In 1998, 'A-Bian Mailbox' was upgraded to the web version by Taipei City Government. After Ma Ying-jeou was elected as the new mayor in the same year, its name was changed into 'Mayor e-mail-box' while keeping the same functions. Taipei City Government also developed a set of mechanisms dealing with the e-mail. The complaint e-mail sent by citizens through a designated website would be registered as an official document, and further be distributed to the appropriate unit.

According to the research, the number of petitioners in the 'Mayor e-mail-box' increased by ten times in just 5 years, with 1,080 email per quarter in 1996 and 12,508 email per quarter in 2001 respectively (Chen, 2001). This platform provides a convenient and low-cost tool for citizens where citizens are more willing to present their daily complaints and ask for an immediate resolution from city government. On the contrary, the government needs to devote more efforts and resources to process mounting complaint e-mails. This pressure pushed the government to reform its managerial and organizational capacities concerning the 'Mayor e-mail-box' (Chen, 2006). It also shows limitations on citizens' level. Internet active population mainly consists of high-educational groups, which raise inequality in participation.

In sum, the election of the new mayor who has a democratic agenda with local government support to put forward citizen involvement in urban policy issues, is the key factor for creating this new path. Besides its limitation, it is not only the start-point to reshape the relationship between state and citizens, but also a turn in opening up the previously blocked political procedures.

3.2 ADVICE COLLECTION MECHANISM

'Research, Development and Evaluation Commission, Executive Yuan' planned to establish 'National Policy Internet Think Tank Online' in 2005 in order to use ICTs to promote citizen participation through different platforms. Especially after Mayor Ma was elected as new president of Taiwan in 2008, Taiwan's democratic agenda was put into a new phrase. The functions of 'National Policy Internet Think Tank Online' was integrated into E-government website 'Think tank'. In addition to continuing the original service, a 'Policy Planning' section was created to provide information on government-related planning projects. It enables citizens to provide opinions through leaving comments. Moreover, the conference on 'Improvement citizen's living condition' hold by Executive Yuan put forward the online grievance investigations and voting project. The project collected the main concerned urban issues such as high housing price, insufficient barrier-free facilities, and unsatisfied living environment. These problems would be put into the primary consideration of the policy agenda. Executive Yuan also promoted '2020 Vision Platform' in 2009 to organize the ideas for future development. 11 scholars were invited for the operation of particular channels, while citizens could join this platform through article publishing, online programs, voting and discussion. The information would be collected as a part of the official report, shaping the future planning vision of Taiwan 2020. In sum, the election of the new president in 2008 was a turning point transforming the previous one-way e-participation towards diverse types of e-participation. In line with the aim of enhancing democracy, approaches to citizen participation have evolved. Not only citizen's complaints on urban issues, but also their advices were included in the future urban policy agenda. However, citizen participation in this phase is still lock-in the government-led framework.

3.3 PARTICIPATORY MECHANISM WITH THE SOCIAL MEDIA

The popularity of networking equipment and the growth of internet population emphasized the sharing between people, which gradually formed the World Wide Web 2.0. As an important strategy, Executive Yuan also mastered the development trend that introduced web 2.0 into the e-government project "Integration of social network". Moreover, 'Guidelines for the operation of government website WEB2.0' was established in 2011. It provides an official guideline for state government to fully utilize social media, such as Facebook fan-page and Plurk, in order to shorten the distance with the citizens and promote citizen participation (Chen, 2016). After then, the 'Think tank' Facebook fan page was established.

In additional to the actions taken by the government, bottom-up initiatives also appeared due to an advertisement of Economic Power-Up Plan released by the government in 2012. Unsatisfied with government's asymmetrical and non-transparent attitude, a group of computer programmers founded the online community 'g0v.tw' in December 2012, to push information transparency. Based on the open

resources, this online community aimed at providing easy-to-use information service for citizen participation (g0v, 2016).

The review procedure of 'Cross-Strait Service Trade Agreement' was undertaken by The Legislative Yuan from March 17, 2014. However, the policy-making process was questioned by citizens since the information was not fully opened to the public and even the public's ideas were not included in the decision-making. It resulted in 318 Movement, through which the student-led group expressed their dissatisfaction to the Legislative Yuan. It is rather remarkable that this student movement widely utilized ICTs to express their pursuits. Process of the movement was instantly published to Facebook, PTT and other online community platforms, provoking a heated discussion, in which way called for more people to participate in the movement. The internet users also took advantages of diverse social media platforms connecting the power of people through APP, sharing files, and webcasts. Thus, it set off a new wave of E-participation in urban policy. Apparently, government agencies also noticed that the speed at which citizens connect with one another in online society go beyond the traditional policy-making pace. It is hard to convince citizens without receiving public opinions and communicate with them through the internet (Hu, 2014; Tang, 2016).

318 Movement altered the former conservative thinking of the government. Consequently, the government started to rethink the role of E-participation. In response to the 318 movement, 'National Affairs Conference on Trade' opened an online participatory platform, including the BBS, webcasts with the combination of existing social media platform. At the same time, 'Taiwan Free Economic Pilot Zones Online' also utilized social media platform to increase public participation and interaction mechanisms in the policy development and implementation stage. Moreover, 'National Development Council Online' webcasts were used to support the policy of Free Economic Pilot Zones. The webcasts not only explained the necessities and importance of free economic pilot zones, but also widely accepted public suggestions as a reference to policy adjustment. It was the first time that government agencies conducted a real-time interaction directly with citizens through the internet (FEPZs, 2014). This breakthrough is considered as a significant step of online consulting on urban policy. From October 2014, Executive Yuan began to share the press conference on Youtube once a week. Live broadcast accompanied with live discussion boards helps 6 Executive Yuan react immediately to the suggestions. 318 movement also provided an opportunity for the development of private initiatives -g0v. In order to guarantee the transparency of information, the community launched a live webcast with the hackfoldr system to integrate on-site conditions, live images and material needs. G0v made it possible for everyone to obtain the first-hand information during the one-month movement. This event also allowed a substantial increase in its participants (g0v, 2016).

To sum it up, the prevalence of social media further stimulated the diversity of e-participation platforms. Bottom-up initiatives also appeared due to their unsatisfied with government's attitude, while these initiatives were not very influential at first. Instead, 318 movement is considered as a turning point of citizen participation towards a combination of social media platform. It brought new opportunities to private initiatives. Meanwhile, the government gradually realized that an active participatory environment that uses social media platform has a great potential to involve the citizens. Using these tools can ensure the integrated forms of communication, encouraging the expressive dynamics of mobilization. Therefore, social media platforms began to be included into the urban policy-making process.

3.4 TWO-DIMENSIONAL PARTICIPATORY MECHANISM: OFFICIAL AND PRIVATE

As the internet word is grows to be an indispensable part of everyone's lives, Taiwan also took efforts to catch this global trend. In December 2014, "Virtual World Law Adjustment Program" was proposed by the Executive Yuan to remove regulatory barriers in the way of virtual world developments. In order to promote the law adjustment program with the power of netizens, g0v project's participants and the Virtual World Development Regulation and Implementation Unit collaborated with each other, building and managing a new platform called 'vTaiwan'. The main concept of 'vTaiwan' is to adjust our own policies by ourselves. The authorities provided background information or draft amendments to the relevant topics. Afterwards, the information is published on the platform for one month to collect advice, fostering a consensus through discussions and exchanges. The consensus can then be implemented through coordination of ministry jurisdictions and amendments or proposals in regulatory practice (vTaiwan, 2015). Until 2015, vTaiwan platform has discussed more than 301 topics with 1363 articles published, and conducted 9 online counseling sessions (Chen, 2015). It promotes e-participation through the construction of a transparent

network community, which differs from the previous platform. The Executive Yuan positions vTaiwan platform as an experimental project for enhancing transparency of citizen participation and policy-making process. For example, law amendments on closed-company were open to discuss from January 7, 2015 through vTaiwan platform. The community participants were invited to join the discussion and online consultation meeting. After half a year, the amendments won the consensus, approved by Legislative Yuan (Commercial Times, 2015). Thus, this platform becomes gradually accepted by citizens.

The National Development Council also launched an urban policy participatory platform, called 'Join', aiming to achieve the disclosure of policy information and strengthening citizens' supervision. Meanwhile, it aims to standardize the construction of the network community, making citizen participation as a common activity. Citizens can participate at all stages of urban policies formation, implementation, and evaluation through this e-participation channel. The multi-function platform ensures advice proposal, policy discussion, process supervision, and problem reflection (Join, 2015). According to the research, the total number of advice proposals has been 85, with 60 of which entering into the second round and 2 already being realized; Policy discussion part includes 52 topics, with 47 topics from the central government and 5 topics from the local government; The current discussion and plan of Free Economic Pilot Zones can be traced from the process supervision section (Chen, 2015). At the same time, fast development of 'g0v.tw' stimulated the bottom-up citizen participation. Within 3 years, g0v became one of the world's top three civic tech community. Its activity can be even keep pace with OKFN(Europe) and Code of America(USA). The main idea of g0v is decentralization that emphasize more on the interaction and collaboration (Chiang, 2016). In this platform, everyone can be an information provider and criticizer. For example, according to the law, election candidates should report their campaign contribution to the Control Yuan, and the contents of the declaration should also be open to the public. However, citizens can only obtain unclear digital files unless citizens themselves print the details at the Control Yuan, which makes further analysis and monitoring difficult for the public. In this case, g0v launched a project for a more transparent monitoring on the campaign contribution. The project advocated public to collect photocopying from the Control Yuan. Netizens were divided to read and record the data from pieces of images, contributing to the reconstruction of an electronic file. Thanks to nearly three hundred thousand participants, the images were identified only in a week, which make this project as the best example of mass collaboration (Chen, 2016).

To sum it up, due to the political support from "Virtual World Law Adjustment Program", the major government agencies Executive Yuan and the National Development Council both launched their online participatory platforms. Despite the combination of social media, it is an important step towards an integrated platform available for citizens to participate the whole process of urban policy-making. Furthermore, the power from bottom-up initiatives cannot be overlooked. Their efforts on raising public's attention on urban issues and collaboration make up for the insufficiency of government-led platforms. At this moment, both private and official participatory mechanisms have found their position in the way of development.

3 CASE STUDY: TAIWAN'S E-PARTICIPATION IN URBAN POLICY

The article first formulated a theoretical background on citizen participation and ICTs in urban policy. Then, the development trajectories of citizen participation in Taiwan was analyzed under the path-8 dependence framework. The case study testified the trajectories of change that were mainly set in creative moments and then to interpret some contingent events on the complex development trajectory of citizen participation. The main findings are as follow.

First, ICTs as a stimulator for the development of citizen participation. Due to its direct, rapid and borderless nature, ICTs has provided a convenient medium of participation by breaking through the boundaries physically and socially. It indeed creates direct contacts with the executive branch across the representative, political parties, and interest groups. More and more people use ICTs to satisfy their political pursuit.

Second, for a developing state, such as Taiwan, democracy was at the top of the political party's reform agenda in the early phrases. In order to put the idea into practice, promotion of citizen participation became their first choice. It is obvious that their efforts on democratic reform are aimed at winning the election. This is the turning point bring previous non-transparent governance to the trajectories of promoting citizen participation. The mayor who was elected had to be responsive to the public. With

increasing pressure on achieving his promise, the 'Complaint mechanism' became the very first type of e-participation.

As a similar pursuit for political party, the election of president pushed forward the transformation trajectory since the boundary of citizen participation expanded from city to state level. The evolution in ICTs made more types of platform being possible, while the main focus of this phase was collecting advice for future urban planning. Citizens acted more as a provider than participator at this stage. However, the 318 movement is another contingent event that obviously changed the role of the government and citizen in e-participation. The power of citizens became much stronger through the connection of the internet. In this time, the increasing use of the Internet, technology devices, and social media helped materialize the direct interaction between the government and citizens. Private initiatives also grasped the opportunity to become more influential.

Law supports of virtual world enabled a positive transformation. Main government agencies both took actions to create transparent platforms for the participation at all stages of urban policy-making. Private agencies became more powerful to push forward the transparency of information. The development of both official and private initiatives shows a different pattern at the current phase. On one hand, some political figures began to contact the private initiative. On the other hand, private initiatives had gradually infiltrated the government through speech and cooperation. As can be seen from the trajectories of change, even though the ICTs provide possibilities for diverse participatory platforms, the social events are the crucial reasons for the transformation of citizen participation: either the election in the early times, or the movement and law support at the latest stage.

Phase	Contingent Events	Trajectories of Change
1. From black box governance towards a compliant mechanism	<ul style="list-style-type: none"> • The martial law was lifted (1987) • Domestic election of the Taipei's new mayor who aimed to promote democratic agenda (1994) • A-Bien(the mayor) mail box (1995) 	<ul style="list-style-type: none"> • The beginning of e-governance • Citizen involvement through Internet • Reshape the relation between public and government • Focused on compliant mechanism
2. From one way e-participation towards diverse types of advice collection mechanism	<ul style="list-style-type: none"> • <i>National Policy Internet Think Tank</i> Online (2005) • The presidential election (2008) • Online grievance investigation and voting promoted by Executive Yuan (2009) • "2020 vision platform" (2009) 	<ul style="list-style-type: none"> • Diverse platform were offered for e-participation • Government-led e-participation was strengthened through official participatory platform • Focused on advise collection
3. Advice oriented platforms towards a participatory mechanism combined with social media	<ul style="list-style-type: none"> • The prevalence of social media • <i>National Policy Internet Think Tank</i> Facebook fan page • "g0v" online (2012) • Sunflower movement (or 318 movement) (2013) • National development Council online (2014) • Executive Yuan live broadcast channel on youtube (2014) 	<ul style="list-style-type: none"> • The appearance of bottom-up initiatives • Public participation and interaction mechanism was enhanced through social media • ICT platforms started to be considered into urban policy promotion • The connection between citizens became more stronger through the Internet so that online platform had to be included into policy-making process
4. From top-down e-governance towards two-dimensional participatory mechanism: Official and private	<ul style="list-style-type: none"> • Virtual Space Law adjustment (2014) • Booming growth of "g0v" • Online policy discussion platform "vTaiwan" (2014) • Online policy discussion platform "join" (2015) 	<ul style="list-style-type: none"> • Breakthrough in both government-led and citizen-led e-participation • Focused on the construction of the network community • Interpreted platforms available for citizen to participate the whole process of policy making • Private and public agencies began to collaborate • Policy-making became more transparent

1 INTRODUCTION

Preparing students for practice is the key challenge in planning education. Since the late 1990s, the issue of how to balance theory, methods, skills, and practice oriented courses in the core curriculum has been widely debated. Partly as a result of the greater emphasis in the 2006 Planning Accreditation Board guidelines on plan making skills, and partly in response to the increasing demand from students for hands on learning, most planning schools in the United States have by now incorporated practice oriented courses into their core curriculum (Edwards and Bates 2011, Vidharthi, et.al. 2012). Depending on how each program defines what planning is or ought to be, the strategies to incorporate practice oriented learning into the curriculum ranges from special seminars, internship requirements to studios (Lang 1983, Long 2012). Over two thirds (69%) of the 80 schools listed in the 2015 Planetizen Guide to Graduate Urban Planning Programs by now have a studio course requirement. Still, studio pedagogy is neither “dominant, not does it play a significant role in the earliest stages of planning education” (Long 2012, 438). Several questions remain on how to define, incorporate, and assess learning outcomes of studios in planning education (Long 2012, Vidharthi, et.al. 2012).

Since most studio projects involve working with a client, there is also the issue of how community engagement takes place within an academic setting, and how the process impacts partner communities (Frank 2008, Ferman and Hill 2004, Angotti, et.al., 2011). This concern was reflected in the 2016 ACSP Conference Call for Papers: “How are planning programs working effectively with communities in authentic, non-exploitive way that produce real benefit?” Especially within the current political context, it is critical for

planning programs to assess how they can work collaboratively with community based organizations and their coalitions and to link to the broader social justice movements (Shiffman 2007).

This paper explores the challenges and benefits of offering a studio early on, during the first semester, that involves working with a community based client organization, using the case study of a introductory core course at Pratt Institute's Planning Program. After a brief review of some debates on studio pedagogy and service learning, we provide a short description of Pratt's practice and community oriented pedagogy. We then consider the effectiveness of the first-semester Fundamentals of Planning studio/seminar over the past seven years (14 semesters), from both the students' and community clients' perspectives. An online esurvey, with the participation of 163 students (out of the 208 contacted), was used to get students' assessment of the learning outcomes, and structured interviews with the community clients focused on some key issues raised in service learning literature. In conclusion, we consider the benefits, challenges and conditions necessary to effectively integrate a studio course early on into the planning curriculum.

2 PRACTICE ORIENTED LEARNING

There is considerable discussion in the academic literature about the benefits, issues and how to incorporate practice oriented learning into the curriculum. Different authors emphasize different aspects of planning practice and its implications on what practice learning should emphasize. Still, whether explicitly community service-oriented or not, studio pedagogy and internships seem to be the most popular strategy for practice oriented learning in planning programs.

The attitude towards studio pedagogy has changed over time. As the focus of planning programs shifted away from the physical planning oriented planning education of the earlier years towards social science and research oriented education, studio pedagogy was abandoned in most schools, to be revived once again in recent years. While for some, the term 'studio' still implies design-oriented activities, Senbel (2012) analyzes the difference between planning and design studios, and considers how the elements of each could be combined in a hybrid studio setting to teach urban design to beginning planning students. Clearly, studio pedagogy is equally applicable to social policy and policy formulation and analysis as well as physical planning, as it involves "designing and evaluating courses of action in response to problems" (Lang 1983, 123, Long 2012). "Synthesis," "learning-by-doing," and "reflection-in-action," and aiming to expose students to the complexity of "real-world problems" and to initiate "professional socialization" are some of the most common terms used in learning outcomes descriptions in studio syllabi from different programs (Nemeth and Long 2012, 479). For Higgins et.al.(2009) studio pedagogy is about experiential, problem-based, student-centered and reflective learning. Rooji and Frank (2016) and Oonk, et.al.(2016) argue that contemporary planning practice requires development of skills for co-creation and a 'transdisciplinary' approach based on collaboration among scientists, professionals, private and public sector.

For others, studio courses should do more than just teach practice, and investigate "new modes of practice with a focus on advocacy and community outreach, as well as meaningful collaboration among disciplines" (Long 2012, 432). Forester (2012), from a critical pragmatic perspective, argues that studio settings can provide students the opportunity to learn to "think critically about outcomes as well as processes, about institutional and process designs, about power and performance.... [and to] reconstruct possibilities where others might initially perceive or presume impossibilities". Working with a community-based client early in their educational process can help students learn to relate theory to practice, and "can be a transformative experience, forcing them to confront their own values..." (Le Gates and Robinson 1998, 314).

While there is broad consensus on the benefits of studios as a key component of practice oriented learning, there are several challenges. Some authors point out the potential tensions, as well as the benefits, that might arise from teamwork and bringing together students with different, and especially design and non-design backgrounds in studio classes (Cameron, et.al. 2001, Arefi and Edelman 2013, 72). Moreover, "real projects can be messy and unpredictable, drawing students into complex political realms. They generally require work before and after the semester, setting up relationships and completing products" (Cameron, et. al. 1998, 111). And, since studios involve "both cognitive and non-cognitive outcomes and impart a complex set of skills, knowledge, and values to students," Nemeth and Long (2012) draw attention to the need for a systematic model for assessing the learning outcomes and evaluation procedures in studio courses.

While the literature on studio pedagogy focuses on how to bring practice into the classroom, service learning literature discusses issues involved in learning in and with communities. University community service is not new, but Angotti et.al.(2011) point out that planning approaches, like Advocacy Planning, that link service and learning emerged during the Civil Rights era. Federal initiatives and funding in the 1990s also led to areas assessment of the challenges and benefits of earlier university community partnerships (Dewar and Isaac 1998; Baum 2000, Le Gates & Robinson 1998, Ross, et.al. 2002, Sletto 2010). As Vidal et.al.(2002) point out, it is hard to consider service learning without understanding how the community engagement takes place within an academic context. “While quite useful and insightful, this literature is written almost entirely from the higher education perspective, leaving unanswered major questions about how community partners view and evaluatesuch partnerships” (Ferman and Hill 2004, 242). Similarly, others point out that service-learning courses tend to focus on the learning aspect, and the service aspect and impacts on the community are neglected, and they offer frameworks for analyzing their effectiveness (Bose and Wilson, 2014, Erickson 2014, Martin, et.al. 2014). Angottiet.al. argue that community service learning is not only about “shifting the site of learning from the classroom to the community;” it also requires equal partnership between the academic and community partners, one that is based on mutual respect , mutual learning and commitment (2011, 2-3).

3 CONTEXT MATTERS

“Each school’s core is... inevitably a reflection of the uniqueness of the department and the students and faculty who define it” (Edwards and Bates 2011, 173). Pratt Institute’s planning program is rather unique as the only planning program in the US that is located in an Art and Design School, where innovative and creative practice is valued at least as much as academic research and publication. The faculty is mainly comprised of part timers and adjuncts – artists, practitioners, activists, innovators – who often bring to the classroom new ways of thinking, experience and strong networks from the field. Moreover, the program’s approach to planning has been influenced by the legacy of the Pratt Center for Community Development (PCCD). Pratt Center is the oldest surviving university-based community planning organization in the U.S, established in 1963 to address poverty and top down government policies by supporting affected communities to participate in the planning processes .Over the past five decades, Pratt Center’s “high quality” technical assistance and policy advocacy around social and environmental justice issues, working in collaboration with community based organizations in low income neighborhoods around the city, has led to long term relations and trust – a key component of successful university partnerships (A. Vidal & et al. 2002). This was how “an activist planning model” emerged in Pratt’s City and Regional planning program (L. Wolf Powers 2008, 3), attracting adjunct faculty with similar values and experience, and students interested in participatory planning, social and environmental justice and sustainability issues. As part of the Graduate Center for Planning and the Environment (GCPE) in School of Architecture with three other graduate programs, Sustainable Environmental Systems (SES), Historic Preservation (HP) and Urban Place making Management (UPM), the Planning Program (CRP) has two goals: 1) to utilize studio and team learning to educate students about the importance of collaboration in a multidisciplinary field, and 2) to provide opportunity for focused, specialized or interdisciplinary study and degrees (2014 Planning Accreditation Report,p.33). It should be noted here that compared to the 80 planning programs listed in the Planetizen 2015 Guide to Planning Schools, Pratt is the only accredited program that requires 3 studios. Over two thirds (68%) of all of the80 schools listed in the guide have a studio requirement, but only 11 (14%) require two studios. The practice-oriented components of Pratt’s curriculum include 3 studio requirements, a final thesis/demonstration of professional competence project (DPC), as well a range of internship/fellowship and action research opportunities which enable students to work embedded in communities to develop their action oriented research skills (Figure 1). Pratt’s three studios (Fundamentals of Planning seminar/studio and two advanced studios) and a final Demonstration of Professional Competence project or thesis make up half of theeight required courses, and a third of the program’s total 60-credit requirement. Moreover, to provide a multidisciplinary experience for students, two or more programs have started to offer their studio courses concurrently to either study the same geographic area, serve the same client, address the same urban issues, or all of the above. While the studios emphasize team work, students work individually on their final DPC project.

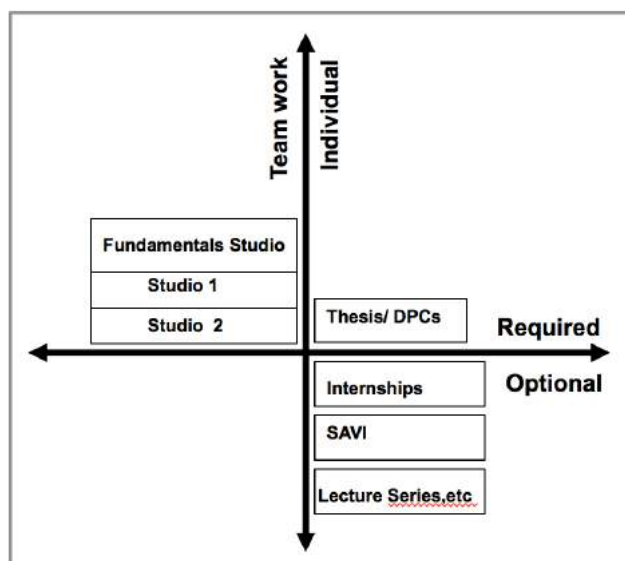

Figure 1. Components of practice-oriented learning at Pratt's Planning Program

An analysis of the 42 advanced studios offered between the spring of 2010 and 2016 reveals that most were client-based (83%), had a community development/advocacy focus (81%), and involved partnerships with community based or city wide non profit organizations (71%). Most studios stressed a multidisciplinary approach by combining faculty from the different programs and/or inviting experts from different fields (93%), and brought together students from different programs, fostering an interdisciplinary environment (71%). Some studios from different programs were linked for research then split for recommendations, some conducted research independently and then linked for recommendations, others came together in “salons” and presentations to each other for cross-learning; shared guest lectures, engaged the same client but employed different study areas or topics, or any combination of the above (GCPE Studio Guidelines Draft, August 2015). The outcome of linked studios, however, has yet to be evaluated.

4 A FIRST-SEMESTER CORE COURSE: FUNDAMENTALS OF PLANNING

It was within this context that a first semester seminar evolved into a five-credit course with a ‘mini studio’ component that involved working for a community based organization. The course is taught by one full time and two part-time faculty members. As expressed in the course syllabus, the goal of this introductory core course is twofold: “to familiarize students with relevant literature, both historical and contemporary, on the principles and practices of planning at different levels, and to relate those readings to practice by working for a real client on a current planning issue in a New York City neighborhood.” The student learning objectives include learning: 1) to critically evaluate and reflect on the readings, 2) to work collaboratively in teams, 3) to work with a community client, 4) to gather data and analyze data on existing conditions and develop planning recommendations to address the client’s concerns, and 5) to prepare and make professional presentations. The lecture/seminar component of the course requires students to prepare short weekly commentaries on the assigned readings that are reorganized each semester to provide relevant background for the studio topic. The purpose of commentaries is to make sure student stay current with the readings for meaning fulclass discussion, and reflect on how they relate to their own experiences and the studio area and project. Due to limited in-class time (two 3 hour-sessions per week), students are required to set additional time for teamwork, as well as site visits, community meetings, stakeholder interviews, etc. The studio topic and site is selected from among a few potential ideas proposed to the instructors by community groups they had worked with before or know through their networks, based on both the potential class size and the immediacy of the community partner’s need. Discussions with the community partner about the focus and scope of the studio project begin often months before the semester, and the deliverables and meeting schedules are confirmed before the semester starts.

Students meet the client at the beginning of the term, to hear directly about the community and the background of the issues they are asked to work on. To get acquainted with the neighborhood, they start

their existing conditions research with a neighborhood survey. The coordination of assignments with the one-credit skills courses (GIS, Graphics Communication, Professional Writing, and Freehand Drawing) is critical in helping students with demographic and spatial analysis and graphic skills necessary to produce professional-quality reports and presentations. Students prepare and present their existing conditions analysis report to the client around the middle of the term. During the second half of the semester, they work on developing recommendations, based on the client's feedback and priorities and their research findings, and conduct additional research as needed. They make a final presentation to the client at the end of the semester and deliver their final report. Often, they are asked to present their findings to the community members or elected officials. They also present their work at the semester end Super Studio Day, and get additional feedback from GCPE faculty and peers.

Inevitably, tensions arise among students with different backgrounds who are used to working individually in more traditional class and studio settings. To resolve such issues, instructors meet with students individually or in teams, as needed, and hold a class meeting after their mid-semester presentation to reflect on the process and brainstorm about how to resolve issues. At the beginning of the semester, they share with the students the lessons learned from previous semesters about how to divide up the work among themselves within and across teams, as well as how to relate to the client. During the latter part of the semester, as students start to work on their recommendations, collaboration gets easier. The final class session is dedicated to reflections on what they have learned and how the process can be improved.

Teamwork and good class citizenship carries significant weight in grading. Commentaries and participation in class activities account for 25% of the grade, each, and the studio project accounts for half of the grade – half on their individual contribution, and the other half, on teamwork and their team's overall performance. Given the close coaching involved during the semester, grading is based on a discussion of a number of different factors about each student's performance and progress, as well as feedback from the client and other faculty members during midterm and final presentations, as suggested in Nemeth and Long (2012).

4.1 STUDENT'S ASSESSMENT OF LEARNING OUTCOMES

An online survey was conducted with students who took the course between Spring of 2010 and 2016. The questionnaire had three open ended questions that explored how the students remembered and would describe the course; whether the concepts and skills learned were useful in later semesters or in their professional work; and how the class could have prepared them better for future academic or professional projects. It also asked if they felt the experience of working for a community-based client was useful as part of their learning process towards becoming a professional planner. (Table 1.) The question on what were the most important concepts/skills they learned in this course was adapted with some changes from the learning outcomes categories developed by Nemeth and Long (2012). The response rate was quite high (78 percent), considering over a third (35%) the 163 respondents had already graduated and six percent either on leave of absence or had transferred to another program within the GCPE or another school. It was above 95 percent for those who took the course over the past three years.

Harris and Irazabal (2011) found that the characteristics of what students described as High Service – High Learning experience involves: a) a well defined significant project with a clear schedule, b) high level of support and supervision, c) close connection between the deliverable to the agency/organization and course assignment, and d) transformed subjectivities. When the Fundamentals studio is considered in terms of these aspects, first, the deliverable to the client organization accounted for half of their grade for the course. In terms of support and supervision, as several students acknowledged in the survey, the faculty spent a lot of time working closely with the students, at times, joining them on weekend team meetings to provide support and guidance. Working on a real planning project for a real community client was very important for the students. The studio process became more structured over time with specific weekly tasks, and guidelines were provided at each phase of the project with tips on how to organize the collaborative process, as well as the deliverables. Still, some students found any unforeseen changes in the schedule and lack of a single correct answer to the issues at hand rather difficult. The steep learning curve and the workload were also challenges for some students. A student who had to work on completing the final report after the semester was over due to his absences during the semester, felt the instructors were being more responsible towards the client organization rather than the students. But as Irazabal and Harris point out, "while assignment design is important to student learning outcomes, so is the attitude of

the individual student” (2011, 118). Finally, transformed subjectivities refer to “gaining an understanding of the challenges and opportunities faced by professionals” and developing confidence to view themselves as professionals, and “becoming more informed and sensitized about social responsibility and ethics in the profession” (Irazabal and Harris, 2012, 115). Most students felt the class was a good orientation to the profession and it helped them confront their own values: “The course is not only an introduction to planning but an opportunity to shape your values as an urban planner through practice and learning.” Another said facilitating a visioning workshop with “low income residents who have values far different than my own in terms of public space usage was more challenging than I would have imagined. I really had to listen and was keenly aware of my own discomfort and the difficult task of working in a community that is not my own.”

Overall, the survey responses seem to confirm the course has been rather successful in meeting its primary goal of linking the background readings to practice through the hands on experience of working with a community partner. Almost all the students in each semester felt working with a community based client was useful. It was also one of the things a majority of students said stood out in their mind about the course. They learned, not only how to interact with a client, but also to respect local knowledge and realized the challenges CBOs face. One student said “it was about working for people who are more invested than my 40-hours per week; working for people who have to live with my decisions or lack of it, and working for people who may know more than I,” and a few others said the CBO provided them the legitimacy to access and work in the community.

Having a real client put an urgency and seriousness to our work that would not have existed with a hypothetical client. Knowing who would see our work led us to want to produce the best product possible so we could see it put to use and see a real response to our work. It was also much more validating at the end of the course to have a community group receive your work and be appreciative of it.

Even though numerous students described the course as “challenging,” “intense,” “hitting the ground running,” and often, as “baptism by fire,” they all said they were glad that they went through the steep learning curve during their first semester. They felt the skills they learned and the experiences of Fundamentals class prepared them for more advanced studios and even later practice: “I find myself referring back to things I learned from the Fundamentals Studio in classes I have had post-studio;” “It is almost overwhelming but it prepares you for what you will be doing in future, and helps you find the areas of planning you want to learn more about;” “I believe this studio helped me get the job I have today.”

While there was a rather equal distribution of responses to main learning outcome categories (Table 1), over sixty percent of the students marked teamwork, learning by doing, and working with a community based client (recognizing accountability or responsibility to the client, assessing planning outcomes on set of values) as the learning outcomes of the class. A significant number of students said they would have liked to have more time with the community partner and more direct interaction with people in the neighborhood. Others wanted more specific communication and analysis skills, or focus on other specific topics, and more in-class time.

TABLE 1. What were the most important skills you learned in this class? Source: Adapted from Nemeth and Long (2012)	# Yes	% of N=163 respondents
COMMUNICATION		
Graphical/visual skills	103	63%
Written skills	85	52%
Oral presentation	99	61%
Understanding the dynamics among plan's multiple stakeholders	112	69%
PROFESSIONAL EXPERIENCE		
Working in a “real world” work environment	88	54%
Gain project management skills (workflow, time management, etc)	98	60%
Understanding quality standards expected in practice	91	56%
Understand various roles of planner	105	64%
LEARNING BY DOING		
Application of general planning concepts to specific context	120	74%
Learning how to synthesize skills, knowledge, values	97	60%

Understanding the relationship between theory and practice	89	55%
Acknowledge uncertainty/complexity in planning practice	114	70%
Recognition of planning as iterative, long-term process	109	67%
PROBLEM SOLVING		
Ability to formulate logical, defensible planning decisions	81	50%
Learn how to evaluate several possible scenarios	93	57%
Negotiate oppositional viewpoints	82	50%
Recognize importance of flexibility in decision-making process	93	57%
Seek appropriate assistance and expertise	76	47%
Being creative in designing solutions and processes	106	65%
Develop critical thinking ability	81	50%
TEAMWORK		
Role recognition in collaborative work	123	75%
Understanding basic group dynamics	125	77%
Development of leadership qualities	94	58%
Gain vital listening abilities	66	40%
Development of interpersonal cooperation skills	114	70%
SERVICE/WORKING W/A COMMUNITY BASED CLIENT		
Assess planning outcomes on set of values (justice, sustainability, etc.)	112	69%
Sublimation of personal opinion	76	47%
Creation of ethical foundation for future practice	85	52%
Recognize accountability/responsibility to client group	113	69%
Acknowledge and challenge systemic power imbalances	45	28%

4.2 ASSESSMENT OF BENEFITS TO THE COMMUNITY PARTNER

The eleven community based organizations (CBO) that the studio worked with from Spring 2010-2016 were interviewed about their views on the benefits and issues in working with students in general, and specifically, their experience with Pratt students (Table 2). The questions were similar to evaluation criteria suggested in community service learning literature (Bose and Wilson 2014, Frank 2008, Erickson 2014). They explored the client's views on the quality and usefulness of the deliverables; how they were used; the time frame; and ideas on improving university-community collaboration.

TABLE 2. Summary of Client Interview Results		
TOTAL(14 Projects/11 organizations)	11 clients	100%
1. Worked w/ Pratt before (Pratt Center)	7	64%
2.A. Benefits of working w/students	14 projects	100%
Resource	9	64%
Enthusiasm and ideas	9	64%
Can go deeper & do more	8	57%
2.B. Issues in working w/ students	14 projects	100%
Time consuming	8	57%
Can be too theoretical or unrealistic	5	36%
Lack of enough interaction	3	21%
Lack of understanding of local issues	10	57%
3. Positive experience w/ Pratt students	13	93%
4. Products useful	14	100%
5. Which materials most useful?	14 projects	100%
Research	14	100%
Visioning workshop (only 2)	2	100%
Recommendations	13	93%
6. Semester schedule was convenient	11 clients	100%
7. Ideas for improving collaboration	11 clients	100%
Structured collaboration	3	27%
Partnership/Extended commitments	10	91%
Structured follow-up internships	3	27%

Most CBO partners had worked with Pratt Institute before through the Pratt Center. They agreed that Students were a great resource, bringing energy, enthusiasm, and new ideas and ways of looking at things:

a) The energy and enthusiasm of the students, b) being made aware of emerging areas of expertise, c) it brought attention to neighborhood issues, d) It gave us an opportunity to see things thru the different eyes of the students and faculty, e) it gave me the opportunity to influence planning students about the real world (Director of Amsterdam Avenue BID).

MARP's director felt students "are a great resource but they are students after all, and so, more idealistic than realistic in approaching issues."

CUFFH also felt that some recommendations could be controversial or too complex to implement in the short run. GOLES director, who had the most experience working with students from different schools, said, "I've always had a positive experience."

Even if sometimes you don't get everything you want, many times you get things you didn't even ask for. So, it's a tradeoff. The same was true about the three Fundamentals studios." Director of NYCEJA, like the Director of Hester Street Collaborative (HSC), pointed out that "It is very useful to have many more eyes looking at issues, as compared to just one staff person analyzing them. In addition, this provides the opportunity to take an issue and analyze it in its broader context – which is often difficult for staff to do on a daily basis," and students "are eager to learn and get involved in co-creating a greater vision."

About half of the clients referred to time and capacity, as Ferman and Hill (2004) discuss in detail, as an issue. Since CBOs are under resourced and understaffed, it was hard for them to make additional time for the studio group, and sometimes, scheduled presentation or meeting dates had to be changed. MARP Director felt it was important to frame the relationship with students early on so that there will be less demand on client's time.

Another said "the amount of time that it takes to bring students up to speed to carry out the analysis" generally takes time away from their own work since "Every now and then, the students' lack of political context is an issue" (GOLES). The compressed schedule of the semester "doesn't allow them time to build relationships and trust with community members and stakeholders. So the client has to broker these relationships, meaning additional work for us" (HSC). While starting the work earlier on was a recommendation, most were aware of the difficulty of synchronizing the academic calendar with how things happen on the ground. As the Director of Hester Street Collaborative put it, "You must plan the curriculum in advance and on the ground things can happen more slowly or faster. An idea may not wait or process can take too long. Just 4 months doesn't allow students to see the end result." Moreover, Director of MARP pointed out that "not all CBOs as lucky as us to have access to Pratt faculty and Pratt Center. There should be a central place for groups to apply to for technical assistance on small projects."

All the clients' experiences with Pratt students were positive. Concrete Safaris director appreciated that the students were also well prepared and respected the time constraints of community based organizations: It was clear that your staff and students cared about the outcomes of the project and respected the time and contributions of non-profits... Visiting the place is essential. Your process of turning the visit into one or multiple events really built a team spirit outside of the classroom. The visits stressed the importance of the fact that work for a community-based organization cannot be done on a computer but in the community.

The Directors of NYC-EJA and HSC, perhaps because of their longer term involvement with the planning program through the ongoing Fellowship arrangements, felt Pratt students brought a more comprehensive perspective, and could grasp the issues at hand more quickly: By large, what is great about working with Pratt students is that ... the program tends to attract students that are sympathetic to environmental justice and its values. It's a richer interaction because there are similar political views. You do not have to explain too much in order for them to understand the broad principles of the work. Also, there was some diversity, so some students directly understood the issues discussed... The fact that they work with a client and enjoy that work makes the project a very pleasant experience for everyone (Director of NYC-EJA).

Pratt students were well prepared for the task and the organization. They were diverse in their backgrounds. They were serious and idealistic but had a practical approach to problems. They worked

with a true sense of enthusiastic learning about the grass roots community they were studying and seemed to grasp the community as unique from others. (Director of Two Bridges CDC).

CLIENT/Semester/Project	OUTCOMES How were the materials used?	CONTINUITY (interns, follow up studios or faculty involvement)
Amsterdam Avenue BID Manhattan CD7 - FA 2009 Commercial revitalization & community development	Posters used at BID meetings & to educate community. Student reports placed in local public library available to the public.	Follow up studio in Spring focused in on recommendations for youth & seniors.
Assemblyman's Office & BID Manhattan CD 7 - SP 2010 A community Vision for the Future	Presentations & Visioning Workshops brought together people who don't work together. Assemblyman disseminated findings in the Community Newsletter.	Fall semester students also helped w/ Visioning workshop
Myrtle Ave. Restoration Project (MARP) Brooklyn CD 2 - FA 2010 Under and Around the Brooklyn Queens Expressway	Visioning presentations & report helped w/ later workshops. Traffic recommendations were refined in MARP's final report to DOT & some were adopted & implemented.	Some students & faculty helped w/ later Visionings. Ahmadi worked on MARP-AFH report to DOT
NYC Environmental Justice Alliance Brooklyn CD1, CD6, CD7 - SP 2011 Planning for Resiliency -Safety & Jobs - in the three SMIA's	Research findings used in negotiations w. City around the Waterfront Plan. Innovative "Peacock" concept for addressing zoning resolution issues; research on best practices and performance standards helped with advocacy.	NYC-EJA has ongoing PSPD Fellows (interns) + faculty involvement continued
Good Old Lower East Side (GOLES) FA 2011 Gentrification, infrastructure, public health & the environment	Studio materials provided valuable research and helpful recommendations, but the long report format made it hard to look up the information needed to make a case. Needed (and got) follow up interns.	A student intern continued work on public health issues
GOLES Manhattan CD3 - SP 2011 Gentrification & Economic Justice in Lower East Side		A student continued research on financial mechanisms to assist GOLES in implementation
Churches United for Fair Housing (CUFHH) Brooklyn CD 1 - FA 2012 Development potential of CUFHH properties for resilient community development	Studio research and recommendations provided useful facts/ideas. The Professional Reference Guide used in conversations with elected officials and clergy.	Internship position announced but not filled
GOLES & LES Ready! Coalition Manhattan CD3 - FA 2013 Community Preparedness and Resilience Plan for LES	Research & recommendations contributed to LES Ready! Community Preparedness and Resilience Plan. GOLES dedicated resources for disaster preparedness. A studio idea on waterfront berm was incorporated into final Rebuild by Design plan & being implemented.	2 student interns for Spring & Summer under faculty supervision - RAMP funding
Hester Street Collaborative & Asian Americans for Equality (AAFE) Manhattan CD3 - SP2013 Open Space Analysis & Recommendations	Studio findings & recommendations used in applying for capital funding from Borough President's Office in partnership w/ the Sara D Roosevelt Park Coalition in Spring 2014.	HSC has ongoing GCPE Fellows (interns)
Carroll Gardens Association (CGA) Brooklyn CD 6 & Columbia Waterfront - SP2014 Affordable Housing in Columbia Waterfront & Red Hook	Studio report presented to Council Member to acquire a proposed site for potential mixed-use light manufacturing/affordable senior housing development.	Internship position announced but not filled
Two Bridges CDC Manhattan CD3 - FA 2014 Bridging the Waterfront: Recommendations for Two Bridges	Studio recommendations incorporated into the mission statement and bylaws of the recently created CDC.	Student thesis on Resiliency Improvement Districts.
Brownsville Partnership Brooklyn CD16 - SP 2015 Brownsville: Opportunity and Strength in the Heart of Brooklyn	Storm surge info and open space ratio finding helped BP make the case for more open space w/ funders, other partners. Food retail recommendation were most useful.	
Youth Ministries for Peace and Justice (YMPJ) Bronx CD9 - FA2015 Strategies for affordable housing and economic and environmental justice	YMPJ used inventory & analysis of vacancies. Some recommendations implemented (e.g. repurposing of the lot adjacent to ABC carpet to regain access to the waterfront).	A student intern at YMPJ during & after the studio and. Ongoing PSPD fellows
Concrete Safaris Manhattan CD11 - SP 2016 Open Space Systems, Youth and in East Harlem	Recommendations and research helped in developing CS's strategic plan, write grant proposals & support both with current facts.	

Table 3. List of Studio Projects, Outcomes and Continuity

All CBO partners found both the existing conditions analysis and the final recommendations useful. The ability to get the existing conditions report at that particular time gave us a current snapshot of the community. In particular, we have used a lot the inventory and analysis of vacancies – block and lot number and ownership information. The recommendations were also great. For example, the repurposing of the lots adjacent to ABC carpet to regain access to the waterfront is something that we have actively been bringing up in various discussions with the City and now may be able to achieve. (Director of YMPJ)

An issue that almost all community partners agreed on was that there was not enough time for more interaction and to follow through with the outcomes of student research and recommendations. Director of Two Bridges suggested, "You should come back with some of the students about a year later to evaluate the results of the studio project. Students should know how the product of their work was used."

Interestingly, no one felt the semester schedule was a problem, but all wanted more continuity, a key challenge in service learning (Martin, et.al. 2014) They had different ideas about how continued collaboration with Pratt could be accomplished, ranging from structured follow-up internship positions to multi-year collaboration agreements. The Director of YMPJ had further ideas about community university collaboration: There are so many other things the university could do to help out... Universities need to be aware of how to increase local organizations capacity too. The reports are cool but are there other potential benefits that should be considered – like to train members of the community, too. What about trainings on how to do research and mapping with Google tools? Or training on what is affordable housing? What about computers or software? Can we even access to universities' academic resources for local youth who want to go there? Can young people be able to sit in on a class? These collaborations could be useful to create a pipeline to design or planning.

5 CONCLUSION

This paper considered the benefits and challenges of engaging students during their first semester in a studio project with a real client. The findings from the student and client survey indicate that the first semester course has been relatively successful in meeting its learning objectives. Not only learning the technical skills for plan preparation, but also working collaboratively in teams, dealing with uncertainties, and acquiring a strong sense of accountability to the community client, provided a foundation for their advanced interdisciplinary studios in the program, and as several students pointed out, later professional work. Almost all the students (96%) reflected that they benefitted in different ways from working with a community based organization. Working with Fundamentals students was a positive experience for the community partners, too. They were, at times, impressed with the materials produced. They could use the data provided in the existing conditions report in different ways. At times, it highlighted issues they had not considered before (especially in relation to potential disasters and impacts of climate change). The recommendations generated new ideas that went beyond the scope they expected. Presentations to the community (Community Boards, other CBOs, CBO's constituencies) and visioning workshops were useful in a number of ways. They provided useful information for the CBO, but were also important in bringing together stakeholder groups that often did not work together. The presence of an independent outside party provided a sense of neutrality, and eventually, some of the recommendations were refined and implemented in the neighborhood.

Continued engagement and support was the community partners' main concern, reflecting a key challenge in the community service-learning. Cameron, et.al. suggest that campus based community design or development centers, like the Pratt Center for Community Development, "help create a more permanent framework for community relations and service" (1998, 110). Still, there is need for coordination (as has been started through the GCPE Studio Group meetings) to conduct follow up studios, and administrative support (Martin et.al. 2014). Coordination between the internship course, fellowships, and some of the studios has led to the creation of internship positions linked to studios, enabling students to continue to work longer with the partner CBOs or in the communities.

Despite the unique advantages of the Pratt's planning program due to the legacy of the Pratt Center, engaging students early on, during their first semester, with a real client around a plan-making project is possible and important for introducing them to the challenges of professional practice and collaborative work, and helping them confront their values and consider future directions. However, it requires a seminar component to ground students in theory, a structured process to overcome potential anxieties and ensure satisfactory completion of the deliverables on time, and close collaboration with skills courses to enable a steep learning curve. A lot of faculty time and attention is needed to plan the studio process: to meet and discuss early on with the community-based client the goals, expectations, deliverables and meeting schedules, and to work closely with students, incorporating feedback and reflection sessions into the class schedule. Without community outreach and establishment of strong long-term relations and trust with community organizations, however, it is not possible to have effective dialogue and mutual learning experience in communities.

T03 | SPACES OF DIALOGUE FOR ACTIVE, NETWORKED AND RESPONSIBLE CITIZENSHIP

CO-CHAIRS: CAMILLA PERRONE; ROBERTO ROCCO; LIA VASCONCELOS

Doreen Massey (2011) claimed space as the dimension of multiplicity: "If time is the dimension of sequence, then space is the space of contemporaneous existence. In that sense, it is the dimension of the social and therefore it is the dimension that poses the political question of how we are going to live together".

Massey calls this 'radical simultaneity', in which stories, ongoing trajectories and multiple voices happen simultaneously. Space is, therefore, composed by relations, practices and interactions imbued with power.

Descriptions of types of space in terms of levels of interactions are frequent in literature, ranging from self-organisation to deliberative/participatory experiments, as well as contested practices and multiple uses, offering generous inputs to planning theory and practice. What emerges is that spaces, places and people need to be reciprocally interconnected through networking and responsible citizenship.

Massey's concept of space challenges the simultaneity of multiple trajectories displayed in a variety of intertwined existences. It feeds increasing uncertainty about what we mean by 'places' and how we relate to them. At the same time, it triggers a deeper and broader reflection on how to foster spaces of dialogue that can enable contemporaneous co-existences, diversity and social citizenship.

Accordingly, issues like the right to the city, power imbalances, empowerment practices, do-it-yourself urbanism, urban insurgency, social and environmental sustainability and the idea of common goods focus on a certain range of socio-spatial and political issues contributing to enter the debate, feeding democracy.

In radical simultaneity, where some voices are much more powerful and arresting than others, the pursuit of socio-spatial justice becomes urgent.

ID 1371 | BRIDGING THE GAP BETWEEN CRITICAL THEORY AND EMPIRICAL STUDIES: A RELATIONAL APPROACH TO THE STUDY OF THE URBAN COMMONS

Bianchi, Iolanda^{1,2}

¹IUAV; ²UAB

iolebianchi@gmail.com

1 INTRODUCTION

Since the unfolding of industrial capitalism, the institution of the Market, based on the logic of capital accumulation and commodification, has prevailed in the social space through the support of the institution of the State. In reality, the State, on behalf of the Society, should have represented the institution which, through the logic of the Public, based on universalization and social protection, could have balanced and challenged the Market. However, it is evident that the State has not only been an inadequate institution for the protection of the Society, but has also often withdrawn from this role due to a bizarre, complex and intertwined relationship with the Market. The last decades of our history constitute the evidence that the protective role of the State has waned, giving rise to the hegemonic, albeit variegated, neoliberal regime (Peck and al, 2012), whereby the logic of the Market has permeated into the institution of the State. In the face of this reality, that even the latest economic crisis does not seem to have changed, despite the many urban protests which emerged in various parts of the globe and in the wake of the failure of the communist utopia and if the post-politicization of the Left that has finally assumed the same Market logic, the Society seems to be out of alternatives. However, in this apparently catastrophic economic, social and political landscape a new logic has emerged in the contemporary counter-hegemonic discourse: the logic of the Common (Negri; Hardt, 2009; Laval; Dardot, 2014). This logic, based on two main principles, cooperation and self-government, aims to challenge not only the institution of the Market but also the intertwined relation between the latter and the State in order to put in motion a process of emancipation of the Society from both. The theory of the Common derives from and connects to the theory of the Commons as the principles on which both are based are the same. However, despite their close relationship, it is necessary to separate the two theories, especially in the light of empirical work.

The Common is interpreted as a political strategy of the radical Left, able to articulate the fragmented yet existing antagonist struggles in order to institute the Common. This strategy is based on the claim, the production and the reproduction of the Commons that becomes the means through which the logic of the Common can be expanded. Nevertheless, as some scholars have shown, the critical theory of the Commons lacks an empirical approach (Hurton, 2015), preventing the effective understanding of the emancipatory capacity of these practices, that is to institute the Common. This paper aims to contribute to filling this gap, by setting the analysis in the urban context.

The paper starts by explaining the critical theory of the Common and the Commons, their relation and their differences, underlining the lack of an empirical approach. Secondly, by assuming that within the city, Urban Commons cannot exist in their pure autonomous forms, the paper proposes a comparative methodology based on a relational approach whereby Urban Commons have to be studied in relation to the institution from which they aim to outline emancipatory processes: the Market and the State. By drawing from a case study of Urban Commons analyzed in the city of Barcelona, an industrial factory occupied by a group of artists, the paper sustains that only by unveiling this interface between the Urban Commons and the Market and the Urban Commons and the State it is possible to grasp their complexity and envisage their true emancipatory power, understanding how they are formed and how they are maintained. The paper concludes by reflecting on the emancipatory capacity of the Commons and the tension between the logic of the Common and the logic of the Public.

2 FROM THE COMMON TO THE COMMONS AND VICE VERSA

The critical theories of the Common and the Commons are closely linked since, in both cases, they are based on the organizational principles of cooperation and self-government, and since in both cases they aim to design a path of emancipation of the Society from the institutions of the Market and the State. However, despite seeming like Siamese twins, these two theories are actually two separate bodies which we are required to disjoin, especially in the face of empirical implications. The logic of the Common was presented for the first time in "Commonwealth" by Negri and Hardt (2009) and successively in "Commun. Essai sur la révolution au XXI^e siècle" by Laval and Dardot (2014). Despite the dissimilarities of their approaches, based on the meta-level on the more or less spontaneous operationalization of the concept, and on the micro-level, on a myriad of semantic differentiations, their thesis converges on the objective and the function of the concept of the Common in the political discourse through which all the fragmented, dispersed, yet existing antagonist historic struggles can be articulated. In this sense, their convergence-despite-the-differences, represents the first evidence of the articulation capacity of the concept of the Common. According to their theory, the Common is a political principle (Laval and Dardot, 2014) and a project (Negri and Hardt, 2009) that enables the resistance forces of the Society not to stay in the resistance but to go beyond, through an emancipation (Laval and Dardot, 2014) and liberation (Negri and Hardt, 2009) process capable of producing a rupture with the spatial established order and create an alternative configuration of the space. This alternative configuration can be achieved by questioning, challenging and redefining the space occupied by the institution of the Market and by the State, by instituting (Laval; Dardot, 2014) and constituting (Negri; Hardt, 2009) the Common (Laval; Dardot, 2014). In this perspective the Common is not only a synonym of cooperation and self-government but also it becomes the same objective of the cooperation and self-government (Negri; Hardt, 2009).

The way through which the institution and the constitution of the Common is achieved is the main difference in the two works due to two different epistemological approaches, the one of Negri and Hardt following the Marxist historical materialism tradition and the other of Laval and Dardot following the Proudhonian associationism tradition. However, independently from its operationalization, what the two approaches shared is that the institution and the constitution of the Common takes place in the terrain of the practice. It is on this terrain that the theory of the Common connects with the theory of Commons.

The theory of the Commons developed before the theory of the Common and it could be sustained that the latter is an evolution of the former. The theory of the Commons was developed within the new institutionalist studies with the ground-breaking works of Elinor Ostrom whose merit was to demonstrate that the collective management of different resource systems, both material (1990) and immaterial (2012), not only were possible, but also represented a valuable alternative to the State and the Market. Her contribution had the aim to break that public/private dichotomy that had been so dear to the Western economic-political culture of the twentieth century. Although her work was far from being critical because she never questioned the capitalist mode of production nor the social, economic and spatial injustice produced by it, her contribution was crucial to opening up a new space of economic-political theory in a time when that intertwined relation between the State and the Market became stronger than ever. The space for new critical theorization was occupied by a variety of scholars, starting from the De Angeli (2013) and Caffentzis and Federici (2013) to Harvey (2012) and Mattei (2011, 2013). According to their interpretation, the Commons are constitutive (and institutive) practices of struggle based on the cooperation and self-government that demonstrate that autonomous non-capitalist forms to produce and reproduce life are possible beyond the logic of the State and the Market. In this case, there is no emphasis, as in the case of Ostrom, on the mere collective ability of a community of individuals to self-govern a resource system, but on how the process of collectively self-governing a resource, material or immaterial, is an emancipatory practice that resists and challenges the tension of appropriation and commodification of the Market, but also the tension of absorption and transformation into a bureaucratic and homogenous State form. In this way, the practices of struggle represented by the Commons become a means through which the Common can be instituted and constituted. Concretely speaking, the Commons are built when a social relation (Caffentzis and Federici, 2013; Harvey, 2012; Mattei, 2011; Stavrides, 2015), although unstable and malleable, is built between a self-defined social group and an aspect of its social and physical environment deemed crucial to its life and livelihood (Harvey, 2012). By focusing on the cruciality of the social relation, which is objectified in the struggle, the Commons aim to cast our eyes on the necessity of recovering the ownership of the condition needed for life and its reproduction (De Angeli, 2013) and of re-establishing fundamental rights (Marella, 2012), collectively claiming them back. However, it is very difficult for this relationship to be stable and completely separate from the context, as the Commons coexist with a

myriad of other private and public forms of ownership and governance (Chatterton, 2016). As Stavrides (2015) argues, "we need to abandon the view that fantasies on uncontaminated enclaves of emancipation," also because the emancipation of a single group can no longer be considered emancipation but abounded production and reproduction of social, spatial and economic equalities with the consequent production and reproduction of inequalities outside the boundaries of the group. For this, what characterizes Commons is not only the social relationship between the group and the resource, but also the social relation with other institutions that make it possible for the Commons to be constituted. In other words, the Commons are not only a social relation but a relational social relation since the Commons cannot exist in their pure form.

However, the existence of Commons does not necessarily imply the production of the Common. If the Common is an immanently positive concept in the critical sense of the term, as it was born as a cooperative force opposed to commodification force of the Market, the Commons are not, and for them to be so, they must meet certain conditions. First of all, the relation between the members of the self-defined social group must be as horizontal as possible, as well as its decision-making process (Harvey, 2012). Secondly, the relation between the social group and the resource must imply a non-commodification - off limits of the same resource (Harvey, 2012). And last but not least, the relation with the rest of the Society must be a porous relation, so that the Commons do not become elitist enclaves outside of which social, spatial and economic inequalities are produced and reproduced, but so that they become the means through which a universal emancipation process can happen, by overstepping the boundaries of the self-defined social group (Stavrides, 2015). In other words, despite the great emancipatory potential of the Commons, it is not easy to materialize this emancipation. However, despite the abundance of literature on the critical theory of the Common and the Commons, there is a shortage of literature that empirically investigates the true possibility for the Commons to give form to emancipatory processes, that is, to institute the Common. In other words, the critical theory of the Commons lacks an empirical approach (Hurton, 2015), preventing the effective understanding of its emancipatory capacity. This paper aims to contribute to filling this gap, by setting the analysis in the urban context and by studying within this context the relation of a self-defined social group with a particularly contested resource of the city, which is land.

3 THE URBAN COMMONS

The Commons have become the subject of theoretical speculation by many critical urban scholars who see in the urban space a privileged space for the anti-capitalist struggle (Lefebvre, 1970; Harvey, 2012; Stavrides, 2015; Chatterton, 2016). The continued unbridled urbanization of our globe with the increase in the urban in relation to the rural population, as well as to the strong politicization of urban space, mainly due to the great manifestations and occupations that urban social movements developed in this context, has led to a growing academic interest in the urban. Starting from Lefebvre (1970), who was the first to reflect on the urbanization of the world and to argue that the revolution would have been urban or would not have been, to Harvey (2012), who sustains that reclaiming and organizing the city for anti-capitalist struggle is a great place to start, many authors have been struck by the fascination of the urban and its revolutionary potential. However, beyond the fascination, the emergence of the urban is also due to the change of capitalist production in the Western world. As sustained by Negri and Hardt (2009), if during industrial capitalism, the factory was the privileged space for class struggle, being the place of production, of the encounter of workers and of their rebellion, now this privilege can no longer be attributed to this space. The current change in the capitalist mode of production has transcended the factory to invade all the urban territory and so has the struggle. For this reason, they argue that the metropolis is for themultitude what the factory was for the working class. In other words, the urban space is considered to be a privileged space for anti-capitalist struggle where the Commons can become an instrument of this struggle. However, if cities offer a privileged ground for the claiming, production and reproduction of the Commons, they also represent a hostile ground.

Cities, and the production of space, have always played a key role in the capital accumulation process (Lefebvre, 1970; Harvey, 2012). Cities embody the essence of capitalist production on which a major part of the same production is based, through urban expansion and speculative land-use. In many of his works, Harvey has given evidence for the crucial role cities have played in the uneven development of capitalism, underling the relation between capitalism, wealth and urban expansion as in the case of the United State's golden age as well as the one China is now undergoing. Moreover, he provided evidence of how the city has been crucial for the rescue of capitalism itself during its many surplus-based crises, with the absorption

of surplus production into the urban development. The crucial role of cities in capitalist history is also maintained and legally legitimized by a series of regulatory devices, primarily the modern urban planning (Tafuri, 2007), supported by the institution of the State. In other words, cities are a socially constructed environment shaped to favour the action of the Market with a broad support of the State. From this it follows that cities, being privileged spaces of capital accumulation, enshrine that constant tension to the commodification of resources that the market needs. This is particularly true in relation to one of the most valuable resource that cities have, which is land. In this saturated space of both capital investments and people (Hurton, 2015) every single space of the city enters the competitive logic of capitalism, where there is an over-competition and an over-pressure to the use of the space. This is the reason why, the claim, the production and the reproduction of the Commons in the urban environment, especially if one of the resources in question is land, could be a much more hostile process. However, the hostility must not become a deterrent to the study of the Commons in the urban context. Studying their claiming, production and reproduction in this capital-shaped and hostile space is essential to understand the conditions and the limits of the Urban Commons to be truly emancipatory practices.

4 A METHODOLOGY FOR THE URBAN COMMONS

As we have seen, the critical theory of the Commons and the Urban Commons is supported by abundant literature. All of the literature places great emphasis on the emancipatory capacity of the Commons, but it is difficult to find empirical studies that materially respond to this emancipation, firstly because there are still few empirical contributions being made, and secondly because they start from specific research objectives: some research has been dedicated to the qualification of the Urban Commons (Hurton, 2015), some research focuses on defining limits and challenges (Brenhian and Byrne, 2015) and some research studies the organization of resistance (Bunce, 2016). The result is that the shortage and fragmentation of the empirical contribution is still not able to substantially back-feed the theoretical contribution. The aim of this paper is to try to bridge the gap between critical theory and empirical study by proposing an empirical approach to the study of the Urban Commons that can help in the construction of an empirically-based theory of their emancipatory capacity, that is to say on their capacity to institute the Common. This empirical approach stems from the same ontology of the Commons, that is their relational nature. This nature is even more evident in the urban context where economic and demographic saturation and over-pressure and overcompetition on a strongly State-regulated space make it impossible for Commons to exist in their pure

form. For this reason, the empirical approach that this research proposes is a relational approach to the study of the Urban Commons, whereby the object of the study becomes the nature of the relation between a self-defined group and a social or physical resource and the nature of the relation between the former relation and the main institutions that dominate the social space, which are the State and the Market, that are also the same institutions from which they aim to emancipate from.

Figure 1: The relational approach to the study of the Urban Commons

Normally, the relational nature of the Commons is a fact that emerges as a result of empirical works, when the type of alliances a Commons builds to sustain its survival or its partial institutionalization through the integration into public programmes are finally shown (Hurton, 2015; Brenhian and Byrne, 2015; Bunce, 2016). However, what is argued here, as also confirmed by the work of Chatterton (2016), is that in order to understand the process of emancipation of the Commons, their relational nature, and therefore their non-pure-self-governing-form, can not simply be the result of an inductive work but must be deductively considered as a postulate of the research itself and as a guide for the entire empirical work. In order to show this methodology, this paper uses the case of an artists' self-governed space that developed in postindustrial Barcelona in the late 1990s. The relational approach is firstly used to define through which

web of social relations the Urban Commons takes shape and to what extent this web is capable of producing the Common; and secondly to analyze what the threats and the limitations of these relations are and whether they could be maintained over time.

5 THE CASE OF THE ESCOCESA ARTS FACTORY

THE URBAN COMMONS

The Escocesa Urban Commons is the expression of a social relation established between a group of artists and a privately owned industrial warehouse of 7500 square meter, called the Escocesa, located in the Pere IV street of the Poblenou, the former industrial district of Barcelona. The industry in place since 1885, officially terminated its operations in 1998. After one year, the factory began to be rented by creative professionals. At the beginning, they were around 12-13 artists. Generally, the relation built between the owner and artists was based mainly on mutual advantage. Artists could benefit from affordable renting prices of wide industrial spaces in a rather central area of the city and the owner could benefit from a low but constant profit in a time when these spaces were otherwise unprofitable. As time passed the number of artists grew steadily. By the end of 2006 there were around 75 artists among which were painters, sculptors, photographers, circus performers, etc. During this period, the Escocesa was self-governed and self-sufficient. Self-government was rather elementary, as artists had to share little, mainly the bills, and only few decisions had to be taken together, principally concerning the realization of shared arts events within the Escocesa and shared events with other art spaces of the neighbourhood. Self-sufficiency must be understood in the sense that the artists' social group of the Escocesa was not receiving any type of public funding as a group and each artist was paying the rent separately. This means that, the economic sufficiency differed from case to case, with some artists who were more and some who were less economically self-sufficient.

However, the Escocesa was not an isolated case. In those years, the Poblenou, suffering the decline of industrial activities, was an undervalued area due to the financial disinvestment by banks and real estate developers and the laissez-faire approach of institutional power. This is why, from the 1970s onwards many artists' groups settled in the area, using the former industrial factories as work spaces. During that period, in which no other social group and no other economic and institutional actors were interested in these properties, artists represented the only ones. As a result, the artists' concentration in the Poblenou grew to the point where it was identified in the literature as an unplanned creative milieu (Marti-Costa and Pradel, 2011) as many others taking place in former industrial districts in western cities (Zukin and Braslow, 2011). There aren't any institutional statistics available, but according to artists' associations (CVAA, 2007) by the end of 2006 in the Poblenou there were 232 artists and 12770 sqm of studios spaces. The Escocesa and the Poblenou creative milieu grew without any institutional planning, but only through the relation between the artists' need for affordable spaces, on the one hand, and landlords' profitability on the other.

The relation that all of the artists had with the Escocesa warehouse was based mainly on economic interest. Artists needed a space to work which had some specific characteristics, such as wide-open areas, an abundance of natural light, affordable renting prices and proximity to the city center, and the industrial site of the Escocesa met all them. Obviously, for young, unsalable and low-income artists the relation of economic interest was a relation of necessity since without access to affordable spaces, they could no longer afford to carry out their arts activities. Nevertheless, in addition to the economic reason, some artists also began to develop an identity relation with the Escocesa and the Poblenou creative milieu, since it made them feel as they were an integrated part of that neighborhood. This is why the Escocesa Urban Commons can not be considered separate from the unplanned creative milieu of Poblenou as it was precisely because of this dense network of self-governed arts spaces that the Common was produced.

THE COMMON

The Common referenced in this case is the democratic, diverse and decommodified arts production, autonomous from market and political pressures. In the case of the Escocesa and of the Poblenou creative milieu, the democratic, diverse and decommodified arts production was due to the affordable access to space. If generally only those who can afford the uncertain economic stability of this

discipline can attempt this professional path, in this case young, unsalable and low-income artists could also find a workplace in the Escocesa, or in other arts spaces, and produce art. In this way, artists were keeping their creativity free, without feeling the pressure to highly commodify their arts or to fully meet the need of the art market or to be constantly in search of public funding, maintaining a sort of collective independence from public patronage. Nevertheless, despite the fact that affordable access to space was helping to democratize, diversify and decommodify art production, and to maintain artists' creative freedom, the democratization, diversification and decommodification could only be partial, since it couldn't guarantee access to space to all of those more than young, low-income and unsalable artists. This is why, it would have been ideal to compensate the production of the Common with a production of the Public, whereby the universal logic, by providing access to affordable space to those more than young, low-income and unsalable artists, could have reduced the imperfection of the logic of the Common.

THE THREAT

The Barcelona City Council, governed in those times by the left-wing Catalonia Socialist Party, played a leading role in the land revalorization process of the Poblenou through the implementation of a pro-growth land-use reform based on the notion of the knowledge city - the 22@ Plan approved in 2000. The 22@ aimed to transform almost two-hundred hectares of the old industrial area of Poblenou, into a knowledge area, mainly ICT-driven, with the mixed uses of housing, economic activities and social facilities. In order to achieve these goals, the 22@ Plan used the Barcelona model, but with a more market-oriented approach. Thus, if, on the one hand, for each 100 sqm of private redevelopment, the public administration retained 31 sqm of the land, of which 18 sqm was to be dedicated to green zones and 10% in public facilities, on the other hand, it increased the construction rate from 2 sqm/sqm to 3 sqm/sqm without limiting the height of buildings. Furthermore, if on the one hand, the plan provides 100% of some sort of social housing of which 25% was to be rented, on the other hand, it also allowed for the reconversion of factories into lofts to be sold on the market at market prices. However, although knowledge (and thus culture) was the driving principle behind the transformation, the presence of the unplanned creative milieu was not taken into account when the plan was drafted. The Urban Planning Department considered the Poblenou merely as an area characterized by a "functional obsolescence" (Barcelona City Council, 2010). In the Plan, the many vacant factories, together with those ones occupied by artists, were only considered to be disused architectural artefacts, symbols of the economic downturn where all artists' social groups were not considered productive agents, but rather only a further demonstration of the economic obsolescence.

With the approval of the 22@ Plan many redevelopment projects began and land value increased (Martí-Costa and Pradel, 2011). Many artists' workshop started to come under threat and disappeared, progressively moving somewhere else, mainly towards another undervalued former industrial area: the Hospitalet de Llobregat. A few years after the Plan's approval, the Escocesa also became threatened. At the end of 2005 the factory was bought by Renta Corporación S.A, a Spanish real estate company. The plan they have for the Escocesa was to redevelop the factory, reforming the existing housing along the Pere IV street, converting the rest into lofts and handing over the remaining 30% (two warehouses) to the City Council for public facilities, as established by the 22@ Plan. The Escocesa redevelopment was approved and made public in March 2007. As soon as Renta Corporación S.A. bought the factory, it started to offer economic compensation to artists to facilitate their departure. Since each contract was subject to a specific negotiation, many of them accepted the indemnification and moved somewhere else. Only a reduced number of artists decided to remain until the end of their contracts refusing the compensation and campaigning against the redevelopment project.

THE STRUGGLE

Artists who decided to stay and to struggle in the Escocesa were few, around 15 people. This group was formed mainly by those young, unsalable and low-income artists who couldn't afford to pay higher rent for a studio space and by those more or less affluent ones who had developed a strong identity relation with the space. Thus, in order to facilitate institutional negotiation, they gathered into the Emma Ideas Association (EMA). When the Escocesa redevelopment project was made public, the EMA association presented a project to the ICUB, the Cultural Institute of Barcelona, in order to take advantage of the possible transfer of facilities space to the City Council. They proposed that the Escocesa become a not-for-profit cultural center

managed by the EMA Association to experiment, produce and spread fine plastic arts, where self-sufficiency would be provided by the members' fees and by the renting out of some studio spaces (EMA, 2007). Eventually, the EMA association managed to remain in the factory, saved thanks to the intervention of the City Council which acquired the two warehouses and included them in the Arts Factories Programme. However, most of the self-governed arts centers under threat didn't benefit from the same institutional help and disappeared from the Poble Nou.

THE PUBLIC LOGIC TO SAVE THE COMMON

The objective of the Arts Factory Programme (AFP) was to support existing and new creative activities by retaining affordable spaces in Barcelona for artists and creative professionals through the provision of a network of public arts factories with different artistic specializations, assigning to arts companies or association or groups the management of these spaces. The Programme was part of the new Strategic Cultural Plan of 2006 that represented a shift in the cultural policy approach of the Barcelona City Council and the ICUB from an entrepreneurial towards a more democratic understanding of culture. In the words of a public officer who contributed to its drafting, the new Plan looked at culture "not as a commodity to foster economic development, but as a right, stating that everyone can benefit independently from its possible commodification and from its status". Through the AFP programme, it seemed that public institutions had understood how the provision of affordable spaces was relevant to guaranteeing a fully democratic, diverse and de-commodified artistic production. Spaces included in the network had to follow four main principles. Firstly, they had to be in the public interest. This means that the artists' accessibility had to be guaranteed by an open and transparent selection process allowing the rotation of artists. Secondly, they had to pursue cultural and artistic interests, giving spaces over to experimentation and innovation, while also sustaining artistic excellence. Thirdly, they had to develop a territorial dimension, forming a relationship with the neighbourhood and offering cultural services to promote social cohesion. Lastly, they had to become spaces for technological innovation in the creative sector. Moreover, all factories, by being included in the network would have to be publicly funded, so that the economic sustainability of each factory would not be a crucial dimension, but had to be assessed on a case by case basis according to the management system of each space (Barcelona City Council, 2007).

The first stage of the plan was characterized by the researching of public industrial buildings across the entire Barcelona area that could be incorporated into the network. The Escocesa factory resulted in the first selection, but surprisingly it wasn't considered for its existing creative activity, but only as an industrial artifact that met architectural requirements (Barcelona City Council, 2007). During this first phase, another six factories were included into the programme: Fabra i Coats, La Central del Circ, Hangar, La Seca, El Graner and Ateneu Popular de Nou Barris, of which only Hangar was a former Poble Nou arts center. Some factories were long-standing self-managed arts spaces, so they were allowed to remain being managed by the same associations, while other factories were entrusted to different organizations, each one representative of a specific artistic sector. The second phase of the AFP involved the architectural renovation of all factories. Once the renovation was about to be terminated, each factory could finally become part of the network and start to receive public funding in order to become a fully functioning Arts Factory.

THE ESCOCESA URBAN COMMONS WITHIN THE PUBLIC LOGIC

According to the 22@ Plan regulation, the 1st of January of 2008, two warehouses of the Escocesa estate were transferred by Renta Corporación S.A. to the ICUB to be used as public arts facilities. However, as the ICUB did not yet have a clear idea of the type of artistic specialization which the two buildings could accommodate, and since it wasn't aware of any other arts associations to entrust them to, it decided to take advantage of the presence of the EMA association by welcoming their claim to manage the building. The same month, one of the two warehouses was temporarily entrusted to the EMA association. The other warehouse, the function of which had yet to be identified, remained in the hands of the ICUB. The rest of the estate was still in the hands of Renta Corporación S.A. which had however temporarily stopped the redevelopment project due to the crisis. According to public officers, the temporary entrustment was due to the fact that Escocesa was not recognized as a long-standing self-managed creative space, as in

the case of Ateneu de Nou Barris and Hangar because the EMA association wasn't an association with a long-standing tradition of social and/or cultural activism and it couldn't rely on a well-structured arts project.

The contract signed between the ICUB and the EMA association established that one of the two warehouses could be managed by the association until the renovation project of the building had taken place. From that moment on, the arts project of the Escocesa factory had to be re-discussed and a public call had to be done to assign the management of the arts project. This didn't prevent the EMA association from presenting itself and winning the call. However, in the event that the EMA had won, the association members would have to leave after two years in order to provide a complete rotation of its artists, for the sake of the public, the cultural and the artistic interest, guaranteeing its open accessibility and use. Thus the ICUB temporarily saved the social relation of Escocesa's artists with the factory, not because it recognized the relation of interest and identity of artists with the space, but only because of a temporary lack of planning that should have soon been overcome. However, the temporary status of the Escocesa factory never ended and became structural.

In 2010 refurbishment works began in all the factories. The Escocesa was the only one in which the refurbishment works didn't begin. The reasons given by public officers were that in those years of economic crisis, in which the municipal budget shrank in all areas, the AFP didn't have enough resources to carry out all of the works. Thus, it had to prioritize some projects and on this list of priorities, the Escocesa was the last one. However, a small amount of funding was allocated in a timely manner to secure the building, as it was already operating as a sort of public arts center, albeit imperfectly. In those times the Escocesa became a not-for-profit arts center self-managed by the EMA association, organizing a variety of public arts and training activities and offering access to some of their studio space for temporary artists through public calls in order to economically sustain the project.

As soon as the refurbishment works were completed, all of the other factories were incorporated into the programme as fully functioning Art Factories and they began to receive a constant public subsidy. Thus the Escocesa was the only factory that, since it didn't undergo the refurbishment works shouldn't have been entitled to funds, since it couldn't be considered a fully fledged Art Factory. However, the Escocesa was part of the programme and it was functioning as a sort of imperfect public arts centre. Thus, in order not to leave the Escocesa in a particularly disadvantaged position the ICUB decided to transform the timely allocation into an annually-renewed contribution. In the beginning, the amount of the contribution was small, around 4000-5000 Euros, but it progressively increased over the following years. However, the funds were much lower in comparison to other factories. This precarious condition created by the postponement of refurbishment works and the reduced amount of public funds has characterized the Escocesa up to recent times.

THE EFFECTS OF THE PUBLIC LOGIC ON THE ESCOCESA URBAN COMMONS
